loadBalanceSQLStateFailover	Comma-delimited list of SQLState codes used by default load-balanced exception checker to determine whether a given SQLException should trigger failover. The SQLState of a given SQLException is evaluated to determine whether it begins with any value in the comma-delimited list.		5.1.13
loadBalanceValidateConnectionOn-SwapServer	Should the load-balanced Connection explicitly check whether the connection is live when swapping to a new physical connection at commit/rollback?	false	5.1.13
maxRows	The maximum number of rows to return (0, the default means return all rows).	-1	all versions
netTimeoutForStreamingResults	What value should the driver automatically set the server setting 'net_write_timeout' to when the streaming result sets feature is in use? (value has unit of seconds, the value '0' means the driver will not try and adjust this value)	600	5.1.0
noAccessToProcedureBodies	When determining procedure parameter types for CallableStatements, and the connected user can't access procedure bodies through "SHOW CREATE PROCEDURE" or select on	false	5.0.3

	mysql.proc should the driver instead create basic metadata (all parameters reported as IN VARCHARs, but allowing registerOutParameter() to be called on them anyway) instead of throwing an exception?		
noDatetimeStringSync	Don't ensure that ResultSet.getDatetimeType().toString().equals(ResultSet.getString())	false	3.1.7
noTimezoneConversionForTimeType	Don't convert TIME values using the server timezone if 'useTimezone'='true'	false	5.0.0
nullCatalogMeansCurrent	When DatabaseMetadataMethods ask for a 'catalog' parameter, does the value null mean use the current catalog? When nullCatalogMeansCurrent is true the current catalog will be used if the catalog parameter is null. If nullCatalogMeansCurrent is false and the catalog parameter is null then the catalog parameter is not used to restrict the catalog search. (This is not JDBC-compliant, but follows legacy behavior from earlier versions of the driver)	true	3.1.8
nullNamePatternMatchesAll	Should DatabaseMetaData methods that accept *pattern parameters treat null the same as '%' (this is not JDBC-compliant, however older versions of the driver accepted this departure from the specification)	true	3.1.8
overrideSupportsIntegrityEnhancementFacility	Should the driver return "true" for DatabaseMetaData.supportsIntegrityEnhancementFacility() even if the database doesn't support it to workaround applications that require this method to return "true" to signal support of foreign keys, even though the SQL specification states that this facility contains much more than just foreign key support (one such application being OpenOffice)?	false	3.1.12
padCharsWithSpace	If a result set column has the CHAR type and the value does not fill the amount of characters specified in the DDL for the column, should the driver pad the remaining characters with space (for ANSI compliance)?	false	5.0.6
pedantic	Follow the JDBC spec to the letter.	false	3.0.0
pinGlobalTxToPhysicalConnection	When using XAConnections, should the driver ensure that operations on a given XID are always routed to the same physical connection? This allows the XAConnection to support "XA START ... JOIN" after "XA END" has been called	false	5.0.1
populateInsertRowWithDefaultValues	When using ResultSets that are CONCUR_UPDATABLE, should the driver pre-populate the "insert" row with default values from the DDL for the table used in the query so those values are immediately available for ResultSet accessors? This functionality requires a call to the database for metadata each time a result set of this type is created. If disabled (the default), the default values will be populated by the an internal call to refreshRow() which pulls back default values and/or values changed by triggers.	false	5.0.5
processEscapeCodesForPrepStmts	Should the driver process escape codes in queries that are prepared?	true	3.1.12
queryTimeoutKillsConnection	If the timeout given in Statement.setQueryTimeout() expires, should the driver forcibly abort the Connection instead of attempting to abort the query?	false	5.1.9
relaxAutoCommit	If the version of MySQL the driver connects to does not support transactions, still allow calls to commit(), rollback() and setAutoCommit() (true/false, defaults to 'false')?	false	2.0.13
retainStatementAfterResultSetClose	Should the driver retain the Statement reference in a ResultSet after ResultSet.close() has been called. This is not JDBC-compliant after JDBC-4.0.	false	3.1.11
rollbackOnPooledClose	Should the driver issue a rollback() when the logical connection in a pool is closed?	true	3.0.15
runningCTS13	Enables workarounds for bugs in Sun's JDBC compliance test-suite version 1.3	false	3.1.7
serverTimezone	Override detection/mapping of timezone. Used when timezone from server doesn't map to Java timezone		3.0.2

statementInterceptors	A comma-delimited list of classes that implement "com.mysql.jdbc.StatementInterceptor" that should be placed "in between" query execution to influence the results. StatementInterceptors are "chainable", the results returned by the "current" interceptor will be passed on to the next in the chain, from left-to-right order, as specified in this property.		5.1.1
strictFloatingPoint	Used only in older versions of compliance test	false	3.0.0
strictUpdates	Should the driver do strict checking (all primary keys selected) of updatable result sets (true, false, defaults to 'true')?	true	3.0.4
tinyInt1isBit	Should the driver treat the datatype TINYINT(1) as the BIT type (because the server silently converts BIT -> TINYINT(1) when creating tables)?	true	3.0.16
transformedBitIsBoolean	If the driver converts TINYINT(1) to a different type, should it use BOOLEAN instead of BIT for future compatibility with MySQL-5.0, as MySQL-5.0 has a BIT type?	false	3.1.9
treatUtilDateAsTimestamp	Should the driver treat java.util.Date as a TIMESTAMP for the purposes of PreparedStatement.setObject()?	true	5.0.5
ultraDevHack	Create PreparedStatements for prepareCall() when required, because UltraDev is broken and issues a prepareCall() for _all_ statements? (true/false, defaults to 'false')	false	2.0.3
useAffectedRows	Don't set the CLIENT_FOUND_ROWS flag when connecting to the server (not JDBC-compliant, will break most applications that rely on "found" rows vs. "affected rows" for DML statements), but does cause "correct" update counts from "INSERT ... ON DUPLICATE KEY UPDATE" statements to be returned by the server.	false	5.1.7
useGmtMillisForDatedtimes	Convert between session timezone and GMT before creating Date and Timestamp instances (value of "false" is legacy behavior, "true" leads to more JDBC-compliant behavior).	false	3.1.12
useHostsInPrivileges	Add '@hostname' to users in DatabaseMetaData.getColumnName/TablePrivileges() (true/false), defaults to 'true'.	true	3.0.2
useInformationSchema	When connected to MySQL-5.0.7 or newer, should the driver use the INFORMATION_SCHEMA to derive information used by DatabaseMetaData?	false	5.0.0
useJDBCCompliantTimezoneShift	Should the driver use JDBC-compliant rules when converting TIME/TIMESTAMP/DATETIME values' timezone information for those JDBC arguments which take a java.util.Calendar argument? (Notice that this option is exclusive of the "useTimezone=true" configuration option.)	false	5.0.0
useLegacyDatetimeCode	Use code for DATE/TIME/DATETIME/TIMESTAMP handling in result sets and statements that consistently handles timezone conversions from client to server and back again, or use the legacy code for these datatypes that has been in the driver for backwards-compatibility?	true	5.1.6
useOldAliasMetadataBehavior	Should the driver use the legacy behavior for "AS" clauses on columns and tables, and only return aliases (if any) for ResultSetMetaData.getColumnNames() or ResultSetMetaData.getTableName() rather than the original column/table name? In 5.0.x, the default value was true.	false	5.0.4
useOldUTF8Behavior	Use the UTF-8 behavior the driver did when communicating with 4.0 and older servers	false	3.1.6
useOnlyServerErrorMessages	Don't prepend 'standard' SQLState error messages to error messages returned by the server.	true	3.0.15
useSSPSCompatibleTimezoneShift	If migrating from an environment that was using server-side prepared statements, and the configuration property "useJDBCCompliantTimezoneShift" set to "true", use compatible behavior when not using server-side prepared statements when sending TIMESTAMP values to the MySQL server.	false	5.0.5
useServerPrepStmts	Use server-side prepared statements if the server supports them?	false	3.1.0
useSqlStateCodes	Use SQL Standard state codes instead of 'legacy' X/Open/SQL	true	3.1.3

	state codes (true/false), default is 'true'		
useStreamLengthsInPrepStmts	Honor stream length parameter in PreparedStatement/ResultSet.setXXXStream() method calls (true/false, defaults to 'true')?	true	3.0.2
useTimezone	Convert time/date types between client and server timezones (true/false, defaults to 'false')?	false	3.0.2
useUnbufferedInput	Don't use BufferedInputStream for reading data from the server	true	3.0.11
yearIsDateType	Should the JDBC driver treat the MySQL type "YEAR" as a java.sql.Date, or as a SHORT?	true	3.1.9
zeroDateTimeBehavior	What should happen when the driver encounters DATETIME values that are composed entirely of zeros (used by MySQL to represent invalid dates)? Valid values are "exception", "round" and "convertToNull".	exception	3.1.4

Connector/J also supports access to MySQL using named pipes on Windows NT/2000/XP using the NamedPipeSocketFactory as a plugin-socket factory using the socketFactory property. If you do not use a namedPipePath property, the default of "\.\pipe\MySQL" will be used. If you use the `NamedPipeSocketFactory`, the host name and port number values in the JDBC url will be ignored. You can enable this feature using:

```
socketFactory=com.mysql.jdbc.NamedPipeSocketFactory
```

Named pipes only work when connecting to a MySQL server on the same physical machine as the one the JDBC driver is being used on. In simple performance tests, it appears that named pipe access is between 30%-50% faster than the standard TCP/IP access. However, this varies per system, and named pipes are slower than TCP/IP in many Windows configurations.

You can create your own socket factories by following the example code in `com.mysql.jdbc.NamedPipeSocketFactory`, or `com.mysql.jdbc.StandardSocketFactory`.

#### 21.3.4.2. JDBC API Implementation Notes

MySQL Connector/J passes all of the tests in the publicly available version of Sun's JDBC compliance test suite. However, in many places the JDBC specification is vague about how certain functionality should be implemented, or the specification enables leeway in implementation.

This section gives details on a interface-by-interface level about how certain implementation decisions may affect how you use MySQL Connector/J.

- **Blob**

Starting with Connector/J version 3.1.0, you can emulate Blobs with locators by adding the property 'emulateLocators=true' to your JDBC URL. Using this method, the driver will delay loading the actual Blob data until you retrieve the other data and then use retrieval methods (`getInputStream()`, `getBytes()`, and so forth) on the blob data stream.

For this to work, you must use a column alias with the value of the column to the actual name of the Blob, for example:

```
SELECT id, 'data' as blob_data from blobtable
```

For this to work, you must also follow these rules:

- The `SELECT` must also reference only one table, the table must have a primary key.
- The `SELECT` must alias the original blob column name, specified as a string, to an alternate name.
- The `SELECT` must cover all columns that make up the primary key.

The Blob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the corresponding `PreparedStatement.setBlob()` or `ResultSet.updateBlob()` (in the case of updatable result sets) methods to save changes back to the database.

- **CallableStatement**

Starting with Connector/J 3.1.1, stored procedures are supported when connecting to MySQL version 5.0 or newer using the `CallableStatement` interface. Currently, the `getParameterMetaData()` method of `CallableStatement` is not supported.

- **Clob**

The Clob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the `PreparedStatement.setBlob()` method to save changes back to the database. The JDBC API does not have a `ResultSet.updateClob()` method.

- **Connection**

Unlike older versions of MM.MySQL the `isClosed()` method does not ping the server to determine if it is available. In accordance with the JDBC specification, it only returns true if `closed()` has been called on the connection. If you need to determine if the connection is still valid, you should issue a simple query, such as `SELECT 1`. The driver will throw an exception if the connection is no longer valid.

- **DatabaseMetaData**

Foreign Key information (`getImportedKeys()`/`getExportedKeys()` and `getCrossReference()`) is only available from InnoDB tables. However, the driver uses `SHOW CREATE TABLE` to retrieve this information, so when other storage engines support foreign keys, the driver will transparently support them as well.

- **PreparedStatement**

PreparedStatements are implemented by the driver, as MySQL does not have a prepared statement feature. Because of this, the driver does not implement `getParameterMetaData()` or `getMetaData()` as it would require the driver to have a complete SQL parser in the client.

Starting with version 3.1.0 MySQL Connector/J, server-side prepared statements and binary-encoded result sets are used when the server supports them.

Take care when using a server-side prepared statement with **large** parameters that are set using `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()`, or `setClob()`. If you want to re-execute the statement with any large parameter changed to a nonlarge parameter, it is necessary to call `clearParameters()` and set all parameters again. The reason for this is as follows:

- During both server-side prepared statements and client-side emulation, large data is exchanged only when `PreparedStatement.execute()` is called.
- Once that has been done, the stream used to read the data on the client side is closed (as per the JDBC spec), and cannot be read from again.
- If a parameter changes from large to nonlarge, the driver must reset the server-side state of the prepared statement to allow the parameter that is being changed to take the place of the prior large value. This removes all of the large data that has already been sent to the server, thus requiring the data to be re-sent, using the `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()` or `setClob()` method.

Consequently, if you want to change the type of a parameter to a nonlarge one, you must call `clearParameters()` and set all parameters of the prepared statement again before it can be re-executed.

- **ResultSet**

By default, ResultSets are completely retrieved and stored in memory. In most cases this is the most efficient way to operate, and due to the design of the MySQL network protocol is easier to implement. If you are working with ResultSets that have a large number of rows or large values, and can not allocate heap space in your JVM for the memory required, you can tell the driver to stream the results back one row at a time.

To enable this functionality, you need to create a Statement instance in the following manner:

```
stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
 java.sql.ResultSet.CONCUR_READ_ONLY);
stmt.setFetchSize(Integer.MIN_VALUE);
```

The combination of a forward-only, read-only result set, with a fetch size of `Integer.MIN_VALUE` serves as a signal to the driver to stream result sets row-by-row. After this any result sets created with the statement will be retrieved row-by-row.

There are some caveats with this approach. You will have to read all of the rows in the result set (or close it) before you can issue any other queries on the connection, or an exception will be thrown.

The earliest the locks these statements hold can be released (whether they be `MyISAM` table-level locks or row-level locks in some other storage engine such as `InnoDB`) is when the statement completes.

If the statement is within scope of a transaction, then locks are released when the transaction completes (which implies that the

statement needs to complete first). As with most other databases, statements are not complete until all the results pending on the statement are read or the active result set for the statement is closed.

Therefore, if using streaming results, you should process them as quickly as possible if you want to maintain concurrent access to the tables referenced by the statement producing the result set.

- **ResultSetMetaData**

The `isAutoIncrement()` method only works when using MySQL servers 4.0 and newer.

- **Statement**

When using versions of the JDBC driver earlier than 3.2.1, and connected to server versions earlier than 5.0.3, the `setFetchSize()` method has no effect, other than to toggle result set streaming as described above.

Connector/J 5.0.0 and later include support for both `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL 5.0.0 or newer server, and require a separate connection to issue the `KILL QUERY` statement. In the case of `setQueryTimeout()`, the implementation creates an additional thread to handle the timeout functionality.

**Note**

Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeException` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead.

MySQL does not support SQL cursors, and the JDBC driver doesn't emulate them, so "setCursorName()" has no effect.

Connector/J 5.1.3 and later include two additional methods:

- `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set using `setLocalInfileInputStream()`.

### 21.3.4.3. Java, JDBC and MySQL Types

MySQL Connector/J is flexible in the way it handles conversions between MySQL data types and Java data types.

In general, any MySQL data type can be converted to a `java.lang.String`, and any numeric type can be converted to any of the Java numeric types, although round-off, overflow, or loss of precision may occur.

Starting with Connector/J 3.1.0, the JDBC driver will issue warnings or throw `DataTruncation` exceptions as is required by the JDBC specification unless the connection was configured not to do so by using the property `jdbcCompliantTruncation` and setting it to `false`.

The conversions that are always guaranteed to work are listed in the following table:

**Connection Properties - Miscellaneous.**

These MySQL Data Types	Can always be converted to these Java types
<code>CHAR</code> , <code>VARCHAR</code> , <code>BLOB</code> , <code>TEXT</code> , <code>ENUM</code> , and <code>SET</code>	<code>java.lang.String</code> , <code>java.io.InputStream</code> , <code>java.io.Reader</code> , <code>java.sql.Blob</code> , <code>java.sql.Clob</code>
<code>FLOAT</code> , <code>REAL</code> , <code>DOUBLE PRECISION</code> , <code>NUMERIC</code> , <code>DECIMAL</code> , <code>TINYINT</code> , <code>SMALLINT</code> , <code>MEDIUMINT</code> , <code>INTEGER</code> , <code>BIGINT</code>	<code>java.lang.String</code> , <code>java.lang.Short</code> , <code>java.lang.Integer</code> , <code>java.lang.Long</code> , <code>java.lang.Double</code> , <code>java.math.BigDecimal</code>
<code>DATE</code> , <code>TIME</code> , <code>DATETIME</code> , <code>TIMESTAMP</code>	<code>java.lang.String</code> , <code>java.sql.Date</code> ,

	<code>java.sql.Timestamp</code>
--	---------------------------------

**Note**

Round-off, overflow or loss of precision may occur if you choose a Java numeric data type that has less precision or capacity than the MySQL data type you are converting to/from.

The `ResultSet.getObject()` method uses the type conversions between MySQL and Java types, following the JDBC specification where appropriate. The value returned by `ResultSetMetaData.getColumnClassName()` is also shown below. For more information on the `java.sql.Types` classes see [Java 2 Platform Types](#).

**MySQL Types to Java Types for ResultSet.getObject().**

MySQL Type Name	Return value of <code>GetColumnName</code>	Returned as Java Class
BIT(1) (new in MySQL 5.0)	BIT	<code>java.lang.Boolean</code>
BIT(> 1) (new in MySQL 5.0)	BIT	<code>byte[]</code>
TINYINT	TINYINT	<code>java.lang.Boolean</code> if the configuration property <code>tinyIntIsBit</code> is set to <code>true</code> (the default) and the storage size is 1, or <code>java.lang.Integer</code> if not.
BOOL, BOOLEAN	TINYINT	See TINYINT, above as these are aliases for TINYINT(1), currently.
SMALLINT[(M)] [UNSIGNED]	SMALLINT [UNSIGNED]	<code>java.lang.Integer</code> (regardless if UNSIGNED or not)
MEDIUMINT[(M)] [UNSIGNED]	MEDIUMINT [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code> (C/J 3.1 and earlier), or <code>java.lang.Integer</code> for C/J 5.0 and later
INT,INTEGER[(M)] [UNSIGNED]	INTEGER [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code>
BIGINT[(M)] [UNSIGNED]	BIGINT [UNSIGNED]	<code>java.lang.Long</code> , if UNSIGNED <code>java.math.BigInteger</code>
FLOAT[(M,D)]	FLOAT	<code>java.lang.Float</code>
DOUBLE[(M,B)]	DOUBLE	<code>java.lang.Double</code>
DECIMAL[(M[,D])]	DECIMAL	<code>java.math.BigDecimal</code>
DATE	DATE	<code>java.sql.Date</code>
DATETIME	DATETIME	<code>java.sql.Timestamp</code>
TIMESTAMP[(M)]	TIMESTAMP	<code>java.sql.Timestamp</code>
TIME	TIME	<code>java.sql.Time</code>
YEAR[(2 4)]	YEAR	If <code>yearIsDateType</code> configuration property is set to false, then the returned object type is <code>java.sql.Short</code> . If set to true (the default) then an object of type <code>java.sql.Date</code> (with the date set to January 1st, at midnight).
CHAR(M)	CHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned.)
VARCHAR(M) [BINARY]	VARCHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned.)
BINARY(M)	BINARY	<code>byte[]</code>
VARBINARY(M)	VARBINARY	<code>byte[]</code>
TINYBLOB	TINYBLOB	<code>byte[]</code>
TINYTEXT	VARCHAR	<code>java.lang.String</code>
BLOB	BLOB	<code>byte[]</code>
TEXT	VARCHAR	<code>java.lang.String</code>
MEDIUMBLOB	MEDIUMBLOB	<code>byte[]</code>
MEDIUMTEXT	VARCHAR	<code>java.lang.String</code>
LONGBLOB	LONGBLOB	<code>byte[]</code>
LONGTEXT	VARCHAR	<code>java.lang.String</code>

ENUM('value1','value2',...)	CHAR	<code>java.lang.String</code>
SET('value1','value2',...)	CHAR	<code>java.lang.String</code>

#### 21.3.4.4. Using Character Sets and Unicode

All strings sent from the JDBC driver to the server are converted automatically from native Java Unicode form to the client character encoding, including all queries sent using `Statement.execute()`, `Statement.executeUpdate()`, `Statement.executeQuery()` as well as all `PreparedStatement` and `CallableStatement` parameters with the exclusion of parameters set using `setBytes()`, `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()` and `setBlob()`.

Prior to MySQL Server 4.1, Connector/J supported a single character encoding per connection, which could either be automatically detected from the server configuration, or could be configured by the user through the `useUnicode` and `characterEncoding` properties.

Starting with MySQL Server 4.1, Connector/J supports a single character encoding between client and server, and any number of character encodings for data returned by the server to the client in `ResultSets`.

The character encoding between client and server is automatically detected upon connection. The encoding used by the driver is specified on the server using the `character_set` system variable for server versions older than 4.1.0 and `character_set_server` for server versions 4.1.0 and newer. For more information, see [Section 9.1.3.1, “Server Character Set and Collation”](#).

To override the automatically detected encoding on the client side, use the `characterEncoding` property in the URL used to connect to the server.

When specifying character encodings on the client side, Java-style names should be used. The following table lists Java-style names for MySQL character sets:

**MySQL to Java Encoding Name Translations.**

MySQL Character Set Name	Java-Style Character Encoding Name
ascii	US-ASCII
big5	Big5
gbk	GBK
sjis	SJIS (or Cp932 or MS932 for MySQL Server < 4.1.11)
cp932	Cp932 or MS932 (MySQL Server > 4.1.11)
gb2312	EUC_CN
ujis	EUC_JP
euckr	EUC_KR
latin1	Cp1252
latin2	ISO8859_2
greek	ISO8859_7
hebrew	ISO8859_8
cp866	Cp866
tis620	TIS620
cp1250	Cp1250
cp1251	Cp1251
cp1257	Cp1257
macroman	MacRoman
macce	MacCentralEurope
utf8	UTF-8
ucs2	UnicodeBig

#### Warning

Do not issue the query 'set names' with Connector/J, as the driver will not detect that the character set has changed.

and will continue to use the character set detected during the initial connection setup.

To allow multiple character sets to be sent from the client, the UTF-8 encoding should be used, either by configuring `utf8` as the default server character set, or by configuring the JDBC driver to use UTF-8 through the `characterEncoding` property.

#### 21.3.4.5. Connecting Securely Using SSL

SSL in MySQL Connector/J encrypts all data (other than the initial handshake) between the JDBC driver and the server. The performance penalty for enabling SSL is an increase in query processing time between 35% and 50%, depending on the size of the query, and the amount of data it returns.

For SSL Support to work, you must have the following:

- A JDK that includes JSSE (Java Secure Sockets Extension), like JDK-1.4.1 or newer. SSL does not currently work with a JDK that you can add JSSE to, like JDK-1.2.x or JDK-1.3.x due to the following JSSE bug: <http://developer.java.sun.com/developer/bugParade/bugs/4273544.html>
- A MySQL server that supports SSL and has been compiled and configured to do so, which is MySQL-4.0.4 or later, see [Section 5.5.6, “Using SSL for Secure Connections”](#), for more information.
- A client certificate (covered later in this section)

The system works through two Java truststore files, one file contains the certificate information for the server (`truststore` in the examples below). The other file contains the certificate for the client (`keystore` in the examples below). All Java truststore files are password protected by supplying a suitable password to the `keytool` when you create the files. You need the file names and associated passwords to create an SSL connection.

You will first need to import the MySQL server CA Certificate into a Java truststore. A sample MySQL server CA Certificate is located in the `SSL` subdirectory of the MySQL source distribution. This is what SSL will use to determine if you are communicating with a secure MySQL server. Alternatively, use the CA Certificate that you have generated or been provided with by your SSL provider.

To use Java's `keytool` to create a truststore in the current directory , and import the server's CA certificate (`cacert.pem`), you can do the following (assuming that `keytool` is in your path. The `keytool` should be located in the `bin` subdirectory of your JDK or JRE):

```
shell> keytool -import -alias mysqlServerCACert \
 -file cacert.pem -keystore truststore
```

You will need to enter the password when prompted for the keystore file. Interaction with `keytool` will look like this:

```
Enter keystore password: *****
Owner: EMAILADDRESS=walrus@example.com, CN=Walrus,
 O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Issuer: EMAILADDRESS=walrus@example.com, CN=Walrus,
 O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Serial number: 0
Valid from:
 Fri Aug 02 16:55:53 CDT 2002 until: Sat Aug 02 16:55:53 CDT 2003
Certificate fingerprints:
 MD5: 61:91:A0:F2:03:07:61:7A:81:38:66:DA:19:C4:8D:AB
 SHA1: 25:77:41:05:D5:AD:99:8C:14:8C:CA:68:9C:2F:B8:89:C3:34:4D:6C
Trust this certificate? [no]: yes
Certificate was added to keystore
```

You then have two options, you can either import the client certificate that matches the CA certificate you just imported, or you can create a new client certificate.

To import an existing certificate, the certificate should be in DER format. You can use `openssl` to convert an existing certificate into the new format. For example:

```
shell> openssl x509 -outform DER -in client-cert.pem -out client.cert
```

You now need to import the converted certificate into your keystore using `keytool`:

```
shell> keytool -import -file client.cert -keystore keystore -alias mysqlClientCertificate
```

To generate your own client certificate, use `keytool` to create a suitable certificate and add it to the `keystore` file:

```
shell> keytool -genkey -keyalg rsa \
```

```
-alias mysqlClientCertificate -keystore keystore
```

Keytool will prompt you for the following information, and create a keystore named `keystore` in the current directory.

You should respond with information that is appropriate for your situation:

```
Enter keystore password: *****
What is your first and last name?
[Unknown]: Matthews
What is the name of your organizational unit?
[Unknown]: Software Development
What is the name of your organization?
[Unknown]: MySQL AB
What is the name of your City or Locality?
[Unknown]: Flossmoor
What is the name of your State or Province?
[Unknown]: IL
What is the two-letter country code for this unit?
[Unknown]: US
Is <CN=Matthews, OU=Software Development, O=MySQL AB,
L=Flossmoor, ST=IL, C=US> correct?
[no]: y

Enter key password for <mysqlClientCertificate>
(RRETURN if same as keystore password):
```

Finally, to get JSSE to use the keystore and truststore that you have generated, you need to set the following system properties when you start your JVM, replacing `path_to_keystore_file` with the full path to the keystore file you created, `path_to_truststore_file` with the path to the truststore file you created, and using the appropriate password values for each property. You can do this either on the command line:

```
-Djavax.net.ssl.keyStore=path_to_keystore_file
-Djavax.net.ssl.keyStorePassword=password
-Djavax.net.ssl.trustStore=path_to_truststore_file
-Djavax.net.ssl.trustStorePassword=password
```

Or you can set the values directly within the application:

```
System.setProperty("javax.net.ssl.keyStore","path_to_keystore_file");
System.setProperty("javax.net.ssl.keyStorePassword","password");
System.setProperty("javax.net.ssl.trustStore","path_to_truststore_file");
System.setProperty("javax.net.ssl.trustStorePassword","password");
```

You will also need to set `useSSL` to `true` in your connection parameters for MySQL Connector/J, either by adding `useSSL=true` to your URL, or by setting the property `useSSL` to `true` in the `java.util.Properties` instance you pass to `DriverManager.getConnection()`.

You can test that SSL is working by turning on JSSE debugging (as detailed below), and look for the following key events:

```
...

JSSE provides debugging (to STDOUT) when you set the following system property: `-Djavax.net.debug=all` This will tell you what keystores and truststores are being used, as well as what is going on during the SSL handshake and certificate exchange. It will be helpful when trying to determine what is not working when trying to get an SSL connection to happen.

#### 21.3.4.6. Using Master/Slave Replication with ReplicationConnection

Starting with Connector/J 3.1.7, we've made available a variant of the driver that will automatically send queries to a read/write master, or a failover or round-robin loadbalanced set of slaves based on the state of `Connection.getReadOnly()`.

An application signals that it wants a transaction to be read-only by calling `Connection.setReadOnly(true)`, this replication-aware connection will use one of the slave connections, which are load-balanced per-vm using a round-robin scheme (a given connection is sticky to a slave unless that slave is removed from service). If you have a write transaction, or if you have a read that is time-sensitive (remember, replication in MySQL is asynchronous), set the connection to be not read-only, by calling `Connection.setReadOnly(false)` and the driver will ensure that further calls are sent to the master MySQL server. The driver takes care of propagating the current state of autocommit, isolation level, and catalog between all of the connections that it uses to accomplish this load balancing functionality.

To enable this functionality, use the "`com.mysql.jdbc.ReplicationDriver`" class when configuring your application server's connection pool or when creating an instance of a JDBC driver for your standalone application. Because it accepts the same URL format as the standard MySQL JDBC driver, `ReplicationDriver` does not currently work with `java.sql.DriverManager`-based connection creation unless it is the only MySQL JDBC driver registered with the `DriverManager`.

Here is a short, simple example of how `ReplicationDriver` might be used in a standalone application.

```
import java.sql.Connection;
import java.sql.ResultSet;
import java.util.Properties;

import com.mysql.jdbc.ReplicationDriver;

public class ReplicationDriverDemo {

 public static void main(String[] args) throws Exception {
 ReplicationDriver driver = new ReplicationDriver();

 Properties props = new Properties();
 // We want this for failover on the slaves
 props.put("autoReconnect", "true");

 // We want to load balance between the slaves
 props.put("roundRobinLoadBalance", "true");

 props.put("user", "foo");
 props.put("password", "bar");

 //
 // Looks like a normal MySQL JDBC url, with a
 // comma-separated list of hosts, the first
 // being the 'master', the rest being any number
 // of slaves that the driver will load balance against
 //

 Connection conn =
 driver.connect("jdbc:mysql:replication:/master,slave1,slave2,slave3/test",
 props);

 //
 // Perform read/write work on the master
 // by setting the read-only flag to "false"
 //

 conn.setReadOnly(false);
 conn.setAutoCommit(false);
 conn.createStatement().executeUpdate("UPDATE some_table");
 conn.commit();

 //
 // Now, do a query from a slave, the driver automatically picks one
 // from the list
 //

 conn.setReadOnly(true);

 ResultSet rs =
 conn.createStatement().executeQuery("SELECT a,b FROM alt_table");

 }
}
```

You may also want to investigate the Load Balancing JDBC Pool (lbpj) tool, which provides a wrapper around the standard JDBC driver and enables you to use DB connection pools that includes checks for system failures and uneven load distribution. For more

information, see [Load Balancing JDBC Pool \(lbpool\)](#).

#### 21.3.4.7. Mapping MySQL Error Numbers to SQLStates

The table below provides a mapping of the MySQL Error Numbers to [SQL States](#)

**Table 21.3. Mapping of MySQL Error Numbers to SQLStates**

MySQL Error Number	MySQL Error Name	Legacy (X/Open) SQL State	Standard SQL State
102	ER_DUP_KEY	S1000	23000
1037	ER_OUT_OFMEMORY	S1001	HY001
1038	ER_OUT_OF_SORT-MEMORY	S1001	HY001

## 21.3.5. Connector/J Notes and Tips

### 21.3.5.1. Basic JDBC Concepts

This section provides some general JDBC background.

#### 21.3.5.1.1. Connecting to MySQL Using the `DriverManager` Interface

When you are using JDBC outside of an application server, the `DriverManager` class manages the establishment of Connections.

The `DriverManager` needs to be told which JDBC drivers it should try to make Connections with. The easiest way to do this is to use `Class.forName()` on the class that implements the `java.sql.Driver` interface. With MySQL Connector/J, the name of this class is `com.mysql.jdbc.Driver`. With this method, you could use an external configuration file to supply the driver class name and driver parameters to use when connecting to a database.

The following section of Java code shows how you might register MySQL Connector/J from the `main()` method of your application. If testing this code please ensure you read the installation section first at [Section 21.3.2, “Connector/J Installation”](#), to make sure you have connector installed correctly and the `CLASSPATH` set up. Also, ensure that MySQL is configured to accept external TCP/IP connections.

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

// Notice, do not import com.mysql.jdbc.*
// or you will have problems!

public class LoadDriver {
 public static void main(String[] args) {
 try {
 // The newInstance() call is a work around for some
 // broken Java implementations

 Class.forName("com.mysql.jdbc.Driver").newInstance();
 } catch (Exception ex) {
 // handle the error
 }
 }
}
```

After the driver has been registered with the `DriverManager`, you can obtain a `Connection` instance that is connected to a particular database by calling `DriverManager.getConnection()`:

#### Example 21.1. Connector/J: Obtaining a connection from the `DriverManager`

If you have not already done so, please review the section [Section 21.3.5.1.1, “Connecting to MySQL Using the DriverManager Interface”](#) before working with these examples.

This example shows how you can obtain a `Connection` instance from the `DriverManager`. There are a few different signatures for the `getConnection()` method. You should see the API documentation that comes with your JDK for more specific information on how to use them.

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

Connection conn = null;
...
try {
 conn =
 DriverManager.getConnection("jdbc:mysql://localhost/test?" +
 "user=monty&password=greatsql");
}

// Do something with the Connection

...
} catch (SQLException ex) {
 // handle any errors
 System.out.println("SQLException: " + ex.getMessage());
 System.out.println("SQLState: " + ex.getSQLState());
 System.out.println("VendorError: " + ex.getErrorCode());
}
```

Once a `Connection` is established, it can be used to create `Statement` and `PreparedStatement` objects, as well as retrieve metadata about the database. This is explained in the following sections.

### 21.3.5.1.2. Using Statements to Execute SQL

`Statement` objects allow you to execute basic SQL queries and retrieve the results through the `ResultSet` class which is described later.

To create a `Statement` instance, you call the `createStatement()` method on the `Connection` object you have retrieved using one of the `DriverManager.getConnection()` or `DataSource.getConnection()` methods described earlier.

Once you have a `Statement` instance, you can execute a `SELECT` query by calling the `executeQuery(String)` method with the SQL you want to use.

To update data in the database, use the `executeUpdate(String SQL)` method. This method returns the number of rows matched by the update statement, not the number of rows that were modified.

If you do not know ahead of time whether the SQL statement will be a `SELECT` or an `UPDATE/INSERT`, then you can use the `execute(String SQL)` method. This method will return true if the SQL query was a `SELECT`, or false if it was an `UPDATE`, `INSERT`, or `DELETE` statement. If the statement was a `SELECT` query, you can retrieve the results by calling the `getResultSet()` method. If the statement was an `UPDATE`, `INSERT`, or `DELETE` statement, you can retrieve the affected rows count by calling `getUpdateCount()` on the `Statement` instance.

#### Example 21.2. Connector/J: Using `java.sql.Statement` to execute a `SELECT` query

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;
import java.sql.Statement;
import java.sql.ResultSet;

// assume that conn is an already created JDBC connection (see previous examples)

Statement stmt = null;
ResultSet rs = null;

try {
 stmt = conn.createStatement();
 rs = stmt.executeQuery("SELECT foo FROM bar");

 // or alternatively, if you don't know ahead of time that
 // the query will be a SELECT...

 if (stmt.execute("SELECT foo FROM bar")) {
 rs = stmt.getResultSet();
 }

 // Now do something with the ResultSet
}
catch (SQLException ex){
 // handle any errors
}
```

```

 System.out.println("SQLException: " + ex.getMessage());
 System.out.println("SQLState: " + ex.getSQLState());
 System.out.println("VendorError: " + ex.getErrorCode());
 }
 finally {
 // it is a good idea to release
 // resources in a finally{} block
 // in reverse-order of their creation
 // if they are no-longer needed

 if (rs != null) {
 try {
 rs.close();
 } catch (SQLException sqlEx) { } // ignore
 rs = null;
 }

 if (stmt != null) {
 try {
 stmt.close();
 } catch (SQLException sqlEx) { } // ignore
 stmt = null;
 }
 }
}

```

### 21.3.5.1.3. Using CallableStatements to Execute Stored Procedures

Starting with MySQL server version 5.0 when used with Connector/J 3.1.1 or newer, the `java.sql.CallableStatement` interface is fully implemented with the exception of the `getParameterMetaData()` method.

For more information on MySQL stored procedures, please refer to <http://dev.mysql.com/doc/mysql/en/stored-routines.html>.

Connector/J exposes stored procedure functionality through JDBC's `CallableStatement` interface.

#### Note

Current versions of MySQL server do not return enough information for the JDBC driver to provide result set metadata for callable statements. This means that when using `CallableStatement`, `ResultSetMetaData` may return `NULL`.

The following example shows a stored procedure that returns the value of `inOutParam` incremented by 1, and the string passed in using `inputParam` as a `ResultSet`:

#### Example 21.3. Connector/J: Calling Stored Procedures

```

CREATE PROCEDURE demoSp(IN inputParam VARCHAR(255), \
 INOUT inOutParam INT)
BEGIN
 DECLARE z INT;
 SET z = inOutParam + 1;
 SET inOutParam = z;

 SELECT inputParam;
 SELECT CONCAT('zyxw', inputParam);
END

```

To use the `demoSp` procedure with Connector/J, follow these steps:

1. Prepare the callable statement by using `Connection.prepareCall()`.

Notice that you have to use JDBC escape syntax, and that the parentheses surrounding the parameter placeholders are not optional:

#### Example 21.4. Connector/J: Using `Connection.prepareCall()`

```

import java.sql.CallableStatement;
...
/*
 * Prepare a call to the stored procedure 'demoSp'
 * with two parameters
 */

```

```
// Notice the use of JDBC-escape syntax ({call ...})
//
CallableStatement cStmt = conn.prepareCall("{call demoSp(?, ?)}");

cStmt.setString(1, "abcdefg");
```

**Note**

`Connection.prepareStatement()` is an expensive method, due to the metadata retrieval that the driver performs to support output parameters. For performance reasons, you should try to minimize unnecessary calls to `Connection.prepareStatement()` by reusing `CallableStatement` instances in your code.

2. Register the output parameters (if any exist)

To retrieve the values of output parameters (parameters specified as `OUT` or `INOUT` when you created the stored procedure), JDBC requires that they be specified before statement execution using the various `registerOutputParameter()` methods in the `CallableStatement` interface:

### Example 21.5. Connector/J: Registering output parameters

```
import java.sql.Types;
...
//
// Connector/J supports both named and indexed
// output parameters. You can register output
// parameters using either method, as well
// as retrieve output parameters using either
// method, regardless of what method was
// used to register them.
//
// The following examples show how to use
// the various methods of registering
// output parameters (you should of course
// use only one registration per parameter).
//

//
// Registers the second parameter as output, and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter(2, Types.INTEGER);

//
// Registers the named parameter 'inOutParam', and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter("inOutParam", Types.INTEGER);
...
```

3. Set the input parameters (if any exist)

Input and in/out parameters are set as for `PreparedStatement` objects. However, `CallableStatement` also supports setting parameters by name:

### Example 21.6. Connector/J: Setting `CallableStatement` input parameters

```
...
//
// Set a parameter by index
//
cStmt.setString(1, "abcdefg");

//
// Alternatively, set a parameter using
// the parameter name
//
cStmt.setString("inputParameter", "abcdefg");
//
```

```

// Set the 'in/out' parameter using an index
//
cStmt.setInt(2, 1);

//
// Alternatively, set the 'in/out' parameter
// by name
//
cStmt.setInt("inOutParam", 1);
...

```

4. Execute the `CallableStatement`, and retrieve any result sets or output parameters.

Although `CallableStatement` supports calling any of the `Statement` execute methods (`executeUpdate()`, `executeQuery()` or `execute()`), the most flexible method to call is `execute()`, as you do not need to know ahead of time if the stored procedure returns result sets:

### **Example 21.7. Connector/J: Retrieving results and output parameter values**

```

...
boolean hadResults = cStmt.execute();

//
// Process all returned result sets
//

while (hadResults) {
 ResultSet rs = cStmt.getResultSet();
 // process result set
 ...

 hadResults = cStmt.getMoreResults();
}

//
// Retrieve output parameters
//
// Connector/J supports both index-based and
// name-based retrieval
//

int outputValue = cStmt.getInt(2); // index-based
outputValue = cStmt.getInt("inOutParam"); // name-based
...

```

#### **21.3.5.1.4. Retrieving AUTO\_INCREMENT Column Values**

Before version 3.0 of the JDBC API, there was no standard way of retrieving key values from databases that supported auto increment or identity columns. With older JDBC drivers for MySQL, you could always use a MySQL-specific method on the `Statement` interface, or issue the query `SELECT LAST_INSERT_ID()` after issuing an `INSERT` to a table that had an `AUTO_INCREMENT` key. Using the MySQL-specific method call isn't portable, and issuing a `SELECT` to get the `AUTO_INCREMENT` key's value requires another round-trip to the database, which isn't as efficient as possible. The following code snippets demonstrate the three different ways to retrieve `AUTO_INCREMENT` values. First, we demonstrate the use of the new JDBC-3.0 method `getGeneratedKeys()` which is now the preferred method to use if you need to retrieve `AUTO_INCREMENT` keys and have access to JDBC-3.0. The second example shows how you can retrieve the same value using a standard `SELECT LAST_INSERT_ID()` query. The final example shows how updatable result sets can retrieve the `AUTO_INCREMENT` value when using the `insertRow()` method.

### **Example 21.8. Connector/J: Retrieving AUTO\_INCREMENT column values using Statement.getGeneratedKeys()**

```

Statement stmt = null;
ResultSet rs = null;

try {
 //
 // Create a Statement instance that we can use for
 // 'normal' result sets assuming you have a

```

```

// Connection 'conn' to a MySQL database already
// available

stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
 java.sql.ResultSet.CONCUR_UPDATABLE);

//
// Issue the DDL queries for the table for this example
//

stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
stmt.executeUpdate(
 "CREATE TABLE autoIncTutorial (" +
 + "priKey INT NOT NULL AUTO_INCREMENT, " +
 + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

//
// Insert one row that will generate an AUTO INCREMENT
// key in the 'priKey' field
//

stmt.executeUpdate(
 "INSERT INTO autoIncTutorial (dataField) " +
 + "values ('Can I Get the Auto Increment Field?'"),
 Statement.RETURN_GENERATED_KEYS);

//
// Example of using Statement.getGeneratedKeys()
// to retrieve the value of an auto-increment
// value
//

int autoIncKeyFromApi = -1;
rs = stmt.getGeneratedKeys();

if (rs.next()) {
 autoIncKeyFromApi = rs.getInt(1);
} else {
 // throw an exception from here
}

rs.close();
rs = null;

System.out.println("Key returned from getGeneratedKeys():"
 + autoIncKeyFromApi);
} finally {
 if (rs != null) {
 try {
 rs.close();
 } catch (SQLException ex) {
 // ignore
 }
 }

 if (stmt != null) {
 try {
 stmt.close();
 } catch (SQLException ex) {
 // ignore
 }
 }
}
}

```

### Example 21.9. Connector/J: Retrieving AUTO\_INCREMENT column values using SELECT LAST\_INSERT\_ID()

```

Statement stmt = null;
ResultSet rs = null;

try {
 //
 // Create a Statement instance that we can use for
 // 'normal' result sets.

 stmt = conn.createStatement();

 //
 // Issue the DDL queries for the table for this example
 //

 stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
 stmt.executeUpdate(
 "CREATE TABLE autoIncTutorial (" +
 + "priKey INT NOT NULL AUTO_INCREMENT, " +
 + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

```

```

// Insert one row that will generate an AUTO INCREMENT
// key in the 'priKey' field
//

stmt.executeUpdate(
 "INSERT INTO autoIncTutorial (dataField) "
 + "values ('Can I Get the Auto Increment Field?')");

// Use the MySQL LAST_INSERT_ID()
// function to do the same thing as getGeneratedKeys()
//

int autoIncKeyFromFunc = -1;
rs = stmt.executeQuery("SELECT LAST_INSERT_ID()");

if (rs.next()) {
 autoIncKeyFromFunc = rs.getInt(1);
} else {
 // throw an exception from here
}

rs.close();

System.out.println("Key returned from " +
 "'SELECT LAST_INSERT_ID()': " +
 autoIncKeyFromFunc);

} finally {
 if (rs != null) {
 try {
 rs.close();
 } catch (SQLException ex) {
 // ignore
 }
 }

 if (stmt != null) {
 try {
 stmt.close();
 } catch (SQLException ex) {
 // ignore
 }
 }
}
}

```

#### Example 21.10. Connector/J: Retrieving AUTO\_INCREMENT column values in Updatable ResultSets

```

Statement stmt = null;
ResultSet rs = null;

try {
 //
 // Create a Statement instance that we can use for
 // 'normal' result sets as well as an 'updatable'
 // one, assuming you have a Connection 'conn' to
 // a MySQL database already available
 //

 stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
 java.sql.ResultSet.CONCUR_UPDATABLE);

 //
 // Issue the DDL queries for the table for this example
 //

 stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
 stmt.executeUpdate(
 "CREATE TABLE autoIncTutorial (" +
 "priKey INT NOT NULL AUTO_INCREMENT, " +
 "dataField VARCHAR(64), PRIMARY KEY (priKey))");

 //
 // Example of retrieving an AUTO INCREMENT key
 // from an updatable result set
 //

 rs = stmt.executeQuery("SELECT priKey, dataField " +
 "FROM autoIncTutorial");

 rs.moveToInsertRow();

 rs.updateString("dataField", "AUTO INCREMENT here?");
 rs.insertRow();
}

```

```

 //
 // the driver adds rows at the end
 //

 rs.last();

 //
 // We should now be on the row we just inserted
 //

 int autoIncKeyFromRS = rs.getInt("priKey");

 rs.close();

 rs = null;

 System.out.println("Key returned for inserted row: "
 + autoIncKeyFromRS);

} finally {
 if (rs != null) {
 try {
 rs.close();
 } catch (SQLException ex) {
 // ignore
 }
 }

 if (stmt != null) {
 try {
 stmt.close();
 } catch (SQLException ex) {
 // ignore
 }
 }
}
}

```

When you run the preceding example code, you should get the following output: Key returned from `getGeneratedKeys()`: 1 Key returned from `SELECT LAST_INSERT_ID()`: 1 Key returned for inserted row: 2 You should be aware, that at times, it can be tricky to use the `SELECT LAST_INSERT_ID()` query, as that function's value is scoped to a connection. So, if some other query happens on the same connection, the value will be overwritten. On the other hand, the `getGeneratedKeys()` method is scoped by the `Statement` instance, so it can be used even if other queries happen on the same connection, but not on the same `Statement` instance.

### 21.3.5.2. Using Connector/J with J2EE and Other Java Frameworks

This section describes how to use Connector/J in several contexts.

#### 21.3.5.2.1. General J2EE Concepts

This section provides general background on J2EE concepts that pertain to use of Connector/J.

##### 21.3.5.2.1.1. Understanding Connection Pooling

Connection pooling is a technique of creating and managing a pool of connections that are ready for use by any thread that needs them.

This technique of pooling connections is based on the fact that most applications only need a thread to have access to a JDBC connection when they are actively processing a transaction, which usually take only milliseconds to complete. When not processing a transaction, the connection would otherwise sit idle. Instead, connection pooling enables the idle connection to be used by some other thread to do useful work.

In practice, when a thread needs to do work against a MySQL or other database with JDBC, it requests a connection from the pool. When the thread is finished using the connection, it returns it to the pool, so that it may be used by any other threads that want to use it.

When the connection is loaned out from the pool, it is used exclusively by the thread that requested it. From a programming point of view, it is the same as if your thread called `DriverManager.getConnection()` every time it needed a JDBC connection, however with connection pooling, your thread may end up using either a new, or already-existing connection.

Connection pooling can greatly increase the performance of your Java application, while reducing overall resource usage. The main benefits to connection pooling are:

- Reduced connection creation time

Although this is not usually an issue with the quick connection setup that MySQL offers compared to other databases, creating new JDBC connections still incurs networking and JDBC driver overhead that will be avoided if connections are recycled.

- Simplified programming model

When using connection pooling, each individual thread can act as though it has created its own JDBC connection, allowing you to use straight-forward JDBC programming techniques.

- Controlled resource usage

If you do not use connection pooling, and instead create a new connection every time a thread needs one, your application's resource usage can be quite wasteful and lead to unpredictable behavior under load.

Remember that each connection to MySQL has overhead (memory, CPU, context switches, and so forth) on both the client and server side. Every connection limits how many resources there are available to your application as well as the MySQL server. Many of these resources will be used whether or not the connection is actually doing any useful work!

Connection pools can be tuned to maximize performance, while keeping resource utilization below the point where your application will start to fail rather than just run slower.

Luckily, Sun has standardized the concept of connection pooling in JDBC through the JDBC-2.0 Optional interfaces, and all major application servers have implementations of these APIs that work fine with MySQL Connector/J.

Generally, you configure a connection pool in your application server configuration files, and access it through the Java Naming and Directory Interface (JNDI). The following code shows how you might use a connection pool from an application deployed in a J2EE application server:

### **Example 21.11. Connector/J: Using a connection pool with a J2EE application server**

```

import java.sql.Connection;
import java.sql.SQLException;
import java.sql.Statement;

import javax.naming.InitialContext;
import javax.sql.DataSource;

public class MyServletJspOrEjb {
 public void doSomething() throws Exception {
 /*
 * Create a JNDI Initial context to be able to
 * lookup the DataSource
 *
 * In production-level code, this should be cached as
 * an instance or static variable, as it can
 * be quite expensive to create a JNDI context.
 *
 * Note: This code only works when you are using servlets
 * or EJBs in a J2EE application server. If you are
 * using connection pooling in standalone Java code, you
 * will have to create/configure datasources using whatever
 * mechanisms your particular connection pooling library
 * provides.
 */
 InitialContext ctx = new InitialContext();

 /*
 * Lookup the DataSource, which will be backed by a pool
 * that the application server provides. DataSource instances
 * are also a good candidate for caching as an instance
 * variable, as JNDI lookups can be expensive as well.
 */
 DataSource ds =
 (DataSource)ctx.lookup("java:comp/env/jdbc/MySQLDB");

 /*
 * The following code is what would actually be in your
 * Servlet, JSP or EJB 'service' method...where you need
 * to work with a JDBC connection.
 */
 Connection conn = null;
 Statement stmt = null;

 try {
 conn = ds.getConnection();
 /*
 * Now, use normal JDBC programming to work with
 */
 }
 }
}

```

As shown in the example above, after obtaining the JNDI InitialContext, and looking up the DataSource, the rest of the code should look familiar to anyone who has done JDBC programming in the past.

The most important thing to remember when using connection pooling is to make sure that no matter what happens in your code (exceptions, flow-of-control, and so forth), connections, and anything created by them (such as statements or result sets) are closed, so that they may be re-used, otherwise they will be stranded, which in the best case means that the MySQL server resources they represent (such as buffers, locks, or sockets) may be tied up for some time, or worst case, may be tied up forever.

## What Is the Best Size for my Connection Pool?

As with all other configuration rules-of-thumb, the answer is: it depends. Although the optimal size depends on anticipated load and average database transaction time, the optimum connection pool size is smaller than you might expect. If you take Sun's Java Petstore blueprint application for example, a connection pool of 15-20 connections can serve a relatively moderate load (600 concurrent users) using MySQL and Tomcat with response times that are acceptable.

To correctly size a connection pool for your application, you should create load test scripts with tools such as Apache JMeter or The Grinder, and load test your application.

An easy way to determine a starting point is to configure your connection pool's maximum number of connections to be unbounded, run a load test, and measure the largest amount of concurrently used connections. You can then work backward from there to determine what values of minimum and maximum pooled connections give the best performance for your particular application.

### 21.3.5.2.2. Using Connector/J with Tomcat

The following instructions are based on the instructions for Tomcat-5.x, available at <http://tomcat.apache.org/tomcat-5.5-doc/jndi-datasource-examples-howto.html> which is current at the time this document was written.

First, install the .jar file that comes with Connector/J in `$CATALINA_HOME/common/lib` so that it is available to all applications installed in the container.

Next, Configure the JNDI DataSource by adding a declaration resource to `$CATALINA_HOME/conf/server.xml` in the context that defines your web application:

```
<Context>
...
<Resource name="jdbc/MySQLDB"
auth="Container"
```

```

 type="javax.sql.DataSource"/>

<!-- The name you used above, must match _exactly_ here!
 The connection pool will be bound into JNDI with the name
 "java:/comp/env/jdbc/MySQLDB"
-->

<ResourceParams name="jdbc/MySQLDB">
 <parameter>
 <name>factory</name>
 <value>org.apache.commons.dbcp.BasicDataSourceFactory</value>
 </parameter>

 <!-- Don't set this any higher than max_connections on your
 MySQL server, usually this should be a 10 or a few 10's
 of connections, not hundreds or thousands -->

 <parameter>
 <name>maxActive</name>
 <value>10</value>
 </parameter>

 <!-- You don't want to many idle connections hanging around
 if you can avoid it, only enough to soak up a spike in
 the load -->

 <parameter>
 <name>maxIdle</name>
 <value>5</value>
 </parameter>

 <!-- Don't use autoReconnect=true, it's going away eventually
 and it's a crutch for older connection pools that couldn't
 test connections. You need to decide whether your application
 is supposed to deal with SQLExceptions (hint, it should), and
 how much of a performance penalty you're willing to pay
 to ensure 'freshness' of the connection -->

 <parameter>
 <name>validationQuery</name>
 <value>SELECT 1</value> <-- See discussion below for update to this option -->
 </parameter>

 <!-- The most conservative approach is to test connections
 before they're given to your application. For most applications
 this is okay, the query used above is very small and takes
 no real server resources to process, other than the time used
 to traverse the network.

 If you have a high-load application you'll need to rely on
 something else. -->

 <parameter>
 <name>testOnBorrow</name>
 <value>true</value>
 </parameter>

 <!-- Otherwise, or in addition to testOnBorrow, you can test
 while connections are sitting idle -->

 <parameter>
 <name>testWhileIdle</name>
 <value>true</value>
 </parameter>

 <!-- You have to set this value, otherwise even though
 you've asked connections to be tested while idle,
 the idle evicter thread will never run -->

 <parameter>
 <name>timeBetweenEvictionRunsMillis</name>
 <value>10000</value>
 </parameter>

 <!-- Don't allow connections to hang out idle too long,
 never longer than what wait_timeout is set to on the
 server...A few minutes or even fraction of a minute
 is sometimes okay here, it depends on your application
 and how much spiky load it will see -->

 <parameter>
 <name>minEvictableIdleTimeMillis</name>
 <value>60000</value>
 </parameter>

 <!-- Username and password used when connecting to MySQL -->

 <parameter>
 <name>username</name>
 <value>someuser</value>
 </parameter>

 <parameter>
 <name>password</name>
 <value>somepass</value>
 </parameter>

```

```

<!-- Class name for the Connector/J driver -->
<parameter>
 <name>driverClassName</name>
 <value>com.mysql.jdbc.Driver</value>
</parameter>

<!-- The JDBC connection url for connecting to MySQL, notice
 that if you want to pass any other MySQL-specific parameters
 you should pass them here in the URL, setting them using the
 parameter tags above will have no effect, you will also
 need to use & to separate parameter values as the
 ampersand is a reserved character in XML -->

<parameter>
 <name>url</name>
 <value>jdbc:mysql://localhost:3306/test</value>
</parameter>

</ResourceParams>
</Context>

```

Note that Connector/J 5.1.3 introduced a facility whereby, rather than use a `validationQuery` value of `SELECT 1`, it is possible to use `validationQuery` with a value set to `/* ping */`. This sends a ping to the server which then returns a fake result set. This is a lighter weight solution. It also has the advantage that if using `ReplicationConnection` or `LoadBalancedConnection` type connections, the ping will be sent across all active connections. The following XML snippet illustrates how to select this option:

```

<parameter>
 <name>validationQuery</name>
 <value>/* ping */</value>
</parameter>

```

Note that `/* ping */` has to be specified exactly.

In general, you should follow the installation instructions that come with your version of Tomcat, as the way you configure data-sources in Tomcat changes from time-to-time, and unfortunately if you use the wrong syntax in your XML file, you will most likely end up with an exception similar to the following:

```
Error: java.sql.SQLException: Cannot load JDBC driver class 'null' SQL state: null
```

### 21.3.5.2.3. Using Connector/J with JBoss

These instructions cover JBoss-4.x. To make the JDBC driver classes available to the application server, copy the .jar file that comes with Connector/J to the `lib` directory for your server configuration (which is usually called `default`). Then, in the same configuration directory, in the subdirectory named `deploy`, create a datasource configuration file that ends with "`ds.xml`", which tells JBoss to deploy this file as a JDBC Datasource. The file should have the following contents:

```

<datasources>
 <local-tx-datasource>
 <!-- This connection pool will be bound into JNDI with the name
 "java:/MySQLDB" -->

 <jndi-name>MySQLDB</jndi-name>
 <connection-url>jdbc:mysql://localhost:3306/dbname</connection-url>
 <driver-class>com.mysql.jdbc.Driver</driver-class>
 <user-name>user</user-name>
 <password>pass</password>

 <min-pool-size>5</min-pool-size>

 <!-- Don't set this any higher than max_connections on your
 MySQL server, usually this should be a 10 or a few 10's
 of connections, not hundreds or thousands -->

 <max-pool-size>20</max-pool-size>

 <!-- Don't allow connections to hang out idle too long,
 never longer than what wait_timeout is set to on the
 server...A few minutes is usually okay here,
 it depends on your application
 and how much spiky load it will see -->

 <idle-timeout-minutes>5</idle-timeout-minutes>

 <!-- If you're using Connector/J 3.1.8 or newer, you can use
 our implementation of these to increase the robustness
 of the connection pool. -->

 <exception-sorter-class-name>
 com.mysql.jdbc.integration.jboss.ExtendedMysqlExceptionSorter
 </exception-sorter-class-name>
 </local-tx-datasource>
</datasources>

```

```

 </exception-sorter-class-name>
 <valid-connection-checker-class-name>
com.mysql.jdbc.integration.jboss.MysqlValidConnectionChecker
 </valid-connection-checker-class-name>

 </local-tx-datasource>
</datasources>

```

#### 21.3.5.2.4. Using Connector/J with Spring

The Spring Framework is a Java-based application framework designed for assisting in application design by providing a way to configure components. The technique used by Spring is a well known design pattern called Dependency Injection (see [Inversion of Control Containers and the Dependency Injection pattern](#)). This article will focus on Java-oriented access to MySQL databases with Spring 2.0. For those wondering, there is a .NET port of Spring appropriately named Spring.NET.

Spring is not only a system for configuring components, but also includes support for aspect oriented programming (AOP). This is one of the main benefits and the foundation for Spring's resource and transaction management. Spring also provides utilities for integrating resource management with JDBC and Hibernate.

For the examples in this section the MySQL world sample database will be used. The first task is to set up a MySQL data source through Spring. Components within Spring use the "bean" terminology. For example, to configure a connection to a MySQL server supporting the world sample database you might use:

```

<util:map id="dbProps">
 <entry key="db.driver" value="com.mysql.jdbc.Driver"/>
 <entry key="db.jdbcurl" value="jdbc:mysql://localhost/world"/>
 <entry key="db.username" value="myuser"/>
 <entry key="db.password" value="mypass"/>
</util:map>

```

In the above example we are assigning values to properties that will be used in the configuration. For the datasource configuration:

```

<bean id="dataSource"
 class="org.springframework.jdbc.datasource.DriverManagerDataSource">
 <property name="driverClassName" value="${db.driver}"/>
 <property name="url" value="${db.jdbcurl}"/>
 <property name="username" value="${db.username}"/>
 <property name="password" value="${db.password}"/>
</bean>

```

The placeholders are used to provide values for properties of this bean. This means that you can specify all the properties of the configuration in one place instead of entering the values for each property on each bean. We do, however, need one more bean to pull this all together. The last bean is responsible for actually replacing the placeholders with the property values.

```

<bean
 class="org.springframework.beans.factory.config.PropertyPlaceholderConfigurer">
 <property name="properties" ref="dbProps"/>
</bean>

```

Now that we have our MySQL data source configured and ready to go, we write some Java code to access it. The example below will retrieve three random cities and their corresponding country using the data source we configured with Spring.

```

// Create a new application context. this processes the Spring config
ApplicationContext ctx =
 new ClassPathXmlApplicationContext("ex1appContext.xml");
// Retrieve the data source from the application context
DataSource ds = (DataSource) ctx.getBean("dataSource");
// Open a database connection using Spring's DataSourceUtils
Connection c = DataSourceUtils.getConnection(ds);
try {
 // retrieve a list of three random cities
 PreparedStatement ps = c.prepareStatement(
 "select City.Name as 'City', Country.Name as 'Country' " +
 "from City inner join Country on City.CountryCode = Country.Code " +
 "order by rand() limit 3");
 ResultSet rs = ps.executeQuery();
 while(rs.next()) {
 String city = rs.getString("City");
 String country = rs.getString("Country");
 System.out.printf("The city %s is in %s%n", city, country);
 }
} catch (SQLException ex) {
 // something has failed and we print a stack trace to analyse the error
 ex.printStackTrace();
 // ignore failure closing connection
 try { c.close(); } catch (SQLException e) { }
} finally {
 // properly release our connection
}

```

```

 } DataSourceUtils.releaseConnection(c, ds);
}

```

This is very similar to normal JDBC access to MySQL with the main difference being that we are using `DataSourceUtils` instead of the `DriverManager` to create the connection.

While it may seem like a small difference, the implications are somewhat far reaching. Spring manages this resource in a way similar to a container managed data source in a J2EE application server. When a connection is opened, it can be subsequently accessed in other parts of the code if it is synchronized with a transaction. This makes it possible to treat different parts of your application as transactional instead of passing around a database connection.

#### 21.3.5.2.4.1. Using `JdbcTemplate`

Spring makes extensive use of the Template method design pattern (see [Template Method Pattern](#)). Our immediate focus will be on the `JdbcTemplate` and related classes, specifically `NamedParameterJdbcTemplate`. The template classes handle obtaining and releasing a connection for data access when one is needed.

The next example shows how to use `NamedParameterJdbcTemplate` inside of a DAO (Data Access Object) class to retrieve a random city given a country code.

```

public class Ex2JdbcDao {
 /**
 * Data source reference which will be provided by Spring.
 */
 private DataSource dataSource;

 /**
 * Our query to find a random city given a country code. Notice
 * the ":country" parameter toward the end. This is called a
 * named parameter.
 */
 private String queryString = "select Name from City " +
 "where CountryCode = :country order by rand() limit 1";

 /**
 * Retrieve a random city using Spring JDBC access classes.
 */
 public String getRandomCityByCountryCode(String countryCode) {
 // A template that permits using queries with named parameters
 NamedParameterJdbcTemplate template =
 new NamedParameterJdbcTemplate(dataSource);
 // A java.util.Map is used to provide values for the parameters
 Map params = new HashMap();
 params.put("country", countryCode);
 // We query for an Object and specify what class we are expecting
 return (String)template.queryForObject(queryString, params, String.class);
 }

 /**
 * A JavaBean setter-style method to allow Spring to inject the data source.
 * @param dataSource
 */
 public void setDataSource(DataSource dataSource) {
 this.dataSource = dataSource;
 }
}

```

The focus in the above code is on the `getRandomCityByCountryCode()` method. We pass a country code and use the `NamedParameterJdbcTemplate` to query for a city. The country code is placed in a Map with the key "country", which is the parameter is named in the SQL query.

To access this code, you need to configure it with Spring by providing a reference to the data source.

```

<bean id="dao" class="code.Ex2JdbcDao">
 <property name="dataSource" ref="dataSource"/>
</bean>

```

At this point, we can just grab a reference to the DAO from Spring and call `getRandomCityByCountryCode()`.

```

// Create the application context
ApplicationContext ctx =
 new ClassPathXmlApplicationContext("ex2appContext.xml");
// Obtain a reference to our DAO
Ex2JdbcDao dao = (Ex2JdbcDao) ctx.getBean("dao");

String countryCode = "USA";

// Find a few random cities in the US
for(int i = 0; i < 4; ++i)
 System.out.printf("A random city in %s is %s%n",
 countryCode,
 dao.getRandomCityByCountryCode(countryCode));

```

This example shows how to use Spring's JDBC classes to completely abstract away the use of traditional JDBC classes including [Connection](#) and [PreparedStatement](#).

#### 21.3.5.2.4.2. Transactional JDBC Access

You might be wondering how we can add transactions into our code if we do not deal directly with the JDBC classes. Spring provides a transaction management package that not only replaces JDBC transaction management, but also enables declarative transaction management (configuration instead of code).

To use transactional database access, we will need to change the storage engine of the tables in the world database. The downloaded script explicitly creates MyISAM tables which do not support transactional semantics. The InnoDB storage engine does support transactions and this is what we will be using. We can change the storage engine with the following statements.

```
ALTER TABLE City ENGINE=InnoDB;
ALTER TABLE Country ENGINE=InnoDB;
ALTER TABLE CountryLanguage ENGINE=InnoDB;
```

A good programming practice emphasized by Spring is separating interfaces and implementations. What this means is that we can create a Java interface and only use the operations on this interface without any internal knowledge of what the actual implementation is. We will let Spring manage the implementation and with this it will manage the transactions for our implementation.

First you create a simple interface:

```
public interface Ex3Dao {
 Integer createCity(String name, String countryCode,
 String district, Integer population);
}
```

This interface contains one method that will create a new city record in the database and return the id of the new record. Next you need to create an implementation of this interface.

```
public class Ex3DaoImpl implements Ex3Dao {
 protected DataSource dataSource;
 protected SqlUpdate updateQuery;
 protected SqlFunction idQuery;

 public Integer createCity(String name, String countryCode,
 String district, Integer population) {
 updateQuery.update(new Object[] { name, countryCode,
 district, population });
 return getLastId();
 }

 protected Integer getLastId() {
 return idQuery.run();
 }
}
```

You can see that we only operate on abstract query objects here and do not deal directly with the JDBC API. Also, this is the complete implementation. All of our transaction management will be dealt with in the configuration. To get the configuration started, we need to create the DAO.

```
<bean id="dao" class="code.Ex3DaoImpl">
 <property name="dataSource" ref="dataSource" />
 <property name="updateQuery">...</property>
 <property name="idQuery">...</property>
</bean>
```

Now you need to set up the transaction configuration. The first thing you must do is create transaction manager to manage the data source and a specification of what transaction properties are required for the [dao](#) methods.

```
<bean id="transactionManager"
 class="org.springframework.jdbc.datasource.DataSourceTransactionManager">
 <property name="dataSource" ref="dataSource" />
</bean>

<tx:advice id="txAdvice" transaction-manager="transactionManager">
 <tx:attributes>
 <tx:method name="*" />
 </tx:attributes>
</tx:advice>
```

The preceding code creates a transaction manager that handles transactions for the data source provided to it. The [txAdvice](#) uses this transaction manager and the attributes specify to create a transaction for all methods. Finally you need to apply this advice with an AOP pointcut.

```
<aop:config>
 <aop:pointcut id="daoMethods" />
```

```

 expression="execution(* code.Ex3Dao.*(..))"/>
<aop:advisor advice-ref="txAdvice" pointcut-ref="daoMethods" />
</aop:config>
```

This basically says that all methods called on the `Ex3Dao` interface will be wrapped in a transaction. To make use of this, you only have to retrieve the `dao` from the application context and call a method on the `dao` instance.

```
Ex3Dao dao = (Ex3Dao) ctx.getBean("dao");
Integer id = dao.createCity(name, countryCode, district, pop);
```

We can verify from this that there is no transaction management happening in our Java code and it is all configured with Spring. This is a very powerful notion and regarded as one of the most beneficial features of Spring.

#### 21.3.5.2.4.3. Connection Pooling

In many situations, such as web applications, there will be a large number of small database transactions. When this is the case, it usually makes sense to create a pool of database connections available for web requests as needed. Although MySQL does not spawn an extra process when a connection is made, there is still a small amount of overhead to create and set up the connection. Pooling of connections also alleviates problems such as collecting large amounts of sockets in the `TIME_WAIT` state.

Setting up pooling of MySQL connections with Spring is as simple as changing the data source configuration in the application context. There are a number of configurations that we can use. The first example is based on the [Jakarta Commons DBCP library](#). The example below replaces the source configuration that was based on `DriverManagerDataSource` with DBCP's `BasicDataSource`.

```
<bean id="dataSource" destroy-method="close"
 class="org.apache.commons.dbcp.BasicDataSource">
 <property name="driverClassName" value="${db.driver}" />
 <property name="url" value="${db.jdbcurl}" />
 <property name="username" value="${db.username}" />
 <property name="password" value="${db.password}" />
 <property name="initialSize" value="3" />
</bean>
```

The configuration of the two solutions is very similar. The difference is that DBCP will pool connections to the database instead of creating a new connection every time one is requested. We have also set a parameter here called `initialSize`. This tells DBCP that we want three connections in the pool when it is created.

Another way to configure connection pooling is to configure a data source in our J2EE application server. Using JBoss as an example, you can set up the MySQL connection pool by creating a file called `mysql-local-ds.xml` and placing it in the server/default/deploy directory in JBoss. Once we have this setup, we can use JNDI to look it up. With Spring, this lookup is very simple. The data source configuration looks like this.

```
<jee:jndi-lookup id="dataSource" jndi-name="java:MySQL_DS" />
```

#### 21.3.5.2.5. Using Connector/J with GlassFish

This section explains how to use MySQL Connector/J with Glassfish™ Server Open Source Edition 3.0.1. Glassfish can be downloaded from the [Glassfish website](#).

Once Glassfish is installed you will need to make sure it can access MySQL Connector/J. To do this copy the MySQL Connector/J JAR file to the directory `GLASSFISH_INSTALL/glassfish/lib`. For example, copy `mysql-connect-or-java-5.1.12-bin.jar` to `C:\glassfishv3\glassfish\lib`. Restart the Glassfish Application Server.

You are now ready to create JDBC Connection Pools and JDBC Resources.

##### Creating a Connection Pool

1. In the Glassfish Administration Console, using the navigation tree navigate to **RESOURCES, JDBC, CONNECTION POOLS**.
2. In the **JDBC CONNECTION POOLS** frame click **NEW**. You will enter a two step wizard.
3. In the **NAME** field under **GENERAL SETTINGS** enter the name for the connection pool, for example enter `MySQLConnPool`.
4. In the **RESOURCE TYPE** field, select `javax.sql.DataSource` from the drop-down listbox.
5. In the **DATABASE VENDOR** field, select `MySQL` from the drop-down listbox. Click **NEXT** to go to the next page of the wizard.
6. You can accept the default settings for General Settings, Pool Settings and Transactions for this example. Scroll down to Additional Properties.

7. In Additional Properties you will need to ensure the following properties are set:
  - **ServerName** - The server you wish to connect to. For local testing this will be `localhost`.
  - **User** - The user name with which to connect to MySQL.
  - **Password** - The corresponding password for the user.
  - **DatabaseName** - The database you wish to connect to, for example the sample MySQL database `World`.
8. Click FINISH to exit the wizard. You will be taken to the **JDBC CONNECTION POOLS** page where all current connection pools, including the one you just created, will be displayed.
9. In the **JDBC CONNECTION POOLS** frame click on the connection pool you just created. Here you can review and edit information about the connection pool.
10. To test your connection pool click the PING button at the top of the frame. A message will be displayed confirming correct operation or otherwise. If an error message is received recheck the previous steps, and ensure that MySQL Connector/J has been correctly copied into the previously specified location.

Now that you have created a connection pool you will also need to create a JDBC Resource (data source) for use by your application.

#### Creating a JDBC Resource

Your Java application will usually reference a data source object to establish a connection with the database. This needs to be created first using the following procedure.

- Using the navigation tree in the Glassfish Administration Console, navigate to **RESOURCES**, **JDBC**, **JDBC RESOURCES**. A list of resources will be displayed in the **JDBC RESOURCES** frame.
- Click NEW. The **NEW JDBC RESOURCE** frame will be displayed.
- In the **JNDI NAME** field, enter the JNDI name that will be used to access this resource, for example enter `jdbc/MySQLDataSource`.
- In the **POOL NAME** field, select a connection pool you want this resource to use from the drop-down listbox.
- Optionally, you can enter a description into the **DESCRIPTION** field.
- Additional properties can be added if required.
- Click OK to create the new JDBC resource. The **JDBC RESOURCES** frame will list all available JDBC Resources.

#### 21.3.5.2.5.1. A Simple JSP Application with Glassfish, Connector/J and MySQL

This section shows how to deploy a simple JSP application on Glassfish, that connects to a MySQL database.

This example assumes you have already set up a suitable Connection Pool and JDBC Resource, as explained in the preceding sections. It is also assumed you have a sample database installed, such as `world`.

The main application code, `index.jsp` is presented here:

```
<%@ page import="java.sql.* , javax.sql.* , java.io.* , javax.naming.*" %>
<html>
<head><title>Hello world from JSP</title></head>
<body>
<%
 InitialContext ctx;
 DataSource ds;
 Connection conn;
 Statement stmt;
 ResultSet rs;

 try {
 ctx = new InitialContext();
 ds = (DataSource) ctx.lookup("java:comp/env/jdbc/MySQLDataSource");
 //ds = (DataSource) ctx.lookup("jdbc/MySQLDataSource");
 conn = ds.getConnection();
 stmt = conn.createStatement();
 rs = stmt.executeQuery("SELECT * FROM Country");
 while(rs.next()) {

```

```

%> <h3>Name: <%= rs.getString("Name") %></h3>
%> <h3>Population: <%= rs.getString("Population") %></h3>
<%
 }
}
catch (SQLException se) {
%> <%= se.getMessage() %>
<%
}
catch (NamingException ne) {
%> <%= ne.getMessage() %>
<%
}
%>
</body>
</html>

```

In addition two XML files are required: [web.xml](#), and [sun-web.xml](#). There may be other files present, such as classes and images. These files are organized into the directory structure as follows:

```

index.jsp
WEB-INF
|
+-- web.xml
+-- sun-web.xml

```

The code for [web.xml](#) is:

```

<?xml version="1.0" encoding="UTF-8"?>
<web-app version="2.4" xmlns="http://java.sun.com/xml/ns/j2ee" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="http://java.sun.com/xml/ns/j2ee http://java.sun.com/xml/ns/j2ee/web-app_2_4.xsd">
 <display-name>HelloWebApp</display-name>
 <distributable/>
 <resource-ref>
 <res-ref-name>jdbc/MySQLDataSource</res-ref-name>
 <res-type>javax.sql.DataSource</res-type>
 <res-auth>Container</res-auth>
 <res-sharing-scope>Shareable</res-sharing-scope>
 </resource-ref>
</web-app>

```

The code for [sun-web.xml](#) is:

```

<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE sun-web-app PUBLIC "-//Sun Microsystems, Inc.//DTD Application Server 8.1 Servlet 2.4//EN" "http://www.sun.com/applicationservers/8.1/dtds/sun-web-app_2_4.dtd">
<sun-web-app>
 <context-root>HelloWebApp</context-root>
 <resource-ref>
 <res-ref-name>jdbc/MySQLDataSource</res-ref-name>
 <jndi-name>jdbc/MySQLDataSource</jndi-name>
 </resource-ref>
</sun-web-app>

```

These XML files illustrate a very important aspect of running JDBC applications on Glassfish. On Glassfish it is important to map the string specified for a JDBC resource to its JNDI name, as set up in the Glassfish administration console. In this example, the JNDI name for the JDBC resource, as specified in the Glassfish Administration console when creating the JDBC Resource, was [jdbc/MySQLDataSource](#). This must be mapped to the name given in the application. In this example the name specified in the application, [jdbc/MySQLDataSource](#), and the JNDI name, happen to be the same, but this does not necessarily have to be the case. Note that the XML element `<res-ref-name>` is used to specify the name as used in the application source code, and this is mapped to the JNDI name specified using the `<jndi-name>` element, in the file [sun-web.xml](#). The resource also has to be created in the [web.xml](#) file, although the mapping of the resource to a JNDI name takes place in the [sun-web.xml](#) file.

If you do not have this mapping set up correctly in the XML files you will not be able to lookup the data source using a JNDI look-up string such as:

```
ds = (DataSource) ctx.lookup("java:comp/env/jdbc/MySQLDataSource");
```

You will still be able to access the data source directly using:

```
ds = (DataSource) ctx.lookup("jdbc/MySQLDataSource");
```

With the source files in place, in the correct directory structure, you are ready to deploy the application:

1. In the navigation tree, navigate to **APPLICATIONS** - the **APPLICATIONS** frame will be displayed. Click **DEPLOY**.
2. You can now deploy an application packaged into a single WAR file from a remote client, or you can choose a packaged file or directory that is locally accessible to the server. If you are simply testing an application locally you can simply point Glassfish at the directory that contains your application, without needing to package the application into a WAR file.
3. Now select the application type from the **TYPE** drop-down listbox, which in this example is **Web application**.
4. Click **OK**.

Now, when you navigate to the **APPLICATIONS** frame, you will have the option to **LAUNCH**, **REDEPLOY**, or **RESTART** your application. You can test your application by clicking **LAUNCH**. The application will connect to the MySQL database and display the Name and Population of countries in the **Country** table.

#### 21.3.5.2.5.2. A Simple Servlet with Glassfish, Connector/J and MySQL

This section describes a simple servlet that can be used in the Glassfish environment to access a MySQL database. As with the previous section, this example assumes the sample database **world** is installed.

The project is set up with the following directory structure:

```
index.html
WEB-INF
|
|- web.xml
|- sun-web.xml
|- classes
 |
 |- HelloWebServlet.java
 |- HelloWebServlet.class
```

The code for the servlet, located in **HelloWebServlet.java**, is as follows:

```
import javax.servlet.http.*;
import javax.servlet.*;
import java.io.*;
import java.sql.*;
import javax.sql.*;
import javax.naming.*;

public class HelloWebServlet extends HttpServlet {

 InitialContext ctx = null;
 DataSource ds = null;
 Connection conn = null;
 PreparedStatement ps = null;
 ResultSet rs = null;

 String sql = "SELECT Name, Population FROM Country WHERE Name=?";

 public void init () throws ServletException {
 try {
 ctx = new InitialContext();
 ds = (DataSource) ctx.lookup("java:comp/env/jdbc/MySQLDataSource");
 conn = ds.getConnection();
 ps = conn.prepareStatement(sql);
 } catch (SQLException se) {
 System.out.println("SQLException: "+se.getMessage());
 } catch (NamingException ne) {
 System.out.println("NamingException: "+ne.getMessage());
 }
 }

 public void destroy () {
 try {
 if (rs != null)
 rs.close();
 if (ps != null)
 ps.close();
 if (conn != null)
 conn.close();
 if (ctx != null)
 ctx.close();
 } catch (SQLException se) {
 System.out.println("SQLException: "+se.getMessage());
 } catch (NamingException ne) {
 System.out.println("NamingException: "+ne.getMessage());
 }
 }

 public void doPost(HttpServletRequest req, HttpServletResponse resp){
```

```

try {
 String country_name = req.getParameter("country_name");
 resp.setContentType("text/html");
 PrintWriter writer = resp.getWriter();
 writer.println("<html><body>");
 writer.println("<p>Country: "+country_name+"</p>");
 ps.setString(1, country_name);
 rs = ps.executeQuery();
 if (!rs.next()){
 writer.println("<p>Country does not exist!</p>");
 }
 else {
 rs.beforeFirst();
 while(rs.next()) {
 writer.println("<p>Name: "+rs.getString("Name")+"</p>");
 writer.println("<p>Population: "+rs.getString("Population")+"</p>");
 }
 }
 writer.println("</body></html>");
 writer.close();
}
catch (Exception e) {
 e.printStackTrace();
}

public void doGet(HttpServletRequest req, HttpServletResponse resp){
try {
 resp.setContentType("text/html");
 PrintWriter writer = resp.getWriter();
 writer.println("<html><body>");
 writer.println("<p>Hello from servlet doGet()</p>");
 writer.println("</body></html>");
 writer.close();
}
catch (Exception e) {
 e.printStackTrace();
}
}
}

```

In the preceding code a basic `doGet()` method is implemented, but is not used in the example. The code to establish the connection with the database is as shown in the previous example, [Section 21.3.5.2.5.1, “A Simple JSP Application with Glassfish, Connector/J and MySQL”](#), and is most conveniently located in the servlet `init()` method. The corresponding freeing of resources is located in the `destroy` method. The main functionality of the servlet is located in the `doPost()` method. If the user enters into the input form a country name that can be located in the database, the population of the country is returned. The code is invoked using a POST action associated with the input form. The form is defined in the file `index.html`:

```

<html>
<head><title>HelloWebServlet</title></head>

<body>
<h1>HelloWebServlet</h1>

<p>Please enter country name:</p>

<form action="HelloWebServlet" method="POST">
<input type="text" name="country_name" length="50" />
<input type="submit" value="Submit" />
</form>

</body>
</html>

```

The XML files `web.xml` and `sun-web.xml` are as for the example in the preceding section, [Section 21.3.5.2.5.1, “A Simple JSP Application with Glassfish, Connector/J and MySQL”](#), no additional changes are required.

When compiling the Java source code, you will need to specify the path to the file `javaee.jar`. On Windows, this can be done as follows:

```
shell> javac -classpath c:\glassfishv3\glassfish\lib\javaee.jar HelloWebServlet.java
```

Once the code is correctly located within its directory structure, and compiled, the application can be deployed in Glassfish. This is done in exactly the same way as described in the preceding section, [Section 21.3.5.2.5.1, “A Simple JSP Application with Glassfish, Connector/J and MySQL”](#).

Once deployed the application can be launched from within the Glassfish Administration Console. Enter a country name such as “England”, and the application will return “Country does not exist!”. Enter “France”, and the application will return a population of 59225700.

### 21.3.5.3. Connector/J: Common Problems and Solutions

There are a few issues that seem to be commonly encountered often by users of MySQL Connector/J. This section deals with their symptoms, and their resolutions.

## Questions

- [22.3.5.3.1:](#) When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What is going on? I can connect just fine with the MySQL command-line client.

- [22.3.5.3.2:](#) My application throws an SQLException 'No Suitable Driver'. Why is this happening?
- [22.3.5.3.3:](#) I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

- [22.3.5.3.4:](#) I have a servlet/application that works fine for a day, and then stops working overnight
- [22.3.5.3.5:](#) I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.
- [22.3.5.3.6:](#) I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.
- [22.3.5.3.7:](#) I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```
java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MysqlIO.readFully(MysqlIO.java:1392)
at com.mysql.jdbc.MysqlIO.readPacket(MysqlIO.java:1414)
at com.mysql.jdbc.MysqlIO.doHandshake(MysqlIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)
```

- [22.3.5.3.8:](#) My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting an error and stack trace, but these only occur after a fixed period of heavy activity.
- [22.3.5.3.9:](#) When using `gcj` an `java.io.CharConversionException` is raised when working with certain character sequences.
- [22.3.5.3.10:](#) Updating a table that contains a primary key that is either `FLOAT` or compound primary key that uses `FLOAT` fails to update the table and raises an exception.
- [22.3.5.3.11:](#) You get an `ER_NET_PACKET_TOO_LARGE` exception, even though the binary blob size you want to insert using JDBC is safely below the `max_allowed_packet` size.

## Questions and Answers

- [22.3.5.3.1:](#) When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What is going on? I can connect just fine with the MySQL command-line client.

MySQL Connector/J must use TCP/IP sockets to connect to MySQL, as Java does not support Unix Domain Sockets. Therefore, when MySQL Connector/J connects to MySQL, the security manager in MySQL server will use its grant tables to determine whether the connection should be permitted.

You must add the necessary security credentials to the MySQL server for this to happen, using the `GRANT` statement to your MySQL Server. See [Section 12.4.1.3, “GRANT Syntax”](#), for more information.

**Note**

Testing your connectivity with the `mysql` command-line client will not work unless you add the `--host` flag, and use something other than `localhost` for the host. The `mysql` command-line client will use Unix domain sockets if you use the special host name `localhost`. If you are testing connectivity to `localhost`, use `127.0.0.1` as the host name instead.

**Warning**

Changing privileges and permissions improperly in MySQL can potentially cause your server installation to not have optimal security properties.

**22.3.5.3.2: My application throws an SQLException 'No Suitable Driver'. Why is this happening?**

There are three possible causes for this error:

- The Connector/J driver is not in your `CLASSPATH`, see [Section 21.3.2, “Connector/J Installation”](#).
- The format of your connection URL is incorrect, or you are referencing the wrong JDBC driver.
- When using DriverManager, the `jdbc.drivers` system property has not been populated with the location of the Connector/J driver.

**22.3.5.3.3: I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:**

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

Either you're running an Applet, your MySQL server has been installed with the "`--skip-networking`" option set, or your MySQL server has a firewall sitting in front of it.

Applets can only make network connections back to the machine that runs the web server that served the .class files for the applet. This means that MySQL must run on the same machine (or you must have some sort of port re-direction) for this to work. This also means that you will not be able to test applets from your local file system, you must always deploy them to a web server.

MySQL Connector/J can only communicate with MySQL using TCP/IP, as Java does not support Unix domain sockets. TCP/IP communication with MySQL might be affected if MySQL was started with the "`--skip-networking`" flag, or if it is firewalled.

If MySQL has been started with the "`--skip-networking`" option set (the Debian Linux package of MySQL server does this for example), you need to comment it out in the file `/etc/mysql/my.cnf` or `/etc/my.cnf`. Of course your `my.cnf` file might also exist in the `data` directory of your MySQL server, or anywhere else (depending on how MySQL was compiled for your system). Binaries created by us always look in `/etc/my.cnf` and `[datadir]/my.cnf`. If your MySQL server has been firewalled, you will need to have the firewall configured to allow TCP/IP connections from the host where your Java code is running to the MySQL server on the port that MySQL is listening to (by default, 3306).

**22.3.5.3.4: I have a servlet/application that works fine for a day, and then stops working overnight**

MySQL closes connections after 8 hours of inactivity. You either need to use a connection pool that handles stale connections or use the "autoReconnect" parameter (see [Section 21.3.4.1, “Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J”](#)).

Also, you should be catching `SQLExceptions` in your application and dealing with them, rather than propagating them all the way until your application exits, this is just good programming practice. MySQL Connector/J will set the `SQLState` (see `java.sql.SQLException.getSQLState()` in your APIDOCs) to "08S01" when it encounters network-connectivity issues during the processing of a query. Your application code should then attempt to re-connect to MySQL at this point.

The following (simplistic) example shows what code that can handle these exceptions might look like:

**Example 21.12. Connector/J: Example of transaction with retry logic**

```
public void doBusinessOp() throws SQLException {
 Connection conn = null;
 Statement stmt = null;
 ResultSet rs = null;
```

```

// How many times do you want to retry the transaction
// (or at least _getting_ a connection)?
//
int retryCount = 5;

boolean transactionCompleted = false;

do {
 try {
 conn = getConnection(); // assume getting this from a
 // javax.sql.DataSource, or the
 // java.sql.DriverManager

 conn.setAutoCommit(false);

 //
 // Okay, at this point, the 'retry-ability' of the
 // transaction really depends on your application logic,
 // whether or not you're using autocommit (in this case
 // not), and whether you're using transactional storage
 // engines
 //
 // For this example, we'll assume that it's _not_ safe
 // to retry the entire transaction, so we set retry
 // count to 0 at this point
 //
 // If you were using exclusively transaction-safe tables,
 // or your application could recover from a connection going
 // bad in the middle of an operation, then you would not
 // touch 'retryCount' here, and just let the loop repeat
 // until retryCount == 0.
 //
 retryCount = 0;

 stmt = conn.createStatement();

 String query = "SELECT foo FROM bar ORDER BY baz";
 rs = stmt.executeQuery(query);

 while (rs.next()) {
 }

 rs.close();
 rs = null;

 stmt.close();
 stmt = null;

 conn.commit();
 conn.close();
 conn = null;

 transactionCompleted = true;
 } catch (SQLException sqlEx) {
 //
 // The two SQL states that are 'retry-able' are 08S01
 // for a communications error, and 40001 for deadlock.
 //
 // Only retry if the error was due to a stale connection,
 // communications problem or deadlock
 //

 String sqlState = sqlEx.getSQLState();

 if ("08S01".equals(sqlState) || "40001".equals(sqlState)) {
 retryCount--;
 } else {
 retryCount = 0;
 }
 } finally {
 if (rs != null) {
 try {
 rs.close();
 } catch (SQLException sqlEx) {
 // You'd probably want to log this . .
 }
 }
 }

 if (stmt != null) {
 try {
 stmt.close();
 } catch (SQLException sqlEx) {
 // You'd probably want to log this as well . .
 }
 }

 if (conn != null) {
 try {
 //
 // If we got here, and conn is not null, the
 // transaction should be rolled back, as not
 // all work has been done
 }
 }
}

```

```

 try {
 conn.rollback();
 } finally {
 conn.close();
 }
 } catch (SQLException sqlEx) {
 /**
 * If we got an exception here, something
 * pretty serious is going on, so we better
 * pass it up the stack, rather than just
 * logging it...
 */
 throw sqlEx;
}
} while (!transactionCompleted && (retryCount > 0));
}

```

### Note

Use of the `autoReconnect` option is not recommended because there is no safe method of reconnecting to the MySQL server without risking some corruption of the connection state or database state information. Instead, you should use a connection pool which will enable your application to connect to the MySQL server using an available connection from the pool. The `autoReconnect` facility is deprecated, and may be removed in a future release.

#### 22.3.5.3.5: I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.

Because MySQL does not have row identifiers, MySQL Connector/J can only update result sets that have come from queries on tables that have at least one primary key, the query must select every primary key and the query can only span one table (that is, no joins). This is outlined in the JDBC specification.

Note that this issue only occurs when using updatable result sets, and is caused because Connector/J is unable to guarantee that it can identify the correct rows within the result set to be updated without having a unique reference to each row. There is no requirement to have a unique field on a table if you are using `UPDATE` or `DELETE` statements on a table where you can individually specify the criteria to be matched using a `WHERE` clause.

#### 22.3.5.3.6: I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.

Make sure that the `skip-networking` option has not been enabled on your server. Connector/J must be able to communicate with your server over TCP/IP, named sockets are not supported. Also ensure that you are not filtering connections through a Firewall or other network security system. For more information, see [Section B.5.2.2, “Can't connect to \[local\] MySQL server”](#).

#### 22.3.5.3.7: I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```

java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MysqlIO.readFully(MysqlIO.java:1392)
at com.mysql.jdbc.MysqlIO.readPacket(MysqlIO.java:1414)
at com.mysql.jdbc.MysqlIO.doHandshake(MysqlIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)

```

The error probably indicates that you are using a older version of the Connector/J JDBC driver (2.0.14 or 3.0.x) and you are trying to connect to a MySQL server with version 4.1x or newer. The older drivers are not compatible with 4.1 or newer of MySQL as they do not support the newer authentication mechanisms.

It is likely that the older version of the Connector/J driver exists within your application directory or your `CLASSPATH` includes the older Connector/J package.

#### 22.3.5.3.8: My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting a error and stack trace, but these only occur after a fixed period of heavy activity.

This is a JBoss, not Connector/J, issue and is connected to the use of transactions. Under heavy loads the time taken for transactions to complete can increase, and the error is caused because you have exceeded the predefined timeout.

You can increase the timeout value by setting the `TransactionTimeout` attribute to the `TransactionManagerService` within the `/conf/jboss-service.xml` file (pre-4.0.3) or `/deploy/jta-service.xml` for JBoss 4.0.3 or later. See `TransactionTimeout` within the JBoss wiki for more information.

### 22.3.5.3.9: When using `gcj` an `java.io.CharConversionException` is raised when working with certain character sequences.

This is a known issue with `gcj` which raises an exception when it reaches an unknown character or one it cannot convert. You should add `useJvmCharsetConverters=true` to your connection string to force character conversion outside of the `gcj` libraries, or try a different JDK.

### 22.3.5.3.10: Updating a table that contains a primary key that is either `FLOAT` or compound primary key that uses `FLOAT` fails to update the table and raises an exception.

Connector/J adds conditions to the `WHERE` clause during an `UPDATE` to check the old values of the primary key. If there is no match then Connector/J considers this a failure condition and raises an exception.

The problem is that rounding differences between supplied values and the values stored in the database may mean that the values never match, and hence the update fails. The issue will affect all queries, not just those from Connector/J.

To prevent this issue, use a primary key that does not use `FLOAT`. If you have to use a floating point column in your primary key use `DOUBLE` or `DECIMAL` types in place of `FLOAT`.

### 22.3.5.3.11: You get an `ER_NET_PACKET_TOO_LARGE` exception, even though the binary blob size you want to insert using JDBC is safely below the `max_allowed_packet` size.

This is because the `hexEscapeBlock()` method in `com.mysql.jdbc.PreparedStatement.streamToBytes()` may almost double the size of your data.

## 21.3.6. Connector/J Support

### 21.3.6.1. Connector/J Community Support

Oracle provides assistance to the user community by means of its mailing lists. For Connector/J related issues, you can get help from experienced users by using the MySQL and Java mailing list. Archives and subscription information is available online at <http://lists.mysql.com/java>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See Section 1.6.1, “MySQL Mailing Lists”.

Community support from experienced users is also available through the [JDBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See Section 1.6.2, “MySQL Community Support at the MySQL Forums”.

### 21.3.6.2. How to Report Connector/J Bugs or Problems

The normal place to report bugs is <http://bugs.mysql.com/>, which is the address for our bugs database. This database is public, and can be browsed and searched by anyone. If you log in to the system, you will also be able to enter new reports.

If you have found a sensitive security bug in MySQL, you can send email to [<security@mysql.com>](mailto:<security@mysql.com>).

Writing a good bug report takes patience, but doing it right the first time saves time both for us and for yourself. A good bug report, containing a full test case for the bug, makes it very likely that we will fix the bug in the next release.

This section will help you write your report correctly so that you do not waste your time doing things that may not help us much or at all.

If you have a repeatable bug report, please report it to the bugs database at <http://bugs.mysql.com/>. Any bug that we are able to repeat has a high chance of being fixed in the next MySQL release.

To report other problems, you can use one of the MySQL mailing lists.

Remember that it is possible for us to respond to a message containing too much information, but not to one containing too little. People often omit facts because they think they know the cause of a problem and assume that some details do not matter.

A good principle is this: If you are in doubt about stating something, state it. It is faster and less troublesome to write a couple more lines in your report than to wait longer for the answer if we must ask you to provide information that was missing from the initial report.

The most common errors made in bug reports are (a) not including the version number of Connector/J or MySQL used, and (b) not fully describing the platform on which Connector/J is installed (including the JVM version, and the platform type and version number that MySQL itself is installed on).

This is highly relevant information, and in 99 cases out of 100, the bug report is useless without it. Very often we get questions

like, “Why doesn’t this work for me?” Then we find that the feature requested wasn’t implemented in that MySQL version, or that a bug described in a report has already been fixed in newer MySQL versions.

Sometimes the error is platform-dependent; in such cases, it is next to impossible for us to fix anything without knowing the operating system and the version number of the platform.

If at all possible, you should create a repeatable, stanalone testcase that doesn’t involve any third-party classes.

To streamline this process, we ship a base class for testcases with Connector/J, named `'com.mysql.jdbc.util.BaseBugReport'`. To create a testcase for Connector/J using this class, create your own class that inherits from `com.mysql.jdbc.util.BaseBugReport` and override the methods `setUp()`, `tearDown()` and `runTest()`.

In the `setUp()` method, create code that creates your tables, and populates them with any data needed to demonstrate the bug.

In the `runTest()` method, create code that demonstrates the bug using the tables and data you created in the `setUp` method.

In the `tearDown()` method, drop any tables you created in the `setUp()` method.

In any of the above three methods, you should use one of the variants of the `getConnection()` method to create a JDBC connection to MySQL:

- `getConnection()` - Provides a connection to the JDBC URL specified in `getUrl()`. If a connection already exists, that connection is returned, otherwise a new connection is created.
- `getNewConnection()` - Use this if you need to get a new connection for your bug report (that is, there is more than one connection involved).
- `getConnection(String url)` - Returns a connection using the given URL.
- `getConnection(String url, Properties props)` - Returns a connection using the given URL and properties.

If you need to use a JDBC URL that is different from ‘`jdbc:mysql://test`’, override the method `getUrl()` as well.

Use the `assertTrue(boolean expression)` and `assertTrue(String failureMessage, boolean expression)` methods to create conditions that must be met in your testcase demonstrating the behavior you are expecting (vs. the behavior you are observing, which is why you are most likely filing a bug report).

Finally, create a `main()` method that creates a new instance of your testcase, and calls the `run` method:

```
public static void main(String[] args) throws Exception {
 new MyBugReport().run();
}
```

Once you have finished your testcase, and have verified that it demonstrates the bug you are reporting, upload it with your bug report to <http://bugs.mysql.com/>.

### 21.3.6.3. Connector/J Change History

The Connector/J Change History (Changelog) is located with the main Changelog for MySQL. See [Section C.6, “MySQL Connector/J Change History”](#).

## 21.4. MySQL Connector/MXJ

MySQL Connector/MXJ is a Java Utility package for deploying and managing a MySQL database. Deploying and using MySQL can be as easy as adding another parameter to the JDBC connection url, which will result in the database being started when the first connection is made. This makes it easy for Java developers to deploy applications which require a database by reducing installation barriers for their end-users.

MySQL Connector/MXJ makes the MySQL database appear to be a java-based component. It does this by determining what platform the system is running on, selecting the appropriate binary, and launching the executable. It will also optionally deploy an initial database, with any specified parameters.

Included are instructions for use with a JDBC driver and deploying as a JMX MBean to JBoss.

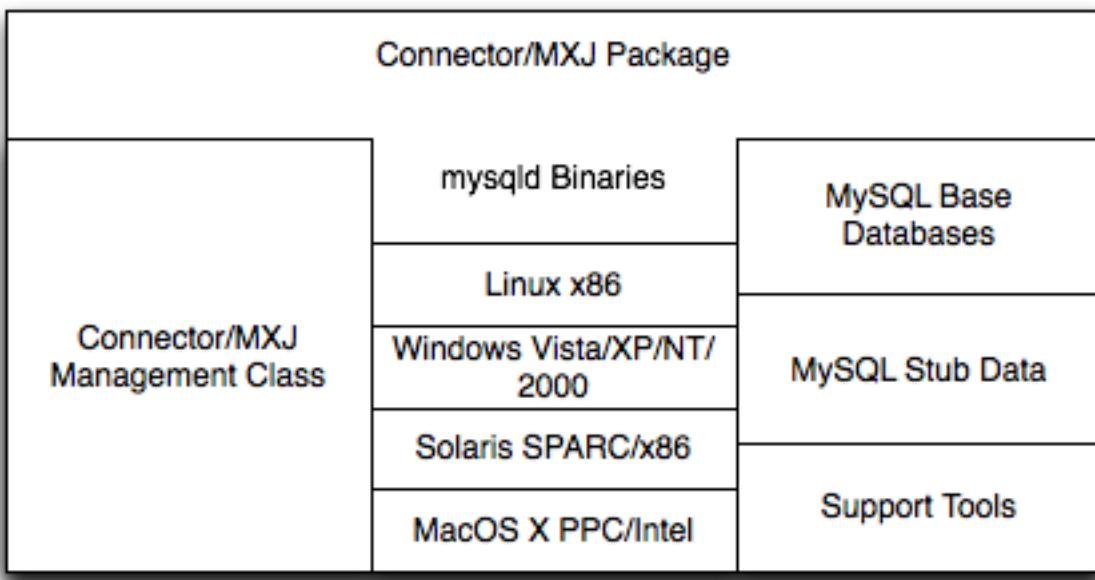

You can download sources and binaries from: <http://dev.mysql.com/downloads/connector/mxj/>

This a beta release and feedback is welcome and encouraged.

Please send questions or comments to the [MySQL and Java mailing list](#).

### 21.4.1. Connector/MXJ Overview

Connector/MXJ consists of a Java class, a copy of the `mysqld` binary for a specific list of platforms, and associated files and support utilities. The Java class controls the initialization of an instance of the embedded `mysqld` binary, and the ongoing management of the `mysqld` process. The entire sequence and management can be controlled entirely from within Java using the Connector/MXJ Java classes. You can see an overview of the contents of the Connector/MXJ package in the figure below.

It is important to note that Connector/MXJ is not an embedded version of MySQL, or a version of MySQL written as part of a Java class. Connector/MXJ works through the use of an embedded, compiled binary of `mysqld` as would normally be used when deploying a standard MySQL installation.

It is the Connector/MXJ wrapper, support classes and tools, that enable Connector/MXJ to appear as a MySQL instance.

When Connector/MXJ is initialized, the corresponding `mysqld` binary for the current platform is extracted, along with a pre-configured data directory. Both are contained within the Connector/MXJ JAR file. The `mysqld` instance is then started, with any additional options as specified during the initialization, and the MySQL database becomes accessible.

Because Connector/MXJ works in combination with Connector/J, you can access and integrate with the MySQL instance through a JDBC connection. When you have finished with the server, the instance is terminated, and, by default, any data created during the session is retained within the temporary directory created when the instance was started.

Connector/MXJ and the embedded `mysqld` instance can be deployed in a number of environments where relying on an existing database, or installing a MySQL instance would be impossible, including CD-ROM embedded database applications and temporary database requirements within a Java-based application environment.

### 21.4.2. Connector/MXJ Versions

Connector/MXJ 5.x, currently in beta status, includes `mysqld` version 5.x and includes binaries for Linux x86, Mac OS X PPC, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 5.x requires the Connector/J 5.x package.

A summary of the different MySQL versions supplied with each Connector/MXJ release are shown in the table.

Connector/MXJ Version	MySQL Version(s)
5.0.11	5.1.40
5.0.9	5.0.51a (CS), 5.0.54 (ES)
5.0.8	5.0.45 (CS), 5.0.46 (ES)
5.0.7	5.0.41 (CS), 5.0.42 (ES)
5.0.6	5.0.37 (CS), 5.0.40 (ES)
5.0.5	5.0.37 (CS), 5.0.36 (ES)

Connector/MXJ Version	MySQL Version(s)
5.0.4	5.0.27 (CS), 5.0.32 (ES)
5.0.3	5.0.22
5.0.2	5.0.19

This guide provides information on the Connector/MXJ 5.x release. For information on using the older releases, please see the documentation included with the appropriate distribution.

### 21.4.3. Connector/MXJ Installation

Connector/MXJ does not have a installation application or process, but there are some steps you can follow to make the installation and deployment of Connector/MXJ easier.

Before you start, there are some baseline requirements for

- Java Runtime Environment (v1.4.0 or newer) if you are only going to deploy the package.
- Java Development Kit (v1.4.0 or newer) if you want to build Connector/MXJ from source.
- Connector/J 5.0 or newer.

Depending on your target installation/deployment environment you may also require:

- JBoss - 4.0rc1 or newer
- Apache Tomcat - 5.0 or newer
- Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>)

#### 21.4.3.1. Supported Platforms

Connector/MXJ is compatible with any platform supporting Java and MySQL. By default, Connector/MXJ incorporates the `mysqld` binary for a select number of platforms which differs by version. The following platforms have been tested and working as deployment platforms. Support for all the platforms listed below is not included by default.

- Linux (i386)
- FreeBSD (i386)
- Windows NT (x86), Windows 2000 (x86), Windows XP (x86), Windows Vista (x86)
- Solaris 8, SPARC 32-bit (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X (PowerPC and Intel)

The Connector/MXJ 5.0.8 release includes `mysqld` binaries for the following platforms:

- Linux (i386)
- Windows (x86), compatible with Windows NT, Windows 2000, Windows XP , Windows Vista
- Solaris 8, SPARC 32-bit (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X (PowerPC and Intel)

For more information on packaging your own Connector/MXJ with the platforms you require, see [Section 21.4.6.1, “Creating your own Connector/MXJ Package”](#)

#### 21.4.3.2. Connector/MXJ Base Installation

---

Because there is no formal installation process, the method, installation directory, and access methods you use for Connector/MXJ are entirely up to your individual requirements.

To perform a basic installation, choose a target directory for the files included in the Connector/MXJ package. On Unix/Linux systems you may opt to use a directory such as `/usr/local/connector-mxj`; On Windows, you may want to install the files in the base directory, `C:\Connector-MXJ`, or within the `Program Files` directory.

To install the files, for a Connector/MXJ 5.0.4 installation:

1. Download the Connector/MXJ package, either in Tar/Gzip format (ideal for Unix/Linux systems) or Zip format (Windows).
2. Extract the files from the package. This will create a directory `mysql-connector-mxj-gpl-[ver]`. Copy and optionally rename this directory to your desired location.
3. For best results, you should update your global `CLASSPATH` variable with the location of the required `jar` files.

Within Unix/Linux you can do this globally by editing the global shell profile, or on a user by user basis by editing their individual shell profile.

On Windows 2000, Windows NT and Windows XP, you can edit the global `CLASSPATH` by editing the `Environment Variables` configured through the `System` control panel.

For Connector/MXJ 5.0.6 and later you need the following JAR files in your `CLASSPATH`:

- `mysql-connector-mxj-gpl-[ver].jar`: contains the main Connector/MXJ classes.
- `mysql-connector-mxj-gpl-[ver]-db-files.jar`: contains the embedded `mysqld` and database files.
- `aspectjrt.jar`: the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
- `mysql-connector-java-[ver]-bin.jar`: Connector/J, see [Section 21.3, “MySQL Connector/J”](#).

For Connector/MXJ 5.0.4 and later you need the following JAR files in your `CLASSPATH`:

- `connector-mxj.jar`: contains the main Connector/MXJ classes.
- `connector-mxj-db-files.jar`: contains the embedded `mysqld` and database files.
- `aspectjrt.jar`: the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
- `mysql-connector-mxj-gpl-[ver].jar`: Connector/J, see [Section 21.3, “MySQL Connector/J”](#).

For Connector/MXJ 5.0.3 and earlier, you need the following JAR files:

- `connector-mxj.jar`
- `aspectjrt.jar`: the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
- `mysql-connector-mxj-gpl-[ver].jar`: Connector/J, see [Section 21.3, “MySQL Connector/J”](#).

### 21.4.3.3. Connector/MXJ Quick Start Guide

Once you have extracted the Connector/MXJ and Connector/J components you can run one of the sample applications that initiates a MySQL instance. You can test the installation by running the `ConnectorMXJUrlTestExample`:

```
shell> java ConnectorMXJUrlTestExample
jdbc:mysql:mxj://localhost:3336/our_test_app?server.basedir=
 =/var/tmp/test-mxj&createDatabaseIfNotExist=true&server.initialize-user=true
[/var/tmp/test-mxj/bin/mysqld][--no-defaults][--port=3336][--socket=mysql.sock]
 [--basedir=/var/tmp/test-mxj][--datadir=/var/tmp/test-mxj/data][
 [--pid-file=/var/tmp/test-mxj/data/MysqldResource.pid]
[MyqldResource] launching mysqld (driver_launched_mysqld_1)
InnoDB: The first specified data file ./ibdata1 did not exist:
InnoDB: a new database to be created!
080220 9:40:20 InnoDB: Setting file ./ibdata1 size to 10 MB
InnoDB: Database physically writes the file full: wait...
080220 9:40:20 InnoDB: Log file ./ib_logfile0 did not exist: new to be created
```

```
InnoDB: Setting log file ./ib_logfile0 size to 5 MB
InnoDB: Database physically writes the file full: wait...
080220 9:40:20 InnoDB: Log file ./ib_logfile1 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile1 size to 5 MB
InnoDB: Database physically writes the file full: wait...
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: Creating foreign key constraint system tables
InnoDB: Foreign key constraint system tables created
080220 9:40:21 InnoDB: Started; log sequence number 0 0
080220 9:40:21 [Note] /var/tmp/test-mxj/bin/mysqld: ready for connections.
Version: '5.0.51a' socket: '/mysql.sock' port: 3336 MySQL Community Server (GPL)
[MysqldResource] mysqld running as process: 2238

SELECT VERSION()

5.0.51a

[MysqldResource] stopping mysqld (process: 2238)
080220 9:40:27 [Note] /var/tmp/test-mxj/bin/mysqld: Normal shutdown
080220 9:40:27 InnoDB: Starting shutdown...
080220 9:40:29 InnoDB: Shutdown completed; log sequence number 0 43655
080220 9:40:29 [Note] /var/tmp/test-mxj/bin/mysqld: Shutdown complete
[MysqldResource] shutdown complete
```

The above output shows an instance of MySQL starting, the necessary files being created (log files, InnoDB data files) and the MySQL database entering the running state. The instance is then shutdown by Connector/MXJ before the example terminates.

### Warning

You should avoid running your Connector/MXJ application as the `root` user, because this will cause the `mysqld` to also be executed with root privileges. For more information, see [Section 5.3.6, “How to Run MySQL as a Normal User”](#).

#### 21.4.3.4. Deploying Connector/MXJ using Driver Launch

Connector/MXJ and Connector/J work together to enable you to launch an instance of the `mysqld` server through the use of a keyword in the JDBC connection string. Deploying Connector/MXJ within a Java application can be automated through this method, making the deployment of Connector/MXJ a simple process:

1. Download and unzip Connector/MXJ, add `mysql-connector-mxj-gpl-[ver].jar` to the `CLASSPATH`.  
If you are using Connector/MXJ v5.0.4 or later you will also need to add the `mysql-connect-or-mxj-gpl-[ver]-db-files.jar` file to your `CLASSPATH`.
2. To the JDBC connection string, embed the `mxj` keyword, for example: `jdbc:mysql:mxj://localhost:PORT/DB-NAME`.

For more details, see [Section 21.4.4, “Connector/MXJ Configuration”](#).

#### 21.4.3.5. Deploying Connector/MXJ within JBoss

For deployment of Connector/MXJ within a JBoss environment, you must configure the JBoss environment to use the Connector/MXJ component within the JDBC parameters:

1. Download Connector/MXJ and copy the `mysql-connector-mxj-gpl-[ver].jar` file to the `$JBoss_HOME/server/default/lib` directory.  
If you are using Connector/MXJ v5.0.4 or later you will also need to copy the `mysql-connect-or-mxj-gpl-[ver]-db-files.jar` file to `$JBoss_HOME/server/default/lib`.
2. Download Connector/J and copy the `mysql-connector-java-5.1.5-bin.jar` file to the `$JBoss_HOME/server/default/lib` directory.
3. Create an MBean service xml file in the `$JBoss_HOME/server/default/deploy` directory with any attributes set, for instance the `datadir` and `autostart`.
4. Set the JDBC parameters of your web application to use:

```
String driver = "com.mysql.jdbc.Driver";
String url = "jdbc:mysql:///test?propertiesTransform>"+
 "com.mysql.management.jmx.ConnectorMXJPropertiesTransform";
String user = "root";
```

```
String password = "";
Class.forName(driver);
Connection conn = DriverManager.getConnection(url, user, password);
```

You may wish to create a separate users and database table spaces for each application, rather than using "root and test".

We highly suggest having a routine backup procedure for backing up the database files in the `datadir`.

### 21.4.3.6. Verifying Installation using JUnit

The best way to ensure that your platform is supported is to run the JUnit tests. These will test the Connector/MXJ classes and the associated components.

#### 21.4.3.6.1. JUnit Test Requirements

The first thing to do is make sure that the components will work on the platform. The `MysqldResource` class is really a wrapper for a native version of MySQL, so not all platforms are supported. At the time of this writing, Linux on the i386 architecture has been tested and seems to work quite well, as does OS X v10.3. There has been limited testing on Windows and Solaris.

Requirements:

1. JDK-1.4 or newer (or the JRE if you aren't going to be compiling the source or JSPs).
2. MySQL Connector/J version 5.0 or newer (from <http://dev.mysql.com/downloads/connector/j/>) installed and available using your CLASSPATH.
3. The `javax.management` classes for JMX version 1.2.1, these are present in the following application servers:
  - JBoss - 4.0rc1 or newer.
  - Apache Tomcat - 5.0 or newer.
  - Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>).
4. JUnit 3.8.1 (from <http://www.junit.org/>).

If building from source, All of the requirements from above, plus:

1. Ant version 1.5 or newer (download from <http://ant.apache.org/>).

#### 21.4.3.6.2. Running the JUnit Tests

1. The tests attempt to launch MySQL on the port 3336. If you have a MySQL running, it may conflict, but this isn't very likely because the default port for MySQL is 3306. However, You may set the "c-mxj\_test\_port" Java property to a port of your choosing. Alternatively, you may wish to start by shutting down any instances of MySQL you have running on the target machine.

The tests suppress output to the console by default. For verbose output, you may set the "c-mxj\_test\_silent" Java property to "false".

2. To run the JUnit test suite, the \$CLASSPATH must include the following:
  - JUnit
  - JMX
  - Connector/J
  - MySQL Connector/MXJ
3. If `connector-mxj.jar` is not present in your download, unzip MySQL Connector/MXJ source archive.

```
cd mysqldjmx
ant dist
```

Then add `$TEMP/cmxj/stage/connector-mxj/connector-mxj.jar` to the CLASSPATH.

4. If you have `junit`, execute the unit tests. From the command line, type:

```
java com.mysql.management.AllTestsSuite
```

The output should look something like this:

```
.....
.....
Time: 259.438
OK (101 tests)
```

Note that the tests are a bit slow near the end, so please be patient.

## 21.4.4. Connector/MXJ Configuration

### 21.4.4.1. Running as part of the JDBC Driver

A feature of the MySQL Connector/J JDBC driver is the ability to specify a connection to an embedded Connector/MXJ instance through the use of the `mxj` keyword in the JDBC connection string.

In the following example, we have a program which creates a connection, executes a query, and prints the result to the System.out. The MySQL database will be deployed and started as part of the connection process, and shutdown as part of the finally block.

You can find this file in the Connector/MXJ package as `src/ConnectorMXJUrlTestExample.java`.

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;

import com.mysql.management.driverlaunched.ServerLauncherSocketFactory;
import com.mysql.management.util.QueryUtil;

public class ConnectorMXJUrlTestExample {
 public static String DRIVER = "com.mysql.jdbc.Driver";

 public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

 public static void main(String[] args) throws Exception {
 File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
 File databaseDir = new File(ourAppDir, "test-mxj");
 int port = Integer.parseInt(System.getProperty("c-mxj_test_port", "3336"));
 String dbName = "our_test_app";

 String url = "jdbc:mysql:mxj://localhost:" + port + "/" + dbName //
 + "?" + "server.basedir=" + databaseDir //
 + "&" + "createDatabaseIfNotExist=true"//
 + "&" + "server.initialize-user=true" //
 ;

 System.out.println(url);

 String userName = "alice";
 String password = "q93uti0opwhkd";

 Class.forName(DRIVER);
 Connection conn = null;
 try {
 conn = DriverManager.getConnection(url, userName, password);
 String sql = "SELECT VERSION()";
 String queryForString = new QueryUtil(conn).queryForString(sql);

 System.out.println("-----");
 System.out.println(sql);
 System.out.println("-----");
 System.out.println(queryForString);
 System.out.println("-----");
 System.out.flush();
 Thread.sleep(100); // wait for System.out to finish flush
 } finally {
 try {
 if (conn != null)
 conn.close();
 } catch (Exception e) {
 e.printStackTrace();
 }
 }
 ServerLauncherSocketFactory.shutdown(databaseDir, null);
 }
}
```

```

 }
}
```

To run the above program, be sure to have connector-mxj.jar and Connector/J in the CLASSPATH. Then type:

```
java ConnectorMXJUrlTestExample
```

## 21.4.4.2. Running within a Java Object

If you have a java application and wish to “embed” a MySQL database, make use of the `com.mysql.management.MysqldResource` class directly. This class may be instantiated with the default (no argument) constructor, or by passing in a `java.io.File` object representing the directory you wish the server to be “unzipped” into. It may also be instantiated with printstreams for “stdout” and “stderr” for logging.

Once instantiated, a `java.util.Map`, the object will be able to provide a `java.util.Map` of server options appropriate for the platform and version of MySQL which you will be using.

The `MysqldResource` enables you to “start” MySQL with a `java.util.Map` of server options which you provide, as well as “shutdown” the database. The following example shows a simplistic way to embed MySQL in an application using plain java objects.

You can find this file in the Connector/MXJ package as `src/ConnectorMXJObjectTestExample.java`.

```

import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.util.HashMap;
import java.util.Map;

import com.mysql.management.MysqldResource;
import com.mysql.management.MysqldResourceI;
import com.mysql.management.util.QueryUtil;

public class ConnectorMXJObjectTestExample {
 public static final String DRIVER = "com.mysql.jdbc.Driver";

 public static final String JAVA_IO_TMPDIR = "java.io.tmpdir";

 public static void main(String[] args) throws Exception {
 File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
 File databaseDir = new File(ourAppDir, "mysql-mxj");
 int port = Integer.parseInt(System.getProperty("c-mxj_test_port",
 "3336"));
 String userName = "alice";
 String password = "q93uti0opwhkd";

 MysqldResource mysqldResource = startDatabase(databaseDir, port,
 userName, password);

 Class.forName(DRIVER);
 Connection conn = null;
 try {
 String dbName = "our_test_app";
 String url = "jdbc:mysql://localhost:" + port + "/" + dbName + "?createDatabaseIfNotExist=true";
 conn = DriverManager.getConnection(url, userName, password);
 String sql = "SELECT VERSION();";
 String queryForString = new QueryUtil(conn).queryForString(sql);

 System.out.println("-----");
 System.out.println(sql);
 System.out.println("-----");
 System.out.println(queryForString);
 System.out.println("-----");
 System.out.flush();
 Thread.sleep(100); // wait for System.out to finish flush
 } finally {
 try {
 if (conn != null) {
 conn.close();
 }
 } catch (Exception e) {
 e.printStackTrace();
 }
 try {
 mysqldResource.shutdown();
 } catch (Exception e) {
 e.printStackTrace();
 }
 }
 }

 public static MysqldResource startDatabase(File databaseDir, int port,
 String userName, String password) {

```

```
MysqldResource mysqldResource = new MysqldResource(databaseDir);

Map database_options = new HashMap();
database_options.put(MysqldResourceI.PORT, Integer.toString(port));
database_options.put(MysqldResourceI.INITIALIZE_USER, "true");
database_options.put(MysqldResourceI.INITIALIZE_USER_NAME, userName);
database_options.put(MysqldResourceI.INITIALIZE_PASSWORD, password);

mysqldResource.start("test-mysqld-thread", database_options);

if (!mysqldResource.isRunning()) {
 throw new RuntimeException("MySQL did not start.");
}

System.out.println("MySQL is running.");

return mysqldResource;
}
```

#### **21.4.4.3. Setting server options**

Of course there are many options we may wish to set for a MySQL database. These options may be specified as part of the JDBC connection string simply by prefixing each server option with `server.`. In the following example we set two driver parameters and two server parameters:

```
String url = "jdbc:mysql://" + hostColonPort + "/" +
 + "?"
 + "cacheServerConfiguration=true"
 + "&"
 + "useLocalSessionState=true"
 + "&"
 + "server.basedir=/opt/myapp/db"
 + "&"
 + "server.datadir=/mnt/bigdisk/myapp/data";
```

Starting with Connector/MXJ 5.0.6 you can use the `initialize-user` property to a connection string. If set to true, the default anonymous and root users will be removed and the user/password combination from the connection URL will be used to create a new user. For example:

```
String url = "jdbc:mysql:mxj://localhost:" + port
+ "/alice_db"
+ "?server.datadir=" + dataDir.getPath()
+ "&server.initialize-user=true"
+ "&createDatabaseIfNotExist=true"
;
```

#### **21.4.5. Connector/MXJ Reference**

The following sections include detailed information on the different API interfaces to Connector/MXJ.

#### **21.4.5.1. MysqldResource Constructors**

The `MysqldResource` class supports three different constructor forms:

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err)`

Enables you to set the base directory, data directory, select a server by its version string, standard out and standard error.

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString)`

Enables you to set the base directory, data directory and select a server by its version string. Output for standard out and standard err are directed to System.out and System.err.

- `public MysqldResource(File baseDir, File dataDir)`

Enables you to set the base directory and data directory. The default MySQL version is selected, and output for standard out and standard err are directed to System.out and System.err.

- `public MysqldResource(File baseDir);`

Enables the setting of the "basedir" to deploy the MySQL files to. Output for standard out and standard err are directed to System.out and System.err.

- `public MysqldResource();`

The basedir is defaulted to a subdirectory of the java.io.tempdir. Output for standard out and standard err are directed to System.out and System.err;

### 21.4.5.2. MysqldResource Methods

MysqldResource API includes the following methods:

- `void start(String threadName, Map mysqldArgs);`

Deploys and starts MySQL. The "threadName" string is used to name the thread which actually performs the execution of the MySQL command line. The map is the set of arguments and their values to be passed to the command line.

- `void shutdown();`

Shuts down the MySQL instance managed by the MysqldResource object.

- `Map getServerOptions();`

Returns a map of all the options and their current (or default, if not running) options available for the MySQL database.

- `boolean isRunning();`

Returns true if the MySQL database is running.

- `boolean isReadyForConnections();`

Returns true once the database reports that is ready for connections.

- `void setKillDelay(int millis);`

The default "Kill Delay" is 30 seconds. This represents the amount of time to wait between the initial request to shutdown and issuing a "force kill" if the database has not shutdown by itself.

- `void addCompletionListenser(Runnable listener);`

Enables applications to be notified when the server process completes. Each "listener" will be fired off in its own thread.

- `String getVersion();`

Returns the version of MySQL.

- `void setVersion(int MajorVersion, int minorVersion, int patchLevel);`

The standard distribution comes with only one version of MySQL packaged. However, it is possible to package multiple versions, and specify which version to use.

### 21.4.6. Connector/MXJ Notes and Tips

This section contains notes and tips on using the Connector/MXJ component within your applications.

#### 21.4.6.1. Creating your own Connector/MXJ Package

If you want to create a custom Connector/MXJ package that includes a specific `mysqld` version or platform then you must extract and rebuild the `mysql-connector-mxj.jar` (Connector/MXJ v5.0.3 or earlier) or `mysql-connect-or-mxj-gpl-[ver]-db-files.jar` (Connector/MXJ v5.0.4 or later) file.

First, you should create a new directory into which you can extract the current `connector-mxj.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj.jar
shell> ls
5-0-22/
ConnectorMXJObjectTestExample.class
ConnectorMXJUrlTestExample.class
META-INF/
TestDb.class
com/
kill.exe
```

If you are using Connector/MXJ v5.0.4 or later, you should unpack the `connector-mxj-db-files.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj-db-files.jar
shell> ls
5-0-51a/
META-INF/
connector-mxj.properties
```

The MySQL version directory, [5-0-22](#) or [5-0-51a](#) in the preceding examples, contains all of the files used to create an instance of MySQL when Connector/MXJ is executed. All of the files in this directory are required for each version of MySQL that you want to embed. Note as well the format of the version number, which uses hyphens instead of periods to separate the version number components.

Within the version specific directory are the platform specific directories, and archives of the `data` and `share` directory required by MySQL for the various platforms. For example, here is the listing for the default Connector/MXJ package:

```
shell>> ls
Linux-i386/
META-INF/
Mac_OS_X-ppc/
SunOS-sparc/
Win-x86/
com/
data_dir.jar
share_dir.jar
win_share_dir.jar
```

Platform specific directories are listed by their OS and platform - for example the `mysqld` for Mac OS X PowerPC is located within the `Mac_OS_X-ppc` directory. You can delete directories from this location that you do not require, and add new directories for additional platforms that you want to support.

To add a platform specific `mysqld`, create a new directory with the corresponding name for your operating system/platform. For example, you could add a directory for Mac OS X/Intel using the directory `Mac_OS_X-i386`.

On Unix systems, you can determine the platform using `uname`:

```
shell> uname -p
i386
```

In Connector/MXJ v5.0.9 and later, an additional `platform-map.properties` file is used to associate a specific platform and operating system combination with the directory in which the `mysqld` for that combination is located. The determined operating system and platform are on the left, and the directory name where the appropriate mysqld is located is on the right. You can see a sample of the file below:

```
Linux-i386=Linux-i386
Linux-x86=Linux-i386
Linux-i686=Linux-i386
Linux-x86_64=Linux-i386
Linux-ia64=Linux-i386

#Linux-ppc=Linux-ppc
#Linux-ppc64=Linux-ppc

Mac_OS_X-i386=Mac_OS_X-i386
Mac_OS_X-ppc=Mac_OS_X-ppc
Rhapsody-PowerPC=Mac_OS_X-ppc
#Mac_OS-PowerPC=
#macos-PowerPC=
#MacOS-PowerPC=

SunOS-sparc=SunOS-sparc
Solaris-sparc=SunOS-sparc
SunOS-x86=SunOS-x86
Solaris-x86=SunOS-x86

FreeBSD-x86=FreeBSD-x86

Windows_Vista-x86=Win-x86
Windows_2003-x86=Win-x86
Windows_XP-x86=Win-x86
Windows_2000-x86=Win-x86
Windows_NT-x86=Win-x86
Windows_NT_(unknown)-x86=Win-x86
```

Now you need to download or compile `mysqld` for the MySQL version and platform you want to include in your custom `connector-mxj.jar` package into the new directory.

Create a file called `version.txt` in the OS/platform directory you have just created that contains the version string/path of the

mysqld binary. For example:

```
mysql> ./mysqld
```

You can now recreate the `connector-mxj.jar` file with the added `mysqld`:

```
shell> cd custom-mxj
shell> jar -cf/connector-mxj.jar *
```

For Connector/MXJ v5.0.4 and later, you should repackage to the `connector-mxj-db-files.jar`:

```
shell> cd custom-mxj
shell> jar -cf/mysql-connector-mxj-gpl-[ver]-db-files.jar *
```

You should test this package using the steps outlined in [Section 21.4.3.3, “Connector/MXJ Quick Start Guide”](#).

#### Note

Because the `mysql-connector-mxj-gpl-[ver]-db-files.jar` file is separate from the main Connector/MXJ classes you can distribute different `mysql-connector-mxj-gpl-[ver]-db-files.jar` files to different hosts or for different projects without having to create a completely new main `mysql-connect-or-mxj-gpl-[ver].jar` file for each one.

### 21.4.6.2. Deploying Connector/MXJ with a pre-configured database

To include a pre-configured/populated database within your Connector/MXJ JAR file you must create a custom `data_dir.jar` file, as included within the main `connector-mxj.jar` (Connector/MXJ 5.0.3 or earlier) or `mysql-connect-or-mxj-gpl-[ver]-db-files.jar` (Connector/MXJ 5.0.4 or later) file:

1. First extract the `connector-mxj.jar` or `mysql-connector-gpl-[ver]-db-files.jar` file, as outlined in the previous section (see [Section 21.4.6.1, “Creating your own Connector/MXJ Package”](#)).
2. First, create your database and populate the database with the information you require in an existing instance of MySQL - including Connector/MXJ instances. Data file formats are compatible across platforms.
3. Shutdown the instance of MySQL.
4. Create a JAR file of the data directory and databases that you want to include your Connector/MXJ package. You should include the `mysql` database, which includes user authentication information, in addition to the specific databases you want to include. For example, to create a JAR of the `mysql` and `mxjtest` databases:

```
shell> jar -cf/data_dir.jar mysql mxjtest
```

5. For Connector/MXJ 5.0.3 or earlier, copy the `data_dir.jar` file into the extracted `connector-mxj.jar` directory, and then create an archive for `connector-mxj.jar`.

For Connector/MXJ 5.0.4 or later, copy the `data_dir.jar` file into the extracted `mysql-connect-or-mxj-gpl-[ver]-db-files.jar` directory, and then create an archive for `mysql-connect-or-mxj-db-gpl-[ver]-files.jar`.

Note that if you are create databases using the InnoDB engine, you must include the `ibdata.*` and `ib_logfile*` files within the `data_dir.jar` archive.

### 21.4.6.3. Running within a JMX Agent (custom)

As a JMX MBean, MySQL Connector/MXJ requires a JMX v1.2 compliant MBean container, such as JBoss version 4. The MBean will uses the standard JMX management APIs to present (and allow the setting of) parameters which are appropriate for that platform.

If you are not using the SUN Reference implementation of the JMX libraries, you should skip this section. Or, if you are deploying to JBoss, you also may wish to skip to the next section.

We want to see the `MysqldDynamicMBean` in action inside of a JMX agent. In the `com.mysql.management.jmx.sunri` package is a custom JMX agent with two MBeans:

1. The `MysqldDynamicMBean`, and

2. A com.sun.jdmk.comm.HtmlAdaptorServer, which provides a web interface for manipulating the beans inside of a JMX agent.

When this very simple agent is started, it will allow a MySQL database to be started and stopped with a web browser.

1. Complete the testing of the platform as above.
  - Current JDK, JUnit, Connector/J, MySQL Connector/MXJ
  - This section *requires* the SUN reference implementation of JMX
  - **PATH, JAVA\_HOME, ANT\_HOME, CLASSPATH**
2. If not building from source, skip to next step

Rebuild with the "sunri.present"

```
ant -Dsunri.present=true dist
re-run tests:
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

3. Launch the test agent from the command line:

```
java com.mysql.management.jmx.sunri.MysqldTestAgentSunHtmlAdaptor &
```

4. From a browser:

```
http://localhost:9092/
```

5. Under MysqldAgent,

```
select "name=mysqld"
```

6. Observe the MBean View
7. Scroll to the bottom of the screen press the STARTMYSQLD button
8. Click [Back to MBean View](#)
9. Scroll to the bottom of the screen press STOPMYSQLD button
10. Kill the java process running the Test Agent (jmx server)

#### 21.4.6.4. Deployment in a standard JMX Agent environment (JBoss)

Once there is confidence that the MBean will function on the platform, deploying the MBean inside of a standard JMX Agent is the next step. Included are instructions for deploying to JBoss.

1. Ensure a current version of java development kit (v1.4.x), see above.
  - Ensure **JAVA\_HOME** is set (JBoss requires **JAVA\_HOME**)
  - Ensure **JAVA\_HOME/bin** is in the **PATH** (You will NOT need to set your **CLASSPATH**, nor will you need any of the jars used in the previous tests).
2. Ensure a current version of JBoss (v4.0RC1 or better)

```
http://www.jboss.org/index.html
select "Downloads"
select "jboss-4.0.zip"
pick a mirror
unzip ~/dload/jboss-4.0.zip
create a JBOSS_HOME environment variable set to the unzipped directory
unix only:
cd $JBOSS_HOME/bin
chmod +x *.sh
```

3. Deploy (copy) the `connector-mxj.jar` to `$JBOSS_HOME/server/default/lib`.
4. Deploy (copy) `mysql-connector-java-3.1.4-beta-bin.jar` to `$JBOSS_HOME/server/default/lib`.
5. Create a `mxjtest.war` directory in `$JBOSS_HOME/server/default/deploy`.
6. Deploy (copy) `index.jsp` to `$JBOSS_HOME/server/default/deploy/mxjtest.war`.
7. Create a `mysqld-service.xml` file in `$JBOSS_HOME/server/default/deploy`.

```
<?xml version="1.0" encoding="UTF-8"?>
<server>
 <mbean code="com.mysql.management.jmx.jboss.JBossMysqldDynamicMBean"
 name="mysql:type=service,name=mysqld">
 <attribute name="datadir">/tmp/xxx_data_xxx</attribute>
 <attribute name="autostart">true</attribute>
 </mbean>
</server>
```

8. Start jboss:
  - On unix: `$JBOSS_HOME/bin/run.sh`
  - On windows: `%JBOSS_HOME%\bin\run.bat`
- Be ready: JBoss sends a lot of output to the screen.
9. When JBoss seems to have stopped sending output to the screen, open a web browser to: `http://localhost:8080/jmx-console`
10. Scroll down to the bottom of the page in the `mysql` section, select the bulleted `mysqld` link.
11. Observe the JMX MBean View page. MySQL should already be running.
12. (If "autostart=true" was set, you may skip this step.) Scroll to the bottom of the screen. You may press the INVOKE button to stop (or start) MySQL observe `Operation completed successfully without a return value`. Click [Back to MBean View](#)
13. To confirm MySQL is running, open a web browser to `http://localhost:8080/mxjtest/` and you should see that

```
SELECT 1
```

returned with a result of

```
1
```

14. Guided by the `$JBOSS_HOME/server/default/deploy/mxjtest.war/index.jsp` you will be able to use MySQL in your Web Application. There is a `test` database and a `root` user (no password) ready to experiment with. Try creating a table, inserting some rows, and doing some selects.
15. Shut down MySQL. MySQL will be stopped automatically when JBoss is stopped, or: from the browser, scroll down to the bottom of the MBean View press the stop service INVOKE button to halt the service. Observe `Operation completed successfully without a return value`. Using `ps` or `task manager` see that MySQL is no longer running

As of 1.0.6-beta version is the ability to have the MBean start the MySQL database upon start up. Also, we've taken advantage of the JBoss life-cycle extension methods so that the database will gracefully shut down when JBoss is shutdown.

## 21.4.7. Connector/MXJ Samples

This section contains some sample applications using Connector/MXJ.

### 21.4.7.1. Using Connector/MXJ with JSP

The following web application was provided by Pavan Venkatesh as an example of a JSP based application using Connector/MXJ to provide contact data. The example consists of two components, `insertdata.jsp` and `response.jsp`. The `insertdata.jsp` provides a form into which you can enter information to be stored within the MySQL database provided by Connector/MXJ. The `response.jsp` file is called when you submit the form and then provides a table of the data.

Because the data is stored through Connector/MXJ the instantiation of the MySQL database is handled dynamically on the fly,

making the script lightweight and self-contained.

### Example 21.13. `insertdata.jsp`

```
<%@page contentType="text/html" pageEncoding="UTF-8"%>
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
 "http://www.w3.org/TR/html4/loose.dtd">

## 21.4.8. Connector/MXJ Support

There are a wide variety of options available for obtaining support for using Connector/MXJ. You should contact the Connector/MXJ community for help before reporting a potential bug or problem. See [Section 21.4.8.1, “Connector/MXJ Community Support”](#).

### 21.4.8.1. Connector/MXJ Community Support

Oracle provides assistance to the user community by means of a number of mailing lists and web based forums.

You can find help and support through the [MySQL and Java](#) mailing list.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.6.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [MyODBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.6.2, “MySQL Community Support at the MySQL Forums”](#).

### 21.4.8.2. How to Report Connector/MXJ Problems

If you encounter difficulties or problems with Connector/MXJ, contact the Connector/MXJ community [Section 21.4.8.1, “Connector/MXJ Community Support”](#).

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/MXJ version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

### 21.4.8.3. Connector/MXJ Change History

The Connector/MXJ Change History (Changelog) is located with the main Changelog for MySQL. See [Section C.7, “MySQL Connector/MXJ Change History”](#).

## 21.5. MySQL Connector/C++

MySQL Connector/C++ is a MySQL database connector for C++. The current version is 1.0.5 GA.

The MySQL Connector/C++ is licensed under the terms of the GPL, like most MySQL Connectors. There are special exceptions to the terms and conditions of the GPL as it is applied to this software, see FLOSS License Exception. If you need a non-GPL license for commercial distribution please contact us.

The MySQL Connector/C++ is compatible with the JDBC 4.0 API. However, MySQL Connector/C++ does not implement all of the JDBC 4.0 API. The MySQL Connector/C++ current version features the following classes:

- `Connection`
- `DatabaseMetaData`
- `Driver`
- `PreparedStatement`
- `ResultSet`
- `ResultSetMetaData`
- `Savepoint`
- `Statement`

The JDBC 4.0 API defines approximately 450 methods for the above mentioned classes. MySQL Connector/C++ implements around 80% of these and makes them available in the current release.

The release has been successfully compiled and tested on the following platforms:

### AIX

- 5.2 (PPC32, PPC64)
- 5.3 (PPC32, PPC64)

### FreeBSD

- 6.0 (x86, x86\_64)

### HPUX

- 11.11 (PA-RISC 32bit, PA-RISC 64bit)

### Linux

- Debian 3.1 (PPC32, x86)
- FC4 (x86)
- RHEL 3 (ia64, x86, x86\_64)
- RHEL 4 (ia64, x86, x86\_64)
- RHEL 5 (ia64, x86, x86\_64)
- SLES 9 (ia64, x86, x86\_64)
- SLES 10 (ia64, x86\_64)
- SuSE 10.3, (x86\_64)
- Ubuntu 8.04 (x86)
- Ubuntu 8.10 (x86\_64)

### Mac

- MacOSX 10.3 (PPC32, PPC64)
- MacOSX 10.4 (PPC32, PPC64, x86)
- MacOSX 10.5 (PPC32, PPC64, x86, x86\_64)

### SunOS

- Solaris 8 (SPARC32, SPARC64, x86)
- Solaris 9 (SPARC32, SPARC64, x86)
- Solaris 10 (SPARC32, SPARC64, x86, x86\_64)

### Windows

- XP Professional (32bit)
- 2003 (64bit)

Future versions will run on all platforms supported by the MySQL Server.

#### Note

MySQL Connector/C++ supports MySQL 5.1 and later.

#### Note

MySQL Connector/C++ supports only Microsoft Visual Studio 2003 and above on Windows.

### MySQL Connector/C++ Download

You can download the source code for the MySQL Connector/C++ current release at the [MySQL Connector/C++ downloads](#).

### MySQL Connector/C++ Source repository

The latest development version is also available through [Launchpad](#).

Bazaar is used for the MySQL Connector/C++ code repository. You can check out the latest source code using the `bzr` command line tool:

```
shell> bzr branch lp:~mysql/mysql-connector-cpp/trunk .
```

### Binary distributions

Starting with 1.0.4 Beta, binary distributions were made available in addition to source code releases. The releases available are shown below.

Microsoft Windows platform:

- Without installer, a Zip file
- MSI installer package

Other platforms:

- Compressed GNU TAR archive (tar.gz)

#### Note

Note that source packages are available for all platforms in the Compressed GNU TAR archive (tar.gz) format.

Binary and source packages can be obtained from [MySQL Connector/C++ downloads](#).

### MySQL Connector/C++ Advantages

Using MySQL Connector/C++ instead of the MySQL C API (MySQL Client Library) offers the following advantages for C++ users:

- Convenience of pure C++, no C function calls required
- Supports an industry standard API, JDBC 4.0
- Supports the object-oriented programming paradigm
- Reduces development time
- MySQL Connector/C++ is licensed under the GPL with the FLOSS License Exception
- MySQL Connector/C++ is available under a commercial license upon request

### MySQL Connector/C++ Status

MySQL Connector/C++ is available as a GA version. We kindly ask users and developers to try it out and provide us with feedback.

Note that MySQL Workbench is successfully using MySQL Connector/C++.

If you have any queries please [contact us](#).

## 21.5.1. MySQL Connector/C++ Binary Installation

#### Caution

One problem that can occur is when the tools you use to build your application are not compatible with the tools used to build the binary versions of MySQL Connector/C++. Ideally you need to build your application with the same tools that were used to build the MySQL Connector/C++ binaries. To help with this the following resources are provided.

All distributions contain a `README` file, which contains platform-specific notes. At the end of the `README` file contained in the binary distribution you will find the settings used to build the binaries. If you experience build-related issues on a platform, it may help to check the settings used on the platform to build the binary.

For your convenience the same information, but more frequently updated, can be found on the [MySQL Forge site](#).

A better solution is to build your MySQL Connector/C++ libraries from the source code, using the same tools that you use for building your application. This ensures compatibility.

### Downloading MySQL Connector/C++

Binary and source packages can be obtained from [MySQL Connector/C++ downloads](#).

#### Archive Package

Unpack the archive into an appropriate directory. If you plan to use a dynamically linked version of MySQL Connector/C++, make sure that your system can reference the MySQL Client Library. Consult your operating system documentation on how to modify and expand the search path for libraries. In case you cannot modify the library search path it may help to copy your application, the MySQL Connector/C++ library and the MySQL Client Library into the same directory. Most systems search for libraries in the current directory.

#### Windows MSI Installer

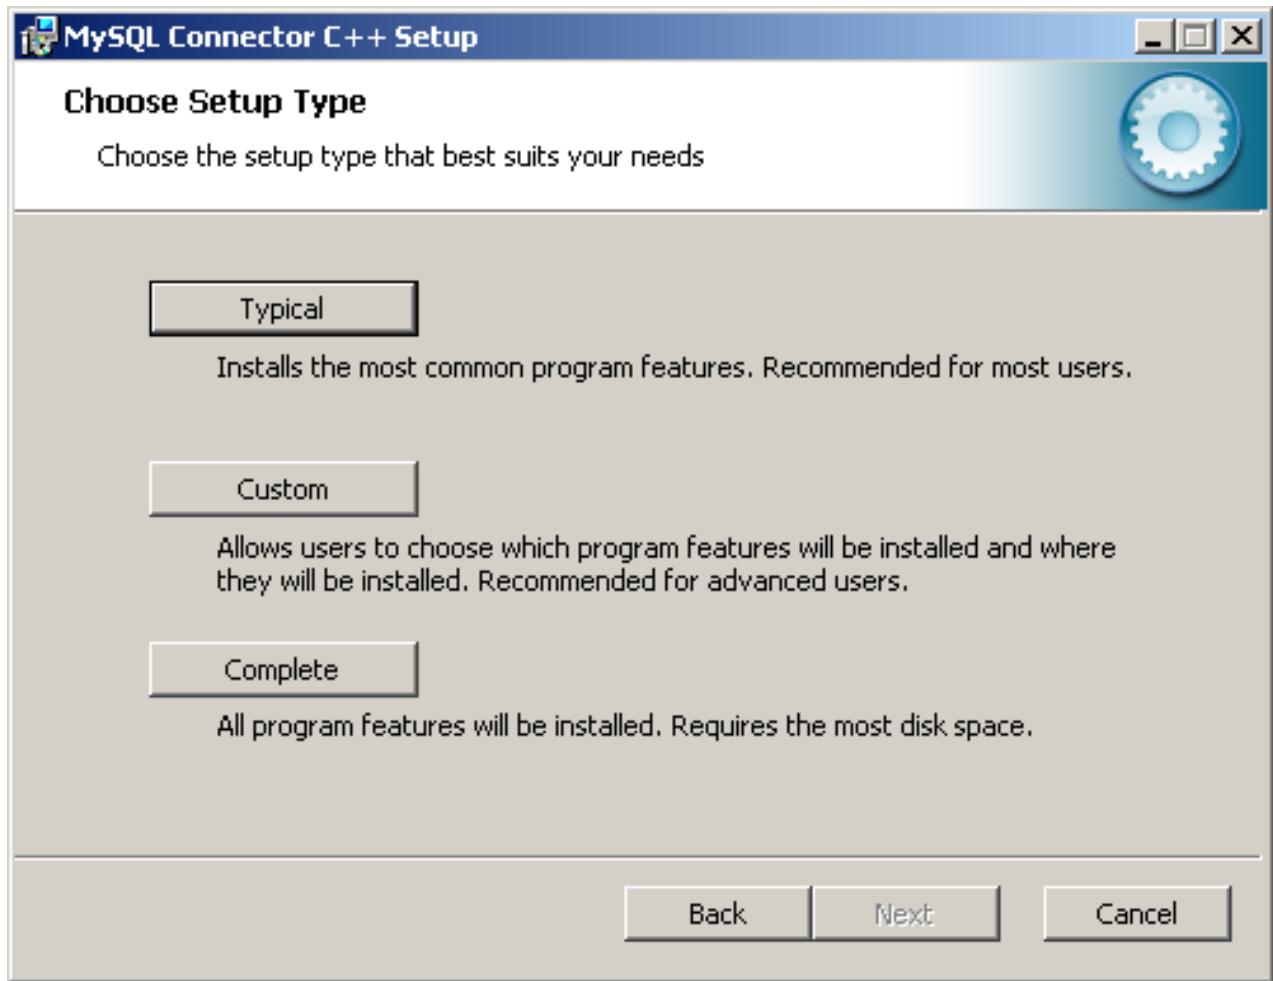

Windows users can choose between two binary packages:

1. Without installer (unzip in C:\)
2. Windows MSI Installer (x86)

Using the MSI Installer may be the easiest solution. Running the MSI Installer does not require any administrative permissions as it simply copies files.

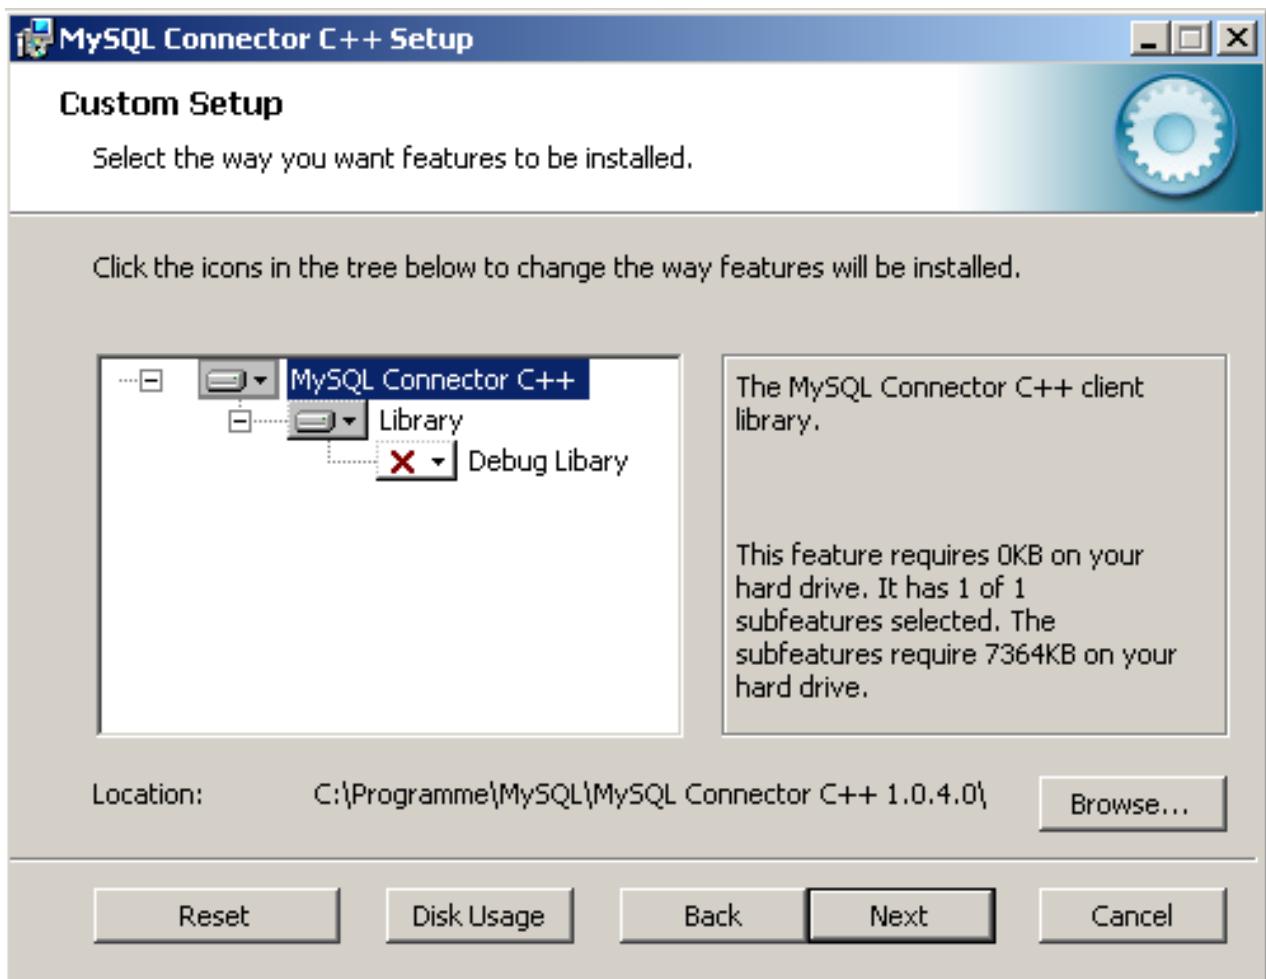

**Figure 21.59. Windows Installer Welcome Screen**

**Figure 21.60. Windows Installer Overview Screen**

The “Typical” installation consists of all required header files and the Release libraries. The only available “Custom” installation option enables you to install additional Debug versions of the connector libraries.

**Figure 21.61. Windows Installer Custom Setup Screen**

## 21.5.2. MySQL Connector/C++ Source Installation

The MySQL Connector/C++ is based on the MySQL Client Library (MySQL C API). MySQL Connector/C++ is linked against the MySQL Client Library. You need to have the MySQL Client Library installed to compile MySQL Connector/C++.

You also need to have the cross-platform build tool CMake 2.4, or newer, and GLib 2.2.3 or newer installed. Check the README file included with the distribution for platform specific notes on building for Windows and SunOS.

Typically the MySQL Client Library is installed when the MySQL Server is installed. However, check your operating system documentation for other installation options.

As of MySQL Connector/C++ version 1.1.0 it is necessary to have the Boost C++ libraries 1.34.0 or newer installed. Boost is only required to build the connector, it is not required to use the connector. You can obtain Boost from [the official site](#) and installation instructions can be obtained from the same site. Once Boost has been installed you will need to tell the make system where the Boost files are. This is done by setting the define `-DBOOST_ROOT:STRING=`. This can be done when initially invoking CMake, for example:

```
shell> CMake . -DBOOST_ROOT:STRING=/usr/local/boost_1_40_0
```

You may need to change `/usr/local/boost_1_40_0/` to match your installation. See the [Section 21.5.2.1, “Building source on Unix, Solaris and Mac OS X”](#) and [Section 21.5.2.2, “Building source on Windows”](#) for further details.

### 21.5.2.1. Building source on Unix, Solaris and Mac OS X

- Run CMake to build a Makefile:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake .
-- Check for working C compiler: /usr/local/bin/gcc
-- Check for working C compiler: /usr/local/bin/gcc -- works
[...]
-- Generating done
```

```
-- Build files have been written to: /path/to/mysql-connector-cpp/
```

On non-Windows systems, CMake first checks to see if the CMake variable `MYSQL_CONFIG_EXECUTABLE` is set. If it is not found CMake will try to locate `mysql_config` in the default locations.

If you have any problems with the configure process please check the troubleshooting instructions below.

2. Use make to build the libraries. First make sure you have a clean build:

```
shell> me@host:/path/to/mysql-connector-cpp> make clean
```

Then build the connector:

```
me@host:/path/to/mysql-connector-cpp> make
[1%] Building CXX object driver/CMakeFiles/mysqlcppconn.dir/mysql_connection.o
[3%] Building CXX object driver/CMakeFiles/mysqlcppconn.dir/mysql_constructed_resultset.o
[...]
[100%] Building CXX object examples/CMakeFiles/statement.dir/statement.o
Linking CXX executable statement
```

If all goes well, you will find the MySQL Connector/C++ library in `/path/to/cppconn/libmysqlcppconn.so`.

3. Finally make sure the header and library files are installed to their correct locations:

```
make install
```

Unless you have changed this in the configuration step, the header files will be copied to the directory `/usr/local/include`. The header files copied are `mysql_connection.h` and `mysql_driver.h`.

Again, unless you have specified otherwise, the library files will be copied to `/usr/local/lib`. The files copied are `libmysqlcppcon.so`, the dynamic library, and `libmysqlcppconn-static.a`, the static library.

If you encounter any errors, please first carry out the checks shown below:

1. CMake options: MySQL installation path, debug version and more

In case of configuration or compilation problems, check the list of CMake options:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake -L
[...]
CMAKE_BACKWARDS_COMPATIBILITY:STRING=2.4
CMAKE_BUILD_TYPE:STRING=
CMAKE_INSTALL_PREFIX:PATH=/usr/local
EXECUTABLE_OUTPUT_PATH:PATH=
LIBRARY_OUTPUT_PATH:PATH=
MYSQLCPPCONN_GCOV_ENABLE:BOOL=0
MYSQLCPPCONN_TRACE_ENABLE:BOOL=0
MYSQL_CONFIG_EXECUTABLE:FILEPATH=/usr/bin/mysql_config
```

For example, if your MySQL Server installation path is not `/usr/local/mysql` and you want to build a debug version of the MySQL Connector/C++ use:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake »
-D CMAKE_BUILD_TYPE:STRING=Debug »
-D MYSQL_CONFIG_EXECUTABLE=/path/to/my/mysql/server/bin/mysql_config .
```

2. Verify your settings with `cmake -L`:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake -L
[...]
CMAKE_BACKWARDS_COMPATIBILITY:STRING=2.4
CMAKE_BUILD_TYPE:STRING=
CMAKE_INSTALL_PREFIX:PATH=/usr/local
EXECUTABLE_OUTPUT_PATH:PATH=
LIBRARY_OUTPUT_PATH:PATH=
MYSQLCPPCONN_GCOV_ENABLE:BOOL=0
MYSQLCPPCONN_TRACE_ENABLE:BOOL=0
MYSQL_CONFIG_EXECUTABLE:/path/to/my/mysql/server/bin/mysql_config
```

Proceed by carrying out a `make clean` command followed by a `make` command, as described above.

Once you have installed MySQL Connector/C++ you can carry out a quick test to check the installation. To do this you can compile and run one of the example programs, such as `examples/standalone_example.cpp`. This example is discussed in more detail later, but for now you can use it to test the connector has been correctly installed. This procedure assumes you have a working MySQL Server that you can connect to.

1. First compile the example. To do this change to the `examples` directory and type:

```
shell> g++ -o test_install -I/usr/local/include -I/usr/local/include/cppconn -Wl,-Bdynamic -lmysqlcppconn standalone_example.cpp
```

2. You need to make sure the dynamic library which is used in this case can be found at run time. To do this enter:

```
shell> export LD_LIBRARY_PATH=/usr/local/lib
```

3. Now run the program to test your installation, exchanging the host, user, password and database to be accessed given below to match your system:

```
./test_install localhost root password database
```

You will see something similar to the following:

```
Connector/C++ standalone program example...
...
... running 'SELECT 'Welcome to Connector/C++' AS _message'
... MySQL replies: Welcome to Connector/C++
... say it again, MySQL
....MySQL replies: Welcome to Connector/C++
...
... find more at http://www.mysql.com
```

If you see any errors take note of them and go through the troubleshooting procedures discussed earlier.

### 21.5.2.2. Building source on Windows

#### Note

Please note the only compiler formally supported for Windows is Microsoft Visual Studio 2003 and above.

The basic steps for building the connector on Windows are the same as for Unix. It is important to use CMake 2.6.2 or newer to generate build files for your compiler and to invoke the compiler.

#### Note

On Windows, `mysql_config` is not present, so CMake will attempt to retrieve the location of MySQL from the environment variable `$ENV{MYSQL_DIR}`. If `MYSQL_DIR` is not set, CMake will then proceed to check for MySQL in the following locations: `$ENV{ProgramFiles}/MySQL/*/include`, and `$ENV{SystemDrive}/MySQL/*/include`.

CMake makes it easy for you to try other compilers. However, you may experience compile warnings, compile errors or linking issues not detected by Visual Studio. Patches are gratefully accepted to fix issues with other compilers.

Consult the CMake manual or check `cmake --help` to find out which build systems are supported by your CMake version:

```
C:\>cmake --help
cmake version 2.6-patch 2
Usage
[...]
Generators

The following generators are available on this platform:
 Borland Makefiles = Generates Borland makefiles.
 MSYS Makefiles = Generates MSYS makefiles.
 MinGW Makefiles = Generates a make file for use with
 mingw32-make.
 NMake Makefiles = Generates NMake makefiles.
 Unix Makefiles = Generates standard UNIX makefiles.
 Visual Studio 6 = Generates Visual Studio 6 project files.
 Visual Studio 7 = Generates Visual Studio .NET 2002 project
 files.
 Visual Studio 7 .NET 2003 = Generates Visual Studio .NET 2003 project
 files.
 Visual Studio 8 2005 = Generates Visual Studio .NET 2005 project
 files.
 Visual Studio 8 2005 Win64 = Generates Visual Studio .NET 2005 Win64
 project files.
 Visual Studio 9 2008 = Generates Visual Studio 9 2008 project fil
```

```
Visual Studio 9 2008 Win64 = Generates Visual Studio 9 2008 Win64 project files.
[...]
```

It is likely that your CMake binary will support more compilers, known by CMake as *generators*, than supported by MySQL Connector/C++. We have built the connector using the following generators:

- Microsoft Visual Studio 8 (Visual Studio 2005)
- Microsoft Visual Studio 9 (Visual Studio 2008, Visual Studio 2008 Express)
- NMake

Please see the building instructions for Unix, Solaris and Mac OS X for troubleshooting and configuration hints.

The steps to build the connector are given below:

1. Run CMake to generate build files for your *generator*:

#### **Visual Studio**

```
C:\path_to_mysql_cpp>cmake -G "Visual Studio 9 2008"
-- Check for working C compiler: cl -- works
-- Detecting C compiler ABI info
-- Detecting C compiler ABI info - done
-- Check for working CXX compiler: cl
-- Check for working CXX compiler: cl -- works
-- Detecting CXX compiler ABI info
-- Detecting CXX compiler ABI info - done
-- ENV[MYSQL_DIR] =
-- MySQL Include dir: C:/Programme/MySQL/MySQL Server 5.1/include
-- MySQL Library : C:/Progams/MySQL/MySQL Server 5.1/lib/opt/mysqlclient.lib
-- MySQL Library dir: C:/Progams/MySQL/MySQL Server 5.1/lib/opt
-- MySQL CFLAGS:
-- MySQL Link flags:
-- MySQL Include dir: C:/Progams/MySQL/MySQL Server 5.1/include
-- MySQL Library dir: C:/Progams/MySQL/MySQL Server 5.1/lib/opt
-- MySQL CFLAGS:
-- MySQL Link flags:
-- Configuring cppconn
-- Configuring test cases
-- Looking for isnf
-- Looking for isnf - not found
-- Looking for isnf
-- Looking for isnf - not found.
-- Looking for finite
-- Looking for finite - not found.
-- Configuring C/J junit tests port
-- Configuring examples
-- Configuring done
-- Generating done
-- Build files have been written to: C:\path_to_mysql_cpp
C:\path_to_mysql_cpp>dir *.sln *.vcproj
[...]
19.11.2008 12:16 23.332 MYSQLCPPCONN.sln
[...]
19.11.2008 12:16 27.564 ALL_BUILD.vcproj
19.11.2008 12:16 27.869 INSTALL.vcproj
19.11.2008 12:16 28.073 PACKAGE.vcproj
19.11.2008 12:16 27.495 ZERO_CHECK.vcproj
```

#### **NMake**

```
C:\path_to_mysql_cpp>cmake -G "NMake Makefiles"
-- The C compiler identification is MSVC
-- The CXX compiler identification is MSVC
[...]
-- Build files have been written to: C:\path_to_mysql_cpp
```

2. Use your compiler to build MySQL Connector/C++

#### **Visual Studio - GUI**

Open the newly generated project files in the Visual Studio GUI or use a Visual Studio command line to build the driver. The project files contain a variety of different configurations. Among them debug and nondebug versions.

#### **Visual Studio - NMake**

```
C:\path_to_mysql_cpp>nmake
Microsoft (R) Program Maintenance Utility Version 9.00.30729.01
Copyright (C) Microsoft Corporation. All rights reserved.

Scanning dependencies of target mysqlcppconn
[2%] Building CXX object driver/CMakeFiles/mysqlcppconn.dir/mysql_connection.obj
mysql_connection.cpp
[...]
Linking CXX executable statement.exe
[100%] Built target statement
```

### 21.5.2.3. Dynamically Linking MySQL Connector/C++ against the MySQL Client Library

#### Note

Note this section refers to dynamic linking of the MySQL Connector/C++ with the client library, not the dynamic linking of the application to MySQL Connector/C++.

An application that uses MySQL Connector/C++ can be either statically or dynamically linked to the MySQL Connector/C++ libraries. MySQL Connector/C++ is usually statically linked to the underlying MySQL Client Library (or Connector/C). Note, that unless otherwise stated, reference to the MySQL Client Library is also taken to include Connector/C, which is a separately packaged, stand alone version of the MySQL Client Library. From MySQL Connector/C++ version 1.1.0 it is possible to also dynamically link to the underlying MySQL Client Library. The ability of MySQL Connector/C++ to dynamically link to MySQL Client Library is not enabled by default, and enabling this feature is done through a compile time option, when compiling the MySQL Connector/C++ source code.

To use the ability to dynamically link the client library to MySQL Connector/C++ the `MYSQLCLIENT_STATIC_BINDING:BOOL` needs to be defined when building the MySQL Connector/C++ source code:

```
rm CMakeCache.txt
cmake -DMYSQLCLIENT_STATIC_BINDING:BOOL=1 .
make clean
make
make install
```

Note that pre-compiled binaries of MySQL Connector/C++ use static binding with the client library by default.

Now, in your application, when creating a connection, MySQL Connector/C++ will select and load a client library at runtime. It will choose the client library by searching defined locations and environment variables depending on the host operating system. It is also possible when creating a connection in an application to define an absolute path to the client library to be loaded at runtime. This can be convenient if you have defined a standard location from which you want the client library to be loaded. This is sometimes done to circumvent possible conflicts with other versions of the client library that may be located on the system.

### 21.5.3. MySQL Connector/C++ Building Windows applications with Microsoft Visual Studio

MySQL Connector/C++ is available as a static or dynamic library to use with your application. This section looks at how to link the library to your application.

#### Note

To avoid potential crashes the build configuration of MySQL Connector/C++ should match the build configuration of the application using it. For example, do not use the release build of MySQL Connector/C++ with a debug build of the client application.

#### Static library

The MySQL Connector/C++ static library file is `mysqlcppconn-static.lib`. This needs to be statically linked with your application. You also need to link against the files `libmysql.dll` and `libmysql.lib`. Once linking has been successfully completed, the application will require access to `libmysql.dll` at run time.

#### Dynamic library

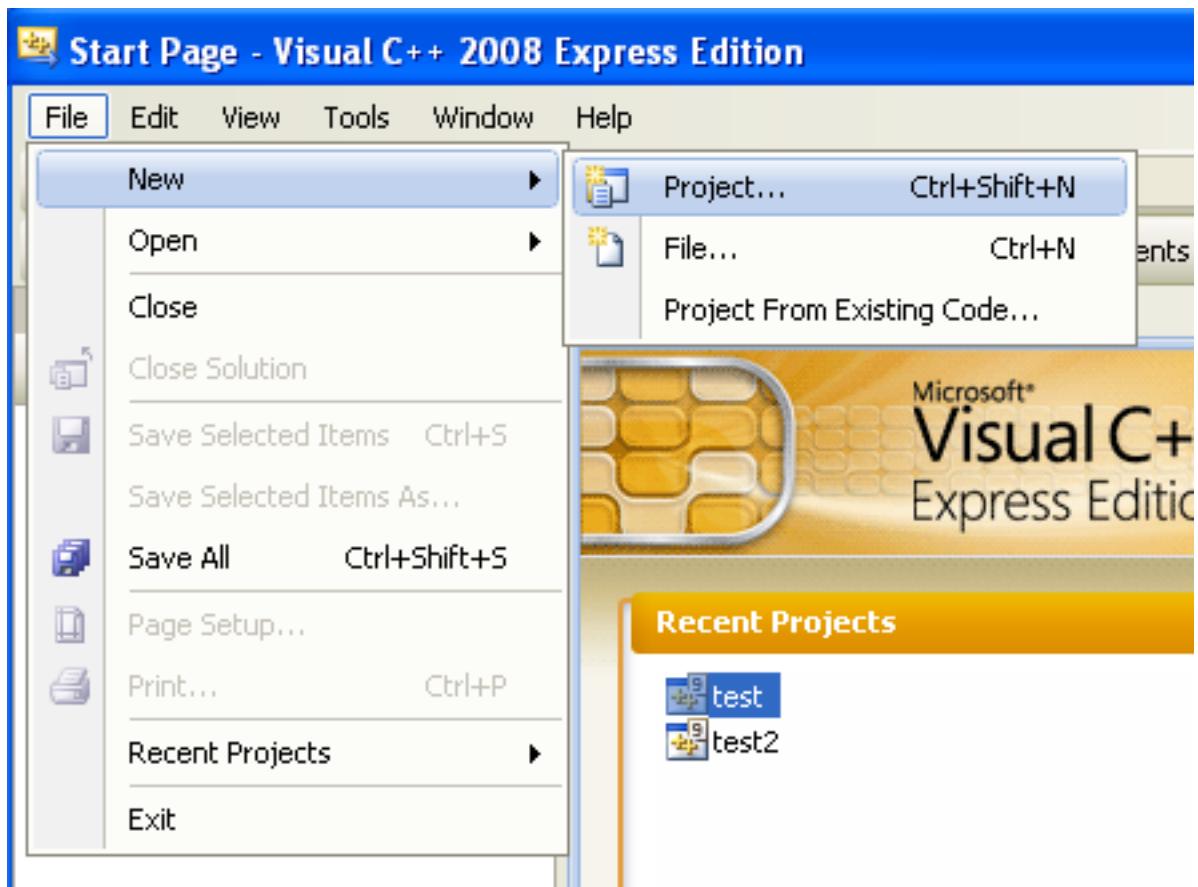

The MySQL Connector/C++ dynamic library file is `mysqlcppconn.dll`. To build your client application, you must link it with the file `mysqlcppconn.lib`. At run time, the application will require access to the files `mysqlcppconn.dll` and `libmysql.dll`.

#### Building a MySQL Connector/C++ application with Microsoft Visual Studio

Initially, the procedure for building an application to use either the static or dynamic library is the same. You then carry out some additional steps depending on whether you want to build your application to use the [static](#) or [dynamic](#) library.

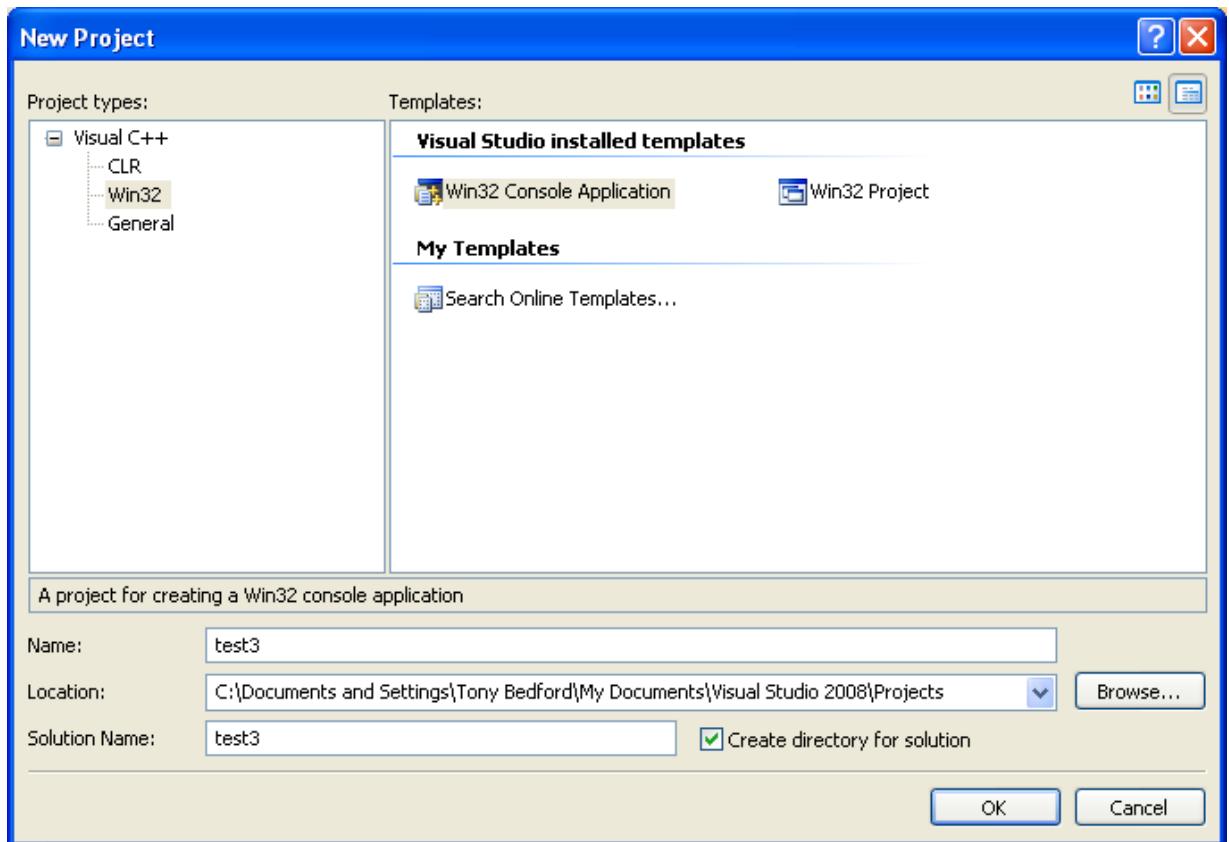

1. Select **FILE**, **NEW**, **PROJECT** from the main menu.

**Figure 21.62. Creating a New Project**

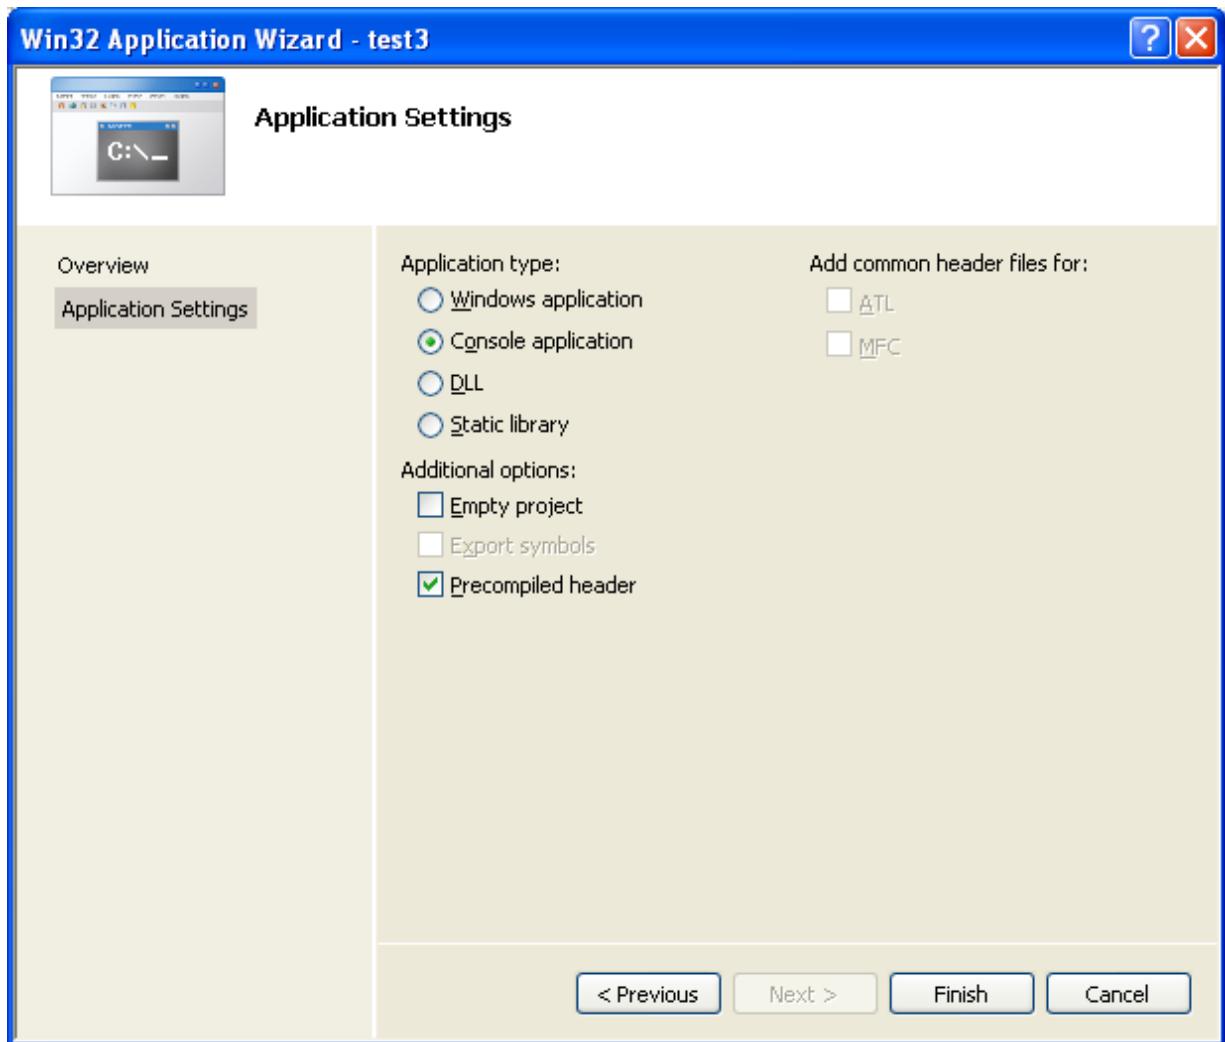

2. In the wizard select **VISUAL C++, WIN32**. From **VISUAL STUDIO INSTALLED TEMPLATES** select the application type **WIN32 CONSOLE APPLICATION**. Enter a name for the application, and then click **OK**, to move to the Win32 Application Wizard.

**Figure 21.63. The New Project Dialog Box**

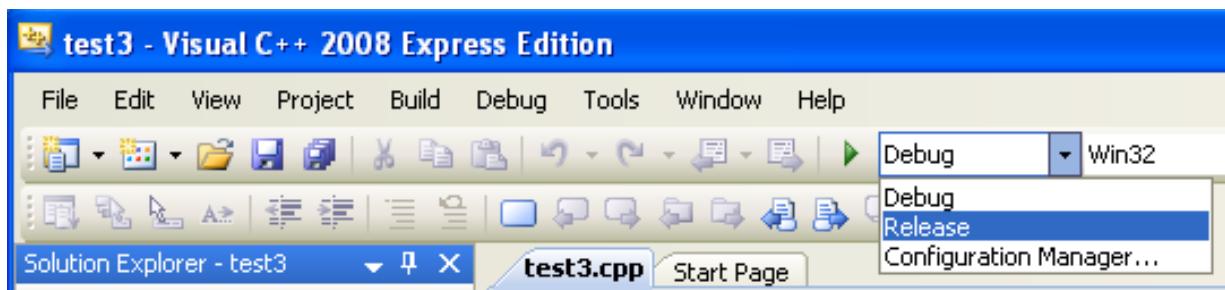

3. In the Win32 Application Wizard, click **APPLICATION SETTINGS** and ensure the defaults are selected. The radio button **CONSOLE APPLICATION**, and the checkbox **PRECOMPILED HEADERS** will be selected. Click **FINISH** to close the wizard.

**Figure 21.64. The Win32 Application Wizard**

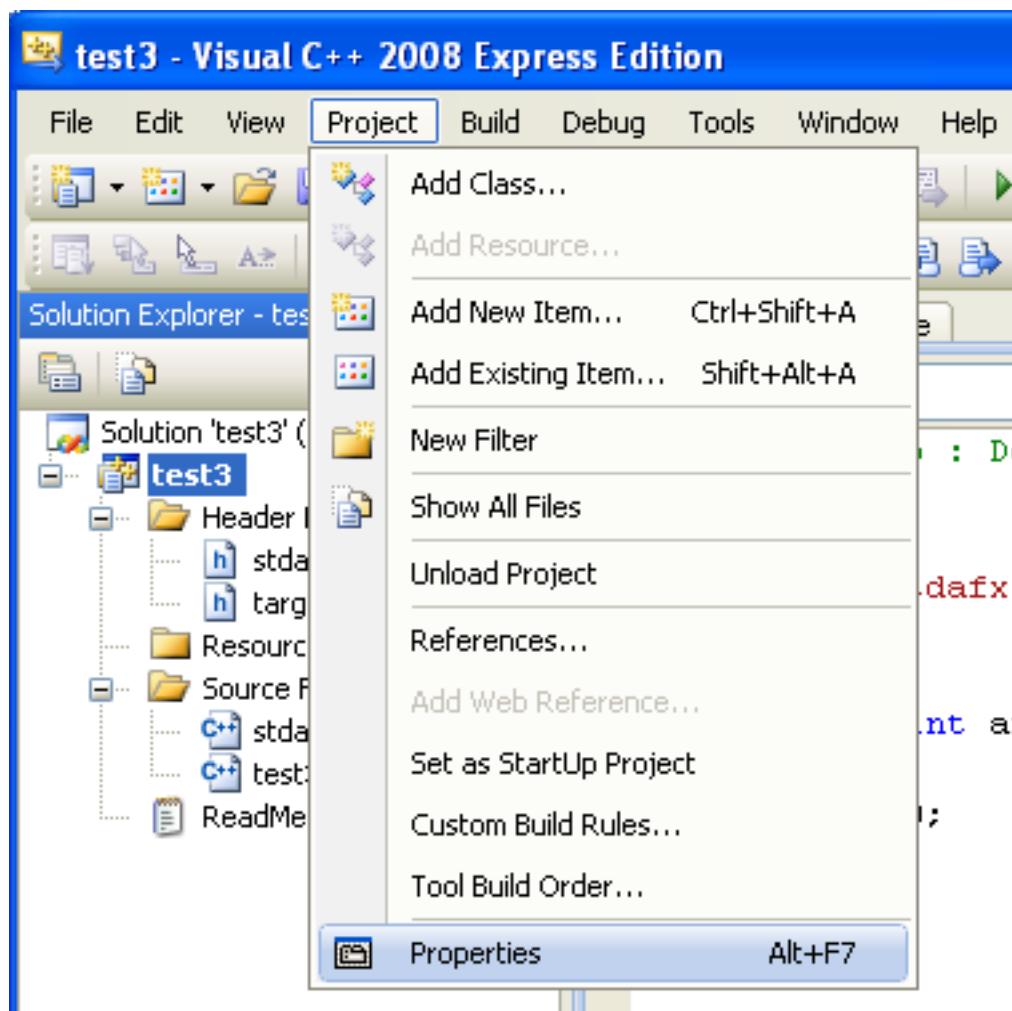

- From the drop down list box on the toolbar, change from the default **DEBUG** build to the **RELEASE** build.

**Figure 21.65. Selecting the Release Build**

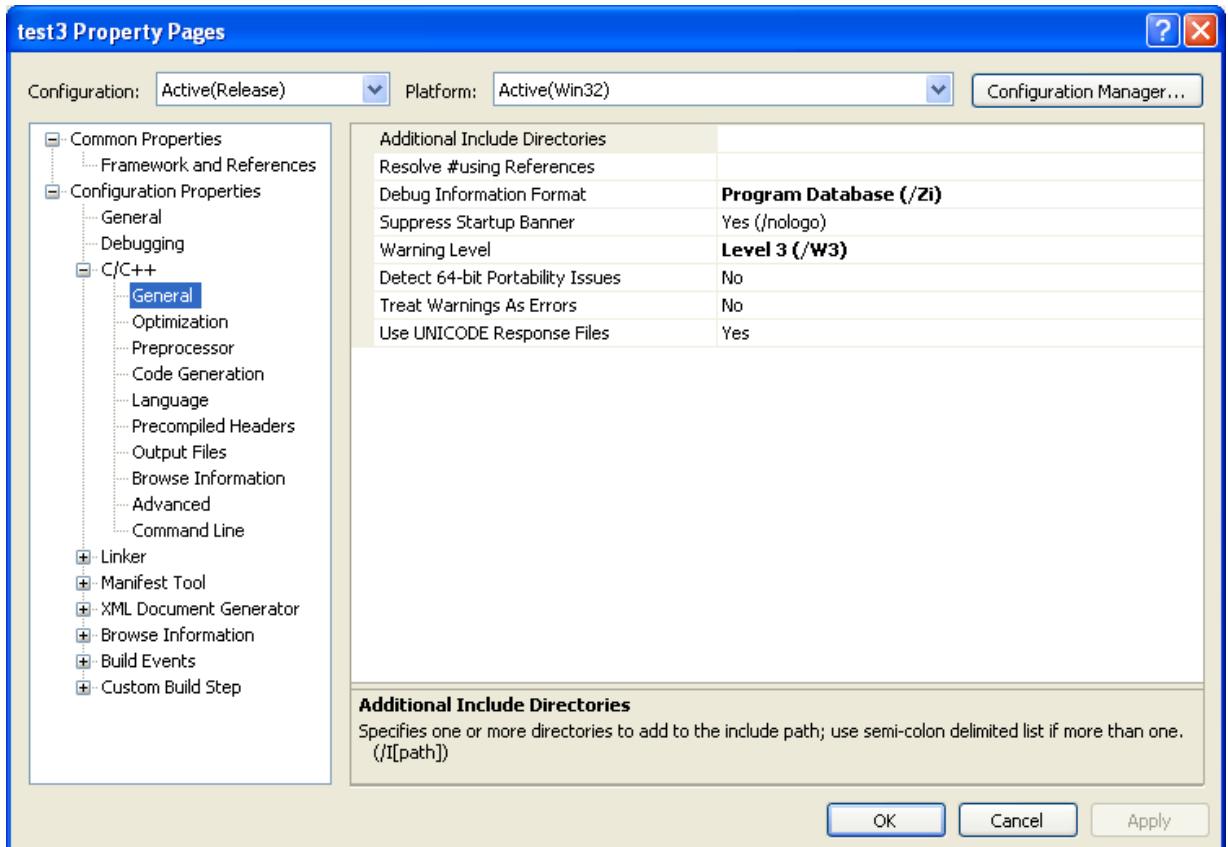

- From the main menu select **PROJECT**, **PROPERTIES**. This can also be accessed using the hot key ALT + F7.

**Figure 21.66. Selecting Project Properties from the Main Menu**

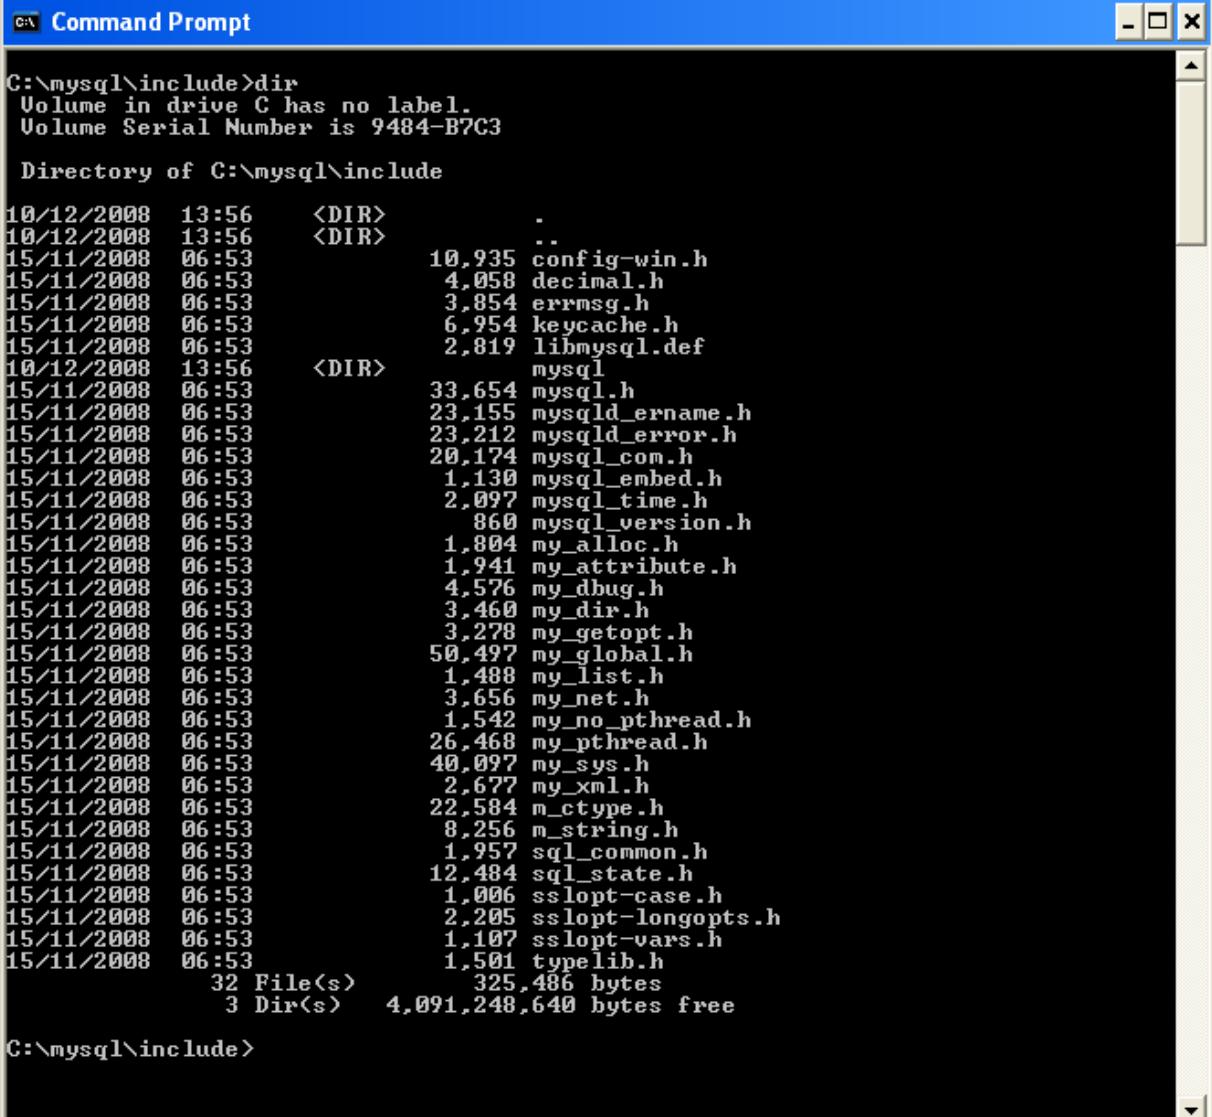

6. Under **CONFIGURATION PROPERTIES**, open the tree view.
7. Select **C++, GENERAL** in the tree view.

**Figure 21.67. Setting Properties**

8. You now need to ensure that Visual Studio can find the MySQL include directory. This directory includes header files that can optionally be installed when installing MySQL Server.

**Figure 21.68. MySQL Include Directory**

```
C:\mysql\include>dir
 Volume in drive C has no label.
 Volume Serial Number is 9484-B7C3

 Directory of C:\mysql\include

15/11/2008 06:53 1,107 sslopt-vars.h
15/11/2008 06:53 1,501 typelib.h

 32 File(s) 325,486 bytes
 3 Dir(s) 4,091,248,640 bytes free

C:\mysql\include>
```

9. Then in the **ADDITIONAL INCLUDE DIRECTORIES** text field, add the MySQL [include](#) directory.

**Figure 21.69. Select Directory Dialog**

10. You will also need to set the location of additional libraries that Visual Studio will need to build the application. These are located in the MySQL `lib/opt` directory, a sub-directory of the MySQL Server installation directory.

**Figure 21.70. Typical Contents of MySQL lib/opt Directory**

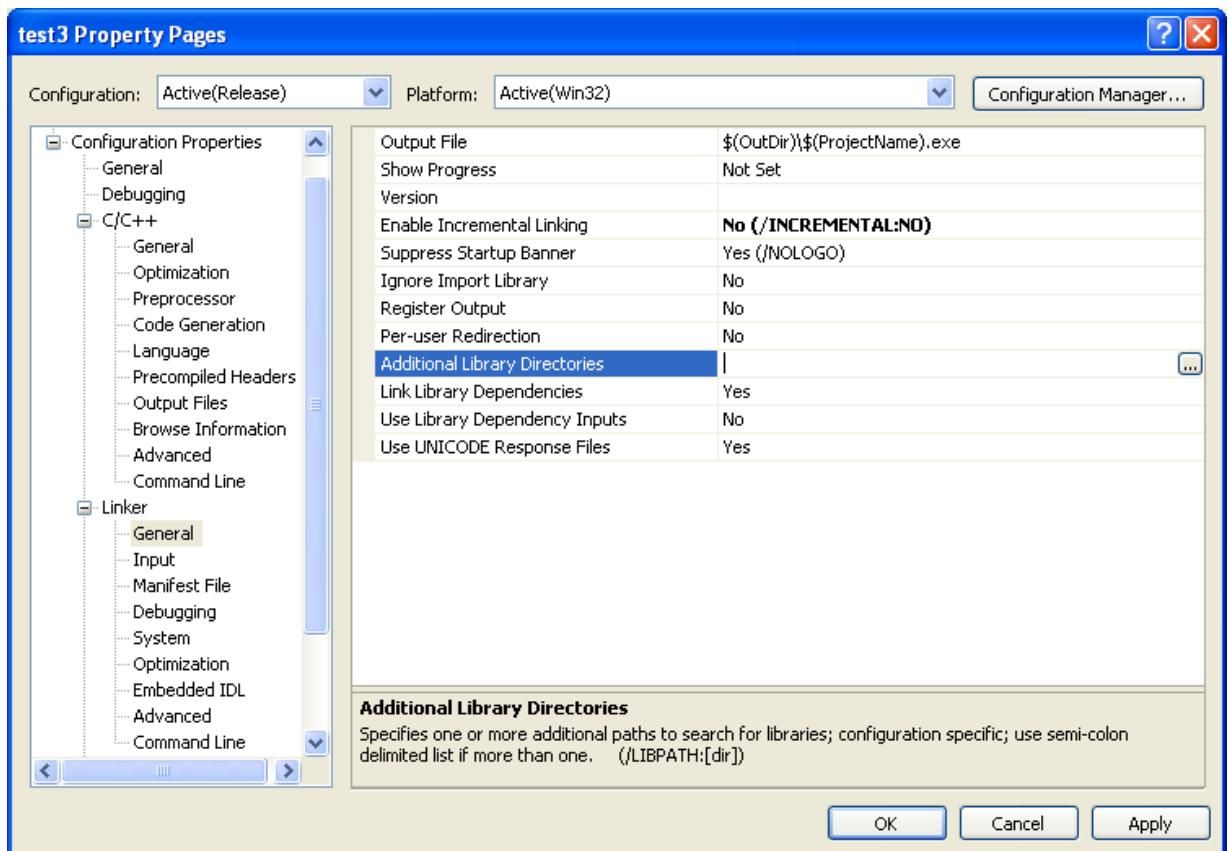

```
C:\mysql\lib\opt>dir
 Volume in drive C has no label.
 Volume Serial Number is 9484-B7C3

 Directory of C:\mysql\lib\opt

10/12/2008 13:56 <DIR> .

C:\mysql\lib\opt>
```

11. In the tree view open **LINKER, GENERAL, ADDITIONAL LIBRARY DIRECTORIES**.

**Figure 21.71. Additional Library Directories**

12. Add the `lib/opt` directory into the **ADDITIONAL LIBRARY DIRECTORIES** text field. This enables the library file `libmysql.lib` to be found.

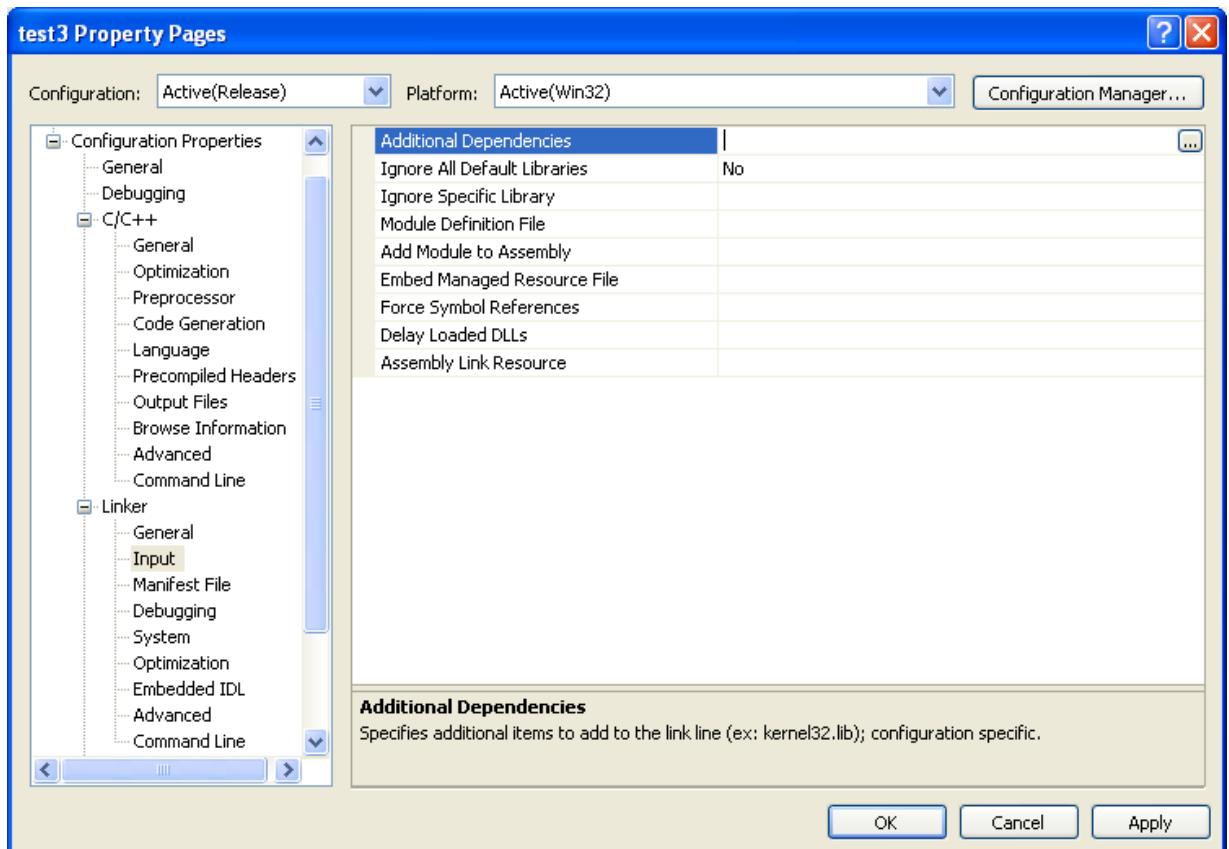

**Figure 21.72. Additional Library Directories Dialog**

The remaining steps depend on whether you are building an application to use the MySQL Connector/C++ static or dynamic library. If you are building your application to use the dynamic library [go here](#). If you are building your application to use the static library, carry out the following steps:

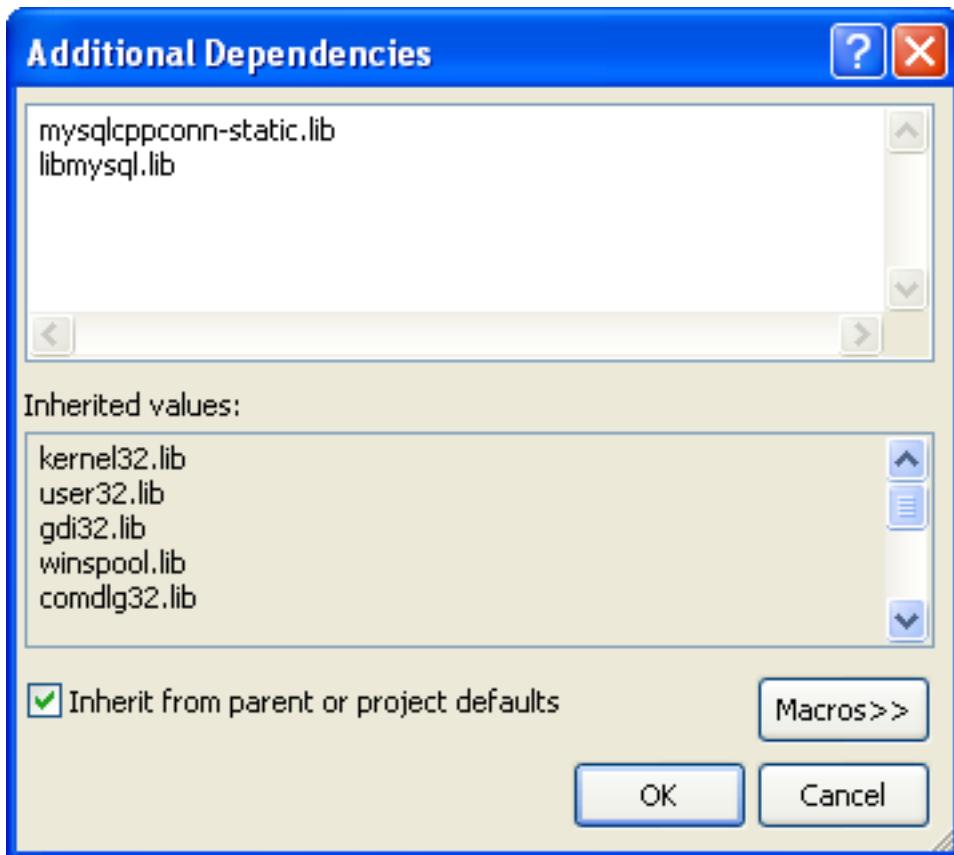

1. Then open **LINKER, INPUT, ADDITIONAL DEPENDENCIES**.

**Figure 21.73.**

2. Enter `mysqlcppconn-static.lib` and `libmysql.lib`.

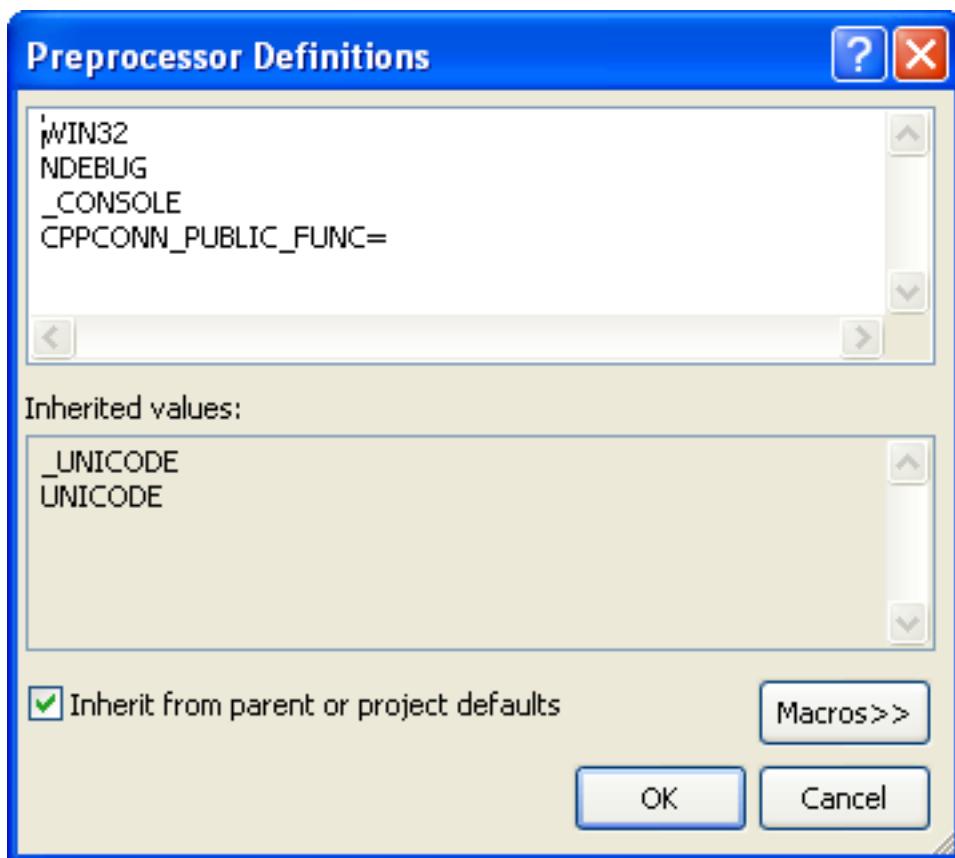

**Figure 21.74. Adding Additional Dependencies**

3. By default `CPPCONN_PUBLIC_FUNC` is defined to declare functions to be compatible with an application that calls a DLL. If building an application to call the static library, you must ensure that function prototypes are compatible with this. In this case `CPPCONN_PUBLIC_FUNC` needs to be defined to be an empty string, so that functions are declared with the correct prototype.

In the **PROJECT, PROPERTIES** tree view, under **C++, PREPROCESSOR**, enter `CPPCONN_PUBLIC_FUNC=` into the [PREPROCESSOR DEFINITIONS](#) text field.

**Figure 21.75. Setting the CPPCONN\_PUBLIC\_FUNC Define**

#### Note

Make sure you enter `CPPCONN_PUBLIC_FUNC=` and not `CPPCONN_PUBLIC_FUNC`, as it needs to be defined as an empty string.

If building an application to use the MySQL Connector/C++ dynamically linked library carry out these steps:

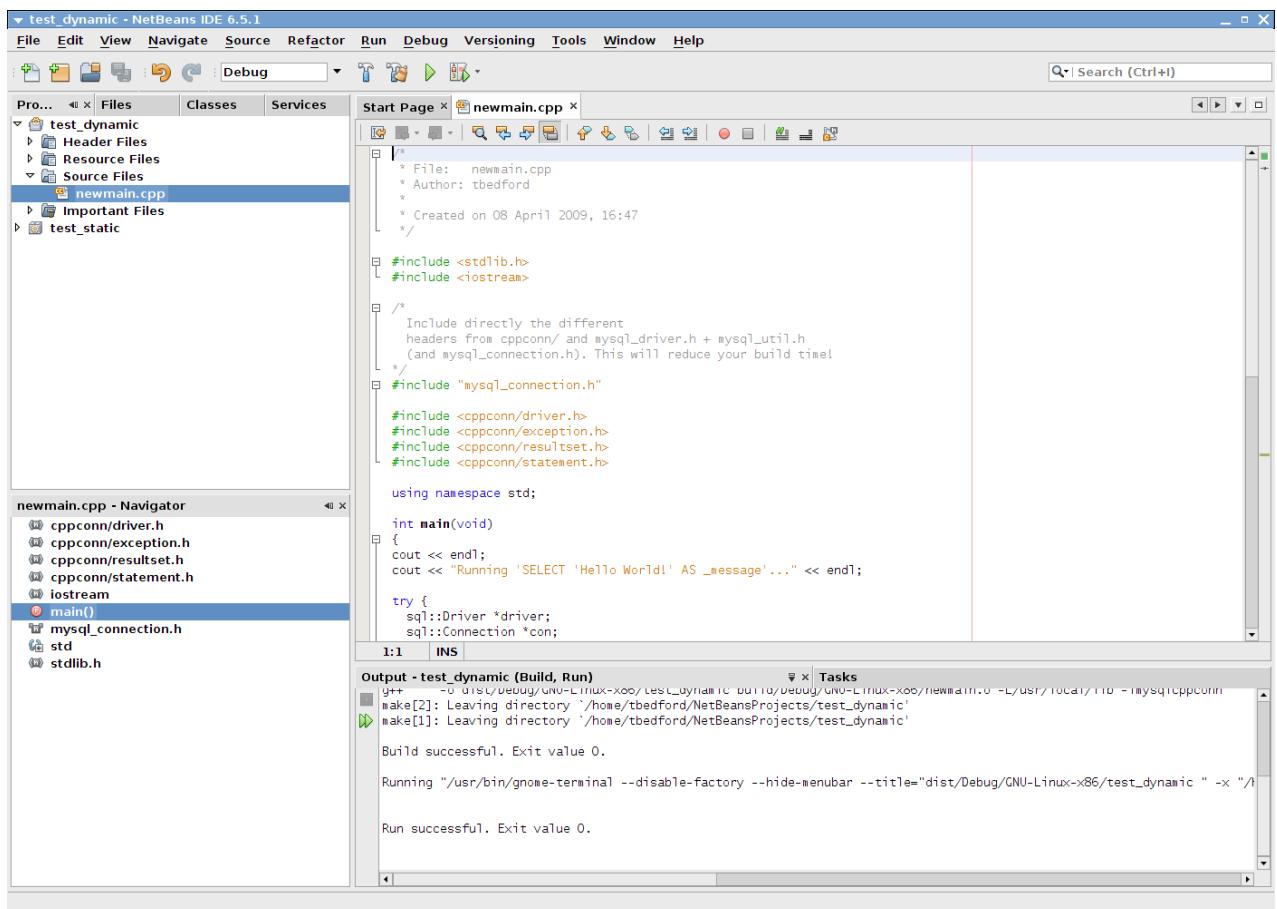

1. Under **LINKER, INPUT**, add `mysqlcppconn.lib` into the **ADDITIONAL DEPENDENCIES** text field.
2. The application will need to access the MySQL Connector/C++ Dynamic Linked Library at run time. Therefore, `mysqlcppconn.dll` needs to be in the same directory as the application executable, or somewhere on the system's path.

Copy `mysqlcppconn.dll` to the same directory as the application. Alternatively, extend the `PATH` environment variable using `SET PATH=%PATH%;C:\path\to\cpp`. Alternatively, you can copy `mysqlcppconn.dll` to the Windows installation Directory, typically `c:\windows`.

### 21.5.4. MySQL Connector/C++ Building Linux applications with NetBeans

This section describes how you can build MySQL Connector/C++ applications for Linux using the NetBeans IDE.

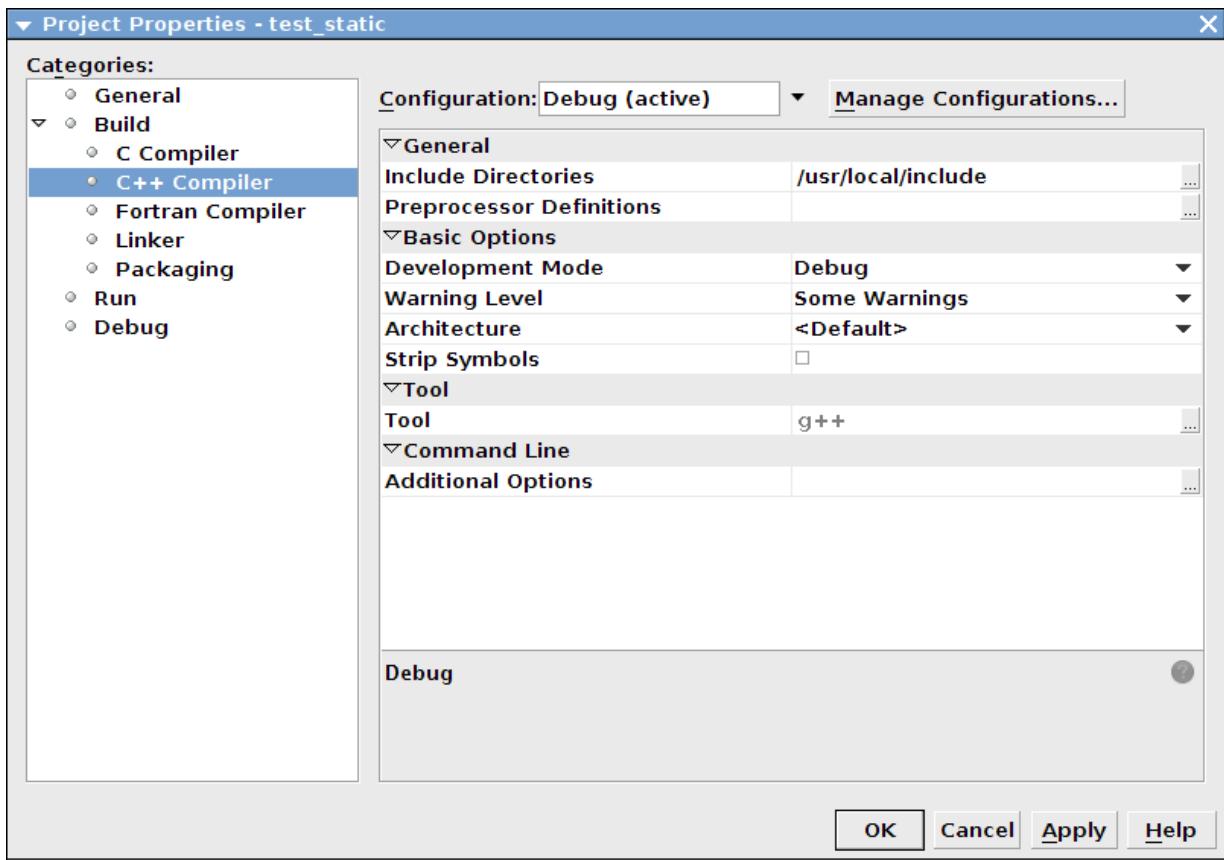

**Figure 21.76. The NetBeans IDE**

### Note

To avoid potential crashes the build configuration of MySQL Connector/C++ should match the build configuration of the application using it. For example, do not use the release build of MySQL Connector/C++ with a debug build of the client application.

1. The first step of building your application is to create a new project. Select **FILE**, **NEW PROJECT**. Choose a **C/C++ APPLICATION** and click **NEXT**.
2. Give the project a name and click **FINISH**. A new project is created.
3. In the **PROJECTS** tab, right-click **SOURCE FILES** and select **NEW**, then **MAIN C++ FILE...**
4. Change the filename, or simply select the defaults and click **FINISH** to add the new file to the project.
5. You now need to add some working code to your main source file. Explore your MySQL Connector/C++ installation and navigate to the **examples** directory.
6. Select a suitable example such as **standalone\_example\_docs1.cpp**. Copy all the code in this file, and use it to replace the code in your existing main source file. Amend the code to reflect the connection properties required for your test database. You now have a working example that will access a MySQL database using MySQL Connector/C++.
7. You will notice that at this point NetBeans is showing some errors in the source code. This is because you need to direct NetBeans to the necessary header files that need to be included. Select **FILE**, **PROJECT PROPERTIES** from the main menu.
8. In the **CATEGORIES**: tree view panel, navigate to **BUILD**, **C++ COMPILER**.
9. In the **GENERAL** panel, select **INCLUDE DIRECTORIES**.
10. Click the ... button.
11. Click **ADD** and then navigate to the directory where the MySQL Connector/C++ header files are located. This will be **/usr/local/include** unless you have installed the files to a different location. Click **SELECT**. Click **OK**.

**Figure 21.77. Setting the Header Include Directory**

12. Click OK again to close the **PROJECT PROPERTIES** dialog.

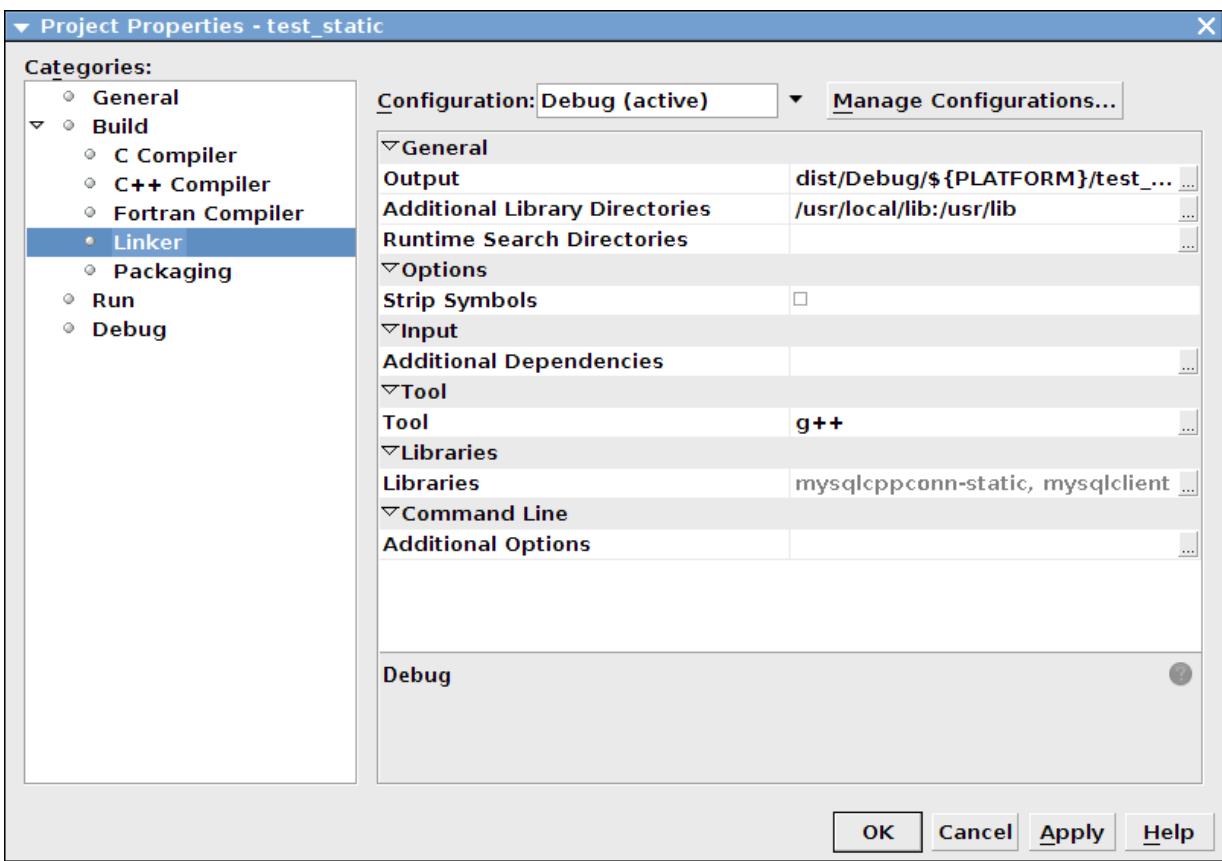

At this point you have created a NetBeans project, containing a single C++ source file. You have also ensured that the necessary include files are accessible. Before continuing, you need to decide whether your project is to use the MySQL Connector/C++ static or dynamic library. The project settings are slightly different in each case, as you need to link against a different library.

#### Using the static library

If you intend to use the static library you will need to link against two library files, `libmysqlcppconn-static.a` and `libmysqlclient.a`. The locations of the files will depend on your setup, but typically the former will be found in `/usr/local/lib` and the latter in `/usr/lib`. Note the file `libmysqlclient.a` is not part of MySQL Connector/C++, but is the MySQL Client Library file distributed with MySQL Server. Remember, the MySQL Client Library is an optional component as part of the MySQL Server installation process. Note the MySQL Client Library is also available as part of the new MySQL Connector/C distribution.

1. The first step is to set the project to link the necessary library files. Select **FILE**, **PROJECT PROPERTIES** from the main menu.
2. In the **CATEGORES:** tree view navigate to **LINKER**.
3. In the **GENERAL** panel select **ADDITIONAL LIBRARY DIRECTORIES**. Click the ... button.
4. Select and add the `/usr/lib` and `/usr/local/lib` directories.
5. In the same panel add the two library files required for static linking as discussed earlier. The properties panel should then look similar to the following screenshot:

**Figure 21.78. Setting the Static Library Directories and File Names**

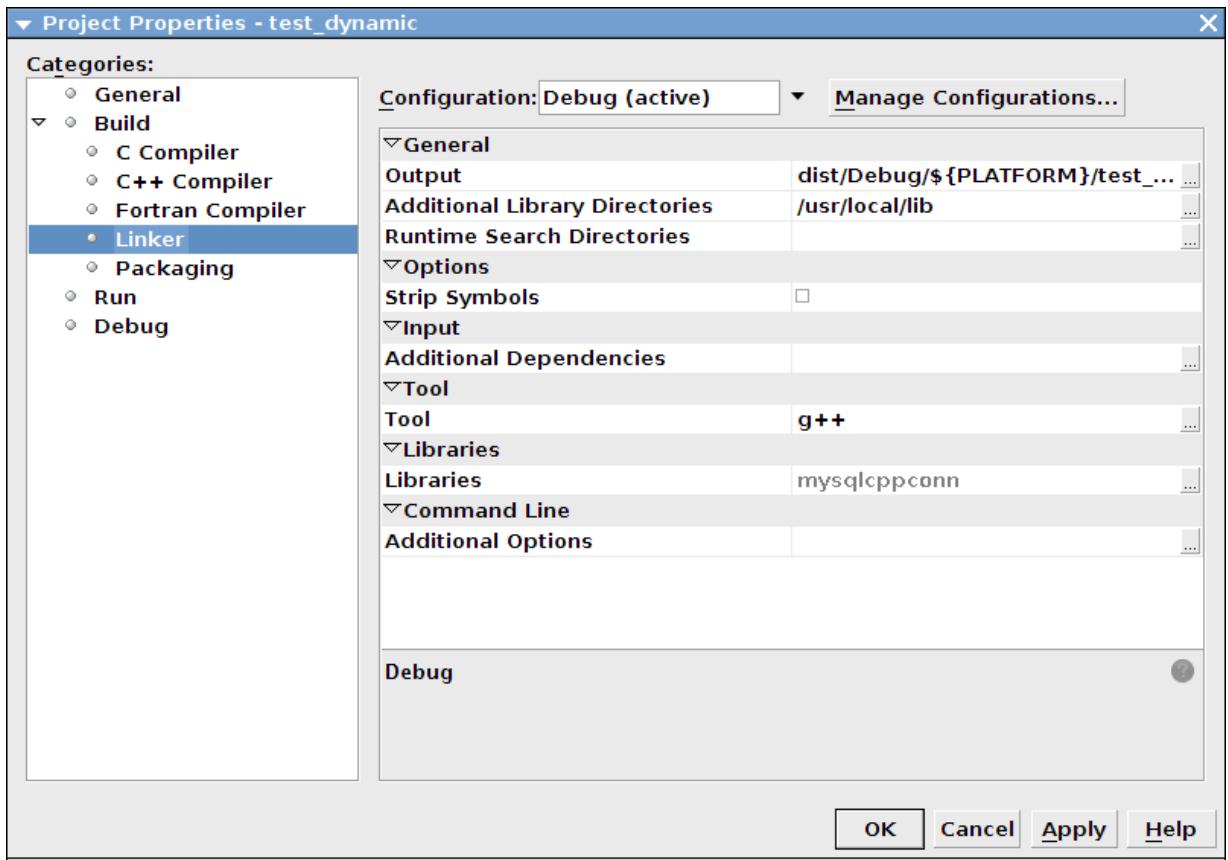

- Click OK to close the **PROJECT PROPERTIES** dialog.

### Using the dynamic library

If you require your application to use the MySQL Connector/C++ dynamic library, you simply need to link your project with a single library file, `libmysqlcppconn.so`. The location of this file will depend on how you configured your installation of MySQL Connector/C++, but will typically be `/usr/local/lib`.

- The first step is to set the project to link the necessary library file. Select **FILE**, **PROJECT PROPERTIES** from the main menu.
- In the **CATEGORIES:** tree view navigate to **LINKER**.
- In the **GENERAL** panel select **ADDITIONAL LIBRARY DIRECTORIES**. Click the ... button.
- Select and add the `/usr/local/lib` directories.
- In the same panel add the library file required for static linking as discussed earlier. The properties panel should then look similar to the following screenshot:

**Figure 21.79. Setting the Dynamic Library Directory and File Name**

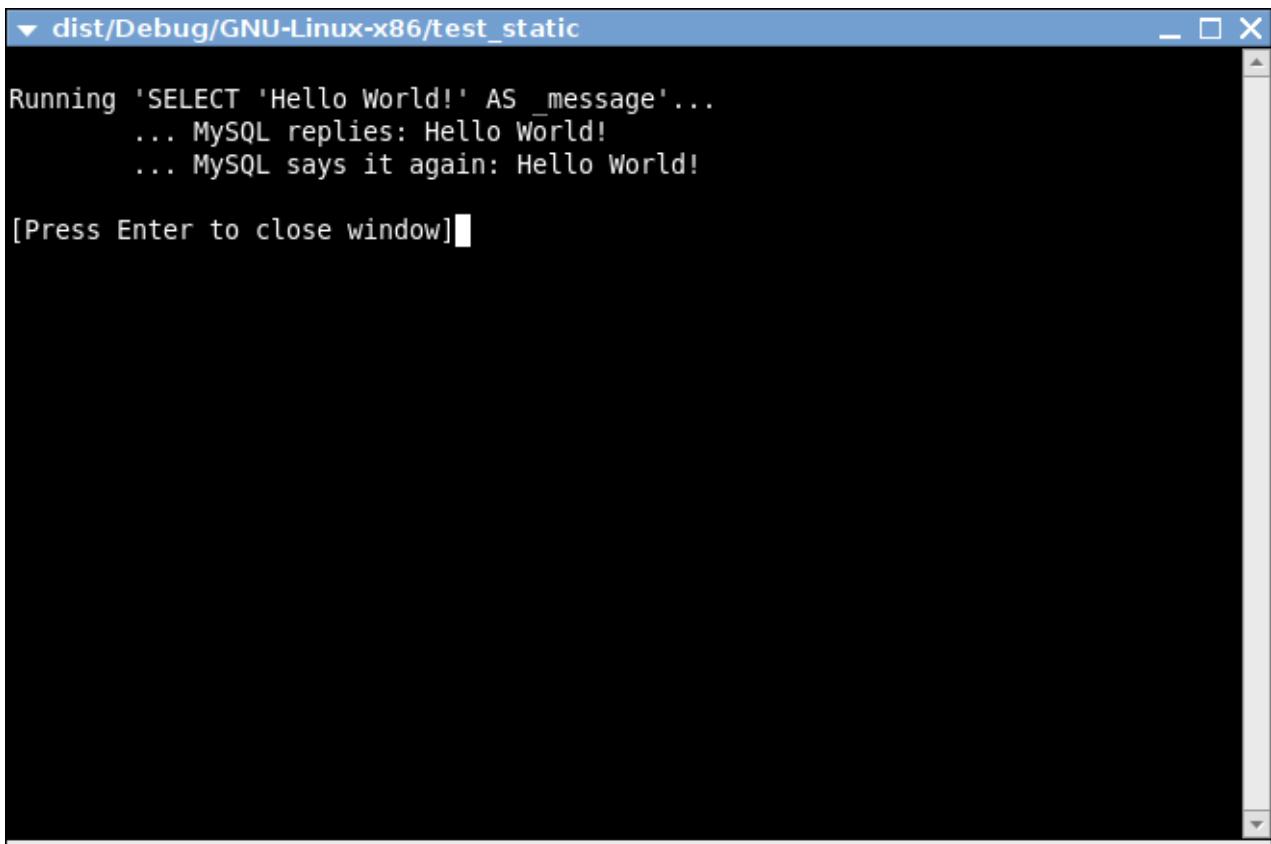

- Click OK to close the Project Properties dialog.

Having configured your project you can build it by selecting RUN, BUILD MAIN PROJECT from the main menu. You can then run the project using RUN, RUN MAIN PROJECT.

On running the application you should see a screen similar to the following (this is actually the static version of the application shown):

**Figure 21.80. The Example Application Running**

```
▼ dist/Debug/GNU-Linux-x86/test_static
Running 'SELECT 'Hello World!' AS _message'...
... MySQL replies: Hello World!
... MySQL says it again: Hello World!

[Press Enter to close window]■
```

**Note**

Note the above settings and procedures were carried out for the default `Debug` configuration. If you want to create a `Release` configuration you will need to select that configuration before setting the Project Properties.

### 21.5.5. MySQL Connector/C++ Getting Started: Usage Examples

The download package contains usage examples in the directory `examples/`. The examples explain the basic usage of the following classes:

- `Connection`
- `Driver`
- `PreparedStatement`
- `ResultSet`
- `ResultSetMetaData`
- `Statement`

The examples cover:

- Using the `Driver` class to connect to MySQL
- Creating tables, inserting rows, fetching rows using (simple) statements
- Creating tables, inserting rows, fetching rows using prepared statements
- Hints for working around prepared statement limitations
- Accessing result set metadata

The examples in this document are only code snippets. The code snippets provide a brief overview on the API. They are not complete programs. Please check the `examples/` directory of your MySQL Connector/C++ installation for complete programs. Please also read the `README` file in the `examples/` directory. Note to test the example code you will first need to edit the `examples.h` file in the `examples/` directory, to add your connection information. Then simply rebuild the code by issuing a `make` command.

The examples in the `examples/` directory include:

- `examples/connect.cpp`:

How to create a connection, insert data into MySQL and handle exceptions.

- `examples/connection_meta_schemaobj.cpp`:

How to obtain metadata associated with a connection object, for example, a list of tables, databases, MySQL version, connector version.

- `examples/debug_output.cpp`:

How to activate and deactivate the MySQL Connector/C++ debug protocol.

- `examples/exceptions.cpp`:

A closer look at the exceptions thrown by the connector and how to fetch error information.

- `examples/prepared_statements.cpp`:

How to run Prepared Statements including an example how to handle SQL commands that cannot be prepared by the MySQL Server.

- `examples/resultset.cpp`:

How to fetch data and iterate over the result set (cursor).

- `examples/resultset_meta.cpp`:

How to obtain metadata associated with a result set, for example, number of columns and column types.

- `examples/resultset_types.cpp`:

Result sets returned from metadata methods - this is more a test than much of an example.

- `examples/standalone_example.cpp`:

Simple standalone program not integrated into regular CMake builds.

- `examples/statements.cpp`:

How to run SQL commands without using Prepared Statements.

- `examples/cpp_trace_analyzer.cpp`:

This example shows how to filter the output of the `debug trace`. Please see the inline comments for further documentation. This script is unsupported.

## 21.5.5.1. MySQL Connector/C++ Connecting to MySQL

A connection to MySQL is established by retrieving an instance of `sql::Connection` from a `sql::mysql::MySQL_Driver` object. A `sql::mysql::MySQL_Driver` object is returned by `sql::mysql::MySQL_Driver::get_mysql_driver_instance()`.

```
sql::mysql::MySQL_Driver *driver;
sql::Connection *con;

driver = sql::mysql::MySQL_Driver::get_mysql_driver_instance();
con = driver->connect("tcp://127.0.0.1:3306", "user", "password");
delete con;
```

Make sure that you free the `sql::Connection` object as soon as you do not need it any more. But do not explicitly free the connector object!

### 21.5.5.2. MySQL Connector/C++ Running a simple query

For running simple queries you can use the methods `sql::Statement::execute()`, `sql::Statement::executeQuery()` and `sql::Statement::executeUpdate()`. The method `sql::Statement::execute()` should be used if your query does not return a result set or if your query returns more than one result set. See the `examples/` directory for more on this.

```
sql::mysql::MySQL_Driver *driver;
sql::Connection *con;
sql::Statement *stmt;

driver = sql::mysql::get_mysql_driver_instance();
con = driver->connect("tcp://127.0.0.1:3306", "user", "password");

stmt = con->createStatement();
stmt->execute("USE " EXAMPLE_DB);
stmt->execute("DROP TABLE IF EXISTS test");
stmt->execute("CREATE TABLE test(id INT, label CHAR(1))");
stmt->execute("INSERT INTO test(id, label) VALUES (1, 'a')");

delete stmt;
delete con;
```

Note that you have to free `sql::Statement` and `sql::Connection` objects explicitly using delete.

### 21.5.5.3. MySQL Connector/C++ Fetching results

The API for fetching result sets is identical for (simple) statements and prepared statements. If your query returns one result set you should use `sql::Statement::executeQuery()` or `sql::PreparedStatement::executeQuery()` to run your query. Both methods return `sql::ResultSet` objects. The preview version does buffer all result sets on the client to support cursors.

```
// ...
sql::Connection *con;
sql::Statement *stmt;
sql::ResultSet *res;
// ...
stmt = con->createStatement();
// ...

res = stmt->executeQuery("SELECT id, label FROM test ORDER BY id ASC");
while (res->next()) {
 // You can use either numeric offsets...
 cout << "id = " <>t; res->getInt(0);
 // ... or column names for accessing results. »
 The latter is recommended.
 cout << ", label = '" <>t;
 res->getString("label") << endl;
}

delete res;
delete stmt;
delete con;
```

Note that you have to free `sql::Statement`, `sql::Connection` and `sql::ResultSet` objects explicitly using delete.

The usage of cursors is demonstrated in the examples contained in the download package.

### 21.5.5.4. MySQL Connector/C++ Using Prepared Statements

If you are not familiar with Prepared Statements on MySQL have an extra look at the source code comments and explanations in the file `examples/prepared_statement.cpp`.

`sql::PreparedStatement` is created by passing a SQL query to `sql::Connection::prepareStatement()`. As `sql::PreparedStatement` is derived from `sql::Statement`, you will feel familiar with the API once you have learned how to use (simple) statements (`sql::Statement`). For example, the syntax for fetching results is identical.

```
// ...
sql::Connection *con;
sql::PreparedStatement *prep_stmt
// ...

prep_stmt = con->prepareStatement("INSERT INTO test(id, label) VALUES (?, ?)");

prep_stmt->setInt(1, 1);
prep_stmt->setString(2, "a");
prep_stmt->execute();

prep_stmt->setInt(1, 2);
prep_stmt->setString(2, "b");
prep_stmt->execute();
```

```
delete prep_stmt;
delete con;
```

As usual, you have to free `sql::PreparedStatement` and `sql::Connection` objects explicitly.

### 21.5.5.5. MySQL Connector/C++ Complete Example 1

The following code shows a complete example of how to use MySQL Connector/C++:

```
/* Copyright 2008, 2010, Oracle and/or its affiliates. All rights reserved.

*/

/* Standard C++ includes */
#include <stdlib.h>
#include <iostream>

/*
 Include directly the different
 headers from cppconn/ and mysql_driver.h + mysql_util.h
 (and mysql_connection.h). This will reduce your build time!
*/
#include "mysql_connection.h"

#include <cppconn/driver.h>
#include <cppconn/exception.h>
#include <cppconn/resultset.h>
#include <cppconn/statement.h>

using namespace std;

int main(void)
{
cout << endl;
cout << "Running 'SELECT 'Hello World!' "
 AS _message'..." << endl;

try {
 sql::Driver *driver;
 sql::Connection *con;
 sql::Statement *stmt;
 sql::ResultSet *res;

 /* Create a connection */
 driver = get_driver_instance();
 con = driver->connect("tcp://127.0.0.1:3306", "root", "root");
 /* Connect to the MySQL test database */
 con->setSchema("test");

 stmt = con->createStatement();
 res = stmt->executeQuery("SELECT 'Hello World!' AS _message");
 while (res->next()) {
 cout << "\t... MySQL replies: ";
 /* Access column data by alias or column name */
 cout << res->getString("_message") << endl;
 cout << "\t... MySQL says it again: ";
 /* Access column data by numeric offset, 1 is the first column */
 cout << res->getString(1) << endl;
 }
 delete res;
 delete stmt;
 delete con;
} catch (sql::SQLException &e) {
 cout << "# ERR: SQLException in " << __FILE__;
 cout << "(" << __FUNCTION__ << ")" on line " >
 << __LINE__ << endl;
 cout << "# ERR: " << e.what();
 cout << " (MySQL error code: " << e.getErrorCode();
 cout << ", SQLState: " << e.getSQLState() << ")" << endl;
}

cout << endl;
return EXIT_SUCCESS;
}
```

## 21.5.5.6. MySQL Connector/C++ Complete Example 2

The following code shows a complete example of how to use MySQL Connector/C++:

```
/* Copyright 2008, 2010, Oracle and/or its affiliates. All rights reserved.

This program is free software; you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by

*/

/* Standard C++ includes */
#include <stdlib.h>
#include <iostream>

/*
 Include directly the different
 headers from cppconn/ and mysql_driver.h + mysql_util.h
 (and mysql_connection.h). This will reduce your build time!
*/
#include "mysql_connection.h"

#include <cppconn/driver.h>
#include <cppconn/exception.h>
#include <cppconn/resultset.h>
#include <cppconn/statement.h>
#include <cppconn/prepared_statement.h>

using namespace std;

int main(void)
{
cout << endl;
cout << "Let's have MySQL count from 10 to 1..." << endl;

try {
 sql::Driver *driver;
 sql::Connection *con;
 sql::Statement *stmt;
 sql::ResultSet *res;
 sql::PreparedStatement *pstmt;

 /* Create a connection */
 driver = get_driver_instance();
 con = driver->connect("tcp://127.0.0.1:3306", "root", "root");
 /* Connect to the MySQL test database */
 con->setSchema("test");

 stmt = con->createStatement();
 stmt->execute("DROP TABLE IF EXISTS test");
 stmt->execute("CREATE TABLE test(id INT)");
 delete stmt;

 /* '?' is the supported placeholder syntax */
 pstmt = con->prepareStatement("INSERT INTO test(id) VALUES (?)");
 for (int i = 1; i <= 10; i++) {
 pstmt->setInt(1, i);
 pstmt->executeUpdate();
 }
 delete pstmt;

 /* Select in ascending order */
 pstmt = con->prepareStatement("SELECT id FROM test ORDER BY id ASC");
 res = pstmt->executeQuery();

 /* Fetch in reverse = descending order! */
 res->afterLast();
 while (res->previous())
 cout << "\t... MySQL counts: " << res->getInt("id") << endl;
 delete res;

 delete pstmt;
 delete con;
}

} catch (sql::SQLException &e) {
 cout << "# ERR: SQLException in " << __FILE__;
 cout << "(" << __FUNCTION__ << ")" on line " >
 << __LINE__ << endl;
 cout << "# ERR: " << e.what();
 cout << " (MySQL error code: " << e.getErrorCode();
 cout << ", SQLState: " << e.getSQLState() << "
```

```

 ")" << endl;
}

cout << endl;
return EXIT_SUCCESS;
}

```

## 21.5.6. MySQL Connector/C++ Tutorials

Here are some tutorials on using MySQL Connector/C++. You should also have a look at the examples which can be found in the following section [Section 21.5.5, “MySQL Connector/C++ Getting Started: Usage Examples”](#).

### Setting up the World database for use in the tutorials

These tutorials primarily use the `World` database, so you need to have that installed. You can download the `World` database, and documentation on how to install it, from the [MySQL Documentation](#) page - look for the section called “Example Databases”.

### Tutorial framework code

Rather than repeating the same code, a framework is given here. You can reuse this framework with all the tutorials unless otherwise stated. This boiler plate code can then simply be reused for each tutorial.

The framework code is given here:

```

#include <stdlib.h>
#include <iostream>
#include <sstream>
#include <stdexcept>

#include "mysql_connection.h"

#include <cppconn/driver.h>
#include <cppconn/exception.h>
#include <cppconn/resultset.h>
#include <cppconn/statement.h>
#include <cppconn/prepared_statement.h>

#define EXAMPLE_HOST "localhost"
#define EXAMPLE_USER "root"
#define EXAMPLE_PASS ""
#define EXAMPLE_DB "world"

using namespace std;

int main(int argc, const char **argv)
{
 string url(argc >= 2 ? argv[1] : EXAMPLE_HOST);
 const string user(argc >= 3 ? argv[2] : EXAMPLE_USER);
 const string pass(argc >= 4 ? argv[3] : EXAMPLE_PASS);
 const string database(argc >= 5 ? argv[4] : EXAMPLE_DB);

 cout << "Connector/C++ tutorial framework..." << endl;
 cout << endl;

 try {
 /* INSERT TUTORIAL CODE HERE! */

 } catch (sql::SQLException &e) {
 /*
 * The MySQL Connector/C++ throws three different exceptions:
 *
 * - sql::MethodNotImplementedException (derived from sql::SQLException)
 * - sql::InvalidArgumentException (derived from sql::SQLException)
 * - sql::SQLException (derived from std::runtime_error)
 */
 cout << "# ERR: SQLException in " << __FILE__;
 cout << "(" << __FUNCTION__ << ")" on line " << __LINE__ << endl;
 /* Use what() (derived from std::runtime_error) to fetch the error message */
 cout << "# ERR: " << e.what();
 cout << " (MySQL error code: " << e.getErrorCode();
 cout << ", SQLState: " << e.getSQLState() << ")" << endl;

 return EXIT_FAILURE;
 }

 cout << "Done." << endl;
 return EXIT_SUCCESS;
}

```

### To compile and run the framework

First, copy and paste the framework code to a file such as `frmwk.cpp`. Edit the `#define` statements to reflect your connection details (server, user, password, database).

To compile the framework, for example on Mac OS X, type:

```
shell> g++ -o frmwk -I/usr/local/include -I/usr/local/include/cppconn -lmysqlcppconn frmwk.cpp
```

To run the framework, enter the following:

```
shell> ./frmwk
```

You will see a simple message. You are now ready to continue to the tutorials.

### 21.5.6.1. Tutorial: Calling Stored Procedures with Statements in MySQL Connector/C++

Stored Procedures can be called using both Statements and Prepared Statements. This tutorial looks at calling Stored Procedures using Statements. The following tutorial [Section 21.5.6.2, “Tutorial: Calling Stored Procedures with Prepared Statements in MySQL Connector/C++”](#) will cover the use of Prepared Statements.

When considering calling Stored Procedures there are several scenarios that can occur:

1. A Stored Procedure that does not return a result set.
2. A Stored Procedure that returns an output parameter.
3. A Stored Procedure that returns a result set.

Stored Procedures are given below that illustrate each of the above scenarios.

The following routine enables you to add a country into the World database, but does not return a result. This corresponds to Scenario 1 above.

```
CREATE PROCEDURE add_country (IN country_code CHAR(3), IN country_name CHAR(52), IN continent_name CHAR(30))
BEGIN
 INSERT INTO Country(Code, Name, Continent) VALUES (country_code, country_name, continent_name);
END
```

The next routine returns the population of a specified country, and corresponds to Scenario 2 above:

```
CREATE PROCEDURE get_pop (IN country_name CHAR(52), OUT country_pop INT(11))
BEGIN
 SELECT Population INTO country_pop FROM Country WHERE Name = country_name;
END
```

The next routine is an example of a procedure returning a result set containing multiple records. This routine corresponds to Scenario 3 above.

```
CREATE PROCEDURE get_data ()
BEGIN
 SELECT Code, Name, Population, Continent FROM Country WHERE Continent = "Oceania" AND Population < 10000;
 SELECT Code, Name, Population, Continent FROM Country WHERE Continent = "Europe" AND Population < 10000;
 SELECT Code, Name, Population, Continent FROM Country WHERE Continent = "North America" AND Population < 10000
END
```

Enter and test the Stored Procedures to ensure no errors have been introduced. You are now ready to start writing routines to test out the use of Stored Procedures using Connector/C++.

#### Scenario 1 - Stored Procedure does not return a result set

In the first case you will examine Scenario 1, you call a Stored procedure that does not return a result set.

1. Make a copy of the tutorial framework code.
2. Insert the following code into the framework at the correct location (denoted by an `INSERT HERE` comment in the framework).

```
sql::Driver* driver = get_driver_instance();
```

```

std::auto_ptr<sql::Connection> con(driver->connect(url, user, pass));
con->setSchema(database);
std::auto_ptr<sql::Statement> stmt(con->createStatement());
// We don't need to check the return value explicitly, if it indicates
// an error Connector/C++ will generate an exception.
stmt->execute("CALL add_country(\"ATL\", \"Atlantis\", \"North America\")");

```

3. Compile the program using the following command:

```
shell> g++ -o sp_scenario1 -I/usr/local/include/cppconn/ -lmysqlcppconn sp_scenario1.cpp
```

4. Run the program by typing:

```
shell> ./sp_scenario1
```

5. Using the MySQL Command Line Client, or other suitable tool, check the World database to determine that it has been updated correctly. You can use a query such as:

```
SELECT Code, Name, Continent FROM Country WHERE Code="ATL";
```

The code in this case simply creates a statement and then invokes the execute method on it, passing the call to the Stored Procedure as a parameter. The Stored Procedure itself does not return a value, although it is important to note there will always be a return value from the call - this is simply the call status. MySQL Connector/C++ handles this status for you, so you do not need code to handle it explicitly. If the call should fail for some reason an exception will be raised, and this will be handled by the `catch` statement in the code.

### **Scenario 2 - Stored Procedure returns an output parameter**

You will now see how to handle a Stored Procedure that returns an output parameter.

1. Enter the following code into the tutorial framework code:

```

sql::Driver* driver = get_driver_instance();
std::auto_ptr<sql::Connection> con(driver->connect(url, user, pass));
con->setSchema(database);
std::auto_ptr<sql::Statement> stmt(con->createStatement());
stmt->execute("CALL get_pop(\"Uganda\", @pop)");
std::auto_ptr<sql::ResultSet> res(stmt->executeQuery("SELECT @pop AS _reply"));
while (res->next())
 cout << "Population of Uganda: " << res->getString("_reply") << endl;
stmt->execute("CALL get_pop_continent(\"Asia\", @pop)");
res.reset(stmt->executeQuery("SELECT @pop AS _reply"));
while (res->next())
 cout << "Population of Asia: " << res->getString("_reply") << endl;
stmt->execute("CALL get_world_pop(@pop)");
res.reset(stmt->executeQuery("SELECT @pop AS _reply"));
while (res->next())
 cout << "Population of World: " << res->getString("_reply") << endl;

```

2. Compile the program using the following command:

```
shell> g++ -o sp_scenario2 -I/usr/local/include/cppconn/ -lmysqlcppconn sp_scenario2.cpp
```

3. Run the program by typing:

```
shell> ./sp_scenario2
```

Note the output generated by the program.

In this scenario the Stored Procedure sets an output parameter. This is not returned as such, but needs to be obtained using a query. If running the SQL statements directly this might be similar to the following:

```
CALL get_world_pop(@pop);
```

```
SELECT @pop;
```

In the C++ code a similar sequence is carried out. First, the `CALL` is executed as seen earlier. To obtain the output parameter an additional query must be executed. This query results in a `ResultSet` that can then be processed in a `while` loop. The simplest way to retrieve the data in this case is to use a `getString` method on the `ResultSet`, passing the name of the variable to access. In this example `_reply` is used as a placeholder for the variable and therefore is used as the key to access the correct element of the result dictionary.

### Scenario 3 - Stored Procedure returns a Result Set

You will now see how to handle a Stored Procedure that returns a result set.

1. Enter the following code into the tutorial framework code:

```
sql::Driver* driver = get_driver_instance();
std::auto_ptr<sql::Connection> con(driver->connect(url, user, pass));
con->setSchema(database);
std::auto_ptr<sql::Statement> stmt(con->createStatement());

stmt->execute("CALL get_stats()");
std::auto_ptr<sql::ResultSet> res;
do {
 res.reset(stmt->getResultSet());
 while (res->next()) {
 cout << "Result: " << res->getString(1) << endl;
 }
} while (stmt->getMoreResults());
```

2. Compile the program using the following command:

```
shell> g++ -o sp_scenario3 -I/usr/local/include/cppconn/ -lmysqlcppconn sp_scenario3.cpp
```

3. Run the program by typing:

```
shell> ./sp_scenario3
```

Note the output generated by the program.

The code is similar to the examples you have previously seen. The code of particular interest in this case is:

```
do {
 res.reset(stmt->getResultSet());
 while (res->next()) {
 cout << "Name: " << res->getString("Name")
 << " Population: " << res->getInt("Population")
 << endl;
 }
} while (stmt->getMoreResults());
```

The `CALL` is executed as before, with the results being returned into multiple `ResultSets`. This is because the Stored Procedure in this case uses multiple `SELECT` statements. In this example the output shows that three Result Sets are processed, because there are three `SELECT` statements in the Stored Procedure. All of the Result Sets have more than one row.

Studying the code it should be noted that the results are processed using the pattern:

```
do {
 Get Result Set
 while (Get Result) {
 Process Result
 }
} while (Get More Result Sets);
```

#### Note

Note this pattern would be used even if the Stored Procedure carried out a single `SELECT` and you knew there was only one result set. This is a requirement of the underlying protocol.

## 21.5.6.2. Tutorial: Calling Stored Procedures with Prepared Statements in MySQL Connect-

**or/C++**

Before working through this tutorial it is recommended you first work through the previous tutorial [Section 21.5.6.1, “Tutorial: Calling Stored Procedures with Statements in MySQL Connector/C++”](#).

**Scenario 1 - Using a Prepared Statement to prepare a Stored Procedure that does not return a result set**

1. Add the following code to the `try` block of the tutorial framework:

```

vector<string> code_vector;
code_vector.push_back("SLD");
code_vector.push_back("DSN");
code_vector.push_back("ATL");

vector<string> name_vector;
name_vector.push_back("Sealand");
name_vector.push_back("Disneyland");
name_vector.push_back("Atlantis");

vector<string> cont_vector;
cont_vector.push_back("Europe");
cont_vector.push_back("North America");
cont_vector.push_back("Oceania");

sql::Driver * driver = get_driver_instance();

std::auto_ptr< sql::Connection > con(driver->connect(url, user, pass));
con->setSchema(database);

std::auto_ptr< sql::PreparedStatement > pstmt;

pstmt.reset(con->prepareStatement("CALL add_country(?, ?, ?)"));
for (int i=0; i<3; i++)
{
 pstmt->setString(1,code_vector[i]);
 pstmt->setString(2,name_vector[i]);
 pstmt->setString(3,cont_vector[i]);

 pstmt->execute();
}

```

You will also need to add `#include <vector>` to the top of your code as vectors are used to store sample data.

2. Compile the code using the following command:

```
g++ -o ps_scenario1 -I/usr/local/include/cppconn/ -lmysqlcppconn ps_scenario1.cpp
```

3. Run the code using the command:

```
./ps_scenario1
```

4. You can test the database has been updated correctly by using a query such as:

```
SELECT Code, Name, Continent FROM Country WHERE Code = "DSN" OR Code="ATL" OR Code="SLD";
```

The code is relatively simple, as no processing is required to handle Result Sets. The procedure call, `CALL add_country(?, ?, ?)`, is made using placeholders for input parameters denoted by '?'. These placeholders are replaced by values using the Prepared Statement's `setString` method in this case. The `for` loop is set up to iterate 3 times, as there are three data sets in this example. The same Prepared Statement is executed three times, each time with different input parameters.

**Scenario 2 - Using a Prepared Statement to prepare a Stored Procedure that uses an output parameter**

In this scenario a different Stored Procedure is going to be used compared to the one use in the the tutorial [Section 21.5.6.1, “Tutorial: Calling Stored Procedures with Statements in MySQL Connector/C++”](#). This is to illustrate passing an input parameter as well as fetching an output parameter. The stored routine is as follows:

```

CREATE PROCEDURE get_pop_continent (IN continent_name CHAR(30), OUT continent_pop INT(11))
BEGIN
 SELECT SUM(Population) INTO continent_pop FROM Country WHERE Continent = continent_name;
END

```

1. Copy the following code into the try block of the tutorial framework code:

```

vector<string> cont_vector;
cont_vector.push_back("Europe");
cont_vector.push_back("North America");
cont_vector.push_back("Oceania");

sql::Driver * driver = get_driver_instance();

std::auto_ptr< sql::Connection > con(driver->connect(url, user, pass));
con->setSchema(database);

std::auto_ptr< sql::Statement > stmt(con->createStatement());
std::auto_ptr< sql::PreparedStatement > pstmt;
std::auto_ptr< sql::ResultSet > res;

pstmt.reset(con->prepareStatement("CALL get_pop_continent(?,@pop)"));

for (int i=0; i<3; i++)
{
 pstmt->setString(1,cont_vector[i]);
 pstmt->execute();
 res.reset(stmt->executeQuery("SELECT @pop AS _population"));
 while (res->next())
 cout << "Population of " << cont_vector[i] << " is " << res->getString("_population") << endl;
}

```

You will also need to add the line `#include <vector>` to the top of the code, as vectors are used in this example.

2. Compile the code using:

```
shell> g++ -o ps_scenario2 -I/usr/local/include/cppconn/ -lmysqlcppconn ps_scenario2.cpp
```

3. Run the code using:

```
shell> ./ps_scenario2
```

4. Make a note of the output.

In this scenario a Prepared Statement is created that calls the Stored Procedure `get_pop_continent`. This procedure takes an input parameter, and also returns an output parameter. The approach used is to create another statement that can be used to fetch the output parameter using a `SELECT` query. Note that when the Prepared Statement is created, the input parameter to the Stored Procedure is denoted by '?'. Prior to execution of Prepared Statement it is necessary to replace this placeholder by an actual value. This is done using methods such as `setString` and `setInt`, for example:

```
pstmt->setString(1,cont_vector[i]);
```

Although for the query used to obtain the output parameter a single result set is expected, it is important to use the `while` loop to catch more than one result, to avoid the possibility of the connection becoming unstable.

### **Scenario 3 - Using a Prepared Statement to prepare a Stored Procedure that returns multiple Result Sets**

#### **Note**

Note this scenario is not supported on versions of MySQL prior to 5.5.3. This is due to a limitation in the client-server protocol.

1. Enter the following code into the `try` block of the tutorial framework:

```

sql::Driver * driver = get_driver_instance();

std::auto_ptr< sql::Connection > con(driver->connect(url, user, pass));
con->setSchema(database);

std::auto_ptr< sql::PreparedStatement > pstmt;
std::auto_ptr< sql::ResultSet > res;

pstmt.reset(con->prepareStatement("CALL get_data()"));
res.reset(pstmt->executeQuery());

do {
 res.reset(pstmt->getResultSet());
 while (res->next()) {
 cout << "Name: " << res->getString("Name")
 << " Population: " << res->getInt("Population")
 << endl;
 }
}

```

```
 } while (pstmt->getMoreResults());
```

2. Compile the code using the following command:

```
shell> g++ -o ps_scenario3 -I/usr/local/include/cppconn/ -lmysqlcppconn ps_scenario3.cpp
```

3. Run the program using the command:

```
shell> ./ps_scenario3
```

4. Make a note of the output generated.

The code executes the Stored Procedure using a Prepared Statement. The standard do-while construct is used to ensure that all Result Sets are fetched. In this case the returned values are fetched from the Result Sets using the `getInt` and `getString` methods.

## 21.5.7. MySQL Connector/C++ Debug Tracing

Although a debugger can be used to debug your application, you may find it beneficial to turn on the debug traces of the connector. Some problems happen randomly which makes them difficult to debug using a debugger. In such cases debug traces and protocol files are more useful because they allow you to trace the activities of all instances of your program.

DTrace is a very powerful technology to trace any application without having to develop an extra trace module for your application. Unfortunately, DTrace is currently only available on Solaris, MacOS 10.5, and FreeBSD.

The MySQL Connector/C++ can write two trace files:

1. Trace file generated by the MySQL Client Library
2. Trace file generated internally by MySQL Connector/C++

The first trace file can be generated by the underlying MySQL Client Library (libmysql). To enable this trace the connector will call the C-API function `mysql_debug()` internally. Only debug versions of the MySQL Client Library are capable of writing a trace file. Therefore you need to compile MySQL Connector/C++ against a debug version of the library, if you want utilize this trace. The trace shows the internal function calls and the addresses of internal objects as you can see below:

```
>mysql_stmt_init
| >_mymalloc
| | enter: Size: 816
| | exit: ptr: 0x68e7b8
| <_mymalloc | >_alloc_root
| | enter: root: 0x68e7b8
| | >_mymalloc
| | | enter: Size: 2064
| | | exit: ptr: 0x68eb28
[...]
```

The second trace is the MySQL Connector/C++ internal trace. It is available with debug and nondebug builds of the connector as long as you have enabled the tracing module at compile time using `cmake -DMYSQLCPPCONN_TRACE_ENABLE:BOOL=1`. By default, the tracing functionality is not available and calls to trace functions are removed by the preprocessor.

Compiling the connector with tracing functionality enabled will cause two additional tracing function calls per each connector function call. You will need to run your own benchmark to find out how much this will impact the performance of your application.

A simple test using a loop running 30,000 INSERT SQL statements showed no significant real-time impact. The two variants of this application using a trace enabled and trace disabled version of the connector performed equally well. The run time measured in real-time was not significantly impacted as long as writing a debug trace was not enabled. However, there will be a difference in the time spent in the application. When writing a debug trace the IO subsystem may become a bottleneck.

In summary, use connector builds with tracing enabled carefully. Trace enabled versions may cause higher CPU usage even if the overall run time of your application is not impacted significantly.

```
| INF: Tracing enabled
<MySQL_Connection::setClientOption
>MySQL_Prepared_Statement::setInt
| INF: this=0x69a2e0
| >MySQL_Prepared_Statement::checkClosed
| <MySQL_Prepared_Statement::checkClosed
| >MySQL_Prepared_Statement::setInt
[...]
```

The example from `examples/debug_output.cpp` demonstrates how to activate the debug traces in your program. Currently they can only be activated through API calls. The traces are controlled on a per-connection basis. You can use the `setClientOptions()` method of a connection object to activate and deactivate the generation of a trace. The MySQL Client Library trace is always written into a file, whereas the connector's protocol messages are printed to standard out.

```
sql::Driver *driver;
int on_off = 1;

/* Using the Driver to create a connection */
driver = get_driver_instance();
std::auto_ptr< sql::Connection > con(driver->connect(host, user, pass));

/*
Activate debug trace of the MySQL Client Library (C-API)
Only available with a debug build of the MySQL Client Library!
*/
con->setClientOption("libmysql_debug", "d:t:O,client.trace");

/*
Tracing is available if you have compiled the driver using
cmake -DMYSQLCPPCONN_TRACE_ENABLE:BOOL=1
*/
con->setClientOption("client_trace", &on_off);
```

## 21.5.8. MySQL Connector/C++ Usage Notes

See the [JDBC overview](#) for information on JDBC 4.0. Please also check the `examples/` directory of the download package.

### Notes on using the MySQL Connector/C++ API

- `DatabaseMetaData::supportsBatchUpdates()` returns `true` because MySQL supports batch updates in general. However, no API calls for batch updates are provided by the MySQL Connector/C++ API.
- Two non-JDBC methods have been introduced for fetching and setting unsigned integers: `getUInt64()` and `getUInt()`. These are available for `ResultSet` and `PreparedStatement`:
  - `ResultSet::getUInt64()`
  - `ResultSet::getUInt()`
  - `PreparedStatement::setUInt64()`
  - `PreparedStatement::setUInt()`

The corresponding `getLong()` and `setLong()` methods have been removed.

- The method `DatabaseMetaData::getColumns()` has 23 columns in its result set, rather than the 22 columns defined by JDBC. The first 22 columns are as described in the JDBC documentation, but column 23 is new:
- 23. `IS_AUTOINCREMENT`: String which is “YES” if the column is an auto-increment column. Otherwise the string contains “NO”.
- MySQL Connector/C++ may return different metadata for the same column.

When you have any column that accepts a charset and a collation in its specification and you specify a binary collation, such as:

```
CHAR(250) CHARACTER SET 'latin1' COLLATE 'latin1_bin'
```

The server sets the `BINARY` flag in the result set metadata of this column. The method `ResultSetMetadata::getColumnTypeName()` uses the metadata and will report, due to the `BINARY` flag, that the column type name is `BINARY`. This is illustrated below:

```
mysql> create table varbin(a varchar(20) character set utf8 collate utf8_bin);
Query OK, 0 rows affected (0.00 sec)

mysql> select * from varbin;
Field 1: `a`
Catalog: `def`
Database: `test`
Table: `varbin`
Org_table: `varbin`
Type: VAR_STRING
Collation: latin1_swedish_ci (8)
Length: 20
Max_length: 0
Decimals: 0
Flags: BINARY
```

```

0 rows in set (0.00 sec)

mysql> select * from information_schema.columns where table_name='varbin'\G
***** 1. row *****
 TABLE_CATALOG: NULL
 TABLE_SCHEMA: test
 TABLE_NAME: varbin
 COLUMN_NAME: a
 ORDINAL_POSITION: 1
 COLUMN_DEFAULT: NULL
 IS_NULLABLE: YES
 DATA_TYPE: varchar
CHARACTER_MAXIMUM_LENGTH: 20
CHARACTER_OCTET_LENGTH: 60
 NUMERIC_PRECISION: NULL
 NUMERIC_SCALE: NULL
 CHARACTER_SET_NAME: utf8
 COLLATION_NAME: utf8_bin
 COLUMN_TYPE: varchar(20)
 COLUMN_KEY:
 EXTRA:
 PRIVILEGES: select,insert,update,references
 COLUMN_COMMENT:
1 row in set (0.01 sec)

```

However, `INFORMATION_SCHEMA` gives no hint in its `COLUMNS` table that metadata will contain the `BINARY` flag. `Data-baseMetaData::getColumns()` uses `INFORMATION_SCHEMA`. It will report the type name `CHAR` for the same column. Note, a different type code is also returned.

- The MySQL Connector/C++ class `sql::::DataType` defines the following JDBC standard data types: `UNKNOWN`, `BIT`, `TINYINT`, `SMALLINT`, `MEDIUMINT`, `INTEGER`, `BIGINT`, `REAL`, `DOUBLE`, `DECIMAL`, `NUMERIC`, `CHAR`, `BINARY`, `VARCHAR`, `VARBINARY`, `LONGVARCHAR`, `LONGVARBINARY`, `TIMESTAMP`, `DATE`, `TIME`, `GEOMETRY`, `ENUM`, `SET`, `SQLNULL`.

However, the following JDBC standard data types are *not* supported by MySQL Connector/C++: `ARRAY`, `BLOB`, `CLOB`, `DIS-TINCT`, `FLOAT`, `OTHER`, `REF`, `STRUCT`.

- When inserting or updating `BLOB` or `TEXT` columns, MySQL Connector/C++ developers are advised not to use `setString()`. Instead it is recommended that the dedicated API function `setBlob()` be used instead.

The use of `setString()` can cause a `Packet too large` error message. The error will occur if the length of the string passed to the connector using `setString()` exceeds `max_allowed_packet` (minus a few bytes reserved in the protocol for control purposes). This situation is not handled in MySQL Connector/C++, as this could lead to security issues, such as extremely large memory allocation requests due to malevolently long strings.

However, if `setBlob()` is used, this problem does not arise. This is because `setBlob()` takes a streaming approach based on `std::::istream`. When sending the data from the stream to MySQL Server, MySQL Connector/C++ will split the stream into chunks appropriate for MySQL Server and observe the `max_allowed_packet` setting currently being used.

### Caution

When using `setString()` it is not possible to set `max_allowed_packet` to a value large enough for the string, prior to passing it to MySQL Connector/C++. The MySQL 5.1 documentation for `max_allowed_packet` states: "As of MySQL 5.1.31, the session value of this variable is read only. Before 5.1.31, setting the session value is permitted but has no effect."

This difference with the JDBC specification ensures that MySQL Connector/C++ is not vulnerable to memory flooding attacks.

- In general MySQL Connector/C++ works with MySQL 5.0, but it is not completely supported. Some methods may not be available when connecting to MySQL 5.0. This is because the Information Schema is used to obtain the requested information. There are no plans to improve the support for 5.0 because the current GA version of MySQL Server is 5.1. As a new product, MySQL Connector/C++ is primarily targeted at the MySQL Server GA version that was available on its release.

The following methods will throw a `sql::::MethodNotImplemented` exception when you connect to MySQL earlier than 5.1.0:

- `DatabaseMetadata::getCrossReference()`
- `DatabaseMetadata::getExportedKeys()`
- MySQL Connector/C++ includes a method `Connection::getClientOption()` which is not included in the JDBC API specification. The prototype is:

```
void getClientOption(const std::string & optionName, void * optionValue)
```

The method can be used to check the value of connection properties set when establishing a database connection. The values are returned through the `optionValue` argument passed to the method with the type `void *`.

Currently, `getClientOption()` supports fetching the `optionValue` of the following options:

- `metadataUseInfoSchema`
- `defaultStatementResultType`
- `defaultPreparedStatementResultType`

The connection option `metadataUseInfoSchema` controls whether to use the `Information_Schemata` for returning the meta data of `SHOW` commands. In the case of `metadataUseInfoSchema` the `optionValue` argument should be interpreted as a boolean upon return.

In the case of both `defaultStatementResultType` and `defaultPreparedStatementResultType`, the `optionValue` argument should be interpreted as an integer upon return.

The connection property can be either set when establishing the connection through the connection property map or using `void Connection::setClientOption(const std::string & optionName, const void * optionValue)` where `optionName` is assigned the value `metadataUseInfoSchema`.

Some examples are given below:

```
int defaultStmtResType;
int defaultPStmtResType;
conn->getClientOption("defaultStatementResultType", (void *) &defaultStmtResType);
conn->getClientOption("defaultPreparedStatementResultType", (void *) &defaultPStmtResType);

bool isInfoSchemaUsed;
conn->getClientOption("metadataUseInfoSchema", (void *) &isInfoSchemaUsed);
```

- MySQL Connector/C++ also supports the following methods not found in the JDBC API standard:

```
std::string MySQL_Connection::getSessionVariable(const std::string & varname)
```

```
void MySQL_Connection::setSessionVariable(const std::string & varname, const std::string & value)
```

Note that both methods are members of the `MySQL_Connection` class. The methods get and set MySQL session variables.

`setSessionVariable()` is equivalent to executing:

```
SET SESSION <varname> = <value>
```

`getSessionVariable()` is equivalent to executing the following and fetching the first return value:

```
SHOW SESSION VARIABLES LIKE "<varname>"
```

You can use “%” and other placeholders in `<varname>`, if the underlying MySQL server supports this.

- Fetching the value of a column can sometimes return different values depending on whether the call is made from a Statement or Prepared Statement. This is because the protocol used to communicate with the server differs depending on whether a Statement or Prepared Statement is used.

To illustrate this, consider the case where a column has been defined as of type `BIGINT`. The most negative `BIGINT` value is then inserted into the column. If a Statement and Prepared Statement are created that perform a `GetUInt64()` call, then the results will be found to be different in each case. The Statement returns the maximum positive value for `BIGINT`. The Prepared Statement returns 0.

The reason for the different results is due to the fact that Statements use a text protocol, and Prepared Statements use a binary protocol. With the binary protocol in this case, a binary value is returned from the server that can be interpreted as an `int64`. In the above scenario a very large negative value was fetched with `GetUInt64()`, which fetches unsigned integers. As the large negative value cannot be sensibly converted to an unsigned value 0 is returned.

In the case of the Statement, which uses the text protocol, values are returned from the server as strings, and then converted as required. When a string value is returned from the server in the above scenario the large negative value will need to be converted by the runtime library function `strtoul()`, which `GetUInt64()` calls. The behavior of `strtoul()` is dependent upon the specific runtime and host operating system, so the results can be variable. In the case given a large positive value was actually returned.

Although it is very rare, there are some cases where Statements and Prepared Statements can return different values unexpectedly, but this usually only happens in extreme cases such as the one mentioned.

- The JDBC documentation [lists many fields](#) for the `DatabaseMetaData` class. JDBC also appears to [define certain values](#) for those fields. However, MySQL Connector/C++ does not define certain values for those fields. Internally enumerations are used and the compiler determines the values to assign to a field.

To compare a value with the field, code such as the following should be used, rather than making assumptions about specific values for the attribute:

```
// dbmeta is an instance of DatabaseMetaData
if (myvalue == dbmeta->attributeNoNulls) {
 ...
}
```

Usually `myvalue` will be a column from a result set holding metadata information. MySQL Connector/C++ does not guarantee that `attributeNoNulls` is 0. It can be any value.

- When programming Stored Procedures JDBC has available an extra class, an extra abstraction layer for callable statements, the `CallableStatement` class. This is not present in MySQL Connector/C++. You therefore need to use the methods from the `Statement` and `Prepared Statement` classes to run a Stored Procedure using `CALL`.

## 21.5.9. MySQL Connector/C++ Known Bugs and Issues

### Note

Please report bugs through [MySQL Bug System](#).

#### Known bugs:

None.

#### Known issues:

- When linking against a static library for 1.0.3 on Windows you need to define `CPPDBC_PUBLIC_FUNC` either in the compiler options (preferable) or with `/D "CPPCONN_PUBLIC_FUNC= "`. You can also explicitly define it in your code by placing `#define CPPCONN_PUBLIC_FUNC` before the header inclusions.
- Generally speaking C++ library binaries are less portable than C library binaries. Issues can be caused by name mangling, different Standard Template Library (STL) versions and using different compilers and linkers for linking against the libraries than were used for building the library itself.

Even a small change in the compiler version can, but does not have to, cause problems. If you obtain error messages, that you suspect are related to binary incompatibilities, build MySQL Connector/C++ from source, using the same compiler and linker that you will use to build and link your application.

Due to the variations between Linux distributions, compiler and linker versions and STL versions, it is not possible to provide binaries for each and every possible configuration. However, the MySQL Connector/C++ binary distributions contain a `README` file that describes the environment and settings used to build the binary versions of the libraries.

- To avoid potential crashes the build configuration of MySQL Connector/C++ should match the build configuration of the application using it. For example, do not use the release build of MySQL Connector/C++ with a debug build of the client application.

See also the MySQL Connector/C++ Changelogs which can be found here [Section C.8, “MySQL Connector/C++ Change History”](#).

## 21.5.10. MySQL Connector/C++ Feature requests

You can suggest new features in the first instance by joining the mailing list or forum and talking with the developers directly. See [Section 21.5.11, “MySQL Connector/C++ Support”](#)

The following feature requests are currently being worked on:

- C++ references for `Statements`, `ResultSets`, and exceptions, are being considered, instead of pointers to heap memory. This reduces the exception handling burden for the programmer.

- Adopt STL (suggestions are welcome).
- JDBC compliance: data type interfaces and support through `ResultSet::getType()` and `PreparedStatement::bind()`. Introduce `sql::Blob`, `sql::Clob`, `sql::Date`, `sql::Time`, `sql::Timestamp`, `sql::URL`. Support `get|setBlob()`, `get|setClob()`, `get|setDate()`, `get|setTime()`, `get|setTimestamp()`, `get|setURL()`
- Add support for all C-API connection options. Improved support for `mysql_options`.
- Add connect method which supports passing options using HashMaps.
- Create Windows installer.

## 21.5.11. MySQL Connector/C++ Support

For general discussion of the MySQL Connector/C++ please use the [C/C++ community forum](#) or join the [MySQL Connector/C++ mailing list](#).

Bugs can be reported at the [MySQL bug Web site](#).

For Licensing questions, and to purchase MySQL Products and Services, please <http://www.mysql.com/buy-mysql/>

The MySQL Connector/C++ Changelogs can be found here [Section C.8, “MySQL Connector/C++ Change History”](#)

## 21.5.12. MySQL Connector/C++ FAQ

### Questions

- [22.5.12.1: What is MySQL Connector/C++?](#)
- [22.5.12.2: Which MySQL Server version\(s\) is MySQL Connector/C++ compatible with?](#)
- [22.5.12.3: Does MySQL Connector/C++ implement the client-server protocol?](#)
- [22.5.12.4: Are any MySQL products using MySQL Connector/C++?](#)

### Questions and Answers

#### **22.5.12.1: What is MySQL Connector/C++?**

MySQL Connector/C++ is a MySQL database connector for C++. It allows you develop applications in C++ that connect to the MySQL Server. MySQL Connector/C++ is compatible with the JDBC 4.0 API.

#### **22.5.12.2: Which MySQL Server version(s) is MySQL Connector/C++ compatible with?**

MySQL Connector/C++ fully supports MySQL Server version 5.1 and later.

#### **22.5.12.3: Does MySQL Connector/C++ implement the client-server protocol?**

No. MySQL Connector/C++ uses the MySQL Client Library for the client-server communication.

#### **22.5.12.4: Are any MySQL products using MySQL Connector/C++?**

Yes, MySQL Workbench and MySQL Connector/OpenOffice.org.

## 21.6. MySQL Connector/C

### What is MySQL Connector/C?

MySQL Connector/C is a C client library for client-server communication. It is a standalone replacement for the MySQL Client Library shipped with the MySQL Server.

### Why have a replacement for MySQL Client Library?

There is no need to compile or install the MySQL Server package if you only need the client library.

MySQL Connector/C does not rely on the MySQL Server release cycle, so bug fixes and new features are released more often.

MySQL Connector/C API documentation is available here [Section 21.9.3, “C API Function Descriptions”](#).

Supported platforms include:

- Windows
- Windows x64
- Linux
- Solaris
- FreeBSD
- Mac OS X
- HP-UX
- IBM AIX
- IBM i5/OS

## 21.6.1. Building MySQL Connector/C from the Source Code

### Obtaining the Source Code

A TAR file containing the source code can be [downloaded](#) from the MySQL Developers site. You will need to select the source code package from the drop down list.

The source code for development releases of the connector can be found at Launchpad. The project home page can be found [here](#).

The source code for the 1.0 branch can be found [here](#).

To obtain the code you will need to have Bazaar installed and use the command `bzr branch lp:libmysql`.

#### • Building on Unix

Examples of supported Unix or Unix-like operating systems include:

- Solaris
- Linux
- HP-UX
- AIX
- OS X

#### Compiler Tools

Ideally, the native compiler tool set for the target platform is used for compilation. This would be SunStudio for Solaris and aCC for HP-UX for example. However, the GNU tool-chain can be used across all platforms.

You also need CMake 2.6 or newer, which is available [online](#).

#### To Build

If using GNU AutoTools change to the MySQL Connector/C source directory and follow the procedure below.

1. To generate the makefile enter:

```
shell> cmake -G "Unix Makefiles"
```

or for a Debug build enter:

```
shell> cmake -G "Unix Makefiles" -DCMAKE_BUILD_TYPE=Debug
```

2. Then build the project using:

```
shell> make
```

### To Install

By default make install will install the MySQL Connector/C files in the `/usr/local` directory. You can change this behavior by specifying another directory when generating the `makefile`:

```
shell> cmake -G "Unix Makefiles" -DCMAKE_INSTALL_PREFIX=/mypath
```

Now, in the root shell, enter the following to install the MySQL Connector/C libraries and tools:

```
root-shell> make install
```

At this point all of the MySQL Connector/C files will be in place.

- **Building on Microsoft Windows**

Older versions of Microsoft Windows are not supported. Supported versions are Windows 2000, Windows XP, Windows Vista, Windows Server 2003, or Windows Server 2008.

#### Compiler Tools

Microsoft Visual Studio 8 and 9 are recommended. The Express Edition of Visual Studio and other compilers may work, but are untested.

You also need CMake 2.6 or newer, available at <http://www.cmake.org>

#### To Build

You need to have the environment variables set for the Visual Studio toolchain. Visual Studio includes a batch file to set these for you, and installs a shortcut into the **START** menu to open a command prompt with these variables set.

Build MySQL Connector/C using the CMake command-line tool by entering the following from the source root directory in a command prompt window:

```
shell> cmake -G "Visual Studio 9 2008"
```

This produces a project file that you can open with Visual Studio or build from the command line with either of:

```
shell> devenv.com libmysql.sln /build Release
```

```
shell> devenv.com libmysql.sln /build RelWithDebInfo
```

For other versions of Visual Studio or `nmake` based build, run the following command:

```
shell> cmake --help
```

to check the supported generators.

To compile the Debug build, you must run set the CMake build type so the correct version of external libraries are used:

```
shell> cmake -G "Visual Studio 8 2005" -DCMAKE_BUILD_TYPE=Debug
```

Followed by:

```
shell> devenv.com libmysql.sln /build Debug
```

### To Install

To create a install package you can choose between two variants:

1. Creating a Zip package
2. Creating an MSI install package

- **Zip package**

To create a Zip package, run the `cpack` command from the root of your MySQL Connector/C source directory.

- **MSI Install package**

The required tools include Windows XML Installer toolset (WIX), which is available [online](#).

To create the MSI install package change to the subdirectory `win` and generate the `makefile`:

```
shell> cmake -G "NMake Makefiles"
```

Create the MSI install package by calling `nmake`:

```
shell> nmake
```

### Build Options

The following options can be used when building the MySQL Connector/C source code:

Build Option	Description
<code>-DWITH_OPENSSL=1</code>	Enables dynamic linking to the system OpenSSL library.
<code>-DWITH_EXTERNAL_ZLIB=1</code>	Enables dynamic linking to the system Zlib library.

## 21.6.2. Testing MySQL Connector/C

For testing MySQL Connector/C you will need a running MySQL server instance. Before you run the test suite you need to specify the following environment variables:

- `MYSQL_TEST_HOST` (default localhost)
- `MYSQL_TEST_USER`
- `MYSQL_TEST_PASSWD`
- `MYSQL_TEST_PORT`
- `MYSQL_TEST_SOCKET`
- `MYSQL_TEST_DB` (default test)

To run the test suite, execute `ctest` from the command line:

```
shell> ctest
```

## 21.6.3. MySQL Connector/C FAQ

### Questions

- [22.6.3.1: What is “libmysqld”?](#)
- [22.6.3.2: What is “libmysql”?](#)
- [22.6.3.3: Does MySQL Connector/C replace any of “Native C API”, “libmysql” and “libmysqld”?](#)
- [22.6.3.4: What is the difference between “Native C API”, “libmysql”, “libmysqld” and “MySQL Connector/C”?](#)
- [22.6.3.5: What is “MySQL Connector/C”?](#)
- [22.6.3.6: What is the “MySQL Native C API”? What are its typical benefits and use cases?](#)

## Questions and Answers

### 22.6.3.1: What is “libmysqld”?

`libmysqld` is an embedded database server with the same API as MySQL Connector/C. It is included with the MySQL Server distribution.

### 22.6.3.2: What is “libmysql”?

`libmysql` is the name of the library that MySQL Connector/C provides.

### 22.6.3.3: Does MySQL Connector/C replace any of “Native C API”, “libmysql” and “libmysqld”?

MySQL Connector/C contains `libmysql`, and implements a native C API. It does not include `libmysqld`, which can be found with the MySQL server distribution.

### 22.6.3.4: What is the difference between “Native C API”, “libmysql”, “libmysqld” and “MySQL Connector/C”?

MySQL Connector/C and `libmysql` are the “native C API for MySQL”, and all three terms can be used interchangeably. “libmysqld” is the embedded version of the MySQL Server, and is included in the server distribution.

### 22.6.3.5: What is “MySQL Connector/C”?

MySQL Connector/C is a standalone distribution of the `libmysql` library, which was previously only available as part of the MySQL Server distribution. The version of `libmysql` included with MySQL Connector/C and the version bundled with the server are functionally equivalent, but the cross-platform build system for MySQL Connector/C uses CMake.

### 22.6.3.6: What is the “MySQL Native C API”? What are its typical benefits and use cases?

MySQL Connector/C, also known as `libmysql`, or MySQL Native C API, is a standalone, C-based API and library that you can use in C applications to connect with the MySQL Server. It implements the same MySQL client API that has been in use for a decade.

It is also used as the foundation for drivers for standard database APIs such as ODBC, Perl's DBI, and Python's DB API.

## 21.7. MySQL Connector/OpenOffice.org

MySQL Connector/OpenOffice.org is a native MySQL database connector for OpenOffice.org. Currently, it is in preview status and supports OpenOffice.org 3.1 and above. It can be used to connect OpenOffice.org applications to a MySQL server.

Before MySQL Connector/OpenOffice.org became available you would have to use MySQL Connector/J (JDBC) or MySQL Connector/ODBC to connect to a MySQL server.

Connector/OpenOffice.org is a community project. The source code for Connector/OpenOffice.org is available under GPL with the FLOSS License Exception.

### Advantages

Using MySQL Connector/OpenOffice.org has the following advantages:

- Easy installation through the OpenOffice.org Extension Manager.
- Seamless integration into OpenOffice.org.
- No need to go through an additional Connector installation routine (ODBC/JDBC)
- No need to configure or register an additional Connector (ODBC)
- No need to install or configure a driver manager (ODBC)

### Status

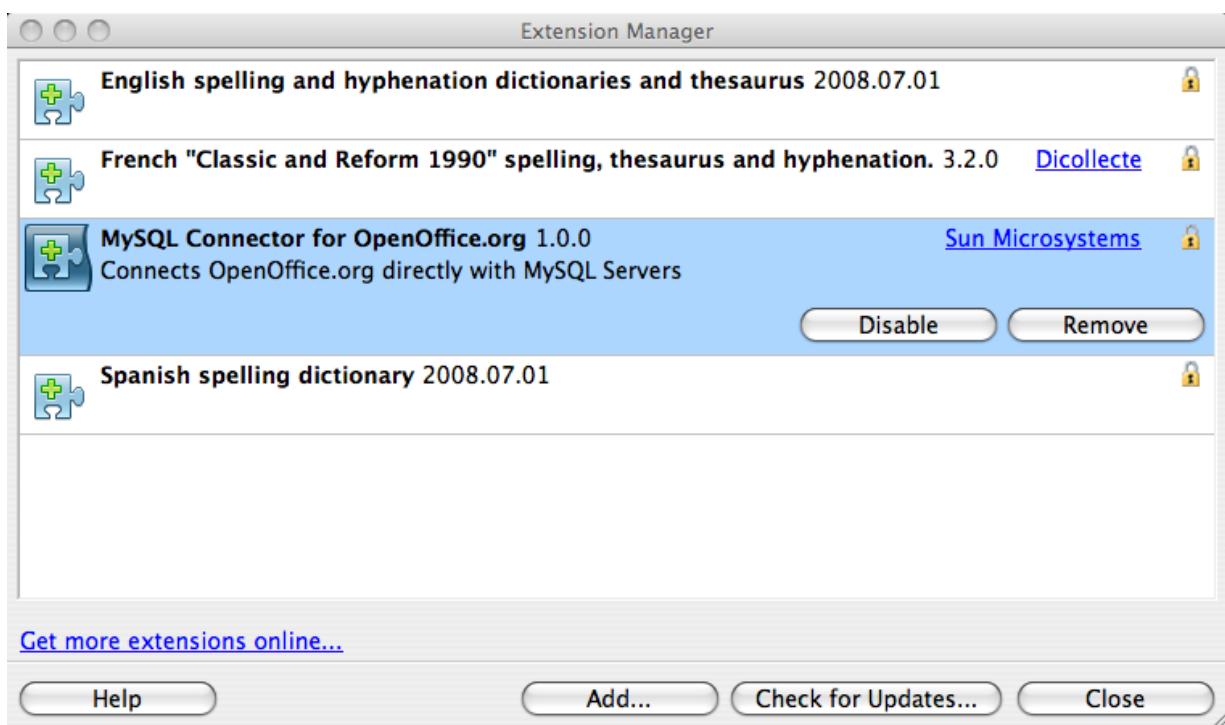

MySQL Connector/OpenOffice.org is currently at version 1.0 GA.

If you have any queries please contact us through our mailing list at [<users@dba.openoffice.org>](mailto:<users@dba.openoffice.org>)

## 21.7.1. Installation

---

1. Install or upgrade to OpenOffice.org 3.1.
2. Download MySQL Connector/OpenOffice.org from [The OpenOffice.org extension download site](#). Save the file corresponding to your platform. Currently supported platforms are Windows, Linux, Linux x86-64, Mac OS X, Solaris x86 and Solaris SPARC.
3. Add the `.oxt` extension through the Extension Manager of OpenOffice.org. In OpenOffice.org, select **TOOLS, EXTENSION MANAGER...** and specify the `.oxt` file as a new extension. When done, MySQL Connector/OpenOffice.org will show up as a new extension in the Extension Manager.

**Figure 21.81. Adding an Extension**

4. Restart OpenOffice.org.

## 21.7.2. Getting Started: Connecting to MySQL

MySQL Connector/OpenOffice.org enables you to access the MySQL Server and its schemata from the OpenOffice.org suite.

The following example demonstrates the creation of a new OpenOffice.org Base database which uses a local MySQL Server for storage and the new connector for connecting.

1. **Select the database**

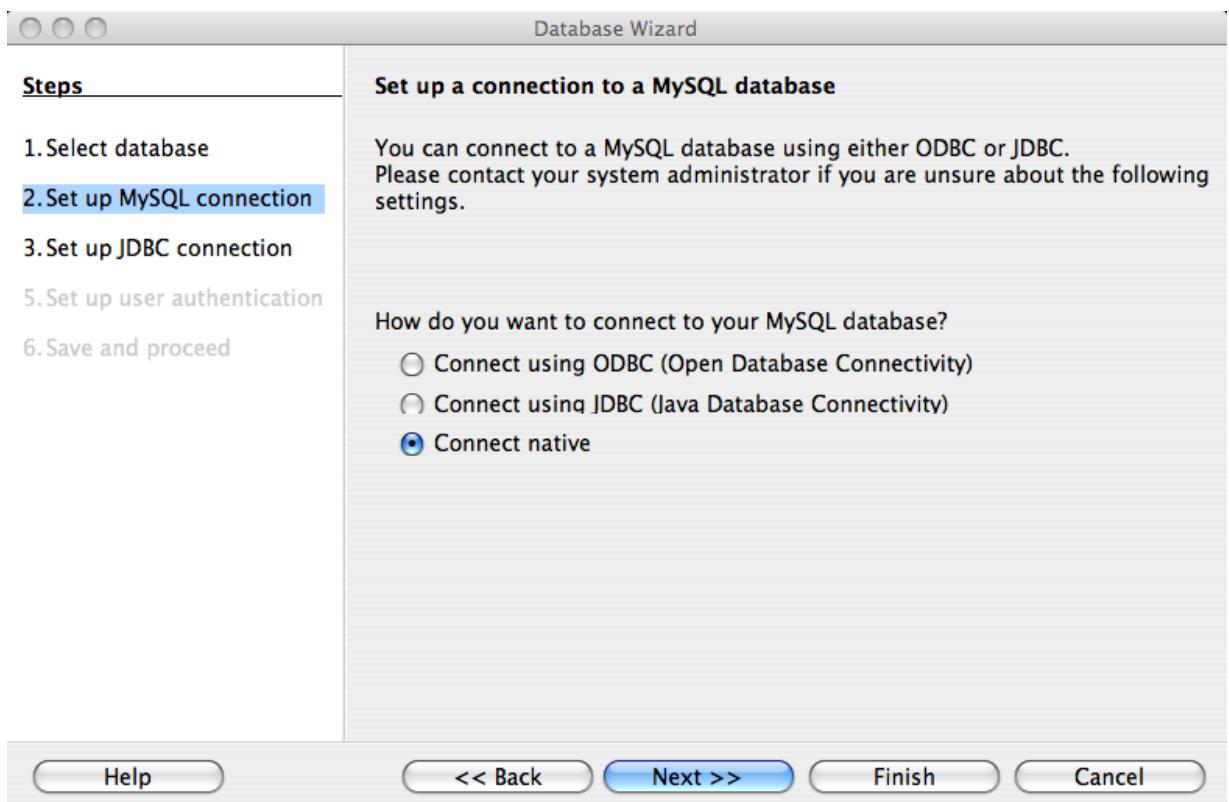

Create a new database by selecting **FILE, NEW, DATABASE**. This starts a wizard that enables you to create a new database, open an existing database, or connect to an existing database. Select the **CONNECT TO EXISTING DATABASE** radio button. From the listbox select MySQL. Click **NEXT >>**.

**Figure 21.82. Selecting the Database**

2. You will be asked how you would like to connect to the database. Select the **CONNECT NATIVE** radio button.

**Figure 21.83. Selecting the connection type**

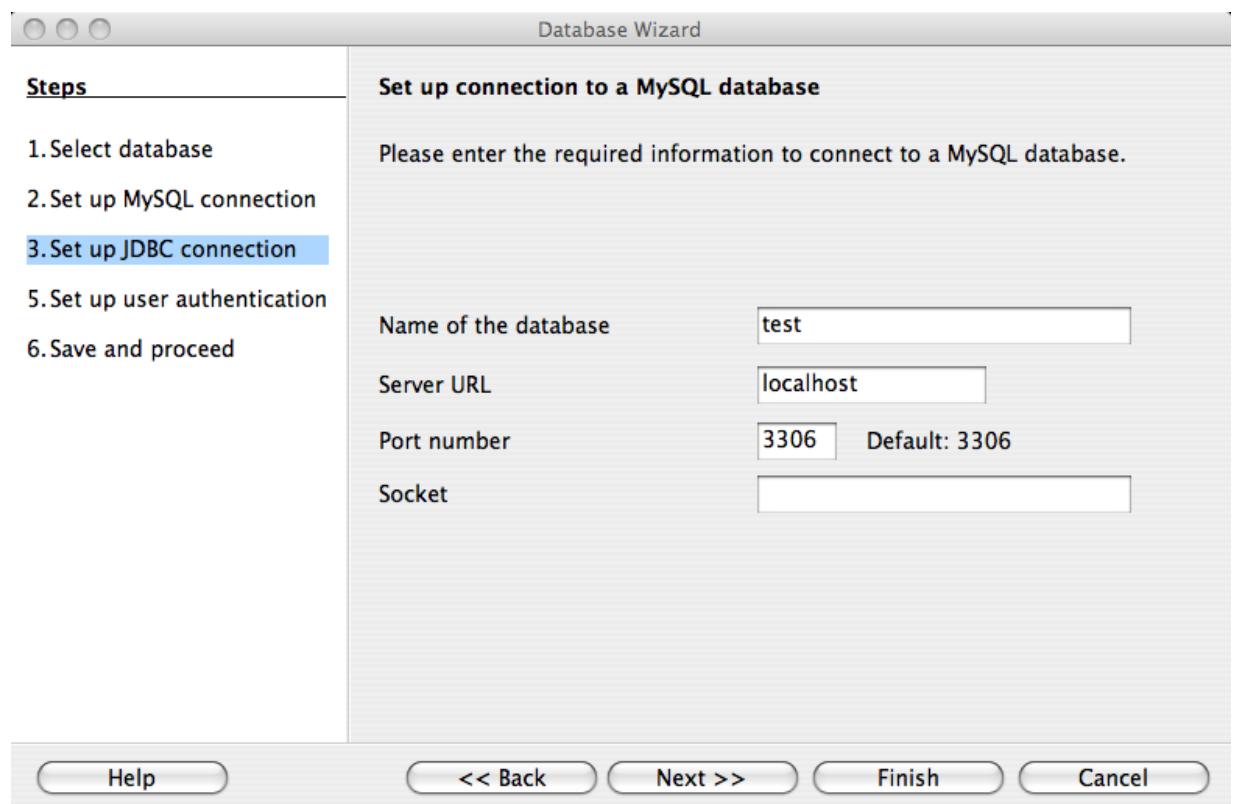

Click NEXT >>.

3. **Fill in the connection settings**

Enter the name of the database, server URL, and optionally the socket to connect on (if not using the default).

Note that if you do not specify a database all databases will be available for selection.

**Figure 21.84. Entering Connection Settings**

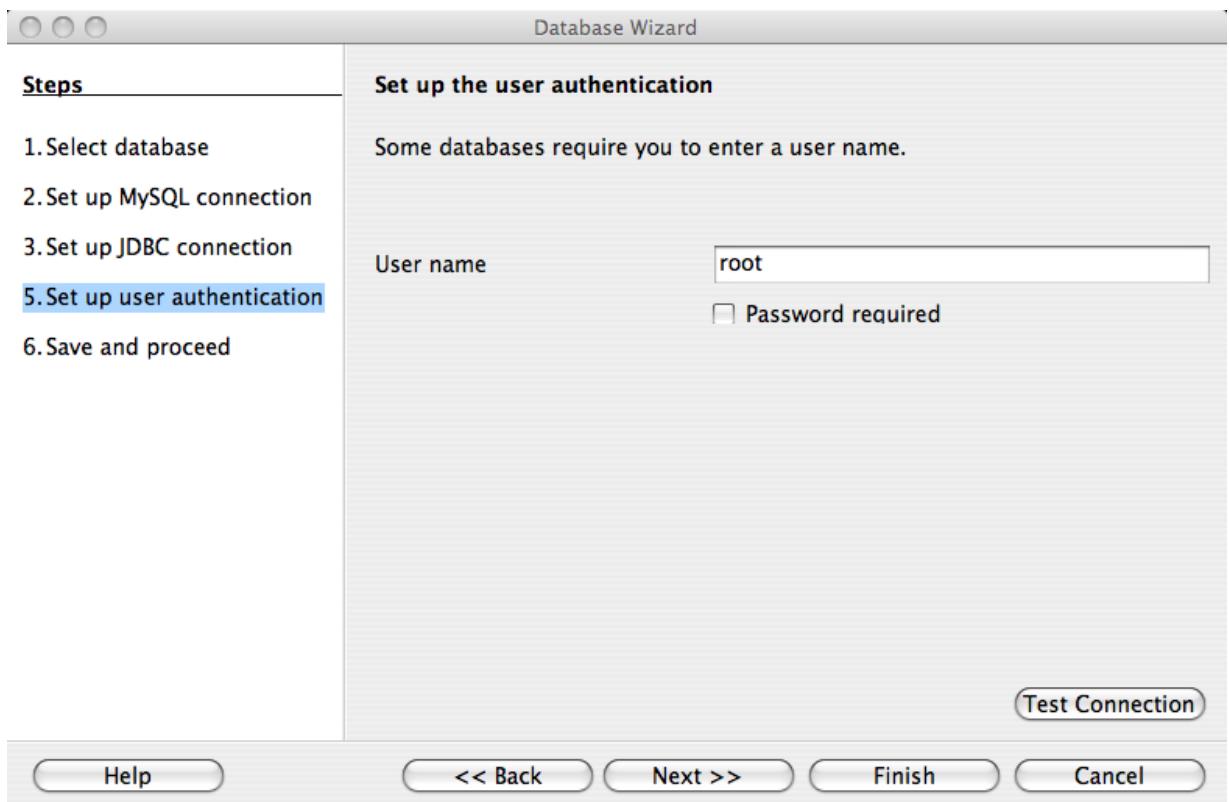

Click NEXT >>.

4. **Set up user authentication**

If you are using MySQL server's anonymous account without a password, you do not have to fill in anything in this step. Otherwise, fill in your MySQL user name and check the password checkbox. Note, for security reasons, you should not normally use the anonymous account without a password.

**Figure 21.85. Setting Up User Authentication**

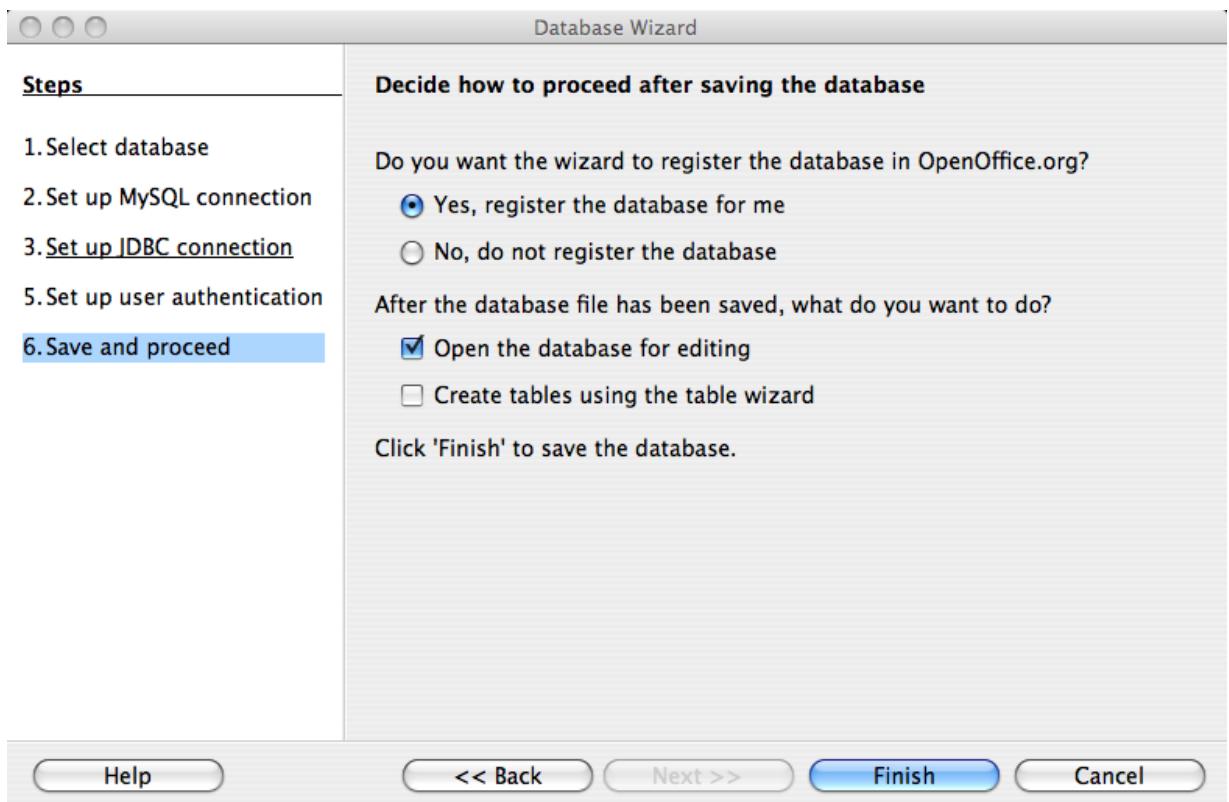

You can now test your connection to the MySQL database server by clicking the TEST CONNECTION button. Check the checkbox if you do not want OpenOffice.org to ask you for your password again in the current session. Testing the connection is optional, although recommended.

Click NEXT >>.

5. Decide how to proceed after connecting to the database

**Figure 21.86. After Connecting to the Database**

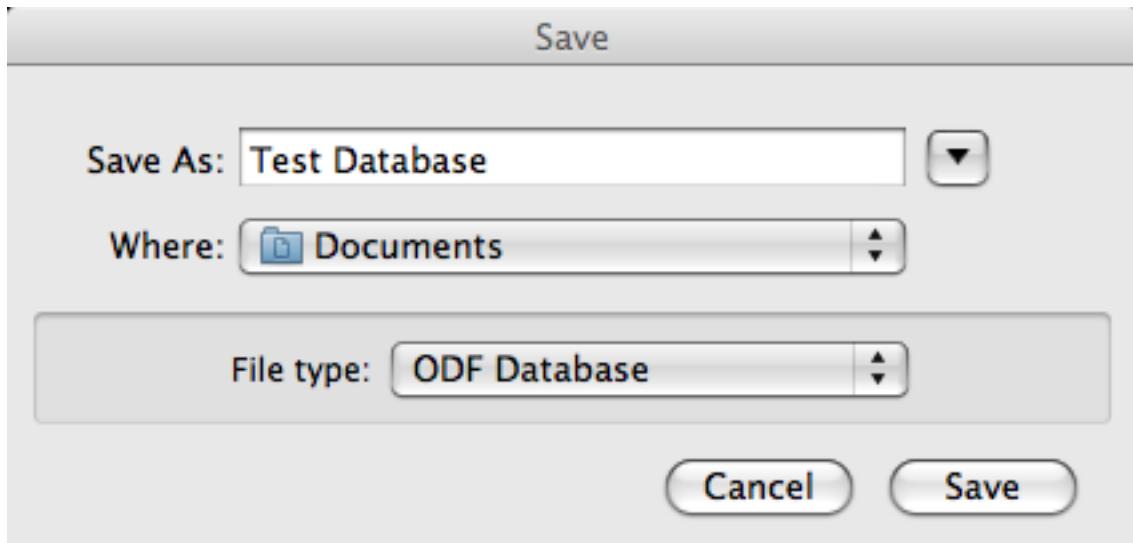

Keep the default settings.

Click FINISH.

6. You will then be prompted to save your database as a database file. Enter the name of the database and the location in which to save the file.

**Figure 21.87. Entering the Database File Name**

Click SAVE.

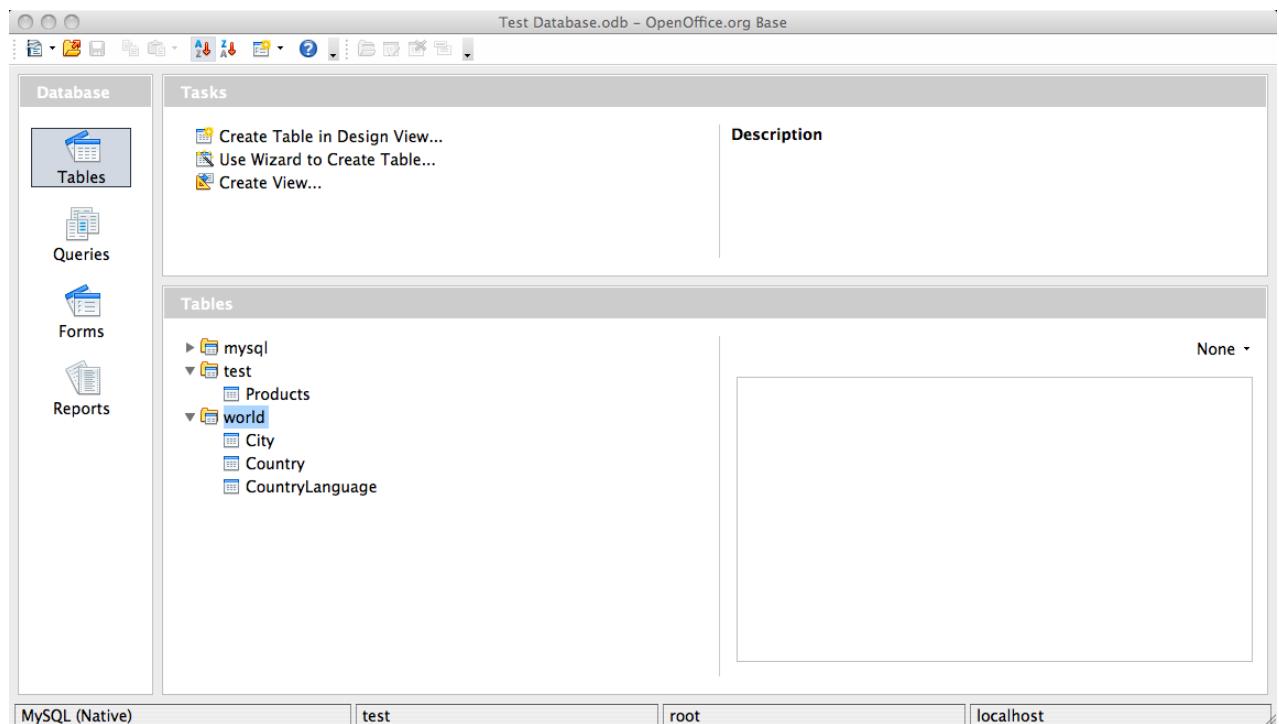

You will be located in the Base application with your database tables displayed.

## 21.7.3. Getting Started: Usage Examples

### Listing Tables

In the **DATABASE** area of the **BASE** main window, select **TABLES**. If this is the first time you are accessing the database you will be prompted for your credentials (user name and password); you can store these settings for your current Base session.

**Figure 21.88. Listing Tables**

Depending on your connection settings you will now see all databases with all their tables, or just the database you have specified in the connection settings.

## 21.7.4. References

See the [OpenOffice.org Web site](#) for documentation of the office suite and its Extension Manager.

## 21.7.5. Known Bugs

If you discover a bug in Connector/OpenOffice.org please [add it to this list](#) and send an email to [<users@dba.openoffice.org>](mailto:<users@dba.openoffice.org>). You need to be logged in with an OpenOffice.org account for both; see the [project mailing list](#) for details.

## 21.7.6. Contact

To discuss the new MySQL Connector/OpenOffice.org, please subscribe to the mailing list [<users@dba.openoffice.org>](mailto:<users@dba.openoffice.org>). It is a low-volume list with less than 10 mails per day.

## 21.8. libmysqld, the Embedded MySQL Server Library

The embedded MySQL server library makes it possible to run a full-featured MySQL server inside a client application. The main benefits are increased speed and more simple management for embedded applications.

The embedded server library is based on the client/server version of MySQL, which is written in C/C++. Consequently, the embedded server also is written in C/C++. There is no embedded server available in other languages.

The API is identical for the embedded MySQL version and the client/server version. To change an old threaded application to use the embedded library, you normally only have to add calls to the following functions.

Function	When to Call
<code>mysql_library_init()</code>	Should be called before any other MySQL function is called, preferably early in the <code>main()</code> function.
<code>mysql_library_end()</code>	Should be called before your program exits.
<code>mysql_thread_init()</code>	Should be called in each thread you create that accesses MySQL.
<code>mysql_thread_end()</code>	Should be called before calling <code>pthread_exit()</code>

Then you must link your code with `libmysqld.a` instead of `libmysqlclient.a`. To ensure binary compatibility between your application and the server library, be sure to compile your application against headers for the same series of MySQL that was used to compile the server library. For example, if `libmysqld` was compiled against MySQL 4.1 headers, do not compile your application against MySQL 5.1 headers, or vice versa.

The `mysql_library_xxx()` functions are also included in `libmysqlclient.a` to enable you to change between the embedded and the client/server version by just linking your application with the right library. See [Section 21.9.3.40, “mysql\\_library\\_init\(\)”](#).

One difference between the embedded server and the standalone server is that for the embedded server, authentication for connections is disabled by default. To use authentication for the embedded server, specify the `-with-embedded-privilege-control` option when you invoke `configure` to configure your MySQL distribution.

### 21.8.1. Compiling Programs with `libmysqld`

In precompiled binary MySQL distributions that include `libmysqld`, the embedded server library, MySQL builds the library using the appropriate vendor compiler if there is one.

To get a `libmysqld` library if you build MySQL from source yourself, you should configure MySQL with the `-with-embedded-server` option. See [Section 2.3.3, “Typical configure Options”](#).

When you link your program with `libmysqld`, you must also include the system-specific `pthread` libraries and some libraries that the MySQL server uses. You can get the full list of libraries by executing `mysql_config --libmysqld-libs`.

The correct flags for compiling and linking a threaded program must be used, even if you do not directly call any thread functions in your code.

To compile a C program to include the necessary files to embed the MySQL server library into an executable version of a program, the compiler will need to know where to find various files and need instructions on how to compile the program. The following example shows how a program could be compiled from the command line, assuming that you are using `gcc`, use the GNU C compiler:

```
gcc mysql_test.c -o mysql_test -lz \
`/usr/local/mysql/bin/mysql_config --include --libmysqld-libs`
```

Immediately following the `gcc` command is the name of the C program source file. After it, the `-o` option is given to indicate that the file name that follows is the name that the compiler is to give to the output file, the compiled program. The next line of code tells the compiler to obtain the location of the include files and libraries and other settings for the system on which it is compiled. Because of a problem with `mysql_config`, the option `-lz` (for compression) is added here. The `mysql_config` command is contained in backticks, not single quotation marks.

On some non-`gcc` platforms, the embedded library depends on C++ runtime libraries and linking against the embedded library might result in missing-symbol errors. To solve this, link using a C++ compiler or explicitly list the required libraries on the link command line.

### 21.8.2. Restrictions When Using the Embedded MySQL Server

The embedded server has the following limitations:

- No user-defined functions (UDFs).
- No stack trace on core dump.
- You cannot set this up as a master or a slave (no replication).
- Very large result sets may be unusable on low memory systems.
- You cannot connect to an embedded server from an outside process with sockets or TCP/IP. However, you can connect to an

intermediate application, which in turn can connect to an embedded server on the behalf of a remote client or outside process.

- `InnoDB` is not reentrant in the embedded server and cannot be used for multiple connections, either successively or simultaneously.
- The Event Scheduler is not available. Because of this, the `event_scheduler` system variable is disabled.

Some of these limitations can be changed by editing the `mysql_embed.h` include file and recompiling MySQL.

### 21.8.3. Options with the Embedded Server

Any options that may be given with the `mysqld` server daemon, may be used with an embedded server library. Server options may be given in an array as an argument to the `mysql_library_init()`, which initializes the server. They also may be given in an option file like `my.cnf`. To specify an option file for a C program, use the `--defaults-file` option as one of the elements of the second argument of the `mysql_library_init()` function. See [Section 21.9.3.40, “`mysql\_library\_init\(\)`”](#), for more information on the `mysql_library_init()` function.

Using option files can make it easier to switch between a client/server application and one where MySQL is embedded. Put common options under the `[server]` group. These are read by both MySQL versions. Client/server-specific options should go under the `[mysqld]` section. Put options specific to the embedded MySQL server library in the `[embedded]` section. Options specific to applications go under section labeled `[ApplicationName_SERVER]`. See [Section 4.2.3.3, “Using Option Files”](#).

### 21.8.4. Embedded Server Examples

These two example programs should work without any changes on a Linux or FreeBSD system. For other operating systems, minor changes are needed, mostly with file paths. These examples are designed to give enough details for you to understand the problem, without the clutter that is a necessary part of a real application. The first example is very straightforward. The second example is a little more advanced with some error checking. The first is followed by a command-line entry for compiling the program. The second is followed by a GNUmakefile that may be used for compiling instead.

#### Example 1

```
test1_libmysqld.c

#include <stdio.h>
#include <stdlib.h>
#include <stdarg.h>
#include "mysql.h"

MYSQL *mysql;
MYSQL_RES *results;
MYSQL_ROW record;

static char *server_options[] = \
{ "mysql_test", "--defaults-file=my.cnf", NULL };
int num_elements = (sizeof(server_options) / sizeof(char *)) - 1;

static char *server_groups[] = { "libmysqld_server",
 "libmysqld_client", NULL };

int main(void)
{
 mysql_library_init(num_elements, server_options, server_groups);
 mysql = mysql_init(NULL);
 mysql_options(mysql, MYSQL_READ_DEFAULT_GROUP, "libmysqld_client");
 mysql_options(mysql, MYSQL_OPT_USE_EMBEDDED_CONNECTION, NULL);

 mysql_real_connect(mysql, NULL,NULL,NULL, "database1", 0,NULL,0);
 mysql_query(mysql, "SELECT column1, column2 FROM table1");

 results = mysql_store_result(mysql);
 while((record = mysql_fetch_row(results))) {
 printf("%s - %s \n", record[0], record[1]);
 }

 mysql_free_result(results);
 mysql_close(mysql);
 mysql_library_end();
}

return 0;
}
```

Here is the command line for compiling the above program:

```
gcc test1_libmysqld.c -o test1_libmysqld -lz \
`/usr/local/mysql/bin/mysql_config --include --libmysqld-libs`
```

**Example 2**

To try the example, create an `test2_libmysqld` directory at the same level as the MySQL source directory. Save the `test2_libmysqld.c` source and the `GNUmakefile` in the directory, and run GNU `make` from inside the `test2_libmysqld` directory.

```
test2_libmysqld.c

/*
 * A simple example client, using the embedded MySQL server library
 */

#include <mysql.h>
#include <stdarg.h>
#include <stdio.h>
#include <stdlib.h>

MYSQL *db_connect(const char *dbname);
void db_disconnect(MYSQL *db);
void db_do_query(MYSQL *db, const char *query);

const char *server_groups[] = {
 "test2_libmysqld_SERVER", "embedded", "server", NULL
};

int
main(int argc, char **argv)
{
 MYSQL *one, *two;

 /* mysql_library_init() must be called before any other mysql
 * functions.
 *
 * You can use mysql_library_init(0, NULL, NULL), and it
 * initializes the server using groups = {
 * "server", "embedded", NULL
 * }.
 *
 * In your $HOME/.my.cnf file, you probably want to put:

[mysql]
language = /path/to/source/of/mysql/sql/share/english

 * You could, of course, modify argc and argv before passing
 * them to this function. Or you could create new ones in any
 * way you like. But all of the arguments in argv (except for
 * argv[0], which is the program name) should be valid options
 * for the MySQL server.
 *
 * If you link this client against the normal mysqlclient
 * library, this function is just a stub that does nothing.
 */
 mysql_library_init(argc, argv, (char **)server_groups);

 one = db_connect("test");
 two = db_connect(NULL);

 db_do_query(one, "SHOW TABLE STATUS");
 db_do_query(two, "SHOW DATABASES");

 mysql_close(two);
 mysql_close(one);

 /* This must be called after all other mysql functions */
 mysql_library_end();

 exit(EXIT_SUCCESS);
}

static void
die(MYSQL *db, char *fmt, ...)
{
 va_list ap;
 va_start(ap, fmt);
 vfprintf(stderr, fmt, ap);
 va_end(ap);
 (void)putc('\n', stderr);
 if (db)
 db_disconnect(db);
 exit(EXIT_FAILURE);
}

MYSQL *
db_connect(const char *dbname)
{
 MYSQL *db = mysql_init(NULL);
 if (!db)
 die(db, "mysql_init failed: no memory");
 /*
 * Notice that the client and server use separate group names.
 * This is critical, because the server does not accept the
 * client's options, and vice versa.
 */
 mysql_options(db, MYSQL_READ_DEFAULT_GROUP, "test2_libmysqld_CLIENT");
}
```

```

if (!mysql_real_connect(db, NULL, NULL, NULL, db, 0, NULL, 0))
 die(db, "mysql_real_connect failed: %s", mysql_error(db));

return db;
}

void
db_disconnect(MYSQL *db)
{
 mysql_close(db);
}

void
db_do_query(MYSQL *db, const char *query)
{
 if (mysql_query(db, query) != 0)
 goto err;

 if (mysql_field_count(db) > 0)
 {
 MYSQL_RES *res;
 MYSQL_ROW row, end_row;
 int num_fields;

 if (!(res = mysql_store_result(db)))
 goto err;
 num_fields = mysql_num_fields(res);
 while ((row = mysql_fetch_row(res)))
 {
 (void)fputs("++ ", stdout);
 for (end_row = row + num_fields; row < end_row; ++row)
 (void)printf("%s\t", row ? (char*)*row : "NULL");
 (void)fputc('\n', stdout);
 }
 (void)fputc('\n', stdout);
 mysql_free_result(res);
 }
 else
 (void)printf("Affected rows: %lld\n", mysql_affected_rows(db));
}

err:
 die(db, "db_do_query failed: %s [%s]", mysql_error(db), query);
}

```

**GNUmakefile**

```

This assumes the MySQL software is installed in /usr/local/mysql
inc := /usr/local/mysql/include/mysql
lib := /usr/local/mysql/lib

If you have not installed the MySQL software yet, try this instead
#inc := $(HOME)/mysql-5.1/include
#lib := $(HOME)/mysql-5.1/libmysqld

CC := gcc
CPPFLAGS := -I$(inc) -D_THREAD_SAFE -D_REENTRANT
CFLAGS := -g -W -Wall
LDFLAGS := -static
You can change -lmysqld to -lmysqlclient to use the
client/server library
LDLIBS = -L$(lib) -lmysqld -lz -lm -ldl -lcrypt

ifneq (,$(shell grep FreeBSD /COPYRIGHT 2>/dev/null))
FreeBSD
LDFLAGS += -pthread
else
Assume Linux
LDLIBS += -lpthread
endif

This works for simple one-file test programs
sources := $(wildcard *.c)
objects := $(patsubst %.c,%o,$(sources))
targets := $(basename $(sources))

all: $(targets)

clean:
 rm -f $(targets) $(objects) *.core

```

**21.8.5. Licensing the Embedded Server**

We encourage everyone to promote free software by releasing code under the GPL or a compatible license. For those who are not able to do this, another option is to purchase a commercial license for the MySQL code from Oracle Corporation. For details, please see <http://www.mysql.com/company/legal/licensing/>.

**21.9. MySQL C API**

The C API code is distributed with MySQL. It is included in the `mysqlclient` library and enables C programs to access a database.

Many of the clients in the MySQL source distribution are written in C. If you are looking for examples that demonstrate how to use the C API, take a look at these clients. You can find these in the `client` directory in the MySQL source distribution.

Most of the other client APIs (all except Connector/J and Connector/NET) use the `mysqlclient` library to communicate with the MySQL server. This means that, for example, you can take advantage of many of the same environment variables that are used by other client programs, because they are referenced from the library. See [Chapter 4, MySQL Programs](#), for a list of these variables.

The client has a maximum communication buffer size. The size of the buffer that is allocated initially (16KB) is automatically increased up to the maximum size (the maximum is 16MB). Because buffer sizes are increased only as demand warrants, simply increasing the default maximum limit does not in itself cause more resources to be used. This size check is mostly a check for erroneous statements and communication packets.

The communication buffer must be large enough to contain a single SQL statement (for client-to-server traffic) and one row of returned data (for server-to-client traffic). Each thread's communication buffer is dynamically enlarged to handle any query or row up to the maximum limit. For example, if you have `BLOB` values that contain up to 16MB of data, you must have a communication buffer limit of at least 16MB (in both server and client). The client's default maximum is 16MB, but the default maximum in the server is 1MB. You can increase this by changing the value of the `max_allowed_packet` parameter when the server is started. See [Section 7.9.3, “Tuning Server Parameters”](#).

The MySQL server shrinks each communication buffer to `net_buffer_length` bytes after each query. For clients, the size of the buffer associated with a connection is not decreased until the connection is closed, at which time client memory is reclaimed.

For programming with threads, see [Section 21.9.16.2, “How to Make a Threaded Client”](#). For creating a standalone application which includes the “server” and “client” in the same program (and does not communicate with an external MySQL server), see [Section 21.8, “libmysqld, the Embedded MySQL Server Library”](#).

### Note

If, after an upgrade, you experience problems with compiled client programs, such as `Commands out of sync` or unexpected core dumps, you probably have used old header or library files when compiling your programs. In this case, you should check the date for your `mysql.h` file and `libmysqlclient.a` library to verify that they are from the new MySQL distribution. If not, recompile your programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example from `libmysqlclient.so.15` to `libmysqlclient.so.16`).

## 21.9.1. C API Data Structures

This section describes C API data structures other than those used for prepared statements. For information about the latter, see [Section 21.9.5, “C API Prepared Statement Data Structures”](#).

- [`MYSQL`](#)

This structure represents a handle to one database connection. It is used for almost all MySQL functions. You should not try to make a copy of a `MYSQL` structure. There is no guarantee that such a copy will be usable.

- [`MYSQL\_RES`](#)

This structure represents the result of a query that returns rows (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`). The information returned from a query is called the *result set* in the remainder of this section.

- [`MYSQL\_ROW`](#)

This is a type-safe representation of one row of data. It is currently implemented as an array of counted byte strings. (You cannot treat these as null-terminated strings if field values may contain binary data, because such values may contain null bytes internally.) Rows are obtained by calling `mysql_fetch_row()`.

- [`MYSQL\_FIELD`](#)

This structure contains information about a field, such as the field's name, type, and size. Its members are described in more detail later in this section. You may obtain the `MYSQL_FIELD` structures for each field by calling `mysql_fetch_field()` repeatedly. Field values are not part of this structure; they are contained in a `MYSQL_ROW` structure.

- [`MYSQL\_FIELD\_OFFSET`](#)

This is a type-safe representation of an offset into a MySQL field list. (Used by `mysql_field_seek()`.) Offsets are field

numbers within a row, beginning at zero.

- **my\_ulonglong**

The type used for the number of rows and for `mysql_affected_rows()`, `mysql_num_rows()`, and `mysql_insert_id()`. This type provides a range of 0 to `1.84e19`.

On some systems, attempting to print a value of type `my_ulonglong` does not work. To print such a value, convert it to `unsigned long` and use a `%lu` print format. Example:

```
printf ("Number of rows: %lu\n",
 (unsigned long) mysql_num_rows(result));
```

- **my\_bool**

A boolean type, for values that are true (nonzero) or false (zero).

The `MYSQL_FIELD` structure contains the members described in the following list:

- **char \* name**

The name of the field, as a null-terminated string. If the field was given an alias with an `AS` clause, the value of `name` is the alias.

- **char \* org\_name**

The name of the field, as a null-terminated string. Aliases are ignored.

- **char \* table**

The name of the table containing this field, if it isn't a calculated field. For calculated fields, the `table` value is an empty string. If the column is selected from a view, `table` names the view. If the table or view was given an alias with an `AS` clause, the value of `table` is the alias. For a `UNION`, the value is the empty string.

- **char \* org\_table**

The name of the table, as a null-terminated string. Aliases are ignored. If the column is selected from a view, `org_table` names the underlying table. For a `UNION`, the value is the empty string.

- **char \* db**

The name of the database that the field comes from, as a null-terminated string. If the field is a calculated field, `db` is an empty string. For a `UNION`, the value is the empty string.

- **char \* catalog**

The catalog name. This value is always `"def"`.

- **char \* def**

The default value of this field, as a null-terminated string. This is set only if you use `mysql_list_fields()`.

- **unsigned long length**

The width of the field. This corresponds to the display length, in bytes.

The server determines the `length` value before it generates the result set, so this is the minimum length required for a data type capable of holding the largest possible value from the result column, without knowing in advance the actual values that will be produced by the query for the result set.

- **unsigned long max\_length**

The maximum width of the field for the result set (the length in bytes of the longest field value for the rows actually in the result set). If you use `mysql_store_result()` or `mysql_list_fields()`, this contains the maximum length for the field. If you use `mysql_use_result()`, the value of this variable is zero.

The value of `max_length` is the length of the string representation of the values in the result set. For example, if you retrieve a `FLOAT` column and the “widest” value is `-12.345`, `max_length` is 7 (the length of '`-12.345`').

If you are using prepared statements, `max_length` is not set by default because for the binary protocol the lengths of the val-

ues depend on the types of the values in the result set. (See [Section 21.9.5, “C API Prepared Statement Data Structures”](#).) If you want the `max_length` values anyway, enable the `STMT_ATTR_UPDATE_MAX_LENGTH` option with `mysql_stmt_attr_set()` and the lengths will be set when you call `mysql_stmt_store_result()`. (See [Section 21.9.7.3, “mysql\\_stmt\\_attr\\_set\(\)”](#), and [Section 21.9.7.27, “mysql\\_stmt\\_store\\_result\(\)”](#).)

- `unsigned int name_length`  
The length of `name`.
- `unsigned int org_name_length`  
The length of `org_name`.
- `unsigned int table_length`  
The length of `table`.
- `unsigned int org_table_length`  
The length of `org_table`.
- `unsigned int db_length`  
The length of `db`.
- `unsigned int catalog_length`  
The length of `catalog`.
- `unsigned int def_length`  
The length of `def`.
- `unsigned int flags`

Bit-flags that describe the field. The `flags` value may have zero or more of the following bits set.

Flag Value	Flag Description
<code>NOT_NULL_FLAG</code>	Field can't be <code>NULL</code>
<code>PRI_KEY_FLAG</code>	Field is part of a primary key
<code>UNIQUE_KEY_FLAG</code>	Field is part of a unique key
<code>MULTIPLE_KEY_FLAG</code>	Field is part of a nonunique key
<code>UNSIGNED_FLAG</code>	Field has the <code>UNSIGNED</code> attribute
<code>ZEROFILL_FLAG</code>	Field has the <code>ZEROFILL</code> attribute
<code>BINARY_FLAG</code>	Field has the <code>BINARY</code> attribute
<code>AUTO_INCREMENT_FLAG</code>	Field has the <code>AUTO_INCREMENT</code> attribute
<code>NUM_FLAG</code>	Field is numeric
<code>ENUM_FLAG</code>	Field is an <code>ENUM</code> (deprecated)
<code>SET_FLAG</code>	Field is a <code>SET</code> (deprecated)
<code>BLOB_FLAG</code>	Field is a <code>BLOB</code> or <code>TEXT</code> (deprecated)
<code>TIMESTAMP_FLAG</code>	Field is a <code>TIMESTAMP</code> (deprecated)
<code>NO_DEFAULT_VALUE_FLAG</code>	Field has no default value; see additional notes following table

Use of the `BLOB_FLAG`, `ENUM_FLAG`, `SET_FLAG`, and `TIMESTAMP_FLAG` flags is deprecated because they indicate the type of a field rather than an attribute of its type. It is preferable to test `field->type` against `MYSQL_TYPE_BLOB`, `MYSQL_TYPE_ENUM`, `MYSQL_TYPE_SET`, or `MYSQL_TYPE_TIMESTAMP` instead.

`NUM_FLAG` indicates that a column is numeric. This includes columns with a type of `MYSQL_TYPE_DECIMAL`, `MYSQL_TYPE_TINY`, `MYSQL_TYPE_SHORT`, `MYSQL_TYPE_LONG`, `MYSQL_TYPE_FLOAT`, `MYSQL_TYPE_DOUBLE`, `MYSQL_TYPE_NULL`, `MYSQL_TYPE_LONGLONG`, `MYSQL_TYPE_INT24`, and `MYSQL_TYPE_YEAR`.

`NO_DEFAULT_VALUE_FLAG` indicates that a column has no `DEFAULT` clause in its definition. This does not apply to `NULL` columns (because such columns have a default of `NULL`), or to `AUTO_INCREMENT` columns (which have an implied default

value).

The following example illustrates a typical use of the `flags` value:

```
if (field->flags & NOT_NULL_FLAG)
 printf("Field can't be null\n");
```

You may use the following convenience macros to determine the boolean status of the `flags` value.

Flag Status	Description
<code>IS_NOT_NULL(flags)</code>	True if this field is defined as <code>NOT NULL</code>
<code>IS_PRI_KEY(flags)</code>	True if this field is a primary key
<code>IS_BLOB(flags)</code>	True if this field is a <code>BLOB</code> or <code>TEXT</code> (deprecated; test <code>field-&gt;type</code> instead)

- `unsigned int decimals`

The number of decimals for numeric fields.

- `unsigned int charsetnr`

An ID number that indicates the character set/collation pair for the field.

To distinguish between binary and nonbinary data for string data types, check whether the `charsetnr` value is 63. If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

`charsetnr` values are the same as those displayed in the `Id` column of the `SHOW COLLATION` statement or the `ID` column of the `INFORMATION_SCHEMA COLLATIONS` table. You can use those information sources to see which character set and collation specific `charsetnr` values indicate:

```
mysql> SHOW COLLATION WHERE Id = 63;
+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+
| binary | binary | 63 | Yes | Yes | 1 |
+-----+-----+-----+-----+-----+
mysql> SELECT COLLATION_NAME, CHARACTER_SET_NAME
-> FROM INFORMATION_SCHEMA.COLLATIONS WHERE ID = 33;
+-----+-----+
| COLLATION_NAME | CHARACTER_SET_NAME |
+-----+-----+
| utf8_general_ci | utf8 |
+-----+-----+
```

- `enum enum_field_types type`

The type of the field. The `type` value may be one of the `MYSQL_TYPE_` symbols shown in the following table.

Type Value	Type Description
<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code> field
<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code> field
<code>MYSQL_TYPE_LONG</code>	<code>INTEGER</code> field
<code>MYSQL_TYPE_INT24</code>	<code>MEDIUMINT</code> field
<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code> field
<code>MYSQL_TYPE_DECIMAL</code>	<code>DECIMAL</code> or <code>NUMERIC</code> field
<code>MYSQL_TYPE_NEWDECIMAL</code>	Precision math <code>DECIMAL</code> or <code>NUMERIC</code>
<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code> field
<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code> or <code>REAL</code> field
<code>MYSQL_TYPE_BIT</code>	<code>BIT</code> field
<code>MYSQL_TYPE_TIMESTAMP</code>	<code>TIMESTAMP</code> field
<code>MYSQL_TYPE_DATE</code>	<code>DATE</code> field
<code>MYSQL_TYPE_TIME</code>	<code>TIME</code> field
<code>MYSQL_TYPE_DATETIME</code>	<code>DATETIME</code> field

<code>MYSQL_TYPE_YEAR</code>	<code>YEAR</code> field
<code>MYSQL_TYPE_STRING</code>	<code>CHAR</code> or <code>BINARY</code> field
<code>MYSQL_TYPE_VAR_STRING</code>	<code>VARCHAR</code> or <code>VARBINARY</code> field
<code>MYSQL_TYPE_BLOB</code>	<code>BLOB</code> or <code>TEXT</code> field (use <code>max_length</code> to determine the maximum length)
<code>MYSQL_TYPE_SET</code>	<code>SET</code> field
<code>MYSQL_TYPE_ENUM</code>	<code>ENUM</code> field
<code>MYSQL_TYPE_GEOMETRY</code>	Spatial field
<code>MYSQL_TYPE_NULL</code>	<code>NULL</code> -type field

You can use the `IS_NUM()` macro to test whether a field has a numeric type. Pass the `type` value to `IS_NUM()` and it evaluates to TRUE if the field is numeric:

```
if (IS_NUM(field->type))
 printf("Field is numeric\n");
```

## 21.9.2. C API Function Overview

The functions available in the C API are summarized here and described in greater detail in a later section. See [Section 21.9.3, “C API Function Descriptions”](#).

Function	Description
<code>my_init()</code>	Initialize global variables, and thread handler in thread-safe programs
<code>mysql_affected_rows()</code>	Returns the number of rows changed/deleted/inserted by the last <code>UPDATE</code> , <code>DELETE</code> , or <code>INSERT</code> query
<code>mysql_autocommit()</code>	Toggles autocommit mode on/off
<code>mysql_change_user()</code>	Changes user and database on an open connection
<code>mysql_character_set_name()</code>	Return default character set name for current connection
<code>mysql_close()</code>	Closes a server connection
<code>mysql_commit()</code>	Commits the transaction
<code>mysql_connect()</code>	Connects to a MySQL server (this function is deprecated; use <code>mysql_real_connect()</code> instead)
<code>mysql_create_db()</code>	Creates a database (this function is deprecated; use the SQL statement <code>CREATE DATABASE</code> instead)
<code>mysql_data_seek()</code>	Seeks to an arbitrary row number in a query result set
<code>mysql_debug()</code>	Does a <code>DEBUG_PUSH</code> with the given string
<code>mysql_drop_db()</code>	Drops a database (this function is deprecated; use the SQL statement <code>DROP DATABASE</code> instead)
<code>mysql_dump_debug_info()</code>	Makes the server write debug information to the log
<code>mysql_eof()</code>	Determines whether the last row of a result set has been read (this function is deprecated; <code>mysql_errno()</code> or <code>mysql_error()</code> may be used instead)
<code>mysql_errno()</code>	Returns the error number for the most recently invoked MySQL function
<code>mysql_error()</code>	Returns the error message for the most recently invoked MySQL function
<code>mysql_escape_string()</code>	Escapes special characters in a string for use in an SQL statement
<code>mysql_fetch_field()</code>	Returns the type of the next table field
<code>mysql_fetch_field_direct()</code>	Returns the type of a table field, given a field number
<code>mysql_fetch_fields()</code>	Returns an array of all field structures
<code>mysql_fetch_lengths()</code>	Returns the lengths of all columns in the current row
<code>mysql_fetch_row()</code>	Fetches the next row from the result set
<code>mysql_field_count()</code>	Returns the number of result columns for the most recent statement
<code>mysql_field_seek()</code>	Puts the column cursor on a specified column
<code>mysql_field_tell()</code>	Returns the position of the field cursor used for the last <code>mysql_fetch_field()</code>

<code>mysql_free_result()</code>	Frees memory used by a result set
<code>mysql_get_character_set_info()</code>	Return information about default character set
<code>mysql_get_client_info()</code>	Returns client version information as a string
<code>mysql_get_client_version()</code>	Returns client version information as an integer
<code>mysql_get_host_info()</code>	Returns a string describing the connection
<code>mysql_get_proto_info()</code>	Returns the protocol version used by the connection
<code>mysql_get_server_info()</code>	Returns the server version number
<code>mysql_get_server_version()</code>	Returns version number of server as an integer
<code>mysql_get_ssl_cipher()</code>	Return current SSL cipher
<code>mysql_hex_string()</code>	Encode string in hexadecimal format
<code>mysql_info()</code>	Returns information about the most recently executed query
<code>mysql_init()</code>	Gets or initializes a <code>MYSQL</code> structure
<code>mysql_insert_id()</code>	Returns the ID generated for an <code>AUTO_INCREMENT</code> column by the previous query
<code>mysql_kill()</code>	Kills a given thread
<code>mysql_library_end()</code>	Finalize the MySQL C API library
<code>mysql_library_init()</code>	Initialize the MySQL C API library
<code>mysql_list_dbs()</code>	Returns database names matching a simple regular expression
<code>mysql_list_fields()</code>	Returns field names matching a simple regular expression
<code>mysql_list_processes()</code>	Returns a list of the current server threads
<code>mysql_list_tables()</code>	Returns table names matching a simple regular expression
<code>mysql_more_results()</code>	Checks whether any more results exist
<code>mysql_next_result()</code>	Returns/initiates the next result in multiple-result executions
<code>mysql_num_fields()</code>	Returns the number of columns in a result set
<code>mysql_num_rows()</code>	Returns the number of rows in a result set
<code>mysql_options()</code>	Sets connect options for <code>mysql_real_connect()</code>
<code>mysql_ping()</code>	Checks whether the connection to the server is working, reconnecting as necessary
<code>mysql_query()</code>	Executes an SQL query specified as a null-terminated string
<code>mysql_real_connect()</code>	Connects to a MySQL server
<code>mysql_real_escape_string()</code>	Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection
<code>mysql_real_query()</code>	Executes an SQL query specified as a counted string
<code>mysql_refresh()</code>	Flush or reset tables and caches
<code>mysql_reload()</code>	Tells the server to reload the grant tables
<code>mysql_rollback()</code>	Rolls back the transaction
<code>mysql_row_seek()</code>	Seeks to a row offset in a result set, using value returned from <code>mysql_row_tell()</code>
<code>mysql_row_tell()</code>	Returns the row cursor position
<code>mysql_select_db()</code>	Selects a database
<code>mysql_server_end()</code>	Finalize the MySQL C API library
<code>mysql_server_init()</code>	Initialize the MySQL C API library
<code>mysql_set_character_set()</code>	Set default character set for current connection
<code>mysql_set_local_infile_default()</code>	Set the <code>LOAD DATA LOCAL INFILE</code> handler callbacks to their default values
<code>mysql_set_local_infile_handler()</code>	Install application-specific <code>LOAD DATA LOCAL INFILE</code> handler callbacks
<code>mysql_set_server_option()</code>	Sets an option for the connection (like <code>multi-statements</code> )
<code>mysql_sqlstate()</code>	Returns the SQLSTATE error code for the last error
<code>mysql_shutdown()</code>	Shuts down the database server
<code>mysql_ssl_set()</code>	Prepare to establish SSL connection to server
<code>mysql_stat()</code>	Returns the server status as a string

<code>mysql_store_result()</code>	Retrieves a complete result set to the client
<code>mysql_thread_end()</code>	Finalize thread handler
<code>mysql_thread_id()</code>	Returns the current thread ID
<code>mysql_thread_init()</code>	Initialize thread handler
<code>mysql_thread_safe()</code>	Returns 1 if the clients are compiled as thread-safe
<code>mysql_use_result()</code>	Initiates a row-by-row result set retrieval
<code>mysql_warning_count()</code>	Returns the warning count for the previous SQL statement

Application programs should use this general outline for interacting with MySQL:

1. Initialize the MySQL library by calling `mysql_library_init()`. This function exists in both the `mysqlclient` C client library and the `mysqld` embedded server library, so it is used whether you build a regular client program by linking with the `-libmysqlclient` flag, or an embedded server application by linking with the `-libmysqld` flag.
2. Initialize a connection handler by calling `mysql_init()` and connect to the server by calling `mysql_real_connect()`.
3. Issue SQL statements and process their results. (The following discussion provides more information about how to do this.)
4. Close the connection to the MySQL server by calling `mysql_close()`.
5. End use of the MySQL library by calling `mysql_library_end()`.

The purpose of calling `mysql_library_init()` and `mysql_library_end()` is to provide proper initialization and finalization of the MySQL library. For applications that are linked with the client library, they provide improved memory management. If you don't call `mysql_library_end()`, a block of memory remains allocated. (This does not increase the amount of memory used by the application, but some memory leak detectors will complain about it.) For applications that are linked with the embedded server, these calls start and stop the server.

In a nonmulti-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly through `mysql_init()`. This should be done prior to any other client library call.

To connect to the server, call `mysql_init()` to initialize a connection handler, then call `mysql_real_connect()` with that handler (along with other information such as the host name, user name, and password). Upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior. When you are done with the connection, call `mysql_close()` to terminate it.

While a connection is active, the client may send SQL statements to the server using `mysql_query()` or `mysql_real_query()`. The difference between the two is that `mysql_query()` expects the query to be specified as a null-terminated string whereas `mysql_real_query()` expects a counted string. If the string contains binary data (which may include null bytes), you must use `mysql_real_query()`.

For each non-`SELECT` query (for example, `INSERT`, `UPDATE`, `DELETE`), you can find out how many rows were changed (affected) by calling `mysql_affected_rows()`.

For `SELECT` queries, you retrieve the selected rows as a result set. (Note that some statements are `SELECT`-like in that they return rows. These include `SHOW`, `DESCRIBE`, and `EXPLAIN`. They should be treated the same way as `SELECT` statements.)

There are two ways for a client to process result sets. One way is to retrieve the entire result set all at once by calling `mysql_store_result()`. This function acquires from the server all the rows returned by the query and stores them in the client. The second way is for the client to initiate a row-by-row result set retrieval by calling `mysql_use_result()`. This function initializes the retrieval, but does not actually get any rows from the server.

In both cases, you access rows by calling `mysql_fetch_row()`. With `mysql_store_result()`, `mysql_fetch_row()` accesses rows that have previously been fetched from the server. With `mysql_use_result()`, `mysql_fetch_row()` actually retrieves the row from the server. Information about the size of the data in each row is available by calling `mysql_fetch_lengths()`.

After you are done with a result set, call `mysql_free_result()` to free the memory used for it.

The two retrieval mechanisms are complementary. Client programs should choose the approach that is most appropriate for their requirements. In practice, clients tend to use `mysql_store_result()` more commonly.

An advantage of `mysql_store_result()` is that because the rows have all been fetched to the client, you not only can access rows sequentially, you can move back and forth in the result set using `mysql_data_seek()` or `mysql_row_seek()` to change the current row position within the result set. You can also find out how many rows there are by calling `mysql_num_rows()`. On the other hand, the memory requirements for `mysql_store_result()` may be very high for large result sets and you are more likely to encounter out-of-memory conditions.

An advantage of `mysql_use_result()` is that the client requires less memory for the result set because it maintains only one row at a time (and because there is less allocation overhead, `mysql_use_result()` can be faster). Disadvantages are that you must process each row quickly to avoid tying up the server, you don't have random access to rows within the result set (you can only access rows sequentially), and you don't know how many rows are in the result set until you have retrieved them all. Furthermore, you **must** retrieve all the rows even if you determine in mid-retrieval that you've found the information you were looking for.

The API makes it possible for clients to respond appropriately to statements (retrieving rows only as necessary) without knowing whether the statement is a `SELECT`. You can do this by calling `mysql_store_result()` after each `mysql_query()` (or `mysql_real_query()`). If the result set call succeeds, the statement was a `SELECT` and you can read the rows. If the result set call fails, call `mysql_field_count()` to determine whether a result was actually to be expected. If `mysql_field_count()` returns zero, the statement returned no data (indicating that it was an `INSERT`, `UPDATE`, `DELETE`, and so forth), and was not expected to return rows. If `mysql_field_count()` is nonzero, the statement should have returned rows, but didn't. This indicates that the statement was a `SELECT` that failed. See the description for `mysql_field_count()` for an example of how this can be done.

Both `mysql_store_result()` and `mysql_use_result()` enable you to obtain information about the fields that make up the result set (the number of fields, their names and types, and so forth). You can access field information sequentially within the row by calling `mysql_fetch_field()` repeatedly, or by field number within the row by calling `mysql_fetch_field_direct()`. The current field cursor position may be changed by calling `mysql_field_seek()`. Setting the field cursor affects subsequent calls to `mysql_fetch_field()`. You can also get information for fields all at once by calling `mysql_fetch_fields()`.

For detecting and reporting errors, MySQL provides access to error information by means of the `mysql_errno()` and `mysql_error()` functions. These return the error code or error message for the most recently invoked function that can succeed or fail, enabling you to determine when an error occurred and what it was.

### 21.9.3. C API Function Descriptions

In the descriptions here, a parameter or return value of `NULL` means `NULL` in the sense of the C programming language, not a MySQL `NULL` value.

Functions that return a value generally return a pointer or an integer. Unless specified otherwise, functions returning a pointer return a non-`NULL` value to indicate success or a `NULL` value to indicate an error, and functions returning an integer return zero to indicate success or nonzero to indicate an error. Note that “nonzero” means just that. Unless the function description says otherwise, do not test against a value other than zero:

```
if (result) /* correct */
... error ...
if (result < 0) /* incorrect */
... error ...
if (result == -1) /* incorrect */
... error ...
```

When a function returns an error, the **Errors** subsection of the function description lists the possible types of errors. You can find out which of these occurred by calling `mysql_errno()`. A string representation of the error may be obtained by calling `mysql_error()`.

#### 21.9.3.1. mysql\_affected\_rows()

```
my_ulonglong mysql_affected_rows(MYSQL *mysql)
```

##### Description

`mysql_affected_rows()` may be called immediately after executing a statement with `mysql_query()` or `mysql_real_query()`. It returns the number of rows changed, deleted, or inserted by the last statement if it was an `UPDATE`, `DELETE`, or `INSERT`. For `SELECT` statements, `mysql_affected_rows()` works like `mysql_num_rows()`.

For `UPDATE` statements, the affected-rows value by default is the number of rows actually changed. If you specify the `CLIENT_FOUND_ROWS` flag to `mysql_real_connect()` when connecting to `mysqld`, the affected-rows value is the number of rows “found”; that is, matched by the `WHERE` clause.

For `REPLACE` statements, the affected-rows value is 2 if the new row replaced an old row, because in this case, one row was inserted after the duplicate was deleted.

For `INSERT ... ON DUPLICATE KEY UPDATE` statements, the affected-rows value is 1 if the row is inserted as a new row and 2 if an existing row is updated.

Following a `CALL` statement for a stored procedure, `mysql_affected_rows()` returns the value that it would return for the last statement executed within the procedure, or `0` if that statement would return `-1`. Within the procedure, you can use `ROW_COUNT()` at the SQL level to obtain the affected-rows value for individual statements.

### Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE` statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query returned an error or that, for a `SELECT` query, `mysql_affected_rows()` was called prior to calling `mysql_store_result()`.

Because `mysql_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

### Errors

None.

### Example

```
char *stmt = "UPDATE products SET cost=cost*1.25
 WHERE group=10";
mysql_query(&mysql,stmt);
printf("%ld products updated",
 (long) mysql_affected_rows(&mysql));
```

## 21.9.3.2. `mysql_autocommit()`

```
my_bool mysql_autocommit(MYSQL *mysql, my_bool mode)
```

### Description

Sets autocommit mode on if `mode` is 1, off if `mode` is 0.

### Return Values

Zero if successful. Nonzero if an error occurred.

### Errors

None.

## 21.9.3.3. `mysql_change_user()`

```
my_bool mysql_change_user(MYSQL *mysql, const char *user, const char *password, const
 char *db)
```

### Description

Changes the user and causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_change_user()` fails if the connected user cannot be authenticated or doesn't have permission to use the database. In this case, the user and database are not changed.

The `db` parameter may be set to `NULL` if you don't want to have a default database.

This command resets the state as if one had done a new connect. (See [Section 21.9.11, “Controlling Automatic Reconnection Behavior”](#).) It always performs a `ROLLBACK` of any active transactions, closes and drops all temporary tables, and unlocks all locked tables. Session system variables are reset to the values of the corresponding global system variables. Prepared statements are released and `HANDLER` variables are closed. Locks acquired with `GET_LOCK()` are released. These effects occur even if the user didn't change.

### Return Values

Zero for success. Nonzero if an error occurred.

### Errors

The same that you can get from `mysql_real_connect()`.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

- `ER_UNKNOWN_COM_ERROR`

The MySQL server doesn't implement this command (probably an old server).

- `ER_ACCESS_DENIED_ERROR`

The user or password was wrong.

- `ER_BAD_DB_ERROR`

The database didn't exist.

- `ER_DBACCESS_DENIED_ERROR`

The user did not have access rights to the database.

- `ER_WRONG_DB_NAME`

The database name was too long.

### Example

```
if (mysql_change_user(&mysql, "user", "password", "new_database"))
{
 fprintf(stderr, "Failed to change user. Error: %s\n",
 mysql_error(&mysql));
}
```

## 21.9.3.4. `mysql_character_set_name()`

```
const char *mysql_character_set_name(MYSQL *mysql)
```

### Description

Returns the default character set name for the current connection.

### Return Values

The default character set name

### Errors

None.

## 21.9.3.5. `mysql_close()`

```
void mysql_close(MYSQL *mysql)
```

**Description**

Closes a previously opened connection. `mysql_close()` also deallocates the connection handle pointed to by `mysql` if the handle was allocated automatically by `mysql_init()` or `mysql_connect()`.

**Return Values**

None.

**Errors**

None.

### 21.9.3.6. `mysql_commit()`

```
my_bool mysql_commit(MYSQL *mysql)
```

**Description**

Commits the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is 2, the server performs a release after terminating a transaction and closes the client connection. The client program should call `mysql_close()` to close the connection from the client side.

**Return Values**

Zero if successful. Nonzero if an error occurred.

**Errors**

None.

### 21.9.3.7. `mysql_connect()`

```
MYSQL *mysql_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd)
```

**Description**

This function is deprecated. Use `mysql_real_connect()` instead.

`mysql_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_connect()` must complete successfully before you can execute any of the other API functions, with the exception of `mysql_get_client_info()`.

The meanings of the parameters are the same as for the corresponding parameters for `mysql_real_connect()` with the difference that the connection parameter may be `NULL`. In this case, the C API allocates memory for the connection structure automatically and frees it when you call `mysql_close()`. The disadvantage of this approach is that you can't retrieve an error message if the connection fails. (To get error information from `mysql_errno()` or `mysql_error()`, you must provide a valid `MYSQL` pointer.)

**Return Values**

Same as for `mysql_real_connect()`.

**Errors**

Same as for `mysql_real_connect()`.

### 21.9.3.8. `mysql_create_db()`

```
int mysql_create_db(MYSQL *mysql, const char *db)
```

**Description**

Creates the database named by the `db` parameter.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `CREATE DATABASE` statement instead.

**Return Values**

Zero if the database was created successfully. Nonzero if an error occurred.

### Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### Example

```
if(mysql_create_db(&mysql, "my_database"))
{
 fprintf(stderr, "Failed to create new database. Error: %s\n",
 mysql_error(&mysql));
}
```

## 21.9.3.9. [mysql\\_data\\_seek\(\)](#)

```
void mysql_data_seek(MYSQL_RES *result, my_ulonglong offset)
```

### Description

Seeks to an arbitrary row in a query result set. The `offset` value is a row number and should be in the range from 0 to `mysql_num_rows(result)-1`.

This function requires that the result set structure contains the entire result of the query, so `mysql_data_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

### Return Values

None.

### Errors

None.

## 21.9.3.10. [mysql\\_debug\(\)](#)

```
void mysql_debug(const char *debug)
```

### Description

Does a `DEBUG_PUSH` with the given string. `mysql_debug()` uses the Fred Fish debug library. To use this function, you must compile the client library to support debugging. See [MySQL Internals: Porting](#).

### Return Values

None.

### Errors

None.

### Example

The call shown here causes the client library to generate a trace file in `/tmp/client.trace` on the client machine:

```
mysql_debug("d:t:o,/tmp/client.trace");
```

### 21.9.3.11. `mysql_drop_db()`

```
int mysql_drop_db(MYSQL *mysql, const char *db)
```

#### Description

Drops the database named by the `db` parameter.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `DROP DATABASE` statement instead.

#### Return Values

Zero if the database was dropped successfully. Nonzero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

#### Example

```
if(mysql_drop_db(&mysql, "my_database"))
 fprintf(stderr, "Failed to drop the database: Error: %s\n",
 mysql_error(&mysql));
```

### 21.9.3.12. `mysql_dump_debug_info()`

```
int mysql_dump_debug_info(MYSQL *mysql)
```

#### Description

Instructs the server to write some debug information to the log. For this to work, the connected user must have the `SUPER` privilege.

#### Return Values

Zero if the command was successful. Nonzero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.13. `mysql_eof()`

```
my_bool mysql_eof(MYSQL_RES *result)
```

#### Description

This function is deprecated. `mysql_errno()` or `mysql_error()` may be used instead.

`mysql_eof()` determines whether the last row of a result set has been read.

If you acquire a result set from a successful call to `mysql_store_result()`, the client receives the entire set in one operation. In this case, a `NULL` return from `mysql_fetch_row()` always means the end of the result set has been reached and it is unnecessary to call `mysql_eof()`. When used with `mysql_store_result()`, `mysql_eof()` always returns true.

On the other hand, if you use `mysql_use_result()` to initiate a result set retrieval, the rows of the set are obtained from the server one by one as you call `mysql_fetch_row()` repeatedly. Because an error may occur on the connection during this process, a `NULL` return value from `mysql_fetch_row()` does not necessarily mean the end of the result set was reached normally. In this case, you can use `mysql_eof()` to determine what happened. `mysql_eof()` returns a nonzero value if the end of the result set was reached and zero if an error occurred.

Historically, `mysql_eof()` predates the standard MySQL error functions `mysql_errno()` and `mysql_error()`. Because those error functions provide the same information, their use is preferred over `mysql_eof()`, which is deprecated. (In fact, they provide more information, because `mysql_eof()` returns only a boolean value whereas the error functions indicate a reason for the error when one occurs.)

#### Return Values

Zero if no error occurred. Nonzero if the end of the result set has been reached.

#### Errors

None.

#### Example

The following example shows how you might use `mysql_eof()`:

```
mysql_query(&mysql, "SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
 // do something with data
}
if(!mysql_eof(result)) // mysql_fetch_row() failed due to an error
{
 fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

However, you can achieve the same effect with the standard MySQL error functions:

```
mysql_query(&mysql, "SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
 // do something with data
}
if(mysql_errno(&mysql)) // mysql_fetch_row() failed due to an error
{
 fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

### 21.9.3.14. `mysql_errno()`

```
unsigned int mysql_errno(MYSQL *mysql)
```

#### Description

For the connection specified by `mysql`, `mysql_errno()` returns the error code for the most recently invoked API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B, Errors, Error Codes, and Common Problems](#).

Note that some functions like `mysql_fetch_row()` don't set `mysql_errno()` if they succeed.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_errno()` if they succeed.

MySQL-specific error numbers returned by `mysql_errno()` differ from SQLSTATE values returned by `mysql_sqlstate()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and `'42S02'` is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

### Return Values

An error code value for the last `mysql_xxx()` call, if it failed. zero means no error occurred.

### Errors

None.

## 21.9.3.15. `mysql_error()`

```
const char *mysql_error(MYSQL *mysql)
```

### Description

For the connection specified by `mysql`, `mysql_error()` returns a null-terminated string containing the error message for the most recently invoked API function that failed. If a function didn't fail, the return value of `mysql_error()` may be the previous error or an empty string to indicate no error.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_error()` if they succeed.

For functions that reset `mysql_error()`, the following two tests are equivalent:

```
if(*mysql_error(&mysql))
{
 // an error occurred
}

if(mysql_error(&mysql)[0])
{
 // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages. See [Section 9.2, “Setting the Error Message Language”](#).

### Return Values

A null-terminated character string that describes the error. An empty string if no error occurred.

### Errors

None.

## 21.9.3.16. `mysql_escape_string()`

You should use `mysql_real_escape_string()` instead!

This function is identical to `mysql_real_escape_string()` except that `mysql_real_escape_string()` takes a connection handler as its first argument and escapes the string according to the current character set. `mysql_escape_string()` does not take a connection argument and does not respect the current character set.

## 21.9.3.17. `mysql_fetch_field()`

```
MYSQL_FIELD *mysql_fetch_field(MYSQL_RES *result)
```

### Description

Returns the definition of one column of a result set as a `MYSQL_FIELD` structure. Call this function repeatedly to retrieve information about all columns in the result set. `mysql_fetch_field()` returns `NULL` when no more fields are left.

`mysql_fetch_field()` is reset to return information about the first field each time you execute a new `SELECT` query. The field returned by `mysql_fetch_field()` is also affected by calls to `mysql_field_seek()`.

If you've called `mysql_query()` to perform a `SELECT` on a table but have not called `mysql_store_result()`, MySQL returns the default blob length (8KB) if you call `mysql_fetch_field()` to ask for the length of a `BLOB` field. (The 8KB size is chosen because MySQL doesn't know the maximum length for the `BLOB`. This should be made configurable sometime.) Once you've retrieved the result set, `field->max_length` contains the length of the largest value for this column in the specific query.

### Return Values

The `MYSQL_FIELD` structure for the current column. `NULL` if no columns are left.

### Errors

None.

### Example

```
MYSQL_FIELD *field;
while((field = mysql_fetch_field(result)))
{
 printf("field name %s\n", field->name);
}
```

## 21.9.3.18. `mysql_fetch_field_direct()`

```
MYSQL_FIELD *mysql_fetch_field_direct(MYSQL_RES *result, unsigned int fieldnr)
```

### Description

Given a field number `fieldnr` for a column within a result set, returns that column's field definition as a `MYSQL_FIELD` structure. You may use this function to retrieve the definition for an arbitrary column. The value of `fieldnr` should be in the range from 0 to `mysql_num_fields(result)-1`.

### Return Values

The `MYSQL_FIELD` structure for the specified column.

### Errors

None.

### Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *field;

num_fields = mysql_num_fields(result);
for(i = 0; i < num_fields; i++)
{
 field = mysql_fetch_field_direct(result, i);
 printf("Field %u is %s\n", i, field->name);
}
```

## 21.9.3.19. `mysql_fetch_fields()`

```
MYSQL_FIELD *mysql_fetch_fields(MYSQL_RES *result)
```

### Description

Returns an array of all `MYSQL_FIELD` structures for a result set. Each structure provides the field definition for one column of the result set.

### Return Values

An array of `MYSQL_FIELD` structures for all columns of a result set.

### Errors

None.

### Example

```
unsigned int num_fields;
```

```

unsigned int i;
MYSQL_FIELD *fields;

num_fields = mysql_num_fields(result);
fields = mysql_fetch_fields(result);
for(i = 0; i < num_fields; i++)
{
 printf("Field %u is %s\n", i, fields[i].name);
}

```

### 21.9.3.20. `mysql_fetch_lengths()`

```
unsigned long *mysql_fetch_lengths(MYSQL_RES *result)
```

#### Description

Returns the lengths of the columns of the current row within a result set. If you plan to copy field values, this length information is also useful for optimization, because you can avoid calling `strlen()`. In addition, if the result set contains binary data, you **must** use this function to determine the size of the data, because `strlen()` returns incorrect results for any field containing null characters.

The length for empty columns and for columns containing `NULL` values is zero. To see how to distinguish these two cases, see the description for `mysql_fetch_row()`.

#### Return Values

An array of unsigned long integers representing the size of each column (not including any terminating null characters). `NULL` if an error occurred.

#### Errors

`mysql_fetch_lengths()` is valid only for the current row of the result set. It returns `NULL` if you call it before calling `mysql_fetch_row()` or after retrieving all rows in the result.

#### Example

```

MYSQL_ROW row;
unsigned long *lengths;
unsigned int num_fields;
unsigned int i;

row = mysql_fetch_row(result);
if (row)
{
 num_fields = mysql_num_fields(result);
 lengths = mysql_fetch_lengths(result);
 for(i = 0; i < num_fields; i++)
 {
 printf("Column %u is %lu bytes in length.\n",
 i, lengths[i]);
 }
}

```

### 21.9.3.21. `mysql_fetch_row()`

```
MYSQL_ROW mysql_fetch_row(MYSQL_RES *result)
```

#### Description

Retrieves the next row of a result set. When used after `mysql_store_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve. When used after `mysql_use_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve or if an error occurred.

The number of values in the row is given by `mysql_num_fields(result)`. If `row` holds the return value from a call to `mysql_fetch_row()`, pointers to the values are accessed as `row[0]` to `row[mysql_num_fields(result)-1]`. `NULL` values in the row are indicated by `NULL` pointers.

The lengths of the field values in the row may be obtained by calling `mysql_fetch_lengths()`. Empty fields and fields containing `NULL` both have length 0; you can distinguish these by checking the pointer for the field value. If the pointer is `NULL`, the field is `NULL`; otherwise, the field is empty.

#### Return Values

A `MYSQL_ROW` structure for the next row. `NULL` if there are no more rows to retrieve or if an error occurred.

#### Errors

Note that error is not reset between calls to `mysql_fetch_row()`

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### Example

```
MYSQL_ROW row;
unsigned int num_fields;
unsigned int i;

num_fields = mysql_num_fields(result);
while ((row = mysql_fetch_row(result)))
{
 unsigned long *lengths;
 lengths = mysql_fetch_lengths(result);
 for(i = 0; i < num_fields; i++)
 {
 printf("[%.*s] ", (int) lengths[i],
 row[i] ? row[i] : "NULL");
 }
 printf("\n");
}
```

## 21.9.3.22. `mysql_field_count()`

```
unsigned int mysql_field_count(MYSQL *mysql)
```

### Description

Returns the number of columns for the most recent query on the connection.

The normal use of this function is when `mysql_store_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SE-LECT`-like) statement. The example shown here illustrates how this may be done.

See [Section 21.9.10.1, “Why `mysql\_store\_result\(\)` Sometimes Returns `NULL` After `mysql\_query\(\)` Returns Success”](#).

### Return Values

An unsigned integer representing the number of columns in a result set.

### Errors

None.

### Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
 // error
}
else // query succeeded, process any data returned by it
{
 result = mysql_store_result(&mysql);
 if (result) // there are rows
 {
 num_fields = mysql_num_fields(result);
 // retrieve rows, then call mysql_free_result(result)
 }
 else // mysql_store_result() returned nothing; should it have?
 {
 if(mysql_field_count(&mysql) == 0)
 {
 // query does not return data
 // (it was not a SELECT)
 num_rows = mysql_affected_rows(&mysql);
 }
 else // mysql_store_result() should have returned data
 }
```

```
 } fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

An alternative is to replace the `mysql_field_count(&mysql)` call with `mysql_errno(&mysql)`. In this case, you are checking directly for an error from `mysql_store_result()` rather than inferring from the value of `mysql_field_count()` whether the statement was a SELECT.

### 21.9.3.23. `mysql_field_seek()`

```
MYSQL_FIELD_OFFSET mysql_field_seek(MYSQL_RES *result, MYSQL_FIELD_OFFSET offset)
```

#### Description

Sets the field cursor to the given offset. The next call to `mysql_fetch_field()` retrieves the field definition of the column associated with that offset.

To seek to the beginning of a row, pass an `offset` value of zero.

#### Return Values

The previous value of the field cursor.

#### Errors

None.

### 21.9.3.24. `mysql_field_tell()`

```
MYSQL_FIELD_OFFSET mysql_field_tell(MYSQL_RES *result)
```

#### Description

Returns the position of the field cursor used for the last `mysql_fetch_field()`. This value can be used as an argument to `mysql_field_seek()`.

#### Return Values

The current offset of the field cursor.

#### Errors

None.

### 21.9.3.25. `mysql_free_result()`

```
void mysql_free_result(MYSQL_RES *result)
```

#### Description

Frees the memory allocated for a result set by `mysql_store_result()`, `mysql_use_result()`, `mysql_list_dbs()`, and so forth. When you are done with a result set, you must free the memory it uses by calling `mysql_free_result()`.

Do not attempt to access a result set after freeing it.

#### Return Values

None.

#### Errors

None.

### 21.9.3.26. `mysql_get_character_set_info()`

```
void mysql_get_character_set_info(MYSQL *mysql, MY_CHARSET_INFO *cs)
```

#### Description

This function provides information about the default client character set. The default character set may be changed with the

`mysql_set_character_set()` function.

### Example

This example shows the fields that are available in the `MY_CHARSET_INFO` structure:

```
if (!mysql_set_character_set(&mysql, "utf8"))
{
 MY_CHARSET_INFO cs;
 mysql_get_character_set_info(&mysql, &cs);
 printf("character set information:\n");
 printf("character set+collation number: %d\n", cs.number);
 printf("character set name: %s\n", cs.name);
 printf("collation name: %s\n", cs.csname);
 printf("comment: %s\n", cs.comment);
 printf("directory: %s\n", cs.dir);
 printf("multi byte character min. length: %d\n", cs.mbminlen);
 printf("multi byte character max. length: %d\n", cs.mbmaxlen);
}
```

## 21.9.3.27. `mysql_get_client_info()`

```
const char *mysql_get_client_info(void)
```

### Description

Returns a string that represents the client library version.

### Return Values

A character string that represents the MySQL client library version.

### Errors

None.

## 21.9.3.28. `mysql_get_client_version()`

```
unsigned long mysql_get_client_version(void)
```

### Description

Returns an integer that represents the client library version. The value has the format `XYYZZ` where `X` is the major version, `YY` is the release level, and `ZZ` is the version number within the release level. For example, a value of `40102` represents a client library version of `4.1.2`.

### Return Values

An integer that represents the MySQL client library version.

### Errors

None.

## 21.9.3.29. `mysql_get_host_info()`

```
const char *mysql_get_host_info(MYSQL *mysql)
```

### Description

Returns a string describing the type of connection in use, including the server host name.

### Return Values

A character string representing the server host name and the connection type.

### Errors

None.

## 21.9.3.30. `mysql_get_proto_info()`

```
unsigned int mysql_get_proto_info(MYSQL *mysql)
```

**Description**

Returns the protocol version used by current connection.

**Return Values**

An unsigned integer representing the protocol version used by the current connection.

**Errors**

None.

### 21.9.3.31. `mysql_get_server_info()`

```
const char *mysql_get_server_info(MYSQL *mysql)
```

**Description**

Returns a string that represents the server version number.

**Return Values**

A character string that represents the server version number.

**Errors**

None.

### 21.9.3.32. `mysql_get_server_version()`

```
unsigned long mysql_get_server_version(MYSQL *mysql)
```

**Description**

Returns the version number of the server as an integer.

**Return Values**

A number that represents the MySQL server version in this format:

```
major_version*10000 + minor_version *100 + sub_version
```

For example, 5.1.5 is returned as 50105.

This function is useful in client programs for quickly determining whether some version-specific server capability exists.

**Errors**

None.

### 21.9.3.33. `mysql_get_ssl_cipher()`

```
const char *mysql_get_ssl_cipher(MYSQL *mysql)
```

**Description**

`mysql_get_ssl_cipher()` returns the SSL cipher used for the given connection to the server. `mysql` is the connection handler returned from `mysql_init()`.

This function was added in MySQL 5.1.11.

**Return Values**

A string naming the SSL cipher used for the connection, or `NULL` if no cipher is being used.

### 21.9.3.34. `mysql_hex_string()`

```
unsigned long mysql_hex_string(char *to, const char *from, unsigned long length)
```

**Description**

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 8.1.1, “Strings”](#).

The string in `from` is encoded to hexadecimal format, with each character encoded as two hexadecimal digits. The result is placed in `to` and a terminating null byte is appended.

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. When `mysql_hex_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

The return value can be placed into an SQL statement using either `0xvalue` or `X'value'` format. However, the return value does not include the `0x` or `X'...'`. The caller must supply whichever of those is desired.

### Example

```
char query[1000],*end;
end = strmov(query,"INSERT INTO test_table values(");
end = strmov(end,"0x");
end += mysql_hex_string(end,"What is this",12);
end = strmov(end,"0x");
end += mysql_hex_string(end,"binary data: \0\r\n",16);
*end++ = ')';
if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
 fprintf(stderr, "Failed to insert row, Error: %s\n",
 mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

### Return Values

The length of the value placed into `to`, not including the terminating null character.

### Errors

None.

## 21.9.3.35. `mysql_info()`

```
const char *mysql_info(MYSQL *mysql)
```

### Description

Retrieves a string providing information about the most recently executed statement, but only for the statements listed here. For other statements, `mysql_info()` returns `NULL`. The format of the string varies depending on the type of statement, as described here. The numbers are illustrative only; the string contains values appropriate for the statement.

- `INSERT INTO ... SELECT ...`  
String format: `Records: 100 Duplicates: 0 Warnings: 0`
- `INSERT INTO ... VALUES (...),(...),(...),...`  
String format: `Records: 3 Duplicates: 0 Warnings: 0`
- `LOAD DATA INFILE ...`  
String format: `Records: 1 Deleted: 0 Skipped: 0 Warnings: 0`
- `ALTER TABLE`  
String format: `Records: 3 Duplicates: 0 Warnings: 0`
- `UPDATE`  
String format: `Rows matched: 40 Changed: 40 Warnings: 0`

Note that `mysql_info()` returns a non-`NULL` value for `INSERT ... VALUES` only for the multiple-row form of the statement (that is, only if multiple value lists are specified).

## Return Values

A character string representing additional information about the most recently executed statement. `NULL` if no information is available for the statement.

## Errors

None.

### 21.9.3.36. `mysql_init()`

```
MYSQL *mysql_init(MYSQL *mysql)
```

#### Description

Allocates or initializes a `MYSQL` object suitable for `mysql_real_connect()`. If `mysql` is a `NULL` pointer, the function allocates, initializes, and returns a new object. Otherwise, the object is initialized and the address of the object is returned. If `mysql_init()` allocates a new object, it is freed when `mysql_close()` is called to close the connection.

#### Return Values

An initialized `MYSQL*` handle. `NULL` if there was insufficient memory to allocate a new object.

#### Errors

In case of insufficient memory, `NULL` is returned.

### 21.9.3.37. `mysql_insert_id()`

```
my_ulonglong mysql_insert_id(MYSQL *mysql)
```

#### Description

Returns the value generated for an `AUTO_INCREMENT` column by the previous `INSERT` or `UPDATE` statement. Use this function after you have performed an `INSERT` statement into a table that contains an `AUTO_INCREMENT` field, or have used `INSERT` or `UPDATE` to set a column value with `LAST_INSERT_ID(expr)`.

The return value of `mysql_insert_id()` is always zero unless explicitly updated under one of the following conditions:

- `INSERT` statements that store a value into an `AUTO_INCREMENT` column. This is true whether the value is automatically generated by storing the special values `NULL` or `0` into the column, or is an explicit nonspecial value.
- In the case of a multiple-row `INSERT` statement, the return value of `mysql_insert_id()` depends on the MySQL server version.

In MySQL 5.1.12 and later, `mysql_insert_id()` returns the *first* automatically generated `AUTO_INCREMENT` value that was *successfully* inserted. In MySQL 5.1.11 and earlier, `mysql_insert_id()` returns the *first* automatically generated `AUTO_INCREMENT` value, regardless of whether insertion of that value was successful.

If no rows are successfully inserted, `mysql_insert_id()` returns 0.

- Starting in MySQL 5.1.12, if an `INSERT ... SELECT` statement is executed, and no automatically generated value is successfully inserted, `mysql_insert_id()` returns the ID of the last inserted row.
- Starting in MySQL 5.1.12, if an `INSERT ... SELECT` statement uses `LAST_INSERT_ID(expr)`, `mysql_insert_id()` returns `expr`.
- `INSERT` statements that generate an `AUTO_INCREMENT` value by inserting `LAST_INSERT_ID(expr)` into any column or by updating any column to `LAST_INSERT_ID(expr)`.
- If the previous statement returned an error, the value of `mysql_insert_id()` is undefined.

For 5.1.12 and later, the return value of `mysql_insert_id()` can be simplified to the following sequence:

1. If there is an `AUTO_INCREMENT` column, and an automatically generated value was successfully inserted, return the first such value.
2. If `LAST_INSERT_ID(expr)` occurred in the statement, return `expr`, even if there was an `AUTO_INCREMENT` column in

the affected table.

3. The return value varies depending on the statement used. When called after an `INSERT` statement:

- If there is an `AUTO_INCREMENT` column in the table, and there were some explicit values for this column that were successfully inserted into the table, return the last of the explicit values.

When called after an `INSERT ... ON DUPLICATE KEY UPDATE` statement:

- If there is an `AUTO_INCREMENT` column in the table and there were some explicit successfully inserted values, or some updated rows, return the last of the inserted or updated values.

`mysql_insert_id()` returns 0 if the previous statement does not use an `AUTO_INCREMENT` value. If you need to save the value for later, be sure to call `mysql_insert_id()` immediately after the statement that generates the value.

The value of `mysql_insert_id()` is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

The `LAST_INSERT_ID()` SQL function returns the value of the first automatically generated value that was successfully inserted (starting from 5.1.12) or the first automatically generated value if any rows were successfully inserted (before 5.1.12).

`LAST_INSERT_ID()` is not reset between statements because the value of that function is maintained in the server. Another difference from `mysql_insert_id()` is that `LAST_INSERT_ID()` is not updated if you set an `AUTO_INCREMENT` column to a specific nonspecial value. See [Section 11.14, “Information Functions”](#).

`mysql_insert_id()` returns 0 following a `CALL` statement for a stored procedure that generates an `AUTO_INCREMENT` value because in this case `mysql_insert_id()` applies to `CALL` and not the statement within the procedure. Within the procedure, you can use `LAST_INSERT_ID()` at the SQL level to obtain the `AUTO_INCREMENT` value.

The reason for the differences between `LAST_INSERT_ID()` and `mysql_insert_id()` is that `LAST_INSERT_ID()` is made easy to use in scripts while `mysql_insert_id()` tries to provide more exact information about what happens to the `AUTO_INCREMENT` column.

## Return Values

Described in the preceding discussion.

## Errors

None.

### 21.9.3.38. `mysql_kill()`

```
int mysql_kill(MYSQL *mysql, unsigned long pid)
```

## Description

Asks the server to kill the thread specified by `pid`.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `KILL` statement instead.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.39. `mysql_library_end()`

```
void mysql_library_end(void)
```

#### Description

This function finalizes the MySQL library. You should call it when you are done using the library (for example, after disconnecting from the server). The action taken by the call depends on whether your application is linked to the MySQL client library or the MySQL embedded server library. For a client program linked against the `libmysqlclient` library by using the `-lmysqlclient` flag, `mysql_library_end()` performs some memory management to clean up. For an embedded server application linked against the `libmysqld` library by using the `-lmysqld` flag, `mysql_library_end()` shuts down the embedded server and then cleans up.

For usage information, see [Section 21.9.2, “C API Function Overview”](#), and [Section 21.9.3.40, “`mysql\_library\_init\(\)`”](#).

### 21.9.3.40. `mysql_library_init()`

```
int mysql_library_init(int argc, char **argv, char **groups)
```

#### Description

This function should be called to initialize the MySQL library before you call any other MySQL function, whether your application is a regular client program or uses the embedded server. If the application uses the embedded server, this call starts the server and initializes any subsystems (`mysys`, `InnoDB`, and so forth) that the server uses.

After your application is done using the MySQL library, call `mysql_library_end()` to clean up. See [Section 21.9.3.39, “`mysql\_library\_end\(\)`”](#).

The choice of whether the application operates as a regular client or uses the embedded server depends on whether you use the `libmysqlclient` or `libmysqld` library at link time to produce the final executable. For additional information, see [Section 21.9.2, “C API Function Overview”](#).

In a nonmulti-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly through `mysql_init()`. This should be done prior to any other client library call.

The `argc` and `argv` arguments are analogous to the arguments to `main()`, and enable passing of options to the embedded server. For convenience, `argc` may be `0` (zero) if there are no command-line arguments for the server. This is the usual case for applications intended for use only as regular (nonembedded) clients, and the call typically is written as `mysql_library_init(0, NULL, NULL)`.

```
#include <mysql.h>
#include <stdlib.h>

int main(void) {
 if (mysql_library_init(0, NULL, NULL)) {
 fprintf(stderr, "could not initialize MySQL library\n");
 exit(1);
 }
 /* Use any MySQL API functions here */
 mysql_library_end();
 return EXIT_SUCCESS;
}
```

When arguments are to be passed (`argc` is greater than `0`), the first element of `argv` is ignored (it typically contains the program name). `mysql_library_init()` makes a copy of the arguments so it is safe to destroy `argv` or `groups` after the call.

For embedded applications, if you want to connect to an external server without starting the embedded server, you have to specify a negative value for `argc`.

The `groups` argument should be an array of strings that indicate the groups in option files from which options should be read. See [Section 4.2.3.3, “Using Option Files”](#). The final entry in the array should be `NUL`. For convenience, if the `groups` argument itself is `NULL`, the `[server]` and `[embedded]` groups are used by default.

```
#include <mysql.h>
```

```
#include <stdlib.h>

static char *server_args[] = {
 "this_program", /* this string is not used */
 "--datadir=.",
 "--key_buffer_size=32M"
};
static char *server_groups[] = {
 "embedded",
 "server",
 "this_program_SERVER",
 (char *)NULL
};

int main(void) {
 if (mysql_library_init(sizeof(server_args) / sizeof(char *),
 server_args, server_groups)) {
 fprintf(stderr, "could not initialize MySQL library\n");
 exit(1);
 }
 /* Use any MySQL API functions here */
 mysql_library_end();
 return EXIT_SUCCESS;
}
```

#### Return Values

Zero if successful. Nonzero if an error occurred.

### 21.9.3.41. `mysql_list_dbs()`

```
MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)
```

#### Description

Returns a result set consisting of database names on the server that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “\_”, or may be a `NULL` pointer to match all databases. Calling `mysql_list_dbs()` is similar to executing the query `SHOW DATABASES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

#### Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.42. `mysql_list_fields()`

```
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char *wild)
```

#### Description

Returns a result set consisting of field names in the given table that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “\_”, or may be a `NULL` pointer to match all fields. Calling `mysql_list_fields()` is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild]`.

It is preferable to use `SHOW COLUMNS FROM tbl_name` instead of `mysql_list_fields()`.

You must free the result set with `mysql_free_result()`.

#### Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.43. `mysql_list_processes()`

```
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

#### Description

Returns a result set describing the current server threads. This is the same kind of information as that reported by `mysqladmin processlist` or a `SHOW PROCESSLIST` query.

You must free the result set with `mysql_free_result()`.

#### Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.44. `mysql_list_tables()`

```
MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)
```

#### Description

---

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “\_”, or may be a `NULL` pointer to match all tables. Calling `mysql_list_tables()` is similar to executing the query `SHOW TABLES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

#### Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.45. `mysql_more_results()`

```
my_bool mysql_more_results(MYSQL *mysql)
```

#### Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute `CALL` statements, which can return multiple result sets.

`mysql_more_results()` true if more results exist from the currently executed statement, in which case the application must call `mysql_next_result()` to fetch the results.

#### Return Values

`TRUE` (1) if more results exist. `FALSE` (0) if no more results exist.

In most cases, you can call `mysql_next_result()` instead to test whether more results exist and initiate retrieval if so.

See [Section 21.9.12, “C API Support for Multiple Statement Execution”](#), and [Section 21.9.3.46, “mysql\\_next\\_result\(\)”](#).

#### Errors

None.

### 21.9.3.46. `mysql_next_result()`

```
int mysql_next_result(MYSQL *mysql)
```

#### Description

This function is used when you execute multiple statements specified as a single statement string, or when you use `CALL` statements to execute stored procedures, which can return multiple result sets.

`mysql_next_result()` reads the next statement result and returns a status to indicate whether more results exist. If `mysql_next_result()` returns an error, there are no more results.

Before each call to `mysql_next_result()`, you must call `mysql_free_result()` for the current statement if it is a statement that returned a result set (rather than just a result status).

After calling `mysql_next_result()` the state of the connection is as if you had called `mysql_real_query()` or `mysql_query()` for the next statement. This means that you can call `mysql_store_result()`,

`mysql_warning_count()`, `mysql_affected_rows()`, and so forth.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, you should process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`).

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_next_result()` to advance to the next result.

For an example that shows how to use `mysql_next_result()`, see [Section 21.9.12, “C API Support for Multiple Statement Execution”](#).

#### Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order. For example, if you didn't call `mysql_use_result()` for a previous result set.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.47. `mysql_num_fields()`

```
unsigned int mysql_num_fields(MYSQL_RES *result)
```

To pass a `MYSQL*` argument instead, use `unsigned int mysql_field_count(MYSQL *mysql)`.

#### Description

Returns the number of columns in a result set.

Note that you can get the number of columns either from a pointer to a result set or to a connection handle. You would use the connection handle if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See [Section 21.9.10.1, “Why `mysql\_store\_result\(\)` Sometimes Returns `NULL` After `mysql\_query\(\)` Returns Success”](#).

#### Return Values

An unsigned integer representing the number of columns in a result set.

#### Errors

None.

### Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
 // error
}
else // query succeeded, process any data returned by it
{
 result = mysql_store_result(&mysql);
 if (result) // there are rows
 {
 num_fields = mysql_num_fields(result);
 // retrieve rows, then call mysql_free_result(result)
 }
 else // mysql_store_result() returned nothing; should it have?
 {
 if (mysql_errno(&mysql))
 {
 fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
 }
 else if (mysql_field_count(&mysql) == 0)
 {
 // query does not return data
 // (it was not a SELECT)
 num_rows = mysql_affected_rows(&mysql);
 }
 }
}
```

An alternative (if you know that your query should have returned a result set) is to replace the `mysql_errno(&mysql)` call with a check whether `mysql_field_count(&mysql)` returns 0. This happens only if something went wrong.

## 21.9.3.48. `mysql_num_rows()`

```
my_ulonglong mysql_num_rows(MYSQL_RES *result)
```

### Description

Returns the number of rows in the result set.

The use of `mysql_num_rows()` depends on whether you use `mysql_store_result()` or `mysql_use_result()` to return the result set. If you use `mysql_store_result()`, `mysql_num_rows()` may be called immediately. If you use `mysql_use_result()`, `mysql_num_rows()` does not return the correct value until all the rows in the result set have been retrieved.

`mysql_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_affected_rows()`.

### Return Values

The number of rows in the result set.

### Errors

None.

## 21.9.3.49. `mysql_options()`

```
int mysql_options(MYSQL *mysql, enum mysql_option option, const void *arg)
```

### Description

Can be used to set extra connect options and affect behavior for a connection. This function may be called multiple times to set several options.

`mysql_options()` should be called after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, `arg` should point to the value of the integer.

The following list describes the possible options, their effect, and how `arg` is used for each option. Several of the options apply only when the application is linked against the `libmysqld` embedded server library and are unused for applications linked against

the `libmysql` client library. For option descriptions that indicate `arg` is unused, its value is irrelevant; it is conventional to pass 0.

- `MYSQL_INIT_COMMAND` (argument type: `char *`)

SQL statement to execute when connecting to the MySQL server. Automatically re-executed if reconnection occurs.

- `MYSQL_OPT_COMPRESS` (argument: not used)

Use the compressed client/server protocol.

- `MYSQL_OPT_CONNECT_TIMEOUT` (argument type: `unsigned int *`)

Connect timeout in seconds.

- `MYSQL_OPT_GUESS_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this enables the library to guess whether to use the embedded server or a remote server. “Guess” means that if the host name is set and is not `localhost`, it uses a remote server. This behavior is the default. `MYSQL_OPT_USE_EMBEDDED_CONNECTION` and `MYSQL_OPT_USE_REMOTE_CONNECTION` can be used to override it. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_LOCAL_INFILE` (argument type: optional pointer to `unsigned int`)

If no pointer is given or if pointer points to an `unsigned int` that has a nonzero value, the `LOAD LOCAL INFILE` statement is enabled.

- `MYSQL_OPT_NAMED_PIPE` (argument: not used)

Use named pipes to connect to a MySQL server on Windows, if the server permits named-pipe connections.

- `MYSQL_OPT_PROTOCOL` (argument type: `unsigned int *`)

Type of protocol to use. Should be one of the enum values of `mysql_protocol_type` defined in `mysql.h`.

- `MYSQL_OPT_READ_TIMEOUT` (argument type: `unsigned int *`)

The timeout in seconds for attempts to read from the server. Each attempt uses this timeout value and there are retries if necessary, so the total effective timeout value is three times the option value. You can set the value so that a lost connection can be detected earlier than the TCP/IP `Close_Wait_Timeout` value of 10 minutes. This option works only for TCP/IP connections and, prior to MySQL 5.1.12, only for Windows.

- `MYSQL_OPT_RECONNECT` (argument type: `my_bool *`)

Enable or disable automatic reconnection to the server if the connection is found to have been lost. Reconnect is off by default; this option provides a way to set reconnection behavior explicitly.

Note: `mysql_real_connect()` incorrectly reset the `MYSQL_OPT_RECONNECT` option to its default value before MySQL 5.1.6. Therefore, prior to that version, if you want reconnect to be enabled for each connection, you must call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option after each call to `mysql_real_connect()`. This is not necessary as of 5.1.6: Call `mysql_options()` only before `mysql_real_connect()` as usual.

- `MYSQL_SET_CLIENT_IP` (argument type: `char *`)

For an application linked against the `libmysqld` embedded server library (when `libmysqld` is compiled with authentication support), this means that the user is considered to have connected from the specified IP address (specified as a string) for authentication purposes. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` (argument type: `my_bool *`)

Enable or disable verification of the server's Common Name value in its certificate against the host name used when connecting to the server. The connection is rejected if there is a mismatch. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default. Added in MySQL 5.1.11.

- `MYSQL_OPT_USE_EMBEDDED_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this forces the use of the embedded server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_REMOTE_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this forces the use of a remote server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_RESULT` (argument: not used)

This option is unused.

- `MYSQL_OPT_WRITE_TIMEOUT` (argument type: `unsigned int *`)

The timeout in seconds for attempts to write to the server. Each attempt uses this timeout value and there are `net_retry_count` retries if necessary, so the total effective timeout value is `net_retry_count` times the option value. This option works only for TCP/IP connections and, prior to MySQL 5.1.12, only for Windows.

- `MYSQL_READ_DEFAULT_FILE` (argument type: `char *`)

Read options from the named option file instead of from `my.cnf`.

- `MYSQL_READ_DEFAULT_GROUP` (argument type: `char *`)

Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE`.

- `MYSQL_REPORT_DATA_TRUNCATION` (argument type: `my_bool *`)

Enable or disable reporting of data truncation errors for prepared statements using the `error` member of `MYSQL_BIND` structures. (Default: enabled.)

- `MYSQL_SECURE_AUTH` (argument type: `my_bool *`)

Whether to connect to a server that does not support the password hashing used in MySQL 4.1.1 and later.

- `MYSQL_SET_CHARSET_DIR` (argument type: `char *`)

The path name to the directory that contains character set definition files.

- `MYSQL_SET_CHARSET_NAME` (argument type: `char *`)

The name of the character set to use as the default character set.

- `MYSQL_SHARED_MEMORY_BASE_NAME` (argument type: `char *`)

The name of the shared-memory object for communication to the server on Windows, if the server supports shared-memory connections. Should have the same value as the `--shared-memory-base-name` option used for the `mysqld` server you want to connect to.

The `client` group is always read if you use `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP`.

The specified group in the option file may contain the following options.

Option	Description
<code>character-sets-dir=path</code>	The directory where character sets are installed.
<code>compress</code>	Use the compressed client/server protocol.
<code>connect-timeout=seconds</code>	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.
<code>database=db_name</code>	Connect to this database if no database was specified in the connect command.
<code>debug</code>	Debug options.
<code>default-character-set=char-set_name</code>	The default character set to use.
<code>disable-local-infile</code>	Disable use of <code>LOAD DATA LOCAL</code> .
<code>host=host_name</code>	Default host name.
<code>init-command=stmt</code>	Statement to execute when connecting to MySQL server. Automatically re-executed if reconnection occurs.
<code>interactive-timeout=seconds</code>	Same as specifying <code>CLIENT_INTERACTIVE</code> to <code>mysql_real_connect()</code> . See <a href="#">Section 21.9.3.52, “mysql_real_connect()”</a> .
<code>local-infile[={0 1}]</code>	If no argument or nonzero argument, enable use of <code>LOAD DATA LOCAL</code> ; other-

	wise disable.
<code>max_allowed_packet=bytes</code>	Maximum size of packet that client can read from server.
<code>multi-queries, multi-results</code>	Enable multiple result sets from multiple-statement executions or stored procedures.
<code>multi-statements</code>	Enable the client to send multiple statements in a single string (separated by “;”).
<code>password=password</code>	Default password.
<code>pipe</code>	Use named pipes to connect to a MySQL server on Windows.
<code>port=port_num</code>	Default port number.
<code>proto={TCP SOCKET PIPE MEMORY}</code>	The protocol to use when connecting to the server.
<code>return-found-rows</code>	Tell <code>mysql_info()</code> to return found rows instead of updated rows when using <code>UPDATE</code> .
<code>shared-memory-base-name=name</code>	Shared-memory name to use to connect to server.
<code>socket=path</code>	Default socket file.
<code>ssl-ca=file_name</code>	Certificate Authority file.
<code>ssl-capath=path</code>	Certificate Authority directory.
<code>ssl-cert=file_name</code>	Certificate file.
<code>ssl-cipher=cipher_list</code>	Permissible SSL ciphers.
<code>ssl-key=file_name</code>	Key file.
<code>timeout=seconds</code>	Like <code>connect-timeout</code> .
<code>user</code>	Default user.

`timeout` has been replaced by `connect-timeout`, but `timeout` is still supported in MySQL 5.1 for backward compatibility.

For more information about option files, see [Section 4.2.3.3, “Using Option Files”](#).

Before MySQL 5.1.18, the `arg` argument was declared as `char *`.

## Return Values

Zero for success. Nonzero if you specify an unknown option.

## Example

The following `mysql_options()` calls request the use of compression in the client/server protocol, cause options to be read from the `[odbc]` group of option files, and disable transaction autocommit mode:

```
MYSQL mysql;
mysql_init(&mysql);
mysql_options(&mysql,MYSQL_OPT_COMPRESS,0);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"odbc");
mysql_options(&mysql,MYSQL_INIT_COMMAND,"SET autocommit=0");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
 fprintf(stderr, "Failed to connect to database: Error: %s\n",
 mysql_error(&mysql));
}
```

This code requests that the client use the compressed client/server protocol and read the additional options from the `odbc` section in the `my.cnf` file.

## 21.9.3.50. `mysql_ping()`

```
int mysql_ping(MYSQL *mysql)
```

### Description

Checks whether the connection to the server is working. If the connection has gone down and auto-reconnect is enabled an attempt to reconnect is made. If the connection is down and auto-reconnect is disabled, `mysql_ping()` returns an error.

Auto-reconnect is disabled by default. To enable it, call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option. For details, see [Section 21.9.3.49, “mysql\\_options\(\)”](#).

`mysql_ping()` can be used by clients that remain idle for a long while, to check whether the server has closed the connection

and reconnect if necessary.

If `mysql_ping()` does cause a reconnect, there is no explicit indication of it. To determine whether a reconnect occurs, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier has changed.

If reconnect occurs, some characteristics of the connection will have been reset. For details about these characteristics, see [Section 21.9.11, “Controlling Automatic Reconnection Behavior”](#).

#### Return Values

Zero if the connection to the server is active. Nonzero if an error occurred. A nonzero return does not indicate whether the MySQL server itself is down; the connection might be broken for other reasons such as network problems.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.51. `mysql_query()`

```
int mysql_query(MYSQL *mysql, const char *stmt_str)
```

#### Description

Executes the SQL statement pointed to by the null-terminated string `stmt_str`. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (“`;`”) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 21.9.12, “C API Support for Multiple Statement Execution”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the “`\0`” character, which `mysql_query()` interprets as the end of the statement string.)

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 21.9.3.22, “mysql\\_field\\_count\(\)”](#).

#### Return Values

Zero if the statement was successful. Nonzero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.52. `mysql_real_connect()`

```
MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char *user, const char
*passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long cli-
ent_flag)
```

### Description

`mysql_real_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_real_connect()` must complete successfully before you can execute any other API functions that require a valid MySQL connection handle structure.

The parameters are specified as follows:

- The first parameter should be the address of an existing MySQL structure. Before calling `mysql_real_connect()` you must call `mysql_init()` to initialize the MySQL structure. You can change a lot of connect options with the `mysql_options()` call. See Section 21.9.3.49, “`mysql_options()`”.
- The value of `host` may be either a host name or an IP address. If `host` is `NULL` or the string “`localhost`”, a connection to the local host is assumed: For Windows, the client connects using a shared-memory connection, if the server has shared-memory connections enabled. Otherwise, TCP/IP is used. For Unix, the client connects using a Unix socket file. For local connections, you can also influence the type of connection to use with the `MYSQL_OPT_PROTOCOL` or `MYSQL_OPT_NAMED_PIPE` options to `mysql_options()`. The type of connection must be supported by the server. For a `host` value of “`.`” on Windows, the client connects using a named pipe, if the server has named-pipe connections enabled. If named-pipe connections are not enabled, an error occurs.
- The `user` parameter contains the user's MySQL login ID. If `user` is `NULL` or the empty string “`''`”, the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current user name must be specified explicitly. See the MyODBC section of Chapter 21, *Connectors and APIs*.
- The `passwd` parameter contains the password for `user`. If `passwd` is `NULL`, only entries in the `user` table for the user that have a blank (empty) password field are checked for a match. This enables the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

### Note

Do not attempt to encrypt the password before calling `mysql_real_connect()`; password encryption is handled automatically by the client API.

- The `user` and `passwd` parameters use whatever character set has been configured for the MySQL object. By default, this is `latin1`, but can be changed by calling `mysql_options(mysql, MYSQL_SET_CHARSET_NAME, "charset_name")` prior to connecting.
- `db` is the database name. If `db` is not `NULL`, the connection sets the default database to this value.
- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.
- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe that should be used. Note that the `host` parameter determines the type of the connection.
- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features.

Flag Name	Flag Description
<code>CLIENT_COMPRESS</code>	Use compression protocol.
<code>CLIENT_FOUND_ROWS</code>	Return the number of found (matched) rows, not the number of changed rows.
<code>CLIENT_IGNORE_SIGPIPE</code>	Prevents the client library from installing a <code>SIGPIPE</code> signal handler. This can be used to avoid conflicts with a handler that the application has already installed.
<code>CLIENT_IGNORE_SPACE</code>	Permit spaces after function names. Makes all functions names reserved words.
<code>CLIENT_INTERACTIVE</code>	Permit <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection. The client's session <code>wait_timeout</code> variable is set to the value of the session <code>interactive_timeout</code> variable.
<code>CLIENT_LOCAL_FILES</code>	Enable <code>LOAD DATA LOCAL</code> handling.
<code>CLIENT_MULTI_RESULTS</code>	Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This flag is automatically enabled if <code>CLIENT_MULTI_STATEMENTS</code> is enabled. See the note following this table for more information about this flag.
<code>CLIENT_MULTI_STATEMENTS</code>	Tell the server that the client may send multiple statements in a single string

	(separated by “;”). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag.
<code>CLIENT_NO_SCHEMA</code>	Do not permit the <code>db_name.tbl_name.col_name</code> syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.
<code>CLIENT_ODBC</code>	Unused.
<code>CLIENT_SSL</code>	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the client library. Instead, use <code>mysql_ssl_set()</code> before calling <code>mysql_real_connect()</code> .
<code>CLIENT_REMEMBER_OPTIONS</code>	Remember options specified by calls to <code>mysql_options()</code> . Without this option, if <code>mysql_real_connect()</code> fails, you must repeat the <code>mysql_options()</code> calls before trying to connect again. With this option, the <code>mysql_options()</code> calls need not be repeated.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, you should process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`).

If you enable `CLIENT_MULTI_STATEMENTS` or `CLIENT_MULTI_RESULTS`, you should process the result for every call to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 21.9.12, “C API Support for Multiple Statement Execution”](#).

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the `mysql_real_connect()` call. To do this, call `mysql_options()` with the `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP` option before calling `mysql_real_connect()`. Then, in the `mysql_real_connect()` call, specify the “no-value” value for each parameter to be read from an option file:

- For `host`, specify a value of `NULL` or the empty string ("").
- For `user`, specify a value of `NULL` or the empty string.
- For `passwd`, specify a value of `NULL`. (For the password, a value of the empty string in the `mysql_real_connect()` call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For `db`, specify a value of `NULL` or the empty string.
- For `port`, specify a value of 0.
- For `unix_socket`, specify a value of `NULL`.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

## Return Values

A `MYSQL*` connection handle if the connection was successful, `NULL` if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

## Errors

- `CR_CONN_HOST_ERROR`  
Failed to connect to the MySQL server.
- `CR_CONNECTION_ERROR`  
Failed to connect to the local MySQL server.

- [CR\\_IPSOCK\\_ERROR](#)  
Failed to create an IP socket.
- [CR\\_OUT\\_OF\\_MEMORY](#)  
Out of memory.
- [CR\\_SOCKET\\_CREATE\\_ERROR](#)  
Failed to create a Unix socket.
- [CR\\_UNKNOWN\\_HOST](#)  
Failed to find the IP address for the host name.
- [CR\\_VERSION\\_ERROR](#)  
A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version.
- [CR\\_NAMEDPIPEOPEN\\_ERROR](#)  
Failed to create a named pipe on Windows.
- [CR\\_NAMEDPIPEWAIT\\_ERROR](#)  
Failed to wait for a named pipe on Windows.
- [CR\\_NAMEDPIPESETSTATE\\_ERROR](#)  
Failed to get a pipe handler on Windows.
- [CR\\_SERVER\\_LOST](#)  
If `connect_timeout` > 0 and it took longer than `connect_timeout` seconds to connect to the server or if the server died while executing the `init-command`.

### Example

```
MYSQL mysql;
mysql_init(&mysql);
mysql_options(&mysql, MYSQL_READ_DEFAULT_GROUP, "your_prog_name");
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
 fprintf(stderr, "Failed to connect to database: Error: %s\n",
 mysql_error(&mysql));
}
```

By using `mysql_options()` the MySQL library reads the `[client]` and `[your_prog_name]` sections in the `my.cnf` file which ensures that your program works, even if someone has set up MySQL in some nonstandard way.

Note that upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of 1 in versions of the API older than 5.0.3, or 0 in newer versions. A value of 1 for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior.

### 21.9.3.53. `mysql_real_escape_string()`

```
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const char *from, unsigned long length)
```

Note that `mysql` must be a valid, open connection. This is needed because the escaping depends on the character set in use by the server.

#### Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 8.1.1, “Strings”](#).

The string in `from` is encoded to an escaped SQL string, taking into account the current character set of the connection. The result is placed in `to` and a terminating null byte is appended. Characters encoded are `NUL` (ASCII 0), “`\n`”, “`\r`”, “`\`”, “`'`”, “`"`”, and Control-Z (see [Section 8.1, “Literal Values”](#)). (Strictly speaking, MySQL requires only that backslash and the quote character used

to quote the string in the query be escaped. This function quotes the other characters to make them easier to read in log files.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and you need room for the terminating null byte.) When `mysql_real_escape_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

If you need to change the character set of the connection, you should use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string()`, which `SET NAMES` does not.

### Example

```
char query[1000],*end;
end = strmov(query,"INSERT INTO test_table values(");
*end++ = '\'';
end += mysql_real_escape_string(&mysql, end,"What is this",12);
*end++ = '\'';
*end++ = '\'';
*end++ = '\'';
end += mysql_real_escape_string(&mysql, end,"binary data: \0\r\n",16);
*end++ = '\'';
*end++ = ')';
if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
 fprintf(stderr, "Failed to insert row, Error: %s\n",
 mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

### Return Values

The length of the value placed into `to`, not including the terminating null character.

### Errors

None.

## 21.9.3.54. `mysql_real_query()`

```
int mysql_real_query(MYSQL *mysql, const char *stmt_str, unsigned long length)
```

### Description

Executes the SQL statement pointed to by `stmt_str`, which should be a string `length` bytes long. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (“;”) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 21.9.12, “C API Support for Multiple Statement Execution”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the “\0” character, which `mysql_query()` interprets as the end of the statement string.) In addition, `mysql_real_query()` is faster than `mysql_query()` because it does not call `strlen()` on the statement string.

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 21.9.3.22, “mysql\\_field\\_count\(\)”](#).

### Return Values

Zero if the statement was successful. Nonzero if an error occurred.

### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### 21.9.3.55. `mysql_refresh()`

```
int mysql_refresh(MYSQL *mysql, unsigned int options)
```

#### Description

This function flushes tables or caches, or resets replication server information. The connected user must have the [RELOAD](#) privilege.

The `options` argument is a bit mask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.

- [REFRESH\\_GRANT](#)

Refresh the grant tables, like [FLUSH PRIVILEGES](#).

- [REFRESH\\_LOG](#)

Flush the logs, like [FLUSH LOGS](#).

- [REFRESH\\_TABLES](#)

Flush the table cache, like [FLUSH TABLES](#).

- [REFRESH\\_HOSTS](#)

Flush the host cache, like [FLUSH HOSTS](#).

- [REFRESH\\_STATUS](#)

Reset status variables, like [FLUSH STATUS](#).

- [REFRESH\\_THREADS](#)

Flush the thread cache.

- [REFRESH\\_SLAVE](#)

On a slave replication server, reset the master server information and restart the slave, like [RESET SLAVE](#).

- [REFRESH\\_MASTER](#)

On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like [RESET MASTER](#).

#### Return Values

Zero for success. Nonzero if an error occurred.

#### Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### 21.9.3.56. [mysql\\_reload\(\)](#)

```
int mysql_reload(MYSQL *mysql)
```

#### Description

Asks the MySQL server to reload the grant tables. The connected user must have the [RELOAD](#) privilege.

This function is deprecated. It is preferable to use [mysql\\_query\(\)](#) to issue an SQL [FLUSH PRIVILEGES](#) statement instead.

#### Return Values

Zero for success. Nonzero if an error occurred.

#### Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### 21.9.3.57. [mysql\\_rollback\(\)](#)

```
my_bool mysql_rollback(MYSQL *mysql)
```

#### Description

Rolls back the current transaction.

The action of this function is subject to the value of the [completion\\_type](#) system variable. In particular, if the value of [completion\\_type](#) is 2, the server performs a release after terminating a transaction and closes the client connection. The client program should call [mysql\\_close\(\)](#) to close the connection from the client side.

#### Return Values

Zero if successful. Nonzero if an error occurred.

#### Errors

None.

### 21.9.3.58. [mysql\\_row\\_seek\(\)](#)

```
MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET offset)
```

#### Description

Sets the row cursor to an arbitrary row in a query result set. The [offset](#) value is a row offset that should be a value returned from [mysql\\_row\\_tell\(\)](#) or from [mysql\\_row\\_seek\(\)](#). This value is not a row number; if you want to seek to a row within a result set by number, use [mysql\\_data\\_seek\(\)](#) instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_row_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

#### Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_row_seek()`.

#### Errors

None.

### 21.9.3.59. `mysql_row_tell()`

```
MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)
```

#### Description

Returns the current position of the row cursor for the last `mysql_fetch_row()`. This value can be used as an argument to `mysql_row_seek()`.

You should use `mysql_row_tell()` only after `mysql_store_result()`, not after `mysql_use_result()`.

#### Return Values

The current offset of the row cursor.

#### Errors

None.

### 21.9.3.60. `mysql_select_db()`

```
int mysql_select_db(MYSQL *mysql, const char *db)
```

#### Description

Causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_select_db()` fails unless the connected user can be authenticated as having permission to use the database.

#### Return Values

Zero for success. Nonzero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.61. `mysql_set_character_set()`

```
int mysql_set_character_set(MYSQL *mysql, const char *csname)
```

#### Description

This function is used to set the default character set for the current connection. The string `csname` specifies a valid character set name. The connection collation becomes the default collation of the character set. This function works like the `SET NAMES` statement, but also sets the value of `mysql->charset`, and thus affects the character set used by `mysql_real_escape_string()`

#### Return Values

Zero for success. Nonzero if an error occurred.

#### Example

```
MYSQL mysql;
mysql_init(&mysql);
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
 fprintf(stderr, "Failed to connect to database: Error: %s\n",
 mysql_error(&mysql));
}
if (!mysql_set_character_set(&mysql, "utf8"))
{
 printf("New client character set: %s\n",
 mysql_character_set_name(&mysql));
}
```

### 21.9.3.62. `mysql_set_local_infile_default()`

```
void mysql_set_local_infile_default(MYSQL *mysql);
```

#### Description

Sets the `LOAD LOCAL DATA INFILE` handler callback functions to the defaults used internally by the C client library. The library calls this function automatically if `mysql_set_local_infile_handler()` has not been called or does not supply valid functions for each of its callbacks.

#### Return Values

None.

#### Errors

None.

### 21.9.3.63. `mysql_set_local_infile_handler()`

```
void mysql_set_local_infile_handler(MYSQL *mysql, int (*local_infile_init)(void **,
const char *, void *), int (*local_infile_read)(void *, char *, unsigned int), void
(*local_infile_end)(void *), int (*local_infile_error)(void *, char*, unsigned int),
void *userdata);
```

#### Description

This function installs callbacks to be used during the execution of `LOAD DATA LOCAL INFILE` statements. It enables application programs to exert control over local (client-side) data file reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```
int
local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the data file, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argument is the same value that is passed to `mysql_set_local_infile_handler()`.

The initialization function should return zero for success, nonzero for an error.

```
int
local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data should be

stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```
void
local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. This function should deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initialization function returns an error.

```
int
local_infile_error(void *ptr,
 char *error_msg,
 unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message should be written, and `error_msg_len` is the length of the buffer. The message should be written as a null-terminated string, so the message can be at most `error_msg_len`-1 bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL INFILE` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The file name specified in `LOAD DATA LOCAL INFILE` will be passed as the second parameter to the `local_infile_init()` callback.

## Return Values

None.

## Errors

None.

### 21.9.3.64. `mysql_set_server_option()`

```
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

## Description

Enables or disables an option for the connection. `option` can have one of the following values.

<code>MYSQL_OPTION_MULTI_STATEMENTS_ON</code>	Enable multiple-statement support
<code>MYSQL_OPTION_MULTI_STATEMENTS_OFF</code>	Disable multiple-statement support

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 21.9.12, “C API Support for Multiple Statement Execution”](#).

Enabling multiple-statement support with `MYSQL_OPTION_MULTI_STATEMENTS_ON` does not have quite the same effect as enabling it by passing the `CLIENT_MULTI_STATEMENTS` flag to `mysql_real_connect()`: `CLIENT_MULTI_STATEMENTS` also enables `CLIENT_MULTI_RESULTS`. If you are using the `CALL` SQL statement in your programs, multiple-result support must be enabled; this means that `MYSQL_OPTION_MULTI_STATEMENTS_ON` by itself is insufficient to permit the use of `CALL`.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `ER_UNKNOWN_COM_ERROR`

The server didn't support `mysql_set_server_option()` (which is the case that the server is older than 4.1.1) or the server didn't support the option one tried to set.

### 21.9.3.65. `mysql_shutdown()`

```
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level shutdown_level)
```

#### Description

Asks the database server to shut down. The connected user must have the `SHUTDOWN` privilege. MySQL 5.1 servers support only one type of shutdown; `shutdown_level` must be equal to `SHUTDOWN_DEFAULT`. Additional shutdown levels are planned to make it possible to choose the desired level. Dynamically linked executables which have been compiled with older versions of the `libmysqlclient` headers and call `mysql_shutdown()` need to be used with the old `libmysqlclient` dynamic library.

The shutdown process is described in [Section 5.1.10, “The Shutdown Process”](#).

#### Return Values

Zero for success. Nonzero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.66. `mysql_sqlstate()`

```
const char *mysql_sqlstate(MYSQL *mysql)
```

#### Description

Returns a null-terminated string containing the SQLSTATE error code for the most recently executed SQL statement. The error code consists of five characters. '`00000`' means “no error”. The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, “Errors, Error Codes, and Common Problems”](#).

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and '`42S02`' is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value 'HY000' (general error) is used for unmapped error numbers.

If you call `mysql_sqlstate()` after `mysql_real_connect()` fails, `mysql_sqlstate()` might not return a useful value. For example, this happens if a host is blocked by the server and the connection is closed without any SQLSTATE value being sent to the client.

#### Return Values

A null-terminated character string containing the SQLSTATE error code.

#### See Also

See [Section 21.9.3.14, “mysql\\_errno\(\)”](#), [Section 21.9.3.15, “mysql\\_error\(\)”](#), and [Section 21.9.7.26, “mysql\\_stmt\\_sqlstate\(\)”](#).

### 21.9.3.67. `mysql_ssl_set()`

```
my_bool mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert, const char *ca,
 const char *capath, const char *cipher)
```

#### Description

`mysql_ssl_set()` is used for establishing secure connections using SSL. It must be called before `mysql_real_connect()`.

`mysql_ssl_set()` does nothing unless SSL support is enabled in the client library.

`mysql` is the connection handler returned from `mysql_init()`. The other parameters are specified as follows:

- `key` is the path name to the key file.
- `cert` is the path name to the certificate file.
- `ca` is the path name to the certificate authority file.
- `capath` is the path name to a directory that contains trusted SSL CA certificates in pem format.
- `cipher` is a list of permissible ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`.

#### Return Values

This function always returns `0`. If SSL setup is incorrect, `mysql_real_connect()` returns an error when you attempt to connect.

### 21.9.3.68. `mysql_stat()`

```
const char *mysql_stat(MYSQL *mysql)
```

#### Description

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

#### Return Values

A character string describing the server status. `NULL` if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.69. `mysql_store_result()`

```
MYSQL_RES *mysql_store_result(MYSQL *mysql)
```

#### Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

You don't have to call `mysql_store_result()` or `mysql_use_result()` for other statements, but it does not do any harm or cause any notable performance degradation if you call `mysql_store_result()` in all cases. You can detect whether the statement has a result set by checking whether `mysql_store_result()` returns a nonzero value (more about this later on).

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 21.9.12, “C API Support for Multiple Statement Execution”](#).

If you want to know whether a statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 21.9.3.22, “mysql\\_field\\_count\(\)”](#).

`mysql_store_result()` reads the entire result of a query to the client, allocates a `MYSQL_RES` structure, and places the result into this structure.

`mysql_store_result()` returns a null pointer if the statement didn't return a result set (for example, if it was an `INSERT` statement).

`mysql_store_result()` also returns a null pointer if reading of the result set failed. You can check whether an error occurred by checking whether `mysql_error()` returns a nonempty string, `mysql_errno()` returns nonzero, or `mysql_field_count()` returns zero.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

After you have called `mysql_store_result()` and gotten back a result that isn't a null pointer, you can call `mysql_num_rows()` to find out how many rows are in the result set.

You can call `mysql_fetch_row()` to fetch rows from the result set, or `mysql_row_seek()` and `mysql_row_tell()` to obtain or set the current row position within the result set.

See [Section 21.9.10.1, “Why mysql\\_store\\_result\(\) Sometimes Returns NULL After mysql\\_query\(\) Returns Success”](#).

#### Return Values

A `MYSQL_RES` result structure with the results. `NULL` (0) if an error occurred.

#### Errors

`mysql_store_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.3.70. `mysql_thread_id()`

```
unsigned long mysql_thread_id(MYSQL *mysql)
```

#### Description

Returns the thread ID of the current connection. This value can be used as an argument to `mysql_kill()` to kill the thread.

If the connection is lost and you reconnect with `mysql_ping()`, the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

#### Return Values

The thread ID of the current connection.

#### Errors

None.

### 21.9.3.71. `mysql_use_result()`

```
MYSQL_RES *mysql_use_result(MYSQL *mysql)
```

#### Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

`mysql_use_result()` initiates a result set retrieval but does not actually read the result set into the client like `mysql_store_result()` does. Instead, each row must be retrieved individually by making calls to `mysql_fetch_row()`. This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than `mysql_store_result()`. The client allocates memory only for the current row and a communication buffer that may grow up to `max_allowed_packet` bytes.

On the other hand, you shouldn't use `mysql_use_result()` if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a `^S` (stop scroll). This ties up the server and prevent other threads from updating any tables from which the data is being fetched.

When using `mysql_use_result()`, you must execute `mysql_fetch_row()` until a `NULL` value is returned, otherwise, the unfetched rows are returned as part of the result set for your next query. The C API gives the error `Commands out of sync; you can't run this command now` if you forget to do this!

You may not use `mysql_data_seek()`, `mysql_row_seek()`, `mysql_row_tell()`, `mysql_num_rows()`, or `mysql_affected_rows()` with a result returned from `mysql_use_result()`, nor may you issue other queries until `mysql_use_result()` has finished. (However, after you have fetched all the rows, `mysql_num_rows()` accurately returns the number of rows fetched.)

You must call `mysql_free_result()` once you are done with the result set.

When using the `libmysqld` embedded server, the memory benefits are essentially lost because memory usage incrementally increases with each row retrieved until `mysql_free_result()` is called.

#### Return Values

A `MYSQL_RES` result structure. `NULL` if an error occurred.

#### Errors

`mysql_use_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 21.9.3.72. `mysql_warning_count()`

```
unsigned int mysql_warning_count(MYSQL *mysql)
```

#### Description

Returns the number of warnings generated during execution of the previous SQL statement.

#### Return Values

The warning count.

#### Errors

None.

## 21.9.4. C API Prepared Statements

The MySQL client/server protocol provides for the use of prepared statements. This capability uses the `MYSQL_STMT` statement handler data structure returned by the `mysql_stmt_init()` initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handle returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and nonprepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

The following SQL statements can be used as prepared statements: `CALL`, `CREATE TABLE`, `DELETE`, `DO`, `INSERT`, `REPLACE`, `SELECT`, `SET`, `UPDATE`, and most `SHOW` statements.

As of MySQL 5.1.10, the following additional statements are supported:

```
ANALYZE TABLE
OPTIMIZE TABLE
REPAIR TABLE
```

As of MySQL 5.1.12, the following additional statements are supported:

```
CACHE INDEX
CHANGE MASTER
CHECKSUM {TABLE | TABLES}
```

```
{CREATE | RENAME | DROP} DATABASE
{CREATE | RENAME | DROP} USER
FLUSH {TABLE | TABLES | TABLES WITH READ LOCK | HOSTS | PRIVILEGES
 | LOGS | STATUS | MASTER | SLAVE | DES_KEY_FILE | USER_RESOURCES}
GRANT
REVOKE
KILL
LOAD INDEX INTO CACHE
RESET {MASTER | SLAVE | QUERY CACHE}
SHOW BINLOG EVENTS
SHOW CREATE {PROCEDURE | FUNCTION | EVENT | TABLE | VIEW}
SHOW {AUTHORS | CONTRIBUTORS | WARNINGS | ERRORS}
SHOW {MASTER | BINARY} LOGS
SHOW {MASTER | SLAVE} STATUS
SLAVE {START | STOP}
INSTALL PLUGIN
UNINSTALL PLUGIN
```

Other statements are not yet supported in MySQL 5.1.

As of MySQL 5.1.25, metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see [Section 12.6.4, “Automatic Prepared Statement Repreparation”](#).

## 21.9.5. C API Prepared Statement Data Structures

Prepared statements use several data structures:

- To obtain a statement handle, pass a `MYSQL` connection handler to `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT` data structure. This structure is used for further operations with the statement. To specify the statement to prepare, pass the `MYSQL_STMT` pointer and the statement string to `mysql_stmt_prepare()`.
- To provide input parameters for a prepared statement, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_param()`. To receive output column values, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_result()`.
- The `MYSQL_TIME` structure is used to transfer temporal data in both directions.

The following discussion describes the prepared statement data types in detail. For examples that show how to use them, see [Section 21.9.7.10, “`mysql\_stmt\_execute\(\)`”, and Section 21.9.7.11, “`mysql\_stmt\_fetch\(\)`”](#).

- `MYSQL_STMT`

This structure is a handle for a prepared statement. A handle is created by calling `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT`. The handle is used for all subsequent operations with the statement until you close it with `mysql_stmt_close()`, at which point the handle becomes invalid.

The `MYSQL_STMT` structure has no members intended for application use. Applications should not try to copy a `MYSQL_STMT` structure. There is no guarantee that such a copy will be usable.

Multiple statement handles can be associated with a single connection. The limit on the number of handles depends on the available system resources.

- `MYSQL_BIND`

This structure is used both for statement input (data values sent to the server) and output (result values returned from the server):

- For input, use `MYSQL_BIND` structures with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`.
- For output, use `MYSQL_BIND` structures with `mysql_stmt_bind_result()` to bind buffers to result set columns, for use in fetching rows with `mysql_stmt_fetch()`.

To use a `MYSQL_BIND` structure, zero its contents to initialize it, then set its members appropriately. For example, to declare and initialize an array of three `MYSQL_BIND` structures, use this code:

```
MYSQL_BIND bind[3];
memset(bind, 0, sizeof(bind));
```

The `MYSQL_BIND` structure contains the following members for use by application programs. For several of the members, the

manner of use depends on whether the structure is used for input or output.

- `enum enum_field_types buffer_type`

The type of the buffer. This member indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored. For permissible `buffer_type` values, see [Section 21.9.5.1, “C API Prepared Statement Type Codes”](#).

- `void *buffer`

A pointer to the buffer to be used for data transfer. This is the address of a C language variable.

For input, `buffer` is a pointer to the variable in which you store the data value for a statement parameter. When you call `mysql_stmt_execute()`, MySQL uses the value stored in the variable in place of the corresponding parameter marker in the statement (specified with `?` in the statement string).

For output, `buffer` is a pointer to the variable in which to return a result set column value. When you call `mysql_stmt_fetch()`, MySQL stores a column value from the current row of the result set in this variable. You can access the value when the call returns.

To minimize the need for MySQL to perform type conversions between C language values on the client side and SQL values on the server side, use C variables that have types similar to those of the corresponding SQL values:

- For numeric data types, `buffer` should point to a variable of the proper numeric C type. For integer variables (which can be `char` for single-byte values or an integer type for larger values), you should also indicate whether the variable has the `unsigned` attribute by setting the `is_unsigned` member, described later.
- For character (nonbinary) and binary string data types, `buffer` should point to a character buffer.
- For date and time data types, `buffer` should point to a `MYSQL_TIME` structure.

For guidelines about mapping between C types and SQL types and notes about type conversions, see [Section 21.9.5.1, “C API Prepared Statement Type Codes”](#), and [Section 21.9.5.2, “C API Prepared Statement Type Conversions”](#).

- `unsigned long buffer_length`

The actual size of `*buffer` in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the `buffer_length` value specifies the length of `*buffer` when used with `mysql_stmt_bind_param()` to specify input values, or the maximum number of output data bytes that can be fetched into the buffer when used with `mysql_stmt_bind_result()`.

- `unsigned long *length`

A pointer to an `unsigned long` variable that indicates the actual number of bytes of data stored in `*buffer.length` is used for character or binary C data.

For input parameter data binding, set `*length` to indicate the actual length of the parameter value stored in `*buffer`. This is used by `mysql_stmt_execute()`.

For output value binding, MySQL sets `*length` when you call `mysql_stmt_fetch()`. The `mysql_stmt_fetch()` return value determines how to interpret the length:

- If the return value is 0, `*length` indicates the actual length of the parameter value.
- If the return value is `MYSQL_DATA_TRUNCATED`, `*length` indicates the nontruncated length of the parameter value. In this case, the minimum of `*length` and `buffer_length` indicates the actual length of the value.

`length` is ignored for numeric and temporal data types because the `buffer_type` value determines the length of the data value.

If you must determine the length of a returned value before fetching it, see [Section 21.9.7.11, “mysql\\_stmt\\_fetch\(\)”](#), for some strategies.

- `my_bool *is_null`

This member points to a `my_bool` variable that is true if a value is `NULL`, false if it is not `NULL`. For input, set `*is_null` to true to indicate that you are passing a `NULL` value as a statement parameter.

`is_null` is a *pointer* to a boolean scalar, not a boolean scalar, to provide flexibility in how you specify `NULL` values:

- If your data values are always `NULL`, use `MYSQL_TYPE_NULL` as the `buffer_type` value when you bind the column. The other `MYSQL_BIND` members, including `is_null`, do not matter.
- If your data values are always `NOT NULL`, set `is_null = (my_bool*) 0`, and set the other members appropriately for the variable you are binding.
- In all other cases, set the other members appropriately and set `is_null` to the address of a `my_bool` variable. Set that variable's value to true or false appropriately between executions to indicate whether the corresponding data value is `NULL` or `NOT NULL`, respectively.

For output, when you fetch a row, MySQL sets the value pointed to by `is_null` to true or false according to whether the result set column value returned from the statement is or is not `NULL`.

- `my_bool is_unsigned`

This member applies for C variables with data types that can be `unsigned (char, short int, int, long long int)`. Set `is_unsigned` to true if the variable pointed to by `buffer` is `unsigned` and false otherwise. For example, if you bind a `signed char` variable to `buffer`, specify a type code of `MYSQL_TYPE_TINY` and set `is_unsigned` to false. If you bind an `unsigned char` instead, the type code is the same but `is_unsigned` should be true. (For `char`, it is not defined whether it is signed or unsigned, so it is best to be explicit about signedness by using `signed char` or `unsigned char`.)

`is_unsigned` applies only to the C language variable on the client side. It indicates nothing about the signedness of the corresponding SQL value on the server side. For example, if you use an `int` variable to supply a value for a `BIGINT UNSIGNED` column, `is_unsigned` should be false because `int` is a signed type. If you use an `unsigned int` variable to supply a value for a `BIGINT` column, `is_unsigned` should be true because `unsigned int` is an unsigned type. MySQL performs the proper conversion between signed and unsigned values in both directions, although a warning occurs if truncation results.

- `my_bool *error`

For output, set this member to point to a `my_bool` variable to have truncation information for the parameter stored there after a row fetching operation. When truncation reporting is enabled, `mysql_stmt_fetch()` returns `MYSQL_DATA_TRUNCATED` and `*error` is true in the `MYSQL_BIND` structures for parameters in which truncation occurred. Truncation indicates loss of sign or significant digits, or that a string was too long to fit in a column. Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.

- `MYSQL_TIME`

This structure is used to send and receive `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` data directly to and from the server. Set the `buffer` member to point to a `MYSQL_TIME` structure, and set the `buffer_type` member of a `MYSQL_BIND` structure to one of the temporal types (`MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATE`, `MYSQL_TYPE_DATETIME`, `MYSQL_TYPE_TIMESTAMP`).

The `MYSQL_TIME` structure contains the members listed in the following table.

Member	Description
<code>unsigned int year</code>	The year
<code>unsigned int month</code>	The month of the year
<code>unsigned int day</code>	The day of the month
<code>unsigned int hour</code>	The hour of the day
<code>unsigned int minute</code>	The minute of the hour
<code>unsigned int second</code>	The second of the minute
<code>my_bool neg</code>	A boolean flag indicating whether the time is negative
<code>unsigned long second_part</code>	The fractional part of the second in microseconds; currently unused

Only those parts of a `MYSQL_TIME` structure that apply to a given type of temporal value are used. The `year`, `month`, and `day` elements are used for `DATE`, `DATETIME`, and `TIMESTAMP` values. The `hour`, `minute`, and `second` elements are used for `TIME`, `DATETIME`, and `TIMESTAMP` values. See Section 21.9.14, “C API Prepared Statement Handling of Date and Time Values”.

### 21.9.5.1. C API Prepared Statement Type Codes

The `buffer_type` member of `MYSQL_BIND` structures indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored.

The following table shows the permissible values for the `buffer_type` member of `MYSQL_BIND` structures for input values sent to the server. The table shows the C variable types that you can use, the corresponding type codes, and the SQL data types for which the supplied value can be used without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

Input Variable C Type	buffer_type Value	SQL Type of Destination Value
<code>signed char</code>	<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code>
<code>short int</code>	<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code>
<code>int</code>	<code>MYSQL_TYPE_LONG</code>	<code>INT</code>
<code>long long int</code>	<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code>
<code>float</code>	<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code>
<code>double</code>	<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIME</code>	<code>TIME</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATE</code>	<code>DATE</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATETIME</code>	<code>DATETIME</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIMESTAMP</code>	<code>TIMESTAMP</code>
<code>char[]</code>	<code>MYSQL_TYPE_STRING</code>	<code>TEXT, CHAR, VARCHAR</code>
<code>char[]</code>	<code>MYSQL_TYPE_BLOB</code>	<code>BLOB, BINARY, VARBINARY</code>
	<code>MYSQL_TYPE_NULL</code>	<code>NULL</code>

Use `MYSQL_TYPE_NULL` as indicated in the description for the `is_null` member in [Section 21.9.5, “C API Prepared Statement Data Structures”](#).

For input string data, use `MYSQL_TYPE_STRING` or `MYSQL_TYPE_BLOB` depending on whether the value is a character (nonbinary) or binary string:

- `MYSQL_TYPE_STRING` indicates character input string data. The value is assumed to be in the character set indicated by the `character_set_client` system variable. If the server stores the value into a column with a different character set, it converts the value to that character set.
- `MYSQL_TYPE_BLOB` indicates binary input string data. The value is treated as having the `binary` character set. That is, it is treated as a byte string and no conversion occurs.

The following table shows the permissible values for the `buffer_type` member of `MYSQL_BIND` structures for output values received from the server. The table shows the SQL types of received values, the corresponding type codes that such values have in result set metadata, and the recommended C language data types to bind to the `MYSQL_BIND` structure to receive the SQL values without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

SQL Type of Received Value	buffer_type Value	Output Variable C Type
<code>TINYINT</code>	<code>MYSQL_TYPE_TINY</code>	<code>signed char</code>
<code>SMALLINT</code>	<code>MYSQL_TYPE_SHORT</code>	<code>short int</code>
<code>MEDIUMINT</code>	<code>MYSQL_TYPE_INT24</code>	<code>int</code>
<code>INT</code>	<code>MYSQL_TYPE_LONG</code>	<code>int</code>
<code>BIGINT</code>	<code>MYSQL_TYPE_LONGLONG</code>	<code>long long int</code>
<code>FLOAT</code>	<code>MYSQL_TYPE_FLOAT</code>	<code>float</code>
<code>DOUBLE</code>	<code>MYSQL_TYPE_DOUBLE</code>	<code>double</code>
<code>DECIMAL</code>	<code>MYSQL_TYPE_NEWDECIMAL</code>	<code>char[]</code>
<code>YEAR</code>	<code>MYSQL_TYPE_SHORT</code>	<code>short int</code>

TIME	MYSQL_TYPE_TIME	MYSQL_TIME
DATE	MYSQL_TYPE_DATE	MYSQL_TIME
DATETIME	MYSQL_TYPE_DATETIME	MYSQL_TIME
TIMESTAMP	MYSQL_TYPE_TIMESTAMP	MYSQL_TIME
CHAR, BINARY	MYSQL_TYPE_STRING	char[]
VARCHAR, VARBINARY	MYSQL_TYPE_VAR_STRING	char[]
TINYBLOB, TINYTEXT	MYSQL_TYPE_TINY_BLOB	char[]
BLOB, TEXT	MYSQL_TYPE_BLOB	char[]
MEDIUMBLOB, MEDIUMTEXT	MYSQL_TYPE_MEDIUM_BLOB	char[]
LONGBLOB, LONGTEXT	MYSQL_TYPE_LONG_BLOB	char[]
BIT	MYSQL_TYPE_BIT	char[]

## 21.9.5.2. C API Prepared Statement Type Conversions

Prepared statements transmit data between the client and server using C language variables on the client side that correspond to SQL values on the server side. If there is a mismatch between the C variable type on the client side and the corresponding SQL value type on the server side, MySQL performs implicit type conversions in both directions.

MySQL knows the type code for the SQL value on the server side. The `buffer_type` value in the `MYSQL_BIND` structure indicates the type code of the C variable that holds the value on the client side. The two codes together tell MySQL what conversion must be performed, if any. Here are some examples:

- If you use `MYSQL_TYPE_LONG` with an `int` variable to pass an integer value to the server that is to be stored into a `FLOAT` column, MySQL converts the value to floating-point format before storing it.
- If you fetch an SQL `MEDIUMINT` column value, but specify a `buffer_type` value of `MYSQL_TYPE_LONGLONG` and use a C variable of type `long long int` as the destination buffer, MySQL converts the `MEDIUMINT` value (which requires less than 8 bytes) for storage into the `long long int` (an 8-byte variable).
- If you fetch a numeric column with a value of 255 into a `char[4]` character array and specify a `buffer_type` value of `MYSQL_TYPE_STRING`, the resulting value in the array is a 4-byte string '`255\0`'.
- MySQL returns `DECIMAL` values as the string representation of the original server-side value, which is why the corresponding C type is `char[]`. For example, `12.345` is returned to the client as '`12.345`'. If you specify `MYSQL_TYPE_NEWDECIMAL` and bind a string buffer to the `MYSQL_BIND` structure, `mysql_stmt_fetch()` stores the value in the buffer as a string without conversion. If instead you specify a numeric variable and type code, `mysql_stmt_fetch()` converts the string-format `DECIMAL` value to numeric form.
- For the `MYSQL_TYPE_BIT` type code, `BIT` values are returned into a string buffer, which is why the corresponding C type is `char[]`. The value represents a bit string that requires interpretation on the client side. To return the value as a type that is easier to deal with, you can cause the value to be cast to integer using either of the following types of expressions:

```
SELECT bit_col + 0 FROM t
SELECT CAST(bit_col AS UNSIGNED) FROM t
```

To retrieve the value, bind an integer variable large enough to hold the value and specify the appropriate corresponding integer type code.

Before binding variables to the `MYSQL_BIND` structures that are to be used for fetching column values, you can check the type codes for each column of the result set. This might be desirable if you want to determine which variable types would be best to use to avoid type conversions. To get the type codes, call `mysql_stmt_result_metadata()` after executing the prepared statement with `mysql_stmt_execute()`. The metadata provides access to the type codes for the result set as described in [Section 21.9.7.22, “mysql\\_stmt\\_result\\_metadata\(\)”](#), and [Section 21.9.1, “C API Data Structures”](#).

To determine whether output string values in a result set returned from the server contain binary or nonbinary data, check whether the `charsetnr` value of the result set metadata is 63 (see [Section 21.9.1, “C API Data Structures”](#)). If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

If you cause the `max_length` member of the `MYSQL_FIELD` column metadata structures to be set (by calling `mysql_stmt_attr_set()`), be aware that the `max_length` values for the result set indicate the lengths of the longest string representation of the result values, not the lengths of the binary representation. That is, `max_length` does not necessarily corre-

pond to the size of the buffers needed to fetch the values with the binary protocol used for prepared statements. Choose the size of the buffers according to the types of the variables into which you fetch the values. For example, a `TINYINT` column containing the value -128 might have a `max_length` value of 4. But the binary representation of any `TINYINT` value requires only 1 byte for storage, so you can supply a `signed char` variable in which to store the value and set `is_unsigned` to indicate that values are signed.

As of MySQL 5.1.25, metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see [Section 12.6.4, “Automatic Prepared Statement Repreparation”](#).

## 21.9.6. C API Prepared Statement Function Overview

The functions available for prepared statement processing are summarized here and described in greater detail in a later section. See [Section 21.9.7, “C API Prepared Statement Function Descriptions”](#).

Function	Description
<code>mysql_stmt_affected_rows()</code>	Returns the number of rows changed, deleted, or inserted by prepared <code>UPDATE</code> , <code>DELETE</code> , or <code>INSERT</code> statement
<code>mysql_stmt_attr_get()</code>	Gets value of an attribute for a prepared statement
<code>mysql_stmt_attr_set()</code>	Sets an attribute for a prepared statement
<code>mysql_stmt_bind_param()</code>	Associates application data buffers with the parameter markers in a prepared SQL statement
<code>mysql_stmt_bind_result()</code>	Associates application data buffers with columns in a result set
<code>mysql_stmt_close()</code>	Frees memory used by a prepared statement
<code>mysql_stmt_data_seek()</code>	Seeks to an arbitrary row number in a statement result set
<code>mysql_stmt_errno()</code>	Returns the error number for the last statement execution
<code>mysql_stmt_error()</code>	Returns the error message for the last statement execution
<code>mysql_stmt_execute()</code>	Executes a prepared statement
<code>mysql_stmt_fetch()</code>	Fetches the next row of data from a result set and returns data for all bound columns
<code>mysql_stmt_fetch_column()</code>	Fetch data for one column of the current row of a result set
<code>mysql_stmt_field_count()</code>	Returns the number of result columns for the most recent statement
<code>mysql_stmt_free_result()</code>	Free the resources allocated to a statement handle
<code>mysql_stmt_init()</code>	Allocates memory for a <code>MYSQL_STMT</code> structure and initializes it
<code>mysql_stmt_insert_id()</code>	Returns the ID generated for an <code>AUTO_INCREMENT</code> column by a prepared statement
<code>mysql_stmt_num_rows()</code>	Returns the row count from a buffered statement result set
<code>mysql_stmt_param_count()</code>	Returns the number of parameters in a prepared statement
<code>mysql_stmt_param_metadata()</code>	(Return parameter metadata in the form of a result set) Currently, this function does nothing
<code>mysql_stmt_prepare()</code>	Prepares an SQL statement string for execution
<code>mysql_stmt_reset()</code>	Resets the statement buffers in the server
<code>mysql_stmt_result_metadata()</code>	Returns prepared statement metadata in the form of a result set
<code>mysql_stmt_row_seek()</code>	Seeks to a row offset in a statement result set, using value returned from <code>mysql_stmt_row_tell()</code>
<code>mysql_stmt_row_tell()</code>	Returns the statement row cursor position
<code>mysql_stmt_send_long_data()</code>	Sends long data in chunks to server
<code>mysql_stmt_sqlstate()</code>	Returns the SQLSTATE error code for the last statement execution
<code>mysql_stmt_store_result()</code>	Retrieves a complete result set to the client

Call `mysql_stmt_init()` to create a statement handle, then `mysql_stmt_prepare()` to prepare the statement string, `mysql_stmt_bind_param()` to supply the parameter data, and `mysql_stmt_execute()` to execute the statement. You can repeat the `mysql_stmt_execute()` by changing parameter values in the respective buffers supplied through `mysql_stmt_bind_param()`.

You can send text or binary data in chunks to server using `mysql_stmt_send_long_data()`. See [Section 21.9.7.25, “mysql\\_stmt\\_send\\_long\\_data\(\)”](#).

If the statement is a `SELECT` or any other statement that produces a result set, `mysql_stmt_prepare()` also returns the result set metadata information in the form of a `MYSQL_RES` result set through `mysql_stmt_result_metadata()`.

You can supply the result buffers using `mysql_stmt_bind_result()`, so that the `mysql_stmt_fetch()` automatically returns data to these buffers. This is row-by-row fetching.

When statement execution has been completed, close the statement handle using `mysql_stmt_close()` so that all resources associated with it can be freed.

If you obtained a `SELECT` statement's result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

### Execution Steps

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handle with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.
2. If the statement will produce a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.
3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.
4. Call `mysql_stmt_execute()` to execute the statement.
5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.
6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.
7. Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:

- The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.
- The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When `mysql_stmt_execute()` is called, the MySQL client/server protocol performs these actions:

- The client uses the statement handle and sends the parameter data to the server.
- The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an okay status and the number of rows changed, deleted, or inserted.

When `mysql_stmt_fetch()` is called, the MySQL client/server protocol performs these actions:

- The client reads the data from the current row of the result set and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error number, error message, and SQLSTATE code using `mysql_stmt_errno()`, `mysql_stmt_error()`, and `mysql_stmt_sqlstate()`, respectively.

### Prepared Statement Logging

For prepared statements that are executed with the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API func-

tions, the server writes `Prepare` and `Execute` lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

1. Call `mysql_stmt_prepare()` to prepare the statement string "`SELECT ?`".
2. Call `mysql_stmt_bind_param()` to bind the value `3` to the parameter in the prepared statement.
3. Call `mysql_stmt_execute()` to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

```
Prepare [1] SELECT ?
Execute [1] SELECT 3
```

Each `Prepare` and `Execute` line in the log is tagged with a `[N]` statement identifier so that you can keep track of which prepared statement is being logged. `N` is a positive integer. If there are multiple prepared statements active simultaneously for the client, `N` may be greater than 1. Each `Execute` lines shows a prepared statement after substitution of data values for `?` parameters.

## 21.9.7. C API Prepared Statement Function Descriptions

To prepare and execute queries, use the functions described in detail in the following sections.

All functions that operate with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

To create a `MYSQL_STMT` handle, use the `mysql_stmt_init()` function.

### 21.9.7.1. `mysql_stmt_affected_rows()`

```
my_ulonglong mysql_stmt_affected_rows(MYSQL_STMT *stmt)
```

#### Description

`mysql_stmt_affected_rows()` may be called immediately after executing a statement with `mysql_stmt_execute()`. It is like `mysql_affected_rows()` but for prepared statements. For a description of what the affected-rows value returned by this function means, See [Section 21.9.3.1, “`mysql\_affected\_rows\(\)`”](#).

#### Errors

None.

#### Example

See the Example in [Section 21.9.7.10, “`mysql\_stmt\_execute\(\)`”](#).

### 21.9.7.2. `mysql_stmt_attr_get()`

```
my_bool mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, void *arg)
```

#### Description

Can be used to get the current value for a statement attribute.

The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, `arg` should point to the value of the integer.

See [Section 21.9.7.3, “`mysql\_stmt\_attr\_set\(\)`”](#), for a list of options and option types.

#### Note

In MySQL 5.1, `mysql_stmt_attr_get()` originally used `unsigned int *`, not `my_bool *`, for `STMT_ATTR_UPDATE_MAX_LENGTH`. This was corrected in MySQL 5.1.7.

#### Return Values

Zero if successful. Nonzero if `option` is unknown.

**Errors**

None.

**21.9.7.3. mysql\_stmt\_attr\_set()**

```
my_bool mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, const void *arg)
```

**Description**

Can be used to affect behavior for a prepared statement. This function may be called multiple times to set several options.

The `option` argument is the option that you want to set. The `arg` argument is the value for the option. `arg` should point to a variable that is set to the desired attribute value. The variable type is as indicated in the following table.

The following table shows the possible `option` values.

Option	Argument Type	Function
STMT_ATTR_UPDATE_MAX_LENGTH	my_bool *	If set to 1, causes <code>mysql_stmt_store_result()</code> to update the metadata <code>MYSQL_FIELD-&gt;max_length</code> value.
STMT_ATTR_CURSOR_TYPE	unsigned long *	Type of cursor to open for statement when <code>mysql_stmt_execute()</code> is invoked. <code>*arg</code> can be <code>CURSOR_TYPE_NO_CURSOR</code> (the default) or <code>CURSOR_TYPE_READ_ONLY</code> .
STMT_ATTR_PREFETCH_ROWS	unsigned long *	Number of rows to fetch from server at a time when using a cursor. <code>*arg</code> can be in the range from 1 to the maximum value of <code>unsigned long</code> . The default is 1.

If you use the `STMT_ATTR_CURSOR_TYPE` option with `CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysql_stmt_execute()`. If there is already an open cursor from a previous `mysql_stmt_execute()` call, it closes the cursor before opening a new one. `mysql_stmt_reset()` also closes any open cursor before preparing the statement for re-execution. `mysql_stmt_free_result()` closes any open cursor.

If you open a cursor for a prepared statement, `mysql_stmt_store_result()` is unnecessary, because that function causes the result set to be buffered on the client side.

**Return Values**

Zero if successful. Nonzero if `option` is unknown.

**Errors**

None.

**Example**

The following example opens a cursor for a prepared statement and sets the number of rows to fetch at a time to 5:

```
MYSQL_STMT *stmt;
int rc;
unsigned long type;
unsigned long prefetch_rows = 5;

stmt = mysql_stmt_init(mysql);
type = (unsigned long) CURSOR_TYPE_READ_ONLY;
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_CURSOR_TYPE, (void*) &type);
/* ... check return value ... */
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_PREFETCH_ROWS,
 (void*) &prefetch_rows);
/* ... check return value ... */
```

**21.9.7.4. mysql\_stmt\_bind\_param()**

```
my_bool mysql_stmt_bind_param(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

**Description**

`mysql_stmt_bind_param()` is used to bind input data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each “?” parameter marker that is present in the query.

Suppose that you prepare the following statement:

```
INSERT INTO mytbl VALUES(?, ?, ?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```
MYSQL_BIND bind[3];
```

[Section 21.9.5, “C API Prepared Statement Data Structures”](#), describes the members of each `MYSQL_BIND` element and how they should be set to provide input values.

#### Return Values

Zero if the bind operation was successful. Nonzero if an error occurred.

#### Errors

- [CR\\_UNSUPPORTED\\_PARAM\\_TYPE](#)

The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.

- [CR\\_OUT\\_OF\\_MEMORY](#)

Out of memory.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

#### Example

See the Example in [Section 21.9.7.10, “mysql\\_stmt\\_execute\(\)”](#).

### 21.9.7.5. `mysql_stmt_bind_result()`

```
my_bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

#### Description

`mysql_stmt_bind_result()` is used to associate (that is, bind) output columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the data values, because the protocol doesn't return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol places data into the newly bound buffers when the next call to `mysql_stmt_fetch()` occurs.

To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and length of the output buffer into which the value should be stored. [Section 21.9.5, “C API Prepared Statement Data Structures”](#), describes the members of each `MYSQL_BIND` element and how they should be set to receive output values.

#### Return Values

Zero if the bind operation was successful. Nonzero if an error occurred.

#### Errors

- **CR\_UNSUPPORTED\_PARAM\_TYPE**

The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.

- **CR\_OUT\_OF\_MEMORY**

Out of memory.

- **CR\_UNKNOWN\_ERROR**

An unknown error occurred.

#### Example

See the Example in [Section 21.9.7.11, “`mysql\_stmt\_fetch\(\)`”](#).

### 21.9.7.6. `mysql_stmt_close()`

```
my_bool mysql_stmt_close(MYSQL_STMT *stmt)
```

#### Description

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handle pointed to by `stmt`.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

#### Return Values

Zero if the statement was freed successfully. Nonzero if an error occurred.

#### Errors

- **CR\_SERVER\_GONE\_ERROR**

The MySQL server has gone away.

- **CR\_UNKNOWN\_ERROR**

An unknown error occurred.

#### Example

See the Example in [Section 21.9.7.10, “`mysql\_stmt\_execute\(\)`”](#).

### 21.9.7.7. `mysql_stmt_data_seek()`

```
void mysql_stmt_data_seek(MYSQL_STMT *stmt, my_ulonglong offset)
```

#### Description

Seeks to an arbitrary row in a statement result set. The `offset` value is a row number and should be in the range from 0 to `mysql_stmt_num_rows(stmt)-1`.

This function requires that the statement result set structure contains the entire result of the last executed query, so `mysql_stmt_data_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

#### Return Values

None.

#### Errors

None.

### 21.9.7.8. `mysql_stmt_errno()`

```
unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)
```

## Description

For the statement specified by `stmt`, `mysql_stmt_errno()` returns the error code for the most recently invoked statement API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B, Errors, Error Codes, and Common Problems](#).

## Return Values

An error code value. Zero if no error occurred.

## Errors

None.

### 21.9.7.9. `mysql_stmt_error()`

```
const char *mysql_stmt_error(MYSQL_STMT *stmt)
```

## Description

For the statement specified by `stmt`, `mysql_stmt_error()` returns a null-terminated string containing the error message for the most recently invoked statement API function that can succeed or fail. An empty string (" ") is returned if no error occurred. This means the following two tests are equivalent:

```
if (*mysql_stmt_errno(stmt))
{
 // an error occurred
}

if (mysql_stmt_error(stmt)[0])
{
 // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages.

## Return Values

A character string that describes the error. An empty string if no error occurred.

## Errors

None.

### 21.9.7.10. `mysql_stmt_execute()`

```
int mysql_stmt_execute(MYSQL_STMT *stmt)
```

## Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handle. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

Statement processing following `mysql_stmt_execute()` depends on the type of statement:

- For an `UPDATE`, `DELETE`, or `INSERT`, the number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`.
- For a statement such as `SELECT` that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to [Section 21.9.7.11, “mysql\\_stmt\\_fetch\(\)”](#).

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

As of MySQL 5.1.25, metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see [Section 12.6.4, “Automatic Prepared Statement](#)

Repreparation”.

### Return Values

Zero if execution was successful. Nonzero if an error occurred.

### Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_OUT\\_OF\\_MEMORY](#)

Out of memory.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to be a valid connection handle. For an example that shows how to retrieve data, see [Section 21.9.7.11, “mysql\\_stmt\\_fetch\(\)”](#).

```
#define STRING_SIZE 50

#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT, \
 col2 VARCHAR(40), \
 col3 SMALLINT, \
 col4 TIMESTAMP)"
#define INSERT_SAMPLE "INSERT INTO \
 test_table(col1,col2,col3) \
 VALUES(?, ?, ?)"

MYSQL_STMT *stmt;
MYSQL_BIND bind[3];
my_ulonglong affected_rows;
int param_count;
short small_data;
int int_data;
char str_data[STRING_SIZE];
unsigned long str_length;
my_bool is_null;

if (mysql_query(mysql, DROP_SAMPLE_TABLE))
{
 fprintf(stderr, " DROP TABLE failed\n");
 fprintf(stderr, " %s\n", mysql_error(mysql));
 exit(0);
}

if (mysql_query(mysql, CREATE_SAMPLE_TABLE))
{
 fprintf(stderr, " CREATE TABLE failed\n");
 fprintf(stderr, " %s\n", mysql_error(mysql));
 exit(0);
}

/* Prepare an INSERT query with 3 parameters */
/* (the TIMESTAMP column is not named; the server */
/* sets it to the current date and time) */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
 fprintf(stderr, " mysql_stmt_init(), out of memory\n");
 exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_SAMPLE, strlen(INSERT_SAMPLE)))
{
 fprintf(stderr, " mysql_stmt_prepare(), INSERT failed\n");
 fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
 exit(0);
}
```

```

}

fprintf(stdout, " prepare, INSERT successful\n");

/* Get the parameter count from the statement */
param_count= mysql_stmt_param_count(stmt);
fprintf(stdout, " total parameters in INSERT: %d\n", param_count);

if (param_count != 3) /* validate parameter count */
{
 fprintf(stderr, " invalid parameter count returned by MySQL\n");
 exit(0);
}

/* Bind the data for all 3 parameters */

memset(bind, 0, sizeof(bind));

/* INTEGER PARAM */
/* This is a number type, so there is no need
 to specify buffer_length */
bind[0].buffer_type= MYSQL_TYPE_LONG;
bind[0].buffer= (char *)&int_data;
bind[0].is_null= 0;
bind[0].length= 0;

/* STRING PARAM */
bind[1].buffer_type= MYSQL_TYPE_STRING;
bind[1].buffer= (char *)str_data;
bind[1].buffer_length= STRING_SIZE;
bind[1].is_null= 0;

/* INSERT SMALLINT data as NULL */
is_null= 1;

/* Execute the INSERT statement - 1*/
if (mysql_stmt_execute(stmt))
{
 fprintf(stderr, " mysql_stmt_execute(), 1 failed\n");
 fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
 exit(0);
}

/* Get the number of affected rows */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 1): %lu\n",
 (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
 fprintf(stderr, " invalid affected rows by MySQL\n");
 exit(0);
}

/* Specify data values for second row,
 then re-execute the statement */
int_data= 1000;
strncpy(str_data, "The most popular Open Source database",
 STRING_SIZE);
str_length= strlen(str_data);
small_data= 1000; /* smallint */
is_null= 0; /* reset */

/* Execute the INSERT statement - 2*/
if (mysql_stmt_execute(stmt))
{
 fprintf(stderr, " mysql_stmt_execute, 2 failed\n");
 fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
 exit(0);
}

/* Get the total rows affected */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 2): %lu\n",
 (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */

```

```

{
 fprintf(stderr, " invalid affected rows by MySQL\n");
 exit(0);
}

/* Close the statement */
if (mysql_stmt_close(stmt))
{
 fprintf(stderr, " failed while closing the statement\n");
 fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
 exit(0);
}

```

**Note**

For complete examples on the use of prepared statement functions, refer to the file `tests/mysql_client_test.c`. This file can be obtained from a MySQL source distribution or from the Bazaar source repository.

### **21.9.7.11. `mysql_stmt_fetch()`**

```
int mysql_stmt_fetch(MYSQL_STMT *stmt)
```

**Description**

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set exists; that is, after a call to `mysql_stmt_execute()` for a statement such as `SELECT` that produces a result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It returns the data in those buffers for all the columns in the current row set and the lengths are returned to the `length` pointer. All columns must be bound by the application before it calls `mysql_stmt_fetch()`.

By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before calling `mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains TRUE (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

Type	Length
<code>MYSQL_TYPE_TINY</code>	1
<code>MYSQL_TYPE_SHORT</code>	2
<code>MYSQL_TYPE_LONG</code>	4
<code>MYSQL_TYPE_LONGLONG</code>	8
<code>MYSQL_TYPE_FLOAT</code>	4
<code>MYSQL_TYPE_DOUBLE</code>	8
<code>MYSQL_TYPE_TIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATE</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATETIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_STRING</code>	<code>data_length</code>
<code>MYSQL_TYPE_BLOB</code>	<code>data_length</code>

In some cases you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or `BLOB` value for which you want to know how much space must be allocated. To accomplish this, you can use these strategies:

- Before invoking `mysql_stmt_fetch()` to retrieve individual rows, pass `STMT_ATTR_UPDATE_MAX_LENGTH` to `mysql_stmt_attr_set()`, then invoke `mysql_stmt_store_result()` to buffer the entire result on the client side. Setting the `STMT_ATTR_UPDATE_MAX_LENGTH` attribute causes the maximal length of column values to be indicated by the `max_length` member of the result set metadata returned by `mysql_stmt_result_metadata()`.
- Invoke `mysql_stmt_fetch()` with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with `mysql_stmt_fetch_column()`.

```
real_length= 0;
```

```

bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length
mysql_stmt_bind_result(stmt, bind);

mysql_stmt_fetch(stmt);
if (real_length > 0)
{
 data= malloc(real_length);
 bind[0].buffer= data;
 bind[0].buffer_length= real_length;
 mysql_stmt_fetch_column(stmt, bind, 0, 0);
}

```

## Return Values

Return Value	Description
0	Successful, the data has been fetched to application data buffers.
1	Error occurred. Error code and message can be obtained by calling <a href="#">mysql_stmt_errno()</a> and <a href="#">mysql_stmt_error()</a> .
<a href="#">MYSQL_NO_DATA</a>	No more rows/data exists
<a href="#">MYSQL_DATA_TRUNCATED</a>	Data truncation occurred

[MYSQL\\_DATA\\_TRUNCATED](#) is returned when truncation reporting is enabled. To determine which column values were truncated when this value is returned, check the [error](#) members of the [MYSQL\\_BIND](#) structures used for fetching values. Truncation reporting is enabled by default, but can be controlled by calling [mysql\\_options\(\)](#) with the [MYSQL\\_REPORT\\_DATA\\_TRUNCATION](#) option.

## Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_OUT\\_OF\\_MEMORY](#)

Out of memory.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

- [CR\\_UNSUPPORTED\\_PARAM\\_TYPE](#)

The buffer type is [MYSQL\\_TYPE\\_DATE](#), [MYSQL\\_TYPE\\_TIME](#), [MYSQL\\_TYPE\\_DATETIME](#), or [MYSQL\\_TYPE\\_TIMESTAMP](#), but the data type is not DATE, TIME, DATETIME, or TIMESTAMP.

- All other unsupported conversion errors are returned from [mysql\\_stmt\\_bind\\_result\(\)](#).

## Example

The following example demonstrates how to fetch data from a table using [mysql\\_stmt\\_result\\_metadata\(\)](#), [mysql\\_stmt\\_bind\\_result\(\)](#), and [mysql\\_stmt\\_fetch\(\)](#). (This example expects to retrieve the two rows inserted by the example shown in [Section 21.9.7.10, “mysql\\_stmt\\_execute\(\)”](#).) The [mysql](#) variable is assumed to be a valid connection handle.

```

#define STRING_SIZE 50
#define SELECT_SAMPLE "SELECT col1, col2, col3, col4 \
 FROM test_table"

```

```

MYSQL_STMT *stmt;
MYSQL_BIND bind[4];
MYSQL_RES *prepare_meta_result;
MYSQL_TIME ts;
unsigned long length[4];
int param_count, column_count, row_count;
short small_data;
int int_data;
char str_data[STRING_SIZE];
my_bool is_null[4];
my_bool error[4];

/* Prepare a SELECT query to fetch data from test_table */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
 fprintf(stderr, "mysql_stmt_init(), out of memory\n");
 exit(0);
}
if (mysql_stmt_prepare(stmt, SELECT_SAMPLE, strlen(SELECT_SAMPLE)))
{

 fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
 exit(0);
}

```

### 21.9.7.12. `mysql_stmt_fetch_column()`

```
int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int column, unsigned long offset)
```

#### Description

Fetch one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0.

`offset` is the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

#### Return Values

Zero if the value was fetched successfully. Nonzero if an error occurred.

#### Errors

- `CR_INVALID_PARAMETER_NO`

Invalid column number.

- `CR_NO_DATA`

The end of the result set has already been reached.

### 21.9.7.13. `mysql_stmt_field_count()`

```
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

#### Description

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

#### Return Values

An unsigned integer representing the number of columns in a result set.

#### Errors

None.

### 21.9.7.14. `mysql_stmt_free_result()`

```
my_bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

#### Description

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, `mysql_stmt_free_result()` closes it.

#### Return Values

Zero if the result set was freed successfully. Nonzero if an error occurred.

#### Errors

### 21.9.7.15. `mysql_stmt_init()`

```
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

#### Description

Create a `MYSQL_STMT` handle. The handle should be freed with `mysql_stmt_close(MYSQL_STMT *)`.

See also [Section 21.9.5, “C API Prepared Statement Data Structures”](#), for more information.

#### Return values

A pointer to a `MYSQL_STMT` structure in case of success. `NULL` if out of memory.

#### Errors

- `CR_OUT_OF_MEMORY`

Out of memory.

### 21.9.7.16. `mysql_stmt_insert_id()`

```
my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)
```

#### Description

Returns the value generated for an `AUTO_INCREMENT` column by the prepared `INSERT` or `UPDATE` statement. Use this function after you have executed a prepared `INSERT` statement on a table which contains an `AUTO_INCREMENT` field.

See [Section 21.9.3.37, “`mysql\_insert\_id\(\)`”](#), for more information.

#### Return Values

Value for `AUTO_INCREMENT` column which was automatically generated or explicitly set during execution of prepared statement, or value generated by `LAST_INSERT_ID(expr)` function. Return value is undefined if statement does not set `AUTO_INCREMENT` value.

#### Errors

None.

### 21.9.7.17. `mysql_stmt_num_rows()`

```
my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)
```

#### Description

Returns the number of rows in the result set.

The use of `mysql_stmt_num_rows()` depends on whether you used `mysql_stmt_store_result()` to buffer the entire result set in the statement handle. If you use `mysql_stmt_store_result()`, `mysql_stmt_num_rows()` may be called immediately. Otherwise, the row count is unavailable unless you count the rows as you fetch them.

`mysql_stmt_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_stmt_affected_rows()`.

#### Return Values

The number of rows in the result set.

#### Errors

None.

### 21.9.7.18. `mysql_stmt_param_count()`

```
unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)
```

#### Description

Returns the number of parameter markers present in the prepared statement.

#### Return Values

An unsigned long integer representing the number of parameters in a statement.

#### Errors

None.

#### Example

See the Example in [Section 21.9.7.10, “`mysql\_stmt\_execute\(\)`”](#).

### 21.9.7.19. `mysql_stmt_param_metadata()`

```
MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)
```

This function currently does nothing.

#### Description

#### Return Values

#### Errors

### 21.9.7.20. `mysql_stmt_prepare()`

```
int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long length)
```

#### Description

Given the statement handle returned by `mysql_stmt_init()`, prepares the SQL statement pointed to by the string `stmt_str` and returns a status value. The string length should be given by the `length` argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (“;”) or `\g` to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (“?”) characters into the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are permitted in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value. However, they are not permitted for identifiers (such as table or column names), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using `mysql_stmt_bind_param()` before executing the statement.

#### Return Values

Zero if the statement was prepared successfully. Nonzero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns nonzero), the error message can be obtained by calling `mysql_stmt_error()`.

#### Example

See the Example in Section 21.9.7.10, “`mysql_stmt_execute()`”.

### 21.9.7.21. `mysql_stmt_reset()`

```
my_bool mysql_stmt_reset(MYSQL_STMT *stmt)
```

#### Description

Resets a prepared statement on client and server to state after prepare. It resets the statement on the server, data sent using `mysql_stmt_send_long_data()`, unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

#### Return Values

Zero if the statement was reset successfully. Nonzero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 21.9.7.22. `mysql_stmt_result_metadata()`

```
MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)
```

#### Description

If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- `mysql_num_fields()`
- `mysql_fetch_field()`
- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`
- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysql_stmt_fetch()`.

#### Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

#### Errors

- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

#### Example

See the Example in [Section 21.9.7.11, “`mysql\_stmt\_fetch\(\)`”](#).

### 21.9.7.23. `mysql_stmt_row_seek()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)
```

#### Description

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

#### Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

#### Errors

None.

### 21.9.7.24. `mysql_stmt_row_tell()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```

#### Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

#### Return Values

The current offset of the row cursor.

#### Errors

None.

### 21.9.7.25. `mysql_stmt_send_long_data()`

```
my_bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int parameter_number, const char *data, unsigned long length)
```

#### Description

Enables an application to send parameter data to the server in pieces (or “chunks”). Call this function after `mysql_stmt_bind_param()` and before `mysql_stmt_execute()`. It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the `TEXT` or `BLOB` data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

#### Note

The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See [Section 21.9.7.21, “`mysql\_stmt\_reset\(\)`”](#).

### Return Values

Zero if the data is sent successfully to server. Nonzero if an error occurred.

### Errors

- `CR_INVALID_BUFFER_USE`

The parameter does not have a string or binary type.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### Example

The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value '[MySQL – The most popular Open Source database](#)' into the `text_column` column. The `mysql` variable is assumed to be a valid connection handle.

```
#define INSERT_QUERY "INSERT INTO \
 test_long_data(text_column) VALUES(?)"

MYSQL_BIND bind[1];
long length;

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
 fprintf(stderr, "mysql_stmt_init(), out of memory\n");
 exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))
{
 fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
 fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
 exit(0);
}
memset(bind, 0, sizeof(bind));
bind[0].buffer_type= MYSQL_TYPE_STRING;
bind[0].length= &length;
bind[0].is_null= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
 fprintf(stderr, "\n param bind failed");
 fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
 exit(0);
}

/* Supply data in chunks to server */
if (mysql_stmt_send_long_data(stmt,0,"MySQL",5))
{
 fprintf(stderr, "\n send_long_data failed");
 fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
 exit(0);
}

/* Supply the next piece of data */
if (mysql_stmt_send_long_data(stmt,0,
 " - The most popular Open Source database",40))
{
 fprintf(stderr, "\n send_long_data failed");
 fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
 exit(0);
}
```

```

/* Now, execute the query */
if (mysql_stmt_execute(stmt))
{
 fprintf(stderr, "\n mysql_stmt_execute failed");
 fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
 exit(0);
}

```

### 21.9.7.26. `mysql_stmt_sqlstate()`

```
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

#### Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. "00000" means "no error." The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, Errors, Error Codes, and Common Problems](#).

Note that not all MySQL errors are yet mapped to SQLSTATE codes. The value "HY000" (general error) is used for unmapped errors.

#### Return Values

A null-terminated character string containing the SQLSTATE error code.

### 21.9.7.27. `mysql_stmt_store_result()`

```
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

#### Description

Result sets are produced by executing prepared statements for SQL statements such as `SELECT`, `SHOW`, `DESCRIBE`, and `EXPLAIN`. By default, result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see [Section 21.9.7.11, “mysql\\_stmt\\_fetch\(\)”](#).)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`, `mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to [Section 21.9.7.22, “mysql\\_stmt\\_result\\_metadata\(\)”](#).

#### Note

MySQL doesn't by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications don't need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See [Section 21.9.7.3, “mysql\\_stmt\\_attr\\_set\(\)”](#).

#### Return Values

Zero if the results are buffered successfully. Nonzero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

## 21.9.8. C API Threaded Function Descriptions

You need to use the following functions when you want to create a threaded client. See [Section 21.9.16.2, “How to Make a Threaded Client”](#).

### 21.9.8.1. `my_init()`

```
void my_init(void)
```

#### Description

`my_init()` initializes some global variables that MySQL needs. If you are using a thread-safe client library, it also calls `mysql_thread_init()` for this thread.

It is necessary for `my_init()` to be called early in the initialization phase of a program's use of the MySQL library. However, `my_init()` is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you ensure that your program invokes one of those functions before any other MySQL calls, there is no need to invoke `my_init()` explicitly.

To access the prototype for `my_init()`, your program should include these header files:

```
#include <my_global.h>
#include <my_sys.h>
```

#### Return Values

None.

### 21.9.8.2. `mysql_thread_end()`

```
void mysql_thread_end(void)
```

#### Description

This function needs to be called before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`.

`mysql_thread_end()` is not invoked automatically by the client library. It must be called explicitly to avoid a memory leak.

#### Return Values

None.

### 21.9.8.3. `mysql_thread_init()`

```
my_bool mysql_thread_init(void)
```

#### Description

This function must be called early within each created thread to initialize thread-specific variables. However, you may not necessarily need to invoke it explicitly: `mysql_thread_init()` is automatically called by `my_init()`, which itself is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you invoke any of those functions, `mysql_thread_init()` will be called for you.

#### Return Values

Zero if successful. Nonzero if an error occurred.

### 21.9.8.4. `mysql_thread_safe()`

```
unsigned int mysql_thread_safe(void)
```

**Description**

This function indicates whether the client library is compiled as thread-safe.

**Return Values**

1 if the client library is thread-safe, 0 otherwise.

## 21.9.9. C API Embedded Server Function Descriptions

MySQL applications can be written to use an embedded server. See [Section 21.8, “libmysqld, the Embedded MySQL Server Library”](#). To write such an application, you must link it against the `libmysqld` library by using the `-lmysqld` flag rather than linking it against the `libmysqlclient` client library by using the `-lmysqlclient` flag. However, the calls to initialize and finalize the library are the same whether you write a client application or one that uses the embedded server: Call `mysql_library_init()` to initialize the library and `mysql_library_end()` when you are done with it. See [Section 21.9.2, “C API Function Overview”](#).

### 21.9.9.1. `mysql_server_init()`

```
int mysql_server_init(int argc, char **argv, char **groups)
```

**Description**

This function initializes the MySQL library, which must be done before you call any other MySQL function. However, `mysql_server_init()` is deprecated and you should call `mysql_library_init()` instead. See [Section 21.9.3.40, “mysql\\_library\\_init\(\)”](#).

**Return Values**

Zero if successful. Nonzero if an error occurred.

### 21.9.9.2. `mysql_server_end()`

```
void mysql_server_end(void)
```

**Description**

This function finalizes the MySQL library, which should be done when you are done using the library. However, `mysql_server_end()` is deprecated and `mysql_library_end()` should be used instead. See [Section 21.9.3.39, “mysql\\_library\\_end\(\)”](#).

**Return Values**

None.

## 21.9.10. Common Questions and Problems When Using the C API

### 21.9.10.1. Why `mysql_store_result()` Sometimes Returns `NULL` After `mysql_query()` Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data couldn't be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a nonempty result by calling `mysql_field_count()`. If `mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a nonzero value, the statement should have produced a nonempty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

## 21.9.10.2. What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an `INSERT`, `UPDATE`, or `DELETE`.  
For a fast re-create, use `TRUNCATE TABLE`.
- `mysql_num_rows()` returns the number of rows in a result set. With `mysql_store_result()`, `mysql_num_rows()` may be called as soon as `mysql_store_result()` returns. With `mysql_use_result()`, `mysql_num_rows()` may be called only after you have fetched all the rows with `mysql_fetch_row()`.
- `mysql_insert_id()` returns the ID generated by the last query that inserted a row into a table with an `AUTO_INCREMENT` index. See [Section 21.9.3.37, “mysql\\_insert\\_id\(\)”](#).
- Some queries (`LOAD DATA INFILE ...`, `INSERT INTO ... SELECT ...`, `UPDATE`) return additional information. The result is returned by `mysql_info()`. See the description for `mysql_info()` for the format of the string that it returns. `mysql_info()` returns a `NULL` pointer if there is no additional information.

## 21.9.10.3. How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an `AUTO_INCREMENT` column, you can obtain the value stored into that column by calling the `mysql_insert_id()` function.

You can check from your C applications whether a value was stored in an `AUTO_INCREMENT` column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an `INSERT` with an `AUTO_INCREMENT` index:

```
if ((result = mysql_store_result(&mysql)) == 0 &&
 mysql_field_count(&mysql) == 0 &&
 mysql_insert_id(&mysql) != 0)
{
 used_id = mysql_insert_id(&mysql);
}
```

When a new `AUTO_INCREMENT` value has been generated, you can also obtain it by executing a `SELECT LAST_INSERT_ID()` statement with `mysql_query()` and retrieving the value from the result set returned by the statement.

When inserting multiple values, the last automatically incremented value is returned.

For `LAST_INSERT_ID()`, the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another `AUTO_INCREMENT` column with a nonmagic value (that is, a value that is not `NULL` and not `0`). Using `LAST_INSERT_ID()` and `AUTO_INCREMENT` columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement *that* client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```
INSERT INTO foo (auto,text)
 VALUES(NULL,'text'); # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
 VALUES(LAST_INSERT_ID(),'text'); # use ID in second table
```

Note that `mysql_insert_id()` returns the value stored into an `AUTO_INCREMENT` column, whether that value is automatically generated by storing `NULL` or `0` or was specified as an explicit value. `LAST_INSERT_ID()` returns only automatically generated `AUTO_INCREMENT` values. If you store an explicit value other than `NULL` or `0`, it does not affect the value returned by `LAST_INSERT_ID()`.

For more information on obtaining the last ID in an `AUTO_INCREMENT` column:

- For information on `LAST_INSERT_ID()`, which can be used within an SQL statement, see [Section 11.14, “Information Functions”](#).
- For information on `mysql_insert_id()`, the function you use from within the C API, see [Section 21.9.3.37, “mysql\\_insert\\_id\(\)”](#).
- For information on obtaining the auto-incremented value when using Connector/J, see [Section 21.3.5, “Connector/J Notes and Tips”](#).

- For information on obtaining the auto-incremented value when using Connector/ODBC, see [Section 21.1.7.1.1, “Obtaining Auto-Increment Values”](#).

## 21.9.11. Controlling Automatic Reconnection Behavior

The MySQL client library can perform an automatic reconnection to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. In this case, the library tries once to reconnect to the server and send the statement again.

If it is important for your application to know that the connection has been dropped (so that it can exit or take action to adjust for the loss of state information), be sure to disable auto-reconnect. This can be done explicitly by calling `mysql_options()` with the `MYSQL_OPT_RECONNECT` option:

```
my_bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);
```

In MySQL 5.1, auto-reconnect is disabled by default.

If the connection has gone down, the `mysql_ping()` function performs a reconnect if auto-reconnect is enabled. If auto-reconnect is disabled, `mysql_ping()` returns an error instead.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

If an automatic reconnection does occur (for example, as a result of calling `mysql_ping()`), there is no explicit indication of it. To check for reconnection, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier has changed.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset and your application will not know about it. The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session variables are reinitialized to the values of the corresponding variables. This also affects variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.

If the connection drops, it is possible that the session associated with the connection on the server side will still be running if the server has not yet detected that the client is no longer connected. In this case, any locks held by the original connection still belong to that session, so you may want to kill it by calling `mysql_kill()`.

## 21.9.12. C API Support for Multiple Statement Execution

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement produces a result set (a set of rows, as for `SELECT`) or an affected-rows count (as for `INSERT`, `UPDATE`, and so forth).

MySQL 5.1 also supports the execution of a string containing multiple statements separated by semicolon (“`;`”) characters. This capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling `mysql_set_server_option()`.

Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check

whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. These functions are used at the end of a loop that iterates as long as more results are available. *Failure to process the result this way may result in a dropped connection to the server.*

Multiple-result processing also is required if you execute `CALL` statements for stored procedures. Results from a stored procedure have these characteristics:

- Statements within the procedure may produce result sets (for example, if it executes `SELECT` statements). These result sets are returned in the order that they are produced as the procedure executes.

In general, the caller cannot know how many result sets a procedure will return. Procedure execution may depend on loops or conditional statements that cause the execution path to differ from one call to the next. Therefore, you must be prepared to retrieve multiple results.

- The final result from the procedure is a status result that includes no result set. The status indicates whether the procedure succeeded or an error occurred.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handles are defined to work only with strings that contain a single statement. See [Section 21.9.4, “C API Prepared Statements”](#).

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevant:
  - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option *must* be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error `Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context`.
  - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.
- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of “simple” results for a multiple-statement string where each statement produces a single result, but is *not* sufficient to permit processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.
2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.
4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns nonzero. The code as written distinguishes between no more results and an error, which enables a message to be printed for the latter occurrence.

```
/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
 db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
 printf("mysql_real_connect() failed\n");
 mysql_close(mysql);
 exit(1);
}
```

```

/* execute multiple statements */
status = mysql_query(mysql,
 "DROP TABLE IF EXISTS test_table;\n"
 "CREATE TABLE test_table(id INT);\n"
 "INSERT INTO test_table VALUES(10);\n"
 "UPDATE test_table SET id=20 WHERE id=10;\n"
 "SELECT * FROM test_table;\n"
 "DROP TABLE test_table");
if (status)
{
 printf("Could not execute statement(s)");
 mysql_close(mysql);
 exit(0);
}

/* process each statement result */
do {
 /* did current statement return data? */
 result = mysql_store_result(mysql);
 if (result)
 {
 /* yes; process rows and free the result set */
 process_result_set(mysql, result);
 mysql_free_result(result);
 }
 else /* no result set or error */
 {
 if (mysql_field_count(mysql) == 0)
 {
 printf("%lld rows affected\n",
 mysql_affected_rows(mysql));
 }
 else /* some error occurred */
 {
 printf("Could not retrieve result set\n");
 break;
 }
 }
 /* more results? -1 = no, >0 = error, 0 = yes (keep looping) */
 if ((status = mysql_next_result(mysql)) > 0)
 printf("Could not execute statement\n");
} while (status == 0);

mysql_close(mysql);

```

## 21.9.13. C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- `TIME`, `TIMESTAMP`, and `DATETIME` do not support parts of seconds (for example, from `DATE_FORMAT()`).
- When converting an integer to string, `ZEROFILL` is honored with prepared statements in some cases where the MySQL server doesn't print the leading zeros. (For example, with `MIN(number-with-zerofill)`).
- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.
- Before MySQL 5.1.17, prepared statements do not use the query cache. As of 5.1.17, prepared statements use the query cache under the conditions described in [Section 7.6.3.1, “How the Query Cache Operates”](#).
- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by “`;`” characters).
- In MySQL 5.1, prepared `CALL` statements cannot invoke stored procedures that return result sets because prepared statements do not support multiple result sets. Nor can the calling application access a stored procedure's `OUT` or `INOUT` parameters when the procedure returns. These capabilities are supported beginning with MySQL 5.5.

## 21.9.14. C API Prepared Statement Handling of Date and Time Values

The binary (prepared statement) protocol enables you to send and receive date and time values (`DATE`, `TIME`, `DATETIME`, and `TIMESTAMP`), using the `MYSQL_TIME` structure. The members of this structure are described in [Section 21.9.5, “C API Prepared Statement Data Structures”](#).

To send temporal data values, create a prepared statement using `mysql_stmt_prepare()`. Then, before calling `mysql_stmt_execute()` to execute the statement, use the following procedure to set up each temporal parameter:

1. In the `MYSQL_BIND` structure associated with the data value, set the `buffer_type` member to the type that indicates what kind of temporal value you're sending. For `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` values, set `buffer_type` to

`MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, respectively.

2. Set the `buffer` member of the `MYSQL_BIND` structure to the address of the `MYSQL_TIME` structure in which you pass the temporal value.
3. Fill in the members of the `MYSQL_TIME` structure that are appropriate for the type of temporal value to be passed.

Use `mysql_stmt_bind_param()` to bind the parameter data to the statement. Then you can call `mysql_stmt_execute()`.

To retrieve temporal values, the procedure is similar, except that you set the `buffer_type` member to the type of value you expect to receive, and the `buffer` member to the address of a `MYSQL_TIME` structure into which the returned value should be placed. Use `mysql_stmt_bind_result()` to bind the buffers to the statement after calling `mysql_stmt_execute()` and before fetching the results.

Here is a simple example that inserts `DATE`, `TIME`, and `TIMESTAMP` data. The `mysql` variable is assumed to be a valid connection handle.

```

MYSQL_TIME ts;
MYSQL_BIND bind[3];
MYSQL_STMT *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field, \
 timestamp_field) VALUES(?, ?, ?)");

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
 fprintf(stderr, "mysql_stmt_init(), out of memory\n");
 exit(0);
}
if (mysql_stmt_prepare(mysql, query, strlen(query)))
{
 fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
 fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
 exit(0);
}

/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...
bind[1]= bind[2]= bind[0];
...

mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;
mysql_stmt_execute(stmt);
...

```

## 21.9.15. C API Support for Prepared `CALL` Statements

In MySQL 5.1, prepared `CALL` statements can be used only for stored procedures that produce at most one result set. Nor can the calling application use placeholders for `OUT` or `INOUT` parameters.

MySQL 5.5 expands prepared `CALL` statement support for stored procedures that produce multiple result sets and to provide placeholder access to `OUT` and `INOUT` parameters.

## 21.9.16. Building Client Programs

If you compile MySQL clients that you've written yourself or that you obtain from a third-party, they must be linked using the `-lmysqlclient -lz` options in the link command. You may also need to specify a `-L` option to tell the linker where to find the library. For example, if the library is installed in `/usr/local/mysql/lib`, use `-L/usr/local/mysql/lib -lmysqlclient -lz` in the link command.

For clients that use MySQL header files, you may need to specify an `-I` option when you compile them (for example, `-I/usr/local/mysql/include`), so that the compiler can find the header files.

To make it simpler to compile MySQL programs on Unix, we have provided the `mysql_config` script for you. See [Section 4.7.2, “`mysql\_config` — Get Compile Options for Compiling Clients”](#).

You can use it to compile a MySQL client as follows:

```
CFG=/usr/local/mysql/bin/mysql_config
sh -c "gcc -o programe `$CFG --cflags` programe.c `$CFG --libs`"
```

The `sh -c` is needed to get the shell not to treat the output from `mysql_config` as one word.

### 21.9.16.1. Problems Linking with the C API

When linking with the C API, the following errors may occur on some systems:

```
gcc -g -o client test.o -L/usr/local/lib/mysql \
-lmysqlclient -lsocket -lnsl

Undefined first referenced
symbol in file
floor /usr/local/lib/mysql/libmysqlclient.a(password.o)
ld: fatal: Symbol referencing errors. No output written to client
```

If this happens on your system, you must include the math library by adding `-lm` to the end of the compile/link line.

Linking with the single-threaded library (`libmysqlclient`) may lead to linker errors related to `pthread` symbols. When using the single-threaded library, please compile your client with `MYSQL_CLIENT_NO_THREADS` defined. This can be done on the command line by using the `-D` option to the compiler, or in your source code before including the MySQL header files. This define should not be used when building for use with the thread-safe client library (`libmysqlclient_r`).

### 21.9.16.2. How to Make a Threaded Client

The client library is almost thread-safe. The biggest problem is that the subroutines in `net.c` that read from sockets are not interrupt safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, the socket handling should be thread-safe.

To avoid aborting the program when a connection terminates, MySQL blocks `SIGPIPE` on the first call to `mysql_library_init()`, `mysql_init()`, or `mysql_connect()`. If you want to use your own `SIGPIPE` handler, you should first call `mysql_library_init()` and then install your handler.

Current binary distributions should have both a normal and a thread-safe client library.

The thread-safe client library, `libmysqlclient_r`, is thread-safe per connection. You can let two threads share the same connection with the following caveats:

- Two threads can't send a query to the MySQL server at the same time on the same connection. In particular, you have to ensure that between calls to `mysql_query()` and `mysql_store_result()` no other thread is using the same connection.
- Many threads can access different result sets that are retrieved with `mysql_store_result()`.
- If you use `mysql_use_result()`, you must ensure that no other thread is using the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.
- If you want to use multiple threads on the same connection, you must have a mutex lock around your pair of `mysql_query()` and `mysql_store_result()` calls. Once `mysql_store_result()` is ready, the lock can be released and other threads may query the same connection.
- If you use POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

You need to know the following if you have a thread that is calling MySQL functions which did not create the connection to the MySQL database:

When you call `mysql_init()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things). If you call a MySQL function before the thread has called `mysql_init()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later. To get things to work smoothly you must do the following:

1. Call `mysql_library_init()` before any other MySQL functions. It is not thread-safe, so call it before threads are created, or protect the call with a mutex.

2. Arrange for `mysql_thread_init()` to be called early in the thread handler before calling any MySQL function. If you call `mysql_init()`, they will call `mysql_thread_init()` for you.
3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

The preceding notes regarding `mysql_init()` also apply to `mysql_connect()`, which calls `mysql_init()`.

If “undefined symbol” errors occur when linking your client with `libmysqlclient_r`, in most cases this is because you haven’t included the thread libraries on the link/compile command.

## 21.10. MySQL PHP API

PHP is a server-side, HTML-embedded scripting language that may be used to create dynamic Web pages. It is available for most operating systems and Web servers, and can access most common databases, including MySQL. PHP may be run as a separate program or compiled as a module for use with the Apache Web server.

PHP actually provides two different MySQL API extensions:

- `mysql`: Available for PHP versions 4 and 5, this extension is intended for use with MySQL versions prior to MySQL 4.1. This extension does not support the improved authentication protocol used in MySQL 4.1, nor does it support prepared statements or multiple statements. If you wish to use this extension with MySQL 4.1, you will likely want to configure the MySQL server to use the `--old-passwords` option (see [Section B.5.2.4, “Client does not support authentication protocol”](#)). This extension is documented on the PHP Web site at <http://php.net/mysql>.
- [Section 21.10.2, “MySQL Improved Extension \(`mysqli`\)”](#) - Stands for “MySQL, Improved”; this extension is available only in PHP 5. It is intended for use with MySQL 4.1.1 and later. This extension fully supports the authentication protocol used in MySQL 5.0, as well as the Prepared Statements and Multiple Statements APIs. In addition, this extension provides an advanced, object-oriented programming interface. You can read the documentation for the `mysqli` extension at <http://php.net/mysqli>. Helpful article can be found at <http://devzone.zend.com/node/view/id/686> and <http://devzone.zend.com/node/view/id/687>.

If you’re experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, see [Section 21.10.7, “Enabling Both `mysql` and `mysqli` in PHP”](#).

The PHP distribution and documentation are available from the [PHP Web site](#).

### 21.10.1. MySQL

[Copyright 1997-2010 the PHP Documentation Group](#).

These functions allow you to access MySQL database servers. More information about MySQL can be found at <http://www.mysql.com/>.

Documentation for MySQL can be found at <http://dev.mysql.com/doc/>.

For an overview of MySQL database connectivity terms and products see [Section 21.10.2.2, “Overview”](#).

#### 21.10.1.1. Installing/Configuring

[Copyright 1997-2010 the PHP Documentation Group](#).

##### 21.10.1.1.1. Requirements

[Copyright 1997-2010 the PHP Documentation Group](#).

In order to have these functions available, you must compile PHP with MySQL support.

##### 21.10.1.1.2. Installation

Copyright 1997-2010 the PHP Documentation Group.

For compiling, simply use the `--with-mysql[=DIR]` configuration option where the optional `[DIR]` points to the MySQL installation directory.

Although this MySQL extension is compatible with MySQL 4.1.0 and greater, it doesn't support the extra functionality that these versions provide. For that, use the [MySQLi](#) extension.

If you would like to install the `mysql` extension along with the `mysqli` extension you have to use the same client library to avoid any conflicts.

### 21.10.1.1.2.1. Installation on Linux Systems

Copyright 1997-2010 the PHP Documentation Group.

#### 21.10.1.1.2.1.1. PHP 4

Copyright 1997-2010 the PHP Documentation Group.

The option `--with-mysql` is enabled by default. This default behavior may be disabled with the `--without-mysql` configuration option. If MySQL is enabled without specifying the path to the MySQL install DIR, PHP will use the bundled MySQL client libraries.

Users who run other applications that use MySQL (for example, `auth-mysql`) should not use the bundled library, but rather specify the path to MySQL's install directory, like so: `--with-mysql=/path/to/mysql`. This will force PHP to use the client libraries installed by MySQL, thus avoiding any conflicts.

#### 21.10.1.1.2.1.2. PHP 5.0.x, 5.1.x, 5.2.x

Copyright 1997-2010 the PHP Documentation Group.

MySQL is not enabled by default, nor is the MySQL library bundled with PHP. Read this [FAQ](#) for details on why. Use the `--with-mysql[=DIR]` configure option to include MySQL support. You can download *headers and libraries* from <http://www.mysql.com/>.

#### 21.10.1.1.2.1.3. PHP 5.3.0+

Copyright 1997-2010 the PHP Documentation Group.

In PHP 5.3.0 and above the MySQL-related database extensions use the [MySQL Native Driver](#) by default. This means that the MySQL Client Library (`libmysql`) is no longer required in order to support connection to a MySQL database. The extensions `mysql`, `mysqli`, and `PHP_PDO_MYSQL` are all enabled by default in PHP 5.3.0+, and all use the MySQL Native Driver by default. In each case no further installation steps are required in order to use these extensions, although you may want to set some preferences in `php.ini` depending on your requirements.

### 21.10.1.1.2.2. Installation on Windows Systems

Copyright 1997-2010 the PHP Documentation Group.

#### 21.10.1.1.2.2.1. PHP 4

Copyright 1997-2010 the PHP Documentation Group.

The PHP MySQL extension is compiled into PHP.

#### 21.10.1.1.2.2.2. PHP 5.0.x, 5.1.x, 5.2.x

Copyright 1997-2010 the PHP Documentation Group.

MySQL is no longer enabled by default, so the `php_mysql.dll` DLL must be enabled inside of `php.ini`. Also, PHP needs access to the MySQL client library. A file named `libmysql.dll` is included in the Windows PHP distribution and in order for PHP to talk to MySQL this file needs to be available to the Windows systems `PATH`. See the FAQ titled "[How do I add my PHP directory to the PATH on Windows](#)" for information on how to do this. Although copying `libmysql.dll` to the Windows system directory also works (because the system directory is by default in the system's `PATH`), it's not recommended.

As with enabling any PHP extension (such as `php_mysql.dll`), the PHP directive `extension_dir` should be set to the directory where the PHP extensions are located. See also the [Manual Windows Installation Instructions](#). An example `extension_dir` value for PHP 5 is `c:\php\ext`

#### Note

If when starting the web server an error similar to the following occurs: "Unable to load dynamic library './php\_mysql.dll'", this is because `php_mysql.dll` and/or `libmysql.dll` cannot be found by the system.

### 21.10.1.1.2.2.3. PHP 5.3.0+

[Copyright 1997-2010 the PHP Documentation Group.](#)

Please refer to [these notes](#) on installing MySQL support on PHP 5.3.0 and above.

### 21.10.1.1.2.3. MySQL Installation Notes

[Copyright 1997-2010 the PHP Documentation Group.](#)

#### Warning

Crashes and startup problems of PHP may be encountered when loading this extension in conjunction with the `recode` extension. See the `recode` extension for more information.

#### Note

If you need charsets other than *latin* (default), you have to install external (not bundled) libmysql with compiled charset support.

### 21.10.1.1.3. Runtime Configuration

[Copyright 1997-2010 the PHP Documentation Group.](#)

The behaviour of these functions is affected by settings in `php.ini`.

**Table 21.4. MySQL Configuration Options**

Name	Default	Changeable	Changelog
<code>mysql.allow_persistent</code>	"1"	PHP_INI_SYSTEM	
<code>mysql.max_persistent</code>	"-1"	PHP_INI_SYSTEM	
<code>mysql.max_links</code>	"-1"	PHP_INI_SYSTEM	
<code>mysql.trace_mode</code>	"0"	PHP_INI_ALL	Available since PHP 4.3.0.
<code>mysql.default_port</code>	NULL	PHP_INI_ALL	
<code>mysql.default_socket</code>	NULL	PHP_INI_ALL	Available since PHP 4.0.1.
<code>mysql.default_host</code>	NULL	PHP_INI_ALL	
<code>mysql.default_user</code>	NULL	PHP_INI_ALL	
<code>mysql.default_password</code>	NULL	PHP_INI_ALL	
<code>mysql.connect_timeout</code>	"60"	PHP_INI_ALL	PHP_INI_SYSTEM in PHP <= 4.3.2. Available since PHP 4.3.0.

For further details and definitions of the PHP\_INI\_\* modes, see the [configuration.changes.modes](#).

Here's a short explanation of the configuration directives.

<code>mysql.allow_persistent</code>	Whether to allow <a href="#">persistent connections</a> to MySQL.
<code>mysql.max_persistent</code>	The maximum number of persistent MySQL connections per process.
<code>mysql.max_links</code>	The maximum number of MySQL connections per process, including persistent connections.
<code>mysql.trace_mode</code>	Trace mode. When <code>mysql.trace_mode</code> is enabled, warnings for table/index scans, non free result sets, and SQL-Errors will be displayed. (Introduced in PHP 4.3.0)
<code>mysql.default_port</code>	The default TCP port number to use when connecting to the database server if no other port is specified. If no default is specified, the port will be obtained from the <code>MYSQL_TCP_PORT</code> environment variable, the <code>mysql-tcp</code> entry in <code>/etc/services</code> or the compile-time

	<code>MYSQL_PORT</code> constant, in that order. Win32 will only use the <code>MYSQL_PORT</code> constant.
<code>mysql.default_socket</code> string	The default socket name to use when connecting to a local database server if no other socket name is specified.
<code>mysql.default_host</code> string	The default server host to use when connecting to the database server if no other host is specified. Doesn't apply in <a href="#">SQL safe mode</a> .
<code>mysql.default_user</code> string	The default user name to use when connecting to the database server if no other name is specified. Doesn't apply in <a href="#">SQL safe mode</a> .
<code>mysql.default_password</code> string	The default password to use when connecting to the database server if no other password is specified. Doesn't apply in <a href="#">SQL safe mode</a> .
<code>mysql.connect_timeout</code> integer	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.

#### 21.10.1.1.4. Resource Types

[Copyright 1997-2010 the PHP Documentation Group](#).

There are two resource types used in the MySQL module. The first one is the link identifier for a database connection, the second a resource which holds the result of a query.

#### 21.10.1.2. Predefined Constants

[Copyright 1997-2010 the PHP Documentation Group](#).

The constants below are defined by this extension, and will only be available when the extension has either been compiled into PHP or dynamically loaded at runtime.

Since PHP 4.3.0 it is possible to specify additional client flags for the `mysql_connect` and `mysql_pconnect` functions. The following constants are defined:

**Table 21.5. MySQL client constants**

Constant	Description
<code>MYSQL_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQL_CLIENT_IGNORE_SPACE</code>	Allow space after function names
<code>MYSQL_CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> ) of inactivity before closing the connection.
<code>MYSQL_CLIENT_SSL</code>	Use SSL encryption. This flag is only available with version 4.x of the MySQL client library or newer. Version 3.23.x is bundled both with PHP 4 and Windows binaries of PHP 5.

The function `mysql_fetch_array` uses a constant for the different types of result arrays. The following constants are defined:

**Table 21.6. MySQL fetch constants**

Constant	Description
<code>MYSQL_ASSOC</code>	Columns are returned into the array having the fieldname as the array index.
<code>MYSQL_BOTH</code>	Columns are returned into the array having both a numerical index and the fieldname as the array index.
<code>MYSQL_NUM</code>	Columns are returned into the array having a numerical index to the fields. This index starts with 0, the first field in the result.

#### 21.10.1.3. Examples

[Copyright 1997-2010 the PHP Documentation Group](#).

##### 21.10.1.3.1. Basic

This simple example shows how to connect, execute a query, print resulting rows and disconnect from a MySQL database.

### Example 21.15. MySQL extension overview example

Copyright 1997-2010 the PHP Documentation Group.

```
<?php
// Connecting, selecting database
$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')
 or die('Could not connect: ' . mysql_error());
echo 'Connected successfully';
mysql_select_db('my_database') or die('Could not select database');

// Performing SQL query
$query = 'SELECT * FROM my_table';
$result = mysql_query($query) or die('Query failed: ' . mysql_error());

// Printing results in HTML
echo "<table>\n";
while ($line = mysql_fetch_array($result, MYSQL_ASSOC)) {
 echo "<tr>\n";
 foreach ($line as $col_value) {
 echo "\t\t<td>$col_value</td>\n";
 }
 echo "\t</tr>\n";
}
echo "</table>\n";

// Free resultset
mysql_free_result($result);

// Closing connection
mysql_close($link);
?>
```

## 21.10.1.4. MySQL Functions

Copyright 1997-2010 the PHP Documentation Group.

### Note

Most MySQL functions accept `link_identifier` as the last optional parameter. If it is not provided, last opened connection is used. If it doesn't exist, connection is tried to establish with default parameters defined in `php.ini`. If it is not successful, functions return `FALSE`.

### 21.10.1.4.1. `mysql_affected_rows`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_affected_rows`

Get number of affected rows in previous MySQL operation

#### Description

```
int mysql_affected_rows(resource link_identifier);
```

Get the number of affected rows by the last INSERT, UPDATE, REPLACE or DELETE query associated with `link_identifier`.

#### Parameters

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

#### Return Values

Returns the number of affected rows on success, and -1 if the last query failed.

If the last query was a DELETE query with no WHERE clause, all of the records will have been deleted from the table but this function will return zero with MySQL versions prior to 4.1.2.

When using UPDATE, MySQL will not update columns where the new value is the same as the old value. This creates the possibility that `mysql_affected_rows` may not actually equal the number of rows matched, only the number of rows that were literally affected by the query.

The REPLACE statement first deletes the record with the same primary key and then inserts the new record. This function returns the number of deleted records plus the number of inserted records.

### Examples

#### Example 21.16. `mysql_affected_rows` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

/* this should return the correct numbers of deleted records */
mysql_query('DELETE FROM mytable WHERE id < 10');
printf("Records deleted: %d\n", mysql_affected_rows());

/* with a where clause that is never true, it should return 0 */
mysql_query('DELETE FROM mytable WHERE 0');
printf("Records deleted: %d\n", mysql_affected_rows());
?>
```

The above example will output something similar to:

```
Records deleted: 10
Records deleted: 0
```

#### Example 21.17. `mysql_affected_rows` example using transactions

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

/* Update records */
mysql_query("UPDATE mytable SET used=1 WHERE id < 10");
printf ("Updated records: %d\n", mysql_affected_rows());
mysql_query("COMMIT");
?>
```

The above example will output something similar to:

```
Updated Records: 10
```

**Notes****Transactions**

If you are using transactions, you need to call `mysql_affected_rows` after your INSERT, UPDATE, or DELETE query, not after the COMMIT.

**SELECT Statements**

To retrieve the number of rows returned by a SELECT, it is possible to use `mysql_num_rows`.

**Cascaded Foreign Keys**

`mysql_affected_rows` does not count rows affected implicitly through the use of ON DELETE CASCADE and/or ON UPDATE CASCADE in foreign key constraints.

**See Also**

`mysql_num_rows`  
`mysql_info`

**21.10.1.4.2. mysql\_client\_encoding**

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_client_encoding`

Returns the name of the character set

**Description**

```
string mysql_client_encoding(resource link_identifier);
```

Retrieves the `character_set` variable from MySQL.

**Parameters**

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

**Return Values**

Returns the default character set name for the current connection.

**Examples****Example 21.18. `mysql_client_encoding` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$charset = mysql_client_encoding($link);
echo "The current character set is: $charset\n";
?>
```

The above example will output something similar to:

```
The current character set is: latin1
```

## See Also

[mysql\\_real\\_escape\\_string](#)

### 21.10.1.4.3. [mysql\\_close](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_close](#)

Close MySQL connection

#### Description

```
bool mysql_close(resource link_identifier);
```

[mysql\\_close](#) closes the non-persistent connection to the MySQL server that's associated with the specified link identifier. If *link\_identifier* isn't specified, the last opened link is used.

Using [mysql\\_close](#) isn't usually necessary, as non-persistent open links are automatically closed at the end of the script's execution. See also [freeing resources](#).

#### Parameters

*link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql\\_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql\\_connect](#) was called with no arguments. If no connection is found or established, an [E\\_WARNING](#) level error is generated.

#### Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

#### Examples

##### Example 21.19. [mysql\\_close](#) example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

The above example will output:

```
Connected successfully
```

**Notes****Note**

`mysql_close` will not close persistent links created by `mysql_pconnect`.

**See Also**

`mysql_connect`  
`mysql_free_result`

**21.10.1.4.4. mysql\_connect**

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_connect`

Open a connection to a MySQL Server

**Description**

```
resource mysql_connect(string server= ini_get("mysql.default_host"),
 string username= ini_get("mysql.default_user"),
 string password= ini_get("mysql.default_password"),
 bool new_link= false,
 int client_flags= 0);
```

Opens or reuses a connection to a MySQL server.

**Parameters****server**

The MySQL server. It can also include a port number. e.g. "hostname:port" or a path to a local socket e.g. "./path/to/socket" for the localhost.

If the PHP directive `mysql.default_host` is undefined (default), then the default value is 'localhost:3306'. In [SQL safe mode](#), this parameter is ignored and value 'localhost:3306' is always used.

**username**

The username. Default value is defined by `mysql.default_user`. In [SQL safe mode](#), this parameter is ignored and the name of the user that owns the server process is used.

**password**

The password. Default value is defined by `mysql.default_password`. In [SQL safe mode](#), this parameter is ignored and empty password is used.

**new\_link**

If a second call is made to `mysql_connect` with the same arguments, no new link will be established, but instead, the link identifier of the already opened link will be returned. The `new_link` parameter modifies this behavior and makes `mysql_connect` always open a new link, even if `mysql_connect` was called before with the same parameters. In [SQL safe mode](#), this parameter is ignored.

**client\_flags**

The `client_flags` parameter can be a combination of the following constants: 128 (enable LOAD DATA LOCAL handling), `MYSQL_CLIENT_SSL`, `MYSQL_CLIENT_COMPRESS`, `MYSQL_CLIENT_IGNORE_SPACE` or `MYSQL_CLIENT_INTERACTIVE`. Read the section about [Table 21.5, “MySQL client constants”](#) for further information. In [SQL safe mode](#), this parameter is ignored.

**Return Values**

Returns a MySQL link identifier on success or `FALSE` on failure.

**Changelog**

Version	Description
4.3.0	Added the <code>client_flags</code> parameter.

Version	Description
4.2.0	Added the <code>new_link</code> parameter.

## Examples

### Example 21.20. `mysql_connect` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

### Example 21.21. `mysql_connect` example using `hostname:port` syntax

```
<?php
// we connect to example.com and port 3307
$link = mysql_connect('example.com:3307', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);

// we connect to localhost at port 3307
$link = mysql_connect('127.0.0.1:3307', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

### Example 21.22. `mysql_connect` example using "`:/path/to/socket`" syntax

```
<?php
// we connect to localhost and socket e.g. /tmp/mysql.sock

//variant 1: ommitt localhost
$link = mysql_connect(':/tmp/mysql', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);

// variant 2: with localhost
$link = mysql_connect('localhost:/tmp/mysql.sock', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

## Notes

### Note

Whenever you specify "localhost" or "localhost:port" as server, the MySQL client library will override this and try to connect to a local socket (named pipe on Windows). If you want to use TCP/IP, use "127.0.0.1" instead of "localhost". If the MySQL client library tries to connect to the wrong local socket, you should set the correct path as `mysql.default_host` string in your PHP configuration and leave the server field blank.

### Note

The link to the server will be closed as soon as the execution of the script ends, unless it's closed earlier by explicitly calling `mysql_close`.

### Note

You can suppress the error message on failure by prepending a `@` to the function name.

### Note

Error "Can't create TCP/IP socket (10106)" usually means that the `variables_order` configure directive doesn't contain character `E`. On Windows, if the environment is not copied the `SYSTEMROOT` environment variable won't be available and PHP will have problems loading Winsock.

## See Also

`mysql_pconnect`  
`mysql_close`

### 21.10.1.4.5. `mysql_create_db`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_create_db`

Create a MySQL database

#### Description

```
bool mysql_create_db(string database_name,
 resource link_identifier);
```

`mysql_create_db` attempts to create a new database on the server associated with the specified link identifier.

#### Parameters

`database_name`

The name of the database being created.

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

#### Return Values

Returns `TRUE` on success or `FALSE` on failure.

#### Examples

##### Example 21.23. `mysql_create_db` alternative example

The function `mysql_create_db` is deprecated. It is preferable to use `mysql_query` to issue an sql `CREATE DATABASE` statement instead.

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
```

```

 die('Could not connect: ' . mysql_error());
}

$sql = 'CREATE DATABASE my_db';
if (mysql_query($sql, $link)) {
 echo "Database my_db created successfully\n";
} else {
 echo 'Error creating database: ' . mysql_error() . "\n";
?>

```

The above example will output something similar to:

```
Database my_db created successfully
```

## Notes

### Note

For backward compatibility, the following deprecated alias may be used: [mysql\\_createdb](#)

### Note

This function will not be available if the MySQL extension was built against a MySQL 4.x client library.

## See Also

[mysql\\_query](#)  
[mysql\\_select\\_db](#)

### 21.10.1.4.6. [mysql\\_data\\_seek](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_data\\_seek](#)

Move internal result pointer

## Description

```
bool mysql_data_seek(resource result,
 int row_number);
```

[mysql\\_data\\_seek](#) moves the internal row pointer of the MySQL result associated with the specified result identifier to point to the specified row number. The next call to a MySQL fetch function, such as [mysql\\_fetch\\_assoc](#), would return that row.

*row\_number* starts at 0. The *row\_number* should be a value in the range from 0 to [mysql\\_num\\_rows](#) - 1. However if the result set is empty ([mysql\\_num\\_rows](#) == 0), a seek to 0 will fail with a [E\\_WARNING](#) and [mysql\\_data\\_seek](#) will return [FALSE](#).

## Parameters

<i>result</i>	The result resource that is being evaluated. This result comes from a call to <a href="#">mysql_query</a> .
<i>row_number</i>	The desired row number of the new result pointer.

## Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

## Examples

### Example 21.24. mysql\_data\_seek example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
$db_selected = mysql_select_db('sample_db');
if (!$db_selected) {
 die('Could not select database: ' . mysql_error());
}
$query = 'SELECT last_name, first_name FROM friends';
$result = mysql_query($query);
if (!$result) {
 die('Query failed: ' . mysql_error());
}
/* fetch rows in reverse order */
for ($i = mysql_num_rows($result) - 1; $i >= 0; $i--) {
 if (!mysql_data_seek($result, $i)) {
 echo "Cannot seek to row $i: " . mysql_error() . "\n";
 continue;
 }
 if (!$row = mysql_fetch_assoc($result)) {
 continue;
 }
 echo $row['last_name'] . ' ' . $row['first_name'] . "
\n";
}
mysql_free_result($result);
?>
```

## Notes

### Note

The function `mysql_data_seek` can be used in conjunction only with `mysql_query`, not with `mysql_unbuffered_query`.

## See Also

[mysql\\_num\\_rows](#)  
[mysql\\_fetch\\_row](#)  
[mysql\\_fetch\\_assoc](#)  
[mysql\\_fetch\\_array](#)  
[mysql\\_fetch\\_object](#)

### 21.10.1.4.7. mysql\_db\_name

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_db\\_name](#)

Get result data

#### Description

```
string mysql_db_name(resource result,
 int row,
 mixed field);
```

Retrieve the database name from a call to `mysql_list_dbs`.

#### Parameters

---

<i>result</i>	The result pointer from a call to <code>mysql_list_dbs</code> .
<i>row</i>	The index into the result set.
<i>field</i>	The field name.

### Return Values

Returns the database name on success, and `FALSE` on failure. If `FALSE` is returned, use `mysql_error` to determine the nature of the error.

### Examples

#### Example 21.25. `mysql_db_name` example

```
<?php
error_reporting(E_ALL);

$link = mysql_connect('dbhost', 'username', 'password');
$db_list = mysql_list_dbs($link);

$i = 0;
$cnt = mysql_num_rows($db_list);
while ($i < $cnt) {
 echo mysql_db_name($db_list, $i) . "\n";
 $i++;
}
?>
```

### Notes

#### Note

For backward compatibility, the following deprecated alias may be used: `mysql_dbname`

### See Also

`mysql_list_dbs`  
`mysql_tablename`

#### 21.10.1.4.8. `mysql_db_query`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_db\\_query](#)

Send a MySQL query

### Description

```
resource mysql_db_query(string database,
 string query,
 resource link_identifier);
```

`mysql_db_query` selects a database, and executes a query on it.

#### Warning

This function has been *DEPRECATED* as of PHP 5.3.0. Relying on this feature is highly discouraged.

### Parameters

---

<code>database</code>	The name of the database that will be selected.
-----------------------	-------------------------------------------------

<code>query</code>	The MySQL query.  Data inside the query should be <a href="#">properly escaped</a> .
<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If no connection is found or established, an <a href="#">E_WARNING</a> level error is generated.

## Return Values

Returns a positive MySQL result resource to the query result, or `FALSE` on error. The function also returns `TRUE / FALSE` for `INSERT/UPDATE/DELETE` queries to indicate success/failure.

## Changelog

Version	Description
5.3.0	This function now throws an <code>E_DEPRECATED</code> notice.
4.0.6	This function is deprecated, do not use this function. Use <code>mysql_select_db</code> and <code>mysql_query</code> instead.

## Examples

### Example 21.26. `mysql_db_query` alternative example

```
<?php
if (!$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')) {
 echo 'Could not connect to mysql';
 exit;
}

if (!mysql_select_db('mysql_dbname', $link)) {
 echo 'Could not select database';
 exit;
}

$sql = 'SELECT foo FROM bar WHERE id = 42';
$result = mysql_query($sql, $link);

if (!$result) {
 echo "DB Error, could not query the database\n";
 echo 'MySQL Error: ' . mysql_error();
 exit;
}

while ($row = mysql_fetch_assoc($result)) {
 echo $row['foo'];
}

mysql_free_result($result);
?>
```

## Notes

### Note

Be aware that this function does *NOT* switch back to the database you were connected before. In other words, you can't use this function to *temporarily* run a sql query on another database, you would have to manually switch back. Users are strongly encouraged to use the `database.table` syntax in their sql queries or `mysql_select_db` instead of this function.

## See Also

[mysql\\_query](#)  
[mysql\\_select\\_db](#)

## 21.10.1.4.9. `mysql_drop_db`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_drop_db`

Drop (delete) a MySQL database

### Description

```
bool mysql_drop_db(string database_name,
 resource link_identifier);
```

`mysql_drop_db` attempts to drop (remove) an entire database from the server associated with the specified link identifier. This function is deprecated, it is preferable to use `mysql_query` to issue an sql `DROP DATABASE` statement instead.

### Parameters

`database_name`

The name of the database that will be deleted.

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Examples

#### Example 21.27. `mysql_drop_db` alternative example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}

$sql = 'DROP DATABASE my_db';
if (mysql_query($sql, $link)) {
 echo "Database my_db was successfully dropped\n";
} else {
 echo 'Error dropping database: ' . mysql_error() . "\n";
?>
```

### Notes

#### Warning

This function will not be available if the MySQL extension was built against a MySQL 4.x client library.

#### Note

For backward compatibility, the following deprecated alias may be used: `mysql_dropdb`

### See Also

`mysql_query`

## 21.10.1.4.10. `mysql_errno`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_errno](#)

Returns the numerical value of the error message from previous MySQL operation

### Description

```
int mysql_errno(resource link_identifier);
```

Returns the error number from the last MySQL function.

Errors coming back from the MySQL database backend no longer issue warnings. Instead, use [mysql\\_errno](#) to retrieve the error code. Note that this function only returns the error code from the most recently executed MySQL function (not including [mysql\\_error](#) and [mysql\\_errno](#)), so if you want to use it, make sure you check the value before calling another MySQL function.

### Parameters

[link\\_identifier](#)

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql\\_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql\\_connect](#) was called with no arguments. If no connection is found or established, an [E\\_WARNING](#) level error is generated.

### Return Values

Returns the error number from the last MySQL function, or [0](#) (zero) if no error occurred.

### Examples

#### Example 21.28. [mysql\\_errno](#) example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");
if (!mysql_select_db("nonexistentdb", $link)) {
 echo mysql_errno($link) . ":" . mysql_error($link). "\n";
}
mysql_select_db("kossu", $link);
if (!mysql_query("SELECT * FROM nonexistenttable", $link)) {
 echo mysql_errno($link) . ":" . mysql_error($link) . "\n";
}
?>
```

The above example will output something similar to:

```
1049: Unknown database 'nonexistentdb'
1146: Table 'kossu.nonexistenttable' doesn't exist
```

### See Also

[mysql\\_error](#)  
[MySQL error codes](#)

#### 21.10.1.4.11. [mysql\\_error](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_error](#)

Returns the text of the error message from previous MySQL operation

## Description

```
string mysql_error(resource link_identifier);
```

Returns the error text from the last MySQL function. Errors coming back from the MySQL database backend no longer issue warnings. Instead, use [mysql\\_error](#) to retrieve the error text. Note that this function only returns the error text from the most recently executed MySQL function (not including [mysql\\_error](#) and [mysql\\_errno](#)), so if you want to use it, make sure you check the value before calling another MySQL function.

## Parameters

### *link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql\\_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql\\_connect](#) was called with no arguments. If no connection is found or established, an [E\\_WARNING](#) level error is generated.

## Return Values

Returns the error text from the last MySQL function, or ' ' (empty string) if no error occurred.

## Examples

### Example 21.29. [mysql\\_error](#) example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");
mysql_select_db("nonexistentdb", $link);
echo mysql_errno($link) . ":" . mysql_error($link) . "\n";
mysql_select_db("kossu", $link);
mysql_query("SELECT * FROM nonexistenttable", $link);
echo mysql_errno($link) . ":" . mysql_error($link) . "\n";
?>
```

The above example will output something similar to:

```
1049: Unknown database 'nonexistentdb'
1146: Table 'kossu.nonexistenttable' doesn't exist
```

## See Also

### 21.10.1.4.12. [mysql\\_escape\\_string](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_escape\\_string](#)

Escapes a string for use in a mysql\_query

### Description

```
string mysql_escape_string(string unescaped_string);
```

This function will escape the `unescaped_string`, so that it is safe to place it in a `mysql_query`. This function is deprecated.

This function is identical to `mysql_real_escape_string` except that `mysql_real_escape_string` takes a connection handler and escapes the string according to the current character set. `mysql_escape_string` does not take a connection argument and does not respect the current charset setting.

### Warning

This function has been *DEPRECATED* as of PHP 5.3.0. Relying on this feature is highly discouraged.

### Parameters

<code>unescaped_string</code>	The string that is to be escaped.
-------------------------------	-----------------------------------

### Return Values

Returns the escaped string.

### Changelog

Version	Description
5.3.0	This function now throws an E_DEPRECATED notice.
4.3.0	This function became deprecated, do not use this function. Instead, use <code>mysql_real_escape_string</code> .

### Examples

#### Example 21.30. `mysql_escape_string` example

```
<?php
$item = "Zak's Laptop";
$escaped_item = mysql_escape_string($item);
printf("Escaped string: %s\n", $escaped_item);
?>
```

The above example will output:

```
Escaped string: Zak\'s Laptop
```

### Notes

#### Note

`mysql_escape_string` does not escape `%` and `_`.

### See Also

```
mysql_real_escape_string
addslashes
The magic_quotes_gpc directive.
```

### 21.10.1.4.13. [mysql\\_fetch\\_array](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_fetch\\_array](#)

Fetch a result row as an associative array, a numeric array, or both

#### Description

```
array mysql_fetch_array(resource result,
 int result_type= MYSQL_BOTH);
```

Returns an array that corresponds to the fetched row and moves the internal data pointer ahead.

#### Parameters

<i>result</i>	The result resource that is being evaluated. This result comes from a call to <a href="#">mysql_query</a> .
<i>result_type</i>	The type of array that is to be fetched. It's a constant and can take the following values: <a href="#">MYSQL_ASSOC</a> , <a href="#">MYSQL_NUM</a> , and <a href="#">MYSQL_BOTH</a> .

#### Return Values

Returns an array of strings that corresponds to the fetched row, or [FALSE](#) if there are no more rows. The type of returned array depends on how *result\_type* is defined. By using [MYSQL\\_BOTH](#) (default), you'll get an array with both associative and number indices. Using [MYSQL\\_ASSOC](#), you only get associative indices (as [mysql\\_fetch\\_assoc](#) works), using [MYSQL\\_NUM](#), you only get number indices (as [mysql\\_fetch\\_row](#) works).

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you must use the numeric index of the column or make an alias for the column. For aliased columns, you cannot access the contents with the original column name.

#### Examples

##### Example 21.31. Query with aliased duplicate field names

```
SELECT table1.field AS foo, table2.field AS bar FROM table1, table2
```

##### Example 21.32. [mysql\\_fetch\\_array](#) with [MYSQL\\_NUM](#)

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
 die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_NUM)) {
 printf("ID: %s Name: %s", $row[0], $row[1]);
}

mysql_free_result($result);
?>
```

**Example 21.33. `mysql_fetch_array` with `MYSQL_ASSOC`**

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
 die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_ASSOC)) {
 printf("ID: %s Name: %s", $row["id"], $row["name"]);
}

mysql_free_result($result);
?>
```

**Example 21.34. `mysql_fetch_array` with `MYSQL_BOTH`**

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
 die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_BOTH)) {
 printf ("ID: %s Name: %s", $row[0], $row["name"]);
}

mysql_free_result($result);
?>
```

**Notes****Performance**

An important thing to note is that using `mysql_fetch_array` is *not significantly* slower than using `mysql_fetch_row`, while it provides a significant added value.

**Note**

Field names returned by this function are *case-sensitive*.

**Note**

This function sets NULL fields to the PHP `NULL` value.

**See Also**

[mysql\\_fetch\\_row](#)  
[mysql\\_fetch\\_assoc](#)  
[mysql\\_data\\_seek](#)  
[mysql\\_query](#)

**21.10.1.4.14. `mysql_fetch_assoc`**

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_fetch\\_assoc](#)

Fetch a result row as an associative array

**Description**

```
array mysql_fetch_assoc(resource result);
```

Returns an associative array that corresponds to the fetched row and moves the internal data pointer ahead.

`mysql_fetch_assoc` is equivalent to calling `mysql_fetch_array` with `MYSQL_ASSOC` for the optional second parameter. It only returns an associative array.

**Parameters**

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

**Return Values**

Returns an associative array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using `mysql_fetch_row` or add alias names. See the example at the `mysql_fetch_array` description about aliases.

**Examples****Example 21.35. An expanded `mysql_fetch_assoc` example**

```
<?php
$conn = mysql_connect("localhost", "mysql_user", "mysql_password");
if (!$conn) {
 echo "Unable to connect to DB: " . mysql_error();
 exit;
}
if (!mysql_select_db("mydbname")) {
 echo "Unable to select mydbname: " . mysql_error();
 exit;
}
$sql = "SELECT id as userid, fullname, userstatus
 FROM sometable
 WHERE userstatus = 1";
$result = mysql_query($sql);
if (!$result) {
 echo "Could not successfully run query ($sql) from DB: " . mysql_error();
 exit;
}
if (mysql_num_rows($result) == 0) {
 echo "No rows found, nothing to print so am exiting";
 exit;
}
// While a row of data exists, put that row in $row as an associative array
// Note: If you're expecting just one row, no need to use a loop
// Note: If you put extract($row); inside the following loop, you'll
// then create $userid, $fullname, and $userstatus
while ($row = mysql_fetch_assoc($result)) {
 echo $row["userid"];
 echo $row["fullname"];
 echo $row["userstatus"];
}
mysql_free_result($result);
?>
```

**Notes****Performance**

An important thing to note is that using `mysql_fetch_assoc` is *not significantly* slower than using

`mysql_fetch_row`, while it provides a significant added value.

## Note

Field names returned by this function are *case-sensitive*.

## Note

This function sets NULL fields to the PHP `NULL` value.

```

#### 21.10.1.4.15. `mysql_fetch_field`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_fetch_field`

Get column information from a result and return as an object

## Description

```
object mysql_fetch_field(resource result,
 int field_offset= 0);
```

Returns an object containing field information. This function can be used to obtain information about fields in the provided query result.

## Parameters

*result* The result resource that is being evaluated. This result comes from a call to `mysql_query`.

*field\_offset* The numerical field offset. If the field offset is not specified, the next field that was not yet retrieved by this function is retrieved. The *field\_offset* starts at 0.

## Return Values

Returns an object containing field information. The properties of the object are:

- name - column name
  - table - name of the table the column belongs to
  - max\_length - maximum length of the column
  - not\_null - 1 if the column cannot be `NULL`
  - primary\_key - 1 if the column is a primary key
  - unique\_key - 1 if the column is a unique key
  - multiple\_key - 1 if the column is a non-unique key
  - numeric - 1 if the column is numeric
  - blob - 1 if the column is a BLOB
  - type - the type of the column

- `unsigned` - 1 if the column is unsigned
- `zerofill` - 1 if the column is zero-filled

## Examples

### Example 21.36. `mysql_fetch_field` example

```
<?php
$conn = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$conn) {
 die('Could not connect: ' . mysql_error());
}
mysql_select_db('database');
$result = mysql_query('select * from table');
if (!$result) {
 die('Query failed: ' . mysql_error());
}
/* get column metadata */
$i = 0;
while ($i < mysql_num_fields($result)) {
 echo "Information for column $i:
\n";
 $meta = mysql_fetch_field($result, $i);
 if (!$meta) {
 echo "No information available
\n";
 }
 echo "<pre>";
blob: $meta->blob
max_length: $meta->max_length
multiple_key: $meta->multiple_key
name: $meta->name
not_null: $meta->not_null
numeric: $meta->numeric
primary_key: $meta->primary_key
table: $meta->table
type: $meta->type
unique_key: $meta->unique_key
unsigned: $meta->unsigned
zerofill: $meta->zerofill
</pre>";
 $i++;
}
mysql_free_result($result);
?>
```

## Notes

### Note

Field names returned by this function are *case-sensitive*.

## See Also

[mysql\\_field\\_seek](#)

### 21.10.1.4.16. `mysql_fetch_lengths`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_fetch\\_lengths](#)

Get the length of each output in a result

## Description

```
array mysql_fetch_lengths(resource result);
```

Returns an array that corresponds to the lengths of each field in the last row fetched by MySQL.

`mysql_fetch_lengths` stores the lengths of each result column in the last row returned by `mysql_fetch_row`,

`mysql_fetch_assoc`, `mysql_fetch_array`, and `mysql_fetch_object` in an array, starting at offset 0.

### Parameters

`result`

The result resource that is being evaluated. This result comes from a call to `mysql_query`.

### Return Values

An array of lengths on success or `FALSE` on failure.

### Examples

#### Example 21.37. A `mysql_fetch_lengths` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
 echo 'Could not run query: ' . mysql_error();
 exit;
}
$row = mysql_fetch_assoc($result);
$lengths = mysql_fetch_lengths($result);

print_r($row);
print_r($lengths);
?>
```

The above example will output something similar to:

```
Array
(
 [id] => 42
 [email] => user@example.com
)
Array
(
 [0] => 2
 [1] => 16
)
```

### See Also

`mysql_field_len`  
`mysql_fetch_row`  
`strlen`

#### 21.10.1.4.17. `mysql_fetch_object`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_fetch_object`

Fetch a result row as an object

### Description

```
object mysql_fetch_object(resource result,
 string class_name,
 array params);
```

Returns an object with properties that correspond to the fetched row and moves the internal data pointer ahead.

## Parameters

<code>result</code>	The result resource that is being evaluated. This result comes from a call to <a href="#">mysql_query</a> .
<code>class_name</code>	The name of the class to instantiate, set the properties of and return. If not specified, a <code>stdClass</code> object is returned.
<code>params</code>	An optional array of parameters to pass to the constructor for <code>class_name</code> objects.

## Return Values

Returns an object with string properties that correspond to the fetched row, or `FALSE` if there are no more rows.

## Changelog

Version	Description
5.0.0	Added the ability to return as a different object.

## Examples

### Example 21.38. `mysql_fetch_object` example

```
<?php
mysql_connect("hostname", "user", "password");
mysql_select_db("mydb");
$result = mysql_query("select * from mytable");
while ($row = mysql_fetch_object($result)) {
 echo $row->user_id;
 echo $row->fullname;
}
mysql_free_result($result);
?>
```

### Example 21.39. `mysql_fetch_object` example

```
<?php
class foo {
 public $name;
}

mysql_connect("hostname", "user", "password");
mysql_select_db("mydb");

$result = mysql_query("select name from mytable limit 1");
$obj = mysql_fetch_object($result, 'foo');
var_dump($obj);
?>
```

## Notes

### Performance

Speed-wise, the function is identical to [mysql\\_fetch\\_array](#), and almost as quick as [mysql\\_fetch\\_row](#) (the difference is insignificant).

### Note

[mysql\\_fetch\\_object](#) is similar to [mysql\\_fetch\\_array](#), with one difference - an object is returned, instead of an array. Indirectly, that means that you can only access the data by the field names, and not by their offsets

■ (numbers are illegal property names).

### **Note**

Field names returned by this function are *case-sensitive*.

### **Note**

This function sets NULL fields to the PHP `NULL` value.

### See Also

[mysql\\_fetch\\_array](#)

[mysql\\_query](#)

## 21.10.1.4.18. `mysql_fetch_row`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_fetch\\_row](#)

Get a result row as an enumerated array

### Description

```
array mysql_fetch_row(resource result);
```

Returns a numerical array that corresponds to the fetched row and moves the internal data pointer ahead.

### Parameters

`result`

The result resource that is being evaluated. This result comes from a call to [mysql\\_query](#).

### Return Values

Returns an numerical array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows.

`mysql_fetch_row` fetches one row of data from the result associated with the specified result identifier. The row is returned as an array. Each result column is stored in an array offset, starting at offset 0.

### Examples

#### Example 21.40. Fetching one row with `mysql_fetch_row`

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
 echo 'Could not run query: ' . mysql_error();
 exit;
}
$row = mysql_fetch_row($result);

echo $row[0]; // 42
echo $row[1]; // the email value
?>
```

### Notes

### **Note**

This function sets NULL fields to the PHP `NULL` value.

## See Also

`mysql_result`

### 21.10.1.4.19. `mysql_field_flags`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_field_flags`

Get the flags associated with the specified field in a result

#### Description

```
string mysql_field_flags(resource result,
 int field_offset);
```

`mysql_field_flags` returns the field flags of the specified field. The flags are reported as a single word per flag separated by a single space, so that you can split the returned value using `explode`.

#### Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`field_offset` The numerical field offset. The `field_offset` starts at 0. If `field_offset` does not exist, an error of level `E_WARNING` is also issued.

#### Return Values

Returns a string of flags associated with the result or `FALSE` on failure.

The following flags are reported, if your version of MySQL is current enough to support them: "not\_null", "primary\_key", "unique\_key", "multiple\_key", "blob", "unsigned", "zerofill", "binary", "enum", "auto\_increment" and "timestamp".

#### Examples

##### Example 21.41. A `mysql_field_flags` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
 echo 'Could not run query: ' . mysql_error();
 exit;
}
$flags = mysql_field_flags($result, 0);
echo $flags;
print_r(explode(' ', $flags));
?>
```

The above example will output something similar to:

```
not_null primary_key auto_increment
```

```
Array
(
 [0] => not_null
 [1] => primary_key
 [2] => auto_increment
)
```

## Notes

### Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldflags`

[mysql\\_field\\_len](#)

### 21.10.1.4.20. mysql\_field\_len

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_field\\_len](#)

Returns the length of the specified field

#### Description

```
int mysql_field_len(resource result,
 int field_offset);
```

`mysql_field_len` returns the length of the specified field.

#### Parameters

`result`

The result resource that is being evaluated. This result comes from a call to [mysql\\_query](#).

`field_offset`

The numerical field offset. The `field_offset` starts at 0. If `field_offset` does not exist, an error of level [E\\_WARNING](#) is also issued.

#### Return Values

The length of the specified field index on success or [FALSE](#) on failure.

#### Examples

##### Example 21.42. mysql\_field\_len example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
 echo 'Could not run query: ' . mysql_error();
 exit;
}

// Will get the length of the id field as specified in the database
// schema.
$length = mysql_field_len($result, 0);
echo $length;
?>
```

**Notes****Note**

For backward compatibility, the following deprecated alias may be used: `mysql_fieldlen`

**See Also**

`mysql_fetch_lengths`  
`strlen`

**21.10.1.4.21. mysql\_field\_name**

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_field_name`

Get the name of the specified field in a result

**Description**

```
string mysql_field_name(resource result,
 int field_offset);
```

`mysql_field_name` returns the name of the specified field index.

**Parameters**

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`field_offset` The numerical field offset. The `field_offset` starts at 0. If `field_offset` does not exist, an error of level `E_WARNING` is also issued.

**Return Values**

The name of the specified field index on success or `FALSE` on failure.

**Examples****Example 21.43. mysql\_field\_name example**

```
<?php
/* The users table consists of three fields:
 * user_id
 * username
 * password.
 */
$link = @mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect to MySQL server: ' . mysql_error());
}
$dbname = 'mydb';
$db_selected = mysql_select_db($dbname, $link);
if (!$db_selected) {
 die("Could not set $dbname: " . mysql_error());
}
$res = mysql_query('select * from users', $link);

echo mysql_field_name($res, 0) . "\n";
echo mysql_field_name($res, 2);
?>
```

The above example will output:

```
user_id
password
```

## Notes

### Note

Field names returned by this function are *case-sensitive*.

### Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldname`

## See Also

`mysql_field_type`  
`mysql_field_len`

## 21.10.1.4.22. `mysql_field_seek`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_field_seek`

Set result pointer to a specified field offset

## Description

```
bool mysql_field_seek(resource result,
 int field_offset);
```

Seeks to the specified field offset. If the next call to `mysql_fetch_field` doesn't include a field offset, the field offset specified in `mysql_field_seek` will be returned.

## Parameters

`result`

The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`field_offset`

The numerical field offset. The `field_offset` starts at 0. If `field_offset` does not exist, an error of level `E_WARNING` is also issued.

## Return Values

Returns `TRUE` on success or `FALSE` on failure.

## See Also

`mysql_fetch_field`

## 21.10.1.4.23. `mysql_field_table`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_field_table`

Get name of the table the specified field is in

## Description

```
string mysql_field_table(resource result,
 int field_offset);
```

Returns the name of the table that the specified field is in.

#### Parameters

<code>result</code>	The result resource that is being evaluated. This result comes from a call to <a href="#">mysql_query</a> .
<code>field_offset</code>	The numerical field offset. The <code>field_offset</code> starts at 0. If <code>field_offset</code> does not exist, an error of level <a href="#">E_WARNING</a> is also issued.

#### Return Values

The name of the table on success.

#### Examples

#### Example 21.44. A `mysql_field_table` example

```
<?php
$query = "SELECT account.*, country.* FROM account, country WHERE country.name = 'Portugal' AND account.country_id = country.id";
// get the result from the DB
$result = mysql_query($query);

// Lists the table name and then the field name
for ($i = 0; $i < mysql_num_fields($result); ++$i) {
 $table = mysql_field_table($result, $i);
 $field = mysql_field_name($result, $i);

 echo "$table: $field\n";
}
?>
```

#### Notes

##### Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldtable`

#### See Also

[mysql\\_list\\_tables](#)

#### 21.10.1.4.24. `mysql_field_type`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_field\\_type](#)

Get the type of the specified field in a result

#### Description

```
string mysql_field_type(resource result,
 int field_offset);
```

`mysql_field_type` is similar to the `mysql_field_name` function. The arguments are identical, but the field type is returned instead.

## Parameters

- `result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.
- `field_offset` The numerical field offset. The `field_offset` starts at `0`. If `field_offset` does not exist, an error of level `E_WARNING` is also issued.

## Return Values

The returned field type will be one of "`int`", "`real`", "`string`", "`blob`", and others as detailed in the [MySQL documentation](#).

## Examples

### Example 21.45. `mysql_field_type` example

```
<?php
mysql_connect("localhost", "mysql_username", "mysql_password");
mysql_select_db("mysql");
$result = mysql_query("SELECT * FROM func");
$fields = mysql_num_fields($result);
$rows = mysql_num_rows($result);
$table = mysql_field_table($result, 0);
echo "Your '$table' table has $fields fields and $rows record(s)\n";
echo "The table has the following fields:\n";
for ($i=0; $i < $fields; $i++) {
 $type = mysql_field_type($result, $i);
 $name = mysql_field_name($result, $i);
 $len = mysql_field_len($result, $i);
 $flags = mysql_field_flags($result, $i);
 echo $type . " " . $name . " " . $len . " " . $flags . "\n";
}
mysql_free_result($result);
mysql_close();
?>
```

The above example will output something similar to:

```
Your 'func' table has 4 fields and 1 record(s)
The table has the following fields:
string name 64 not_null primary_key binary
int ret 1 not_null
string dl 128 not_null
string type 9 not_null enum
```

## Notes

### Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldtype`

## See Also

`mysql_field_name`  
`mysql_field_len`

## 21.10.1.4.25. `mysql_free_result`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_free_result`

Free result memory

### Description

```
bool mysql_free_result(resource result);
```

`mysql_free_result` will free all memory associated with the result identifier `result`.

`mysql_free_result` only needs to be called if you are concerned about how much memory is being used for queries that return large result sets. All associated result memory is automatically freed at the end of the script's execution.

### Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

If a non-resource is used for the `result`, an error of level E\_WARNING will be emitted. It's worth noting that `mysql_query` only returns a resource for SELECT, SHOW, EXPLAIN, and DESCRIBE queries.

### Examples

#### Example 21.46. A `mysql_free_result` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
 echo 'Could not run query: ' . mysql_error();
 exit;
}
/* Use the result, assuming we're done with it afterwards */
$row = mysql_fetch_assoc($result);

/* Now we free up the result and continue on with our script */
mysql_free_result($result);

echo $row['id'];
echo $row['email'];
?>
```

### Notes

#### Note

For backward compatibility, the following deprecated alias may be used: `mysql_freeresult`

### See Also

#### 21.10.1.4.26. `mysql_get_client_info`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_get\\_client\\_info](#)

Get MySQL client info

**Description**

```
string mysql_get_client_info();
```

`mysql_get_client_info` returns a string that represents the client library version.

**Return Values**

The MySQL client version.

**Examples****Example 21.47. `mysql_get_client_info` example**

```
<?php
printf("MySQL client info: %s\n", mysql_get_client_info());
?>
```

The above example will output something similar to:

```
MySQL client info: 3.23.39
```

**See Also**

[mysql\\_get\\_host\\_info](#)  
[mysql\\_get\\_proto\\_info](#)  
[mysql\\_get\\_server\\_info](#)

**21.10.1.4.27. `mysql_get_host_info`**

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_get\\_host\\_info](#)

Get MySQL host info

**Description**

```
string mysql_get_host_info(resource link_identifier);
```

Describes the type of connection in use for the connection, including the server host name.

**Parameters**

*link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

**Return Values**

Returns a string describing the type of MySQL connection in use for the connection or `FALSE` on failure.

**Examples**

**Example 21.48. `mysql_get_host_info` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
printf("MySQL host info: %s\n", mysql_get_host_info());
?>
```

The above example will output something similar to:

```
MySQL host info: Localhost via UNIX socket
```

**See Also**

[mysql\\_get\\_client\\_info](#)  
[mysql\\_get\\_proto\\_info](#)  
[mysql\\_get\\_server\\_info](#)

**21.10.1.4.28. `mysql_get_proto_info`**

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_get\\_proto\\_info](#)

Get MySQL protocol info

**Description**

```
int mysql_get_proto_info(resource link_identifier);
```

Retrieves the MySQL protocol.

**Parameters**

*link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql\\_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql\\_connect](#) was called with no arguments. If no connection is found or established, an [E\\_WARNING](#) level error is generated.

**Return Values**

Returns the MySQL protocol on success or [FALSE](#) on failure.

**Examples****Example 21.49. `mysql_get_proto_info` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
printf("MySQL protocol version: %s\n", mysql_get_proto_info());
```

```
?>
```

The above example will output something similar to:

```
MySQL protocol version: 10
```

### 21.10.1.4.29. mysql\_get\_server\_info

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_get\\_server\\_info](#)  
Get MySQL server info

#### Description

```
string mysql_get_server_info(resource link_identifier);
```

Retrieves the MySQL server version.

#### Parameters

*link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql\\_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql\\_connect](#) was called with no arguments. If no connection is found or established, an [E\\_WARNING](#) level error is generated.

#### Return Values

Returns the MySQL server version on success or [FALSE](#) on failure.

#### Examples

### Example 21.50. mysql\_get\_server\_info example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
printf("MySQL server version: %s\n", mysql_get_server_info());
?>
```

The above example will output something similar to:

```
MySQL server version: 4.0.1-alpha
```

[mysql\\_get\\_host\\_info](#)  
[mysql\\_get\\_proto\\_info](#)  
[phpversion](#)

**21.10.1.4.30. mysql\_info**

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_info](#)

Get information about the most recent query

**Description**

```
string mysql_info(resource link_identifier);
```

Returns detailed information about the last query.

**Parameters**

*link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql\\_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql\\_connect](#) was called with no arguments. If no connection is found or established, an [E\\_WARNING](#) level error is generated.

**Return Values**

Returns information about the statement on success, or [FALSE](#) on failure. See the example below for which statements provide information, and what the returned value may look like. Statements that are not listed will return [FALSE](#).

**Examples****Example 21.51. Relevant MySQL Statements**

Statements that return string values. The numbers are only for illustrating purpose; their values will correspond to the query.

```
INSERT INTO ... SELECT ...
String format: Records: 23 Duplicates: 0 Warnings: 0
INSERT INTO ... VALUES (...),(...),(...)
String format: Records: 37 Duplicates: 0 Warnings: 0
LOAD DATA INFILE ...
String format: Records: 42 Deleted: 0 Skipped: 0 Warnings: 0
ALTER TABLE
String format: Records: 60 Duplicates: 0 Warnings: 0
UPDATE
String format: Rows matched: 65 Changed: 65 Warnings: 0
```

**Notes****Note**

[mysql\\_info](#) returns a non-[FALSE](#) value for the `INSERT ... VALUES` statement only if multiple value lists are specified in the statement.

**See Also**

[mysql\\_affected\\_rows](#)  
[mysql\\_insert\\_id](#)  
[mysql\\_stat](#)

**21.10.1.4.31. mysql\_insert\_id**

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_insert\\_id](#)

Get the ID generated in the last query

**Description**

```
int mysql_insert_id(resource link_identifier);
```

Retrieves the ID generated for an AUTO\_INCREMENT column by the previous query (usually INSERT).

**Parameters**

*link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql\\_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql\\_connect](#) was called with no arguments. If no connection is found or established, an [E\\_WARNING](#) level error is generated.

**Return Values**

The ID generated for an AUTO\_INCREMENT column by the previous query on success, [0](#) if the previous query does not generate an AUTO\_INCREMENT value, or [FALSE](#) if no MySQL connection was established.

**Examples****Example 21.52. mysql\_insert\_id example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

mysql_query("INSERT INTO mytable (product) values ('kossu')");
printf("Last inserted record has id %d\n", mysql_insert_id());
?>
```

**Notes****Caution**

[mysql\\_insert\\_id](#) will convert the return type of the native MySQL C API function [mysql\\_insert\\_id\(\)](#) to a type of [long](#) (named [int](#) in PHP). If your AUTO\_INCREMENT column has a column type of BIGINT (64 bits) the conversion may result in an incorrect value. Instead, use the internal MySQL SQL function LAST\_INSERT\_ID() in an SQL query. For more information about PHP's maximum integer values, please see the [integer](#) documentation.

**Note**

Because [mysql\\_insert\\_id](#) acts on the last performed query, be sure to call [mysql\\_insert\\_id](#) immediately after the query that generates the value.

**Note**

The value of the MySQL SQL function `LAST_INSERT_ID()` always contains the most recently generated `AUTO_INCREMENT` value, and is not reset between queries.

**See Also**

[mysql\\_info](#)

**21.10.1.4.32. mysql\_list\_dbs**

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_list\\_dbs](#)

List databases available on a MySQL server

**Description**

```
resource mysql_list_dbs(resource link_identifier);
```

Returns a result pointer containing the databases available from the current mysql daemon.

**Parameters**

*link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

**Return Values**

Returns a result pointer resource on success, or `FALSE` on failure. Use the `mysql_table_name` function to traverse this result pointer, or any function for result tables, such as `mysql_fetch_array`.

**Examples****Example 21.53. mysql\_list\_dbs example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$db_list = mysql_list_dbs($link);

while ($row = mysql_fetch_object($db_list)) {
 echo $row->Database . "\n";
}
?>
```

The above example will output something similar to:

```
database1
database2
database3
```

**Notes**

**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_listdbs`

**See Also**

`mysql_db_name`  
`mysql_select_db`

**21.10.1.4.33. mysql\_list\_fields**

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_list_fields`

List MySQL table fields

**Description**

```
resource mysql_list_fields(string database_name,
 string table_name,
 resource link_identifier);
```

Retrieves information about the given table name.

This function is deprecated. It is preferable to use `mysql_query` to issue an SQL `SHOW COLUMNS FROM table [LIKE 'name']` statement instead.

**Parameters**

`database_name`

The name of the database that's being queried.

`table_name`

The name of the table that's being queried.

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

**Return Values**

A result pointer resource on success, or `FALSE` on failure.

The returned result can be used with `mysql_field_flags`, `mysql_field_len`, `mysql_field_name` and `mysql_field_type`.

**Examples****Example 21.54. Alternate to deprecated mysql\_list\_fields**

```
<?php
$result = mysql_query("SHOW COLUMNS FROM sometable");
if (!$result) {
 echo 'Could not run query: ' . mysql_error();
 exit;
}
if (mysql_num_rows($result) > 0) {
 while ($row = mysql_fetch_assoc($result)) {
 print_r($row);
 }
}
?>
```

The above example will output something similar to:

```
Array
(
 [Field] => id
 [Type] => int(7)
 [Null] =>
 [Key] => PRI
 [Default] =>
 [Extra] => auto_increment
)
Array
(
 [Field] => email
 [Type] => varchar(100)
 [Null] =>
 [Key] =>
 [Default] =>
 [Extra] =>
)
```

### 21.10.1.4.34. `mysql_list_processes`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_list\\_processes](#)

List MySQL processes

## Description

```
resource mysql_list_processes(resource link_identifier);
```

Retrieves the current MySQL server threads.

## Parameters

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

## Return Values

A result pointer resource on success or `FALSE` on failure.

## Examples

### Example 21.55. `mysql_list_processes` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');

$result = mysql_list_processes($link);
while ($row = mysql_fetch_assoc($result)){
 printf("%s %s %s %s\n", $row["Id"], $row["Host"], $row["db"],
 $row["Command"], $row["Time"]);
}
mysql_free_result($result);
?>
```

The above example will output something similar to:

```
1 localhost test Processlist 0
4 localhost mysql sleep 5
```

[mysql\\_stat](#)

### 21.10.1.4.35. `mysql_list_tables`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_list\\_tables](#)

List tables in a MySQL database

#### Description

```
resource mysql_list_tables(string database,
 resource link_identifier);
```

Retrieves a list of table names from a MySQL database.

This function is deprecated. It is preferable to use [mysql\\_query](#) to issue an SQL `SHOW TABLES [FROM db_name] [LIKE 'pattern']` statement instead.

#### Parameters

*database*

The name of the database

*link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql\\_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql\\_connect](#) was called with no arguments. If no connection is found or established, an [E\\_WARNING](#) level error is generated.

#### Return Values

A result pointer resource on success or [FALSE](#) on failure.

Use the [mysql\\_tablelename](#) function to traverse this result pointer, or any function for result tables, such as [mysql\\_fetch\\_array](#).

#### Changelog

Version	Description
4.3.7	This function became deprecated.

## Examples

### Example 21.56. `mysql_list_tables` alternative example

```
<?php
$dbname = 'mysql_dbname';

if (!mysql_connect('mysql_host', 'mysql_user', 'mysql_password')) {
 echo 'Could not connect to mysql';
 exit;
}

$sql = "SHOW TABLES FROM $dbname";
$result = mysql_query($sql);

if (!$result) {
 echo "DB Error, could not list tables\n";
 echo 'MySQL Error: ' . mysql_error();
 exit;
}

while ($row = mysql_fetch_row($result)) {
 echo "Table: {$row[0]}\n";
}

mysql_free_result($result);
?>
```

## Notes

### Note

For backward compatibility, the following deprecated alias may be used: `mysql_listtables`

## See Also

[mysql\\_tablename](#)

### 21.10.1.4.36. `mysql_num_fields`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_num\\_fields](#)

Get number of fields in result

## Description

```
int mysql_num_fields(resource result);
```

Retrieves the number of fields from a query.

## Parameters

*result* The result resource that is being evaluated. This result comes from a call to [mysql\\_query](#).

## Return Values

Returns the number of fields in the result set resource on success or `FALSE` on failure.

## Examples

### Example 21.57. A `mysql_num_fields` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
 echo 'Could not run query: ' . mysql_error();
 exit;
}
/* returns 2 because id,email === two fields */
echo mysql_num_fields($result);
?>
```

#### Notes

##### Note

For backward compatibility, the following deprecated alias may be used: `mysql_numfields`

#### See Also

[mysql\\_select\\_db](#)  
[mysql\\_query](#)  
[mysql\\_fetch\\_field](#)  
[mysql\\_num\\_rows](#)

### 21.10.1.4.37. `mysql_num_rows`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_num\\_rows](#)

Get number of rows in result

#### Description

```
int mysql_num_rows(resource result);
```

Retrieves the number of rows from a result set. This command is only valid for statements like SELECT or SHOW that return an actual result set. To retrieve the number of rows affected by a INSERT, UPDATE, REPLACE or DELETE query, use [mysql\\_affected\\_rows](#).

#### Parameters

`result`

The result resource that is being evaluated. This result comes from a call to [mysql\\_query](#).

#### Return Values

The number of rows in a result set on success or `FALSE` on failure.

#### Examples

### Example 21.58. `mysql_num_rows` example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");
mysql_select_db("database", $link);

$result = mysql_query("SELECT * FROM table1", $link);
$num_rows = mysql_num_rows($result);
```

```
echo "$num_rows Rows\n";
?>
```

## Notes

### Note

If you use `mysql_unbuffered_query`, `mysql_num_rows` will not return the correct value until all the rows in the result set have been retrieved.

### Note

For backward compatibility, the following deprecated alias may be used: `mysql_numrows`

## See Also

[mysql\\_query](#)

### 21.10.1.4.38. `mysql_pconnect`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_pconnect](#)

Open a persistent connection to a MySQL server

## Description

```
resource mysql_pconnect(string server= ini_get("mysql.default_host"),
 string username= ini_get("mysql.default_user"),
 string password= ini_get("mysql.default_password"),
 int client_flags);
```

Establishes a persistent connection to a MySQL server.

`mysql_pconnect` acts very much like `mysql_connect` with two major differences.

First, when connecting, the function would first try to find a (persistent) link that's already open with the same host, username and password. If one is found, an identifier for it will be returned instead of opening a new connection.

Second, the connection to the SQL server will not be closed when the execution of the script ends. Instead, the link will remain open for future use (`mysql_close` will not close links established by `mysql_pconnect`).

This type of link is therefore called 'persistent'.

## Parameters

### `server`

The MySQL server. It can also include a port number. e.g. "hostname:port" or a path to a local socket e.g. "./path/to/socket" for the localhost.

If the PHP directive `mysql.default_host` is undefined (default), then the default value is 'localhost:3306'

### `username`

The username. Default value is the name of the user that owns the server process.

### `password`

The password. Default value is an empty password.

### `client_flags`

The `client_flags` parameter can be a combination of the following constants: 128 (enable `LOAD DATA LOCAL` handling), `MYSQL_CLIENT_SSL`,

`MYSQL_CLIENT_COMPRESS`, `MYSQL_CLIENT_IGNORE_SPACE` or  
`MYSQL_CLIENT_INTERACTIVE`.

### Return Values

Returns a MySQL persistent link identifier on success, or `FALSE` on failure.

### Changelog

Version	Description
4.3.0	Added the <code>client_flags</code> parameter.

### Notes

#### Note

Note, that these kind of links only work if you are using a module version of PHP. See the [Persistent Database Connections](#) section for more information.

#### Warning

Using persistent connections can require a bit of tuning of your Apache and MySQL configurations to ensure that you do not exceed the number of connections allowed by MySQL.

#### Note

You can suppress the error message on failure by prepending a `@` to the function name.

### See Also

[mysql\\_connect](#)  
[Persistent Database Connections](#)

## 21.10.1.4.39. mysql\_ping

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_ping](#)

Ping a server connection or reconnect if there is no connection

### Description

```
bool mysql_ping(resource link_identifier);
```

Checks whether or not the connection to the server is working. If it has gone down, an automatic reconnection is attempted. This function can be used by scripts that remain idle for a long while, to check whether or not the server has closed the connection and reconnect if necessary.

#### Note

Since MySQL 5.0.13, automatic reconnection feature is disabled.

### Parameters

#### `link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

### Return Values

Returns `TRUE` if the connection to the server MySQL server is working, otherwise `FALSE`.

## Examples

### Example 21.59. A `mysql_ping` example

```
<?php
set_time_limit(0);

$conn = mysql_connect('localhost', 'mysqluser', 'mypass');
$db = mysql_select_db('mydb');

/* Assuming this query will take a long time */
$sql = "SELECT SLEEP(100);";
$result = mysql_query($sql);
if (!$result) {
 echo 'Query #1 failed, exiting.';
 exit;
}

/* Make sure the connection is still alive, if not, try to reconnect */
if (!mysql_ping($conn)) {
 echo 'Lost connection, exiting after query #1';
 exit;
}
mysql_free_result($result);

/* So the connection is still alive, let's run another query */
$result2 = mysql_query($sql2);
?>
```

## See Also

[mysql\\_thread\\_id](#)  
[mysql\\_list\\_processes](#)

### 21.10.1.4.40. `mysql_query`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_query](#)

Send a MySQL query

#### Description

```
resource mysql_query(string query,
 resource link_identifier);
```

`mysql_query` sends a unique query (multiple queries are not supported) to the currently active database on the server that's associated with the specified `link_identifier`.

#### Parameters

`query`

An SQL query

The query string should not end with a semicolon. Data inside the query should be [properly escaped](#).

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

#### Return Values

For SELECT, SHOW, DESCRIBE, EXPLAIN and other statements returning resultset, `mysql_query` returns a resource on success, or `FALSE` on error.

For other type of SQL statements, INSERT, UPDATE, DELETE, DROP, etc, `mysql_query` returns `TRUE` on success or `FALSE` on error.

The returned result resource should be passed to `mysql_fetch_array`, and other functions for dealing with result tables, to access the returned data.

Use `mysql_num_rows` to find out how many rows were returned for a SELECT statement or `mysql_affected_rows` to find out how many rows were affected by a DELETE, INSERT, REPLACE, or UPDATE statement.

`mysql_query` will also fail and return `FALSE` if the user does not have permission to access the table(s) referenced by the query.

## Examples

### Example 21.60. Invalid Query

The following query is syntactically invalid, so `mysql_query` fails and returns `FALSE`.

```
<?php
$result = mysql_query('SELECT * WHERE 1=1');
if (!$result) {
 die('Invalid query: ' . mysql_error());
}
?>
```

### Example 21.61. Valid Query

The following query is valid, so `mysql_query` returns a resource.

```
<?php
// This could be supplied by a user, for example
$firstname = 'fred';
$lastname = 'fox';

// Formulate Query
// This is the best way to perform an SQL query
// For more examples, see mysql_real_escape_string()
$query = sprintf("SELECT firstname, lastname, address, age FROM friends WHERE firstname='%s' AND lastname='%s'",
 mysql_real_escape_string($firstname),
 mysql_real_escape_string($lastname));

// Perform Query
$result = mysql_query($query);

// Check result
// This shows the actual query sent to MySQL, and the error. Useful for debugging.
if (!$result) {
 $message = 'Invalid query: ' . mysql_error() . "\n";
 $message .= 'Whole query: ' . $query;
 die($message);
}

// Use result
// Attempting to print $result won't allow access to information in the resource
// One of the mysql result functions must be used
// See also mysql_result(), mysql_fetch_array(), mysql_fetch_row(), etc.
while ($row = mysql_fetch_assoc($result)) {
 echo $row['firstname'];
 echo $row['lastname'];
 echo $row['address'];
 echo $row['age'];
}

// Free the resources associated with the result set
// This is done automatically at the end of the script
mysql_free_result($result);
?>
```

**See Also**

[mysql\\_connect](#)  
[mysql\\_error](#)  
[mysql\\_real\\_escape\\_string](#)  
[mysql\\_result](#)

[mysql\\_unbuffered\\_query](#)

**21.10.1.4.41. mysql\_real\_escape\_string**

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_real\\_escape\\_string](#)

Escapes special characters in a string for use in an SQL statement

**Description**

```
string mysql_real_escape_string(string unescaped_string,
 resource link_identifier);
```

Escapes special characters in the *unescaped\_string*, taking into account the current character set of the connection so that it is safe to place it in a [mysql\\_query](#). If binary data is to be inserted, this function must be used.

[mysql\\_real\\_escape\\_string](#) calls MySQL's library function `mysql_real_escape_string`, which prepends backslashes to the following characters: `\x00`, `\n`, `\r`, `\``, `'`, `"` and `\x1a`.

This function must always (with few exceptions) be used to make data safe before sending a query to MySQL.

**Parameters**

*unescaped\_string*

The string that is to be escaped.

*link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql\\_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql\\_connect](#) was called with no arguments. If no connection is found or established, an [E\\_WARNING](#) level error is generated.

**Return Values**

Returns the escaped string, or [FALSE](#) on error.

**Examples****Example 21.62. Simple mysql\_real\_escape\_string example**

```
<?php
// Connect
$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')
OR die(mysql_error());

// Query
$query = sprintf("SELECT * FROM users WHERE user='%s' AND password='%s',
 mysql_real_escape_string($user),
 mysql_real_escape_string($password));
?>
```

**Example 21.63. An example SQL Injection Attack**

```
<?php
// Query database to check if there are any matching users
$query = "SELECT * FROM users WHERE user='{$POST['username']}' AND password='{$POST['password']}'";
mysql_query($query);

// We didn't check $_POST['password'], it could be anything the user wanted! For example:
$_POST['username'] = 'aidan';
$_POST['password'] = "' OR ''='";

// This means the query sent to MySQL would be:
echo $query;
?>
```

The query sent to MySQL:

```
SELECT * FROM users WHERE user='aidan' AND password=' OR ''=''
```

This would allow anyone to log in without a valid password.

## Notes

### Note

A MySQL connection is required before using `mysql_real_escape_string` otherwise an error of level `E_WARNING` is generated, and `FALSE` is returned. If `link_identifier` isn't defined, the last MySQL connection is used.

### Note

If `magic_quotes_gpc` is enabled, first apply `stripslashes` to the data. Using this function on data which has already been escaped will escape the data twice.

### Note

If this function is not used to escape data, the query is vulnerable to [SQL Injection Attacks](#).

### Note

`mysql_real_escape_string` does not escape `%` and `_`. These are wildcards in MySQL if combined with `LIKE`, `GRANT`, or `REVOKE`.

The [magic\\_quotes\\_runtime](#) directive

## 21.10.1.4.42. mysql\_result

[Copyright 1997-2010 the PHP Documentation Group.](#)

- [mysql\\_result](#)

Get result data

### Description

```
string mysql_result(resource result,
 int row,
 mixed field= 0);
```

Retrieves the contents of one cell from a MySQL result set.

When working on large result sets, you should consider using one of the functions that fetch an entire row (specified below). As these functions return the contents of multiple cells in one function call, they're MUCH quicker than `mysql_result`. Also, note that specifying a numeric offset for the field argument is much quicker than specifying a fieldname or tablename.fieldname argument.

### Parameters

<code>result</code>	The result resource that is being evaluated. This result comes from a call to <code>mysql_query</code> .
<code>row</code>	The row number from the result that's being retrieved. Row numbers start at 0.
<code>field</code>	The name or offset of the field being retrieved.
	It can be the field's offset, the field's name, or the field's table dot field name (tablename.fieldname). If the column name has been aliased ('select foo as bar from...'), use the alias instead of the column name. If undefined, the first field is retrieved.

### Return Values

The contents of one cell from a MySQL result set on success, or `FALSE` on failure.

### Examples

#### Example 21.64. `mysql_result` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Could not connect: ' . mysql_error());
}
if (!mysql_select_db('database_name')) {
 die('Could not select database: ' . mysql_error());
}
$result = mysql_query('SELECT name FROM work.employee');
if (!$result) {
 die('Could not query:' . mysql_error());
}
echo mysql_result($result, 2); // outputs third employee's name
mysql_close($link);
?>
```

### Notes

#### Note

Calls to `mysql_result` should not be mixed with calls to other functions that deal with the result set.

### See Also

#### 21.10.1.4.43. `mysql_select_db`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_select\\_db](#)

Select a MySQL database

**Description**

```
bool mysql_select_db(string database_name,
 resource link_identifier);
```

Sets the current active database on the server that's associated with the specified link identifier. Every subsequent call to [mysql\\_query](#) will be made on the active database.

**Parameters**

*database\_name*

The name of the database that is to be selected.

*link\_identifier*

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql\\_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql\\_connect](#) was called with no arguments. If no connection is found or established, an [E\\_WARNING](#) level error is generated.

**Return Values**

Returns [TRUE](#) on success or [FALSE](#) on failure.

**Examples****Example 21.65. mysql\_select\_db example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
 die('Not connected : ' . mysql_error());
}

// make foo the current db
$db_selected = mysql_select_db('foo', $link);
if (!$db_selected) {
 die ('Can\'t use foo : ' . mysql_error());
}
?>
```

**Notes****Note**

For backward compatibility, the following deprecated alias may be used: [mysql\\_selectdb](#)

**See Also**

[mysql\\_connect](#)  
[mysql\\_pconnect](#)  
[mysql\\_query](#)

**21.10.1.4.44. mysql\_set\_charset**

[Copyright 1997-2010 the PHP Documentation Group.](#)

- [mysql\\_set\\_charset](#)

Sets the client character set

**Description**

```
bool mysql_set_charset(string charset,
 resource link_identifier);
```

Sets the default character set for the current connection.

### Parameters

`charset` A valid character set name.

`link_identifier` The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Notes

#### Note

This function requires MySQL 5.0.7 or later.

#### Note

This is the preferred way to change the charset. Using `mysql_query` to execute `SET NAMES ...` is not recommended.

### See Also

`mysql_client_encoding`

[List of character sets that MySQL supports](#)

## 21.10.1.4.45. `mysql_stat`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_stat`

Get current system status

### Description

```
string mysql_stat(resource link_identifier);
```

`mysql_stat` returns the current server status.

### Parameters

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

### Return Values

Returns a string with the status for uptime, threads, queries, open tables, flush tables and queries per second. For a complete list of other status variables, you have to use the `SHOW STATUS` SQL command. If `link_identifier` is invalid, `NULL` is returned.

### Examples

#### Example 21.66. `mysql_stat` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$status = explode(' ', mysql_stat($link));
print_r($status);
?>
```

The above example will output something similar to:

```
Array
(
 [0] => Uptime: 5380
 [1] => Threads: 2
 [2] => Questions: 1321299
 [3] => Slow queries: 0
 [4] => Opens: 26
 [5] => Flush tables: 1
 [6] => Open tables: 17
 [7] => Queries per second avg: 245.595
)
```

### Example 21.67. Alternative `mysql_stat` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$result = mysql_query('SHOW STATUS', $link);
while ($row = mysql_fetch_assoc($result)) {
 echo $row['Variable_name'] . ' = ' . $row['Value'] . "\n";
}
?>
```

The above example will output something similar to:

```
back_log = 50
basedir = /usr/local/
bdb_cache_size = 8388600
bdb_log_buffer_size = 32768
bdb_home = /var/db/mysql/
bdb_max_lock = 10000
bdb_logdir =
bdb_shared_data = OFF
bdb_tmpdir = /var/tmp/
...
```

#### See Also

[mysql\\_list\\_processes](#)

### 21.10.1.4.46. `mysql_tablename`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_tablename](#)

Get table name of field

#### Description

```
string mysql_tablename(resource result,
 int i);
```

Retrieves the table name from a *result*.

This function is deprecated. It is preferable to use `mysql_query` to issue an SQL `SHOW TABLES [FROM db_name] [LIKE 'pattern']` statement instead.

### Parameters

<i>result</i>	A result pointer resource that's returned from <code>mysql_list_tables</code> .
<i>i</i>	The integer index (row/table number)

### Return Values

The name of the table on success or `FALSE` on failure.

Use the `mysql_tablename` function to traverse this result pointer, or any function for result tables, such as `mysql_fetch_array`.

### Examples

#### Example 21.68. `mysql_tablename` example

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password");
$result = mysql_list_tables("mydb");
$num_rows = mysql_num_rows($result);
for ($i = 0; $i < $num_rows; $i++) {
 echo "Table: ", mysql_tablename($result, $i), "\n";
}
mysql_free_result($result);
?>
```

### Notes

#### Note

The `mysql_num_rows` function may be used to determine the number of tables in the result pointer.

### See Also

[mysql\\_list\\_tables](#)

[mysql\\_db\\_name](#)

## 21.10.1.4.47. `mysql_thread_id`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_thread_id`

Return the current thread ID

### Description

```
int mysql_thread_id(resource link_identifier);
```

Retrieves the current thread ID. If the connection is lost, and a reconnect with `mysql_ping` is executed, the thread ID will

change. This means only retrieve the thread ID when needed.

### Parameters

<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If no connection is found or established, an <code>E_WARNING</code> level error is generated.
------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### Return Values

The thread ID on success or `FALSE` on failure.

### Examples

#### Example 21.69. `mysql_thread_id` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$thread_id = mysql_thread_id($link);
if ($thread_id){
 printf("current thread id is %d\n", $thread_id);
}
?>
```

The above example will output something similar to:

```
current thread id is 73
```

### See Also

[mysql\\_ping](#)  
[mysql\\_list\\_processes](#)

#### 21.10.1.4.48. `mysql_unbuffered_query`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql\\_unbuffered\\_query](#)

Send an SQL query to MySQL without fetching and buffering the result rows.

### Description

```
resource mysql_unbuffered_query(string query,
 resource link_identifier);
```

`mysql_unbuffered_query` sends the SQL query `query` to MySQL without automatically fetching and buffering the result rows as `mysql_query` does. This saves a considerable amount of memory with SQL queries that produce large result sets, and you can start working on the result set immediately after the first row has been retrieved as you don't have to wait until the complete SQL query has been performed. To use `mysql_unbuffered_query` while multiple database connections are open, you must specify the optional parameter `link_identifier` to identify which connection you want to use.

### Parameters

<code>query</code>	The SQL query to execute.  Data inside the query should be <a href="#">properly escaped</a> .
<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If no connection is found or established, an <a href="#">E_WARNING</a> level error is generated.

### Return Values

For SELECT, SHOW, DESCRIBE or EXPLAIN statements, `mysql_unbuffered_query` returns a resource on success, or `FALSE` on error.

For other type of SQL statements, UPDATE, DELETE, DROP, etc, `mysql_unbuffered_query` returns `TRUE` on success or `FALSE` on error.

### Notes

#### Note

The benefits of `mysql_unbuffered_query` come at a cost: you cannot use `mysql_num_rows` and `mysql_data_seek` on a result set returned from `mysql_unbuffered_query`. You also have to fetch all result rows from an unbuffered SQL query before you can send a new SQL query to MySQL.

## 21.10.2. MySQL Improved Extension (`Mysqli`)

[Copyright 1997-2010 the PHP Documentation Group](#).

The `mysqli` extension allows you to access the functionality provided by MySQL 4.1 and above. More information about the MySQL Database server can be found at <http://www.mysql.com/>

An overview of software available for using MySQL from PHP can be found at [Section 21.10.2.2, “Overview”](#)

Documentation for MySQL can be found at <http://dev.mysql.com/doc/>.

Parts of this documentation included from MySQL manual with permissions of Oracle Corporation.

### 21.10.2.1. Examples

[Copyright 1997-2010 the PHP Documentation Group](#).

All examples in the `mysqli` documentation use the world database. The world database can be found at <http://downloads.mysql.com/docs/world.sql.gz>

### 21.10.2.2. Overview

[Copyright 1997-2010 the PHP Documentation Group](#).

This section provides an introduction to the options available to you when developing a PHP application that needs to interact with a MySQL database.

*What is an API?*

An Application Programming Interface, or API, defines the classes, methods, functions and variables that your application will need to call in order to carry out its desired task. In the case of PHP applications that need to communicate with databases the necessary APIs are usually exposed via PHP extensions.

APIs can be procedural or object-oriented. With a procedural API you call functions to carry out tasks, with the object-oriented API you instantiate classes and then call methods on the resulting objects. Of the two the latter is usually the preferred interface, as it is more modern and leads to better organised code.

When writing PHP applications that need to connect to the MySQL server there are several API options available. This document discusses what is available and how to select the best solution for your application.

### What is a Connector?

In the MySQL documentation, the term *connector* refers to a piece of software that allows your application to connect to the MySQL database server. MySQL provides connectors for a variety of languages, including PHP.

If your PHP application needs to communicate with a database server you will need to write PHP code to perform such activities as connecting to the database server, querying the database and other database-related functions. Software is required to provide the API that your PHP application will use, and also handle the communication between your application and the database server, possibly using other intermediate libraries where necessary. This software is known generically as a connector, as it allows your application to *connect* to a database server.

### What is a Driver?

A driver is a piece of software designed to communicate with a specific type of database server. The driver may also call a library, such as the MySQL Client Library or the MySQL Native Driver. These libraries implement the low-level protocol used to communicate with the MySQL database server.

By way of an example, the [PHP Data Objects \(PDO\)](#) database abstraction layer may use one of several database-specific drivers. One of the drivers it has available is the PDO MYSQL driver, which allows it to interface with the MySQL server.

Sometimes people use the terms connector and driver interchangeably, this can be confusing. In the MySQL-related documentation the term “driver” is reserved for software that provides the database-specific part of a connector package.

### What is an Extension?

In the PHP documentation you will come across another term - *extension*. The PHP code consists of a core, with optional extensions to the core functionality. PHP's MySQL-related extensions, such as the [mysqli](#) extension, and the [mysql](#) extension, are implemented using the PHP extension framework.

An extension typically exposes an API to the PHP programmer, to allow its facilities to be used programmatically. However, some extensions which use the PHP extension framework do not expose an API to the PHP programmer.

The PDO MySQL driver extension, for example, does not expose an API to the PHP programmer, but provides an interface to the PDO layer above it.

The terms API and extension should not be taken to mean the same thing, as an extension may not necessarily expose an API to the programmer.

### What are the main PHP API offerings for using MySQL?

There are three main API options when considering connecting to a MySQL database server:

- PHP's MySQL Extension
- PHP's mysqli Extension
- PHP Data Objects (PDO)

Each has its own advantages and disadvantages. The following discussion aims to give a brief introduction to the key aspects of each API.

### What is PHP's MySQL Extension?

This is the original extension designed to allow you to develop PHP applications that interact with a MySQL database. The [mysql](#) extension provides a procedural interface and is intended for use only with MySQL versions older than 4.1.3. This extension can be used with versions of MySQL 4.1.3 or newer, but not all of the latest MySQL server features will be available.

#### Note

If you are using MySQL versions 4.1.3 or later it is *strongly* recommended that you use the [mysqli](#) extension instead.

The [mysql](#) extension source code is located in the PHP extension directory [ext/mysql](#).

For further information on the [mysql](#) extension, see [Section 21.10.1, “MySQL”](#).

### What is PHP's mysqli Extension?

The [mysqli](#) extension, or as it is sometimes known, the MySQL *improved* extension, was developed to take advantage of new

features found in MySQL systems versions 4.1.3 and newer. The `mysqli` extension is included with PHP versions 5 and later.

The `mysqli` extension has a number of benefits, the key enhancements over the `mysql` extension being:

- Object-oriented interface
- Support for Prepared Statements
- Support for Multiple Statements
- Support for Transactions
- Enhanced debugging capabilities
- Embedded server support

### Note

If you are using MySQL versions 4.1.3 or later it is *strongly* recommended that you use this extension.

As well as the object-oriented interface the extension also provides a procedural interface.

The `mysqli` extension is built using the PHP extension framework, its source code is located in the directory `ext/mysqli`.

For further information on the `mysqli` extension, see [Section 21.10.2, “MySQL Improved Extension \(Mysqli\)”](#).

#### What is PDO?

PHP Data Objects, or PDO, is a database abstraction layer specifically for PHP applications. PDO provides a consistent API for your PHP application regardless of the type of database server your application will connect to. In theory, if you are using the PDO API, you could switch the database server you used, from say Firebird to MySQL, and only need to make minor changes to your PHP code.

Other examples of database abstraction layers include JDBC for Java applications and DBI for Perl.

While PDO has its advantages, such as a clean, simple, portable API, its main disadvantage is that it doesn't allow you to use all of the advanced features that are available in the latest versions of MySQL server. For example, PDO does not allow you to use MySQL's support for Multiple Statements.

PDO is implemented using the PHP extension framework, its source code is located in the directory `ext/pdo`.

For further information on PDO, see the [Section 21.10.4, “MySQL Functions \(PDO\\_MYSQL\)”](#).

#### What is the PDO MySQL driver?

The PDO MySQL driver is not an API as such, at least from the PHP programmer's perspective. In fact the PDO MySQL driver sits in the layer below PDO itself and provides MySQL-specific functionality. The programmer still calls the PDO API, but PDO uses the PDO MySQL driver to carry out communication with the MySQL server.

The PDO MySQL driver is one of several available PDO drivers. Other PDO drivers available include those for the Firebird and PostgreSQL database servers.

The PDO MySQL driver is implemented using the PHP extension framework. Its source code is located in the directory `ext/pdo_mysql`. It does not expose an API to the PHP programmer.

For further information on the PDO MySQL driver, see [Section 21.10.4, “MySQL Functions \(PDO\\_MYSQL\)”](#).

#### What is PHP's MySQL Native Driver?

In order to communicate with the MySQL database server the `mysql` extension, `mysqli` and the PDO MySQL driver each use a low-level library that implements the required protocol. In the past, the only available library was the MySQL Client Library, otherwise known as `libmysql`.

However, the interface presented by `libmysql` was not optimized for communication with PHP applications, as `libmysql` was originally designed with C applications in mind. For this reason the MySQL Native Driver, `mysqlnd`, was developed as an alternative to `libmysql` for PHP applications.

The `mysql` extension, the `mysqli` extension and the PDO MySQL driver can each be individually configured to use either `libmysql` or `mysqlnd`. As `mysqlnd` is designed specifically to be utilised in the PHP system it has numerous memory and speed enhancements over `libmysql`. You are strongly encouraged to take advantage of these improvements.

**Note**

The MySQL Native Driver can only be used with MySQL server versions 4.1.3 and later.

The MySQL Native Driver is implemented using the PHP extension framework. The source code is located in [ext/mysqlnd](#). It does not expose an API to the PHP programmer.

*Comparison of Features*

The following table compares the functionality of the three main methods of connecting to MySQL from PHP:

	<b>PHP's mysqli Extension</b>	<b>PDO (Using PDO MySQL Driver and MySQL Native Driver)</b>	<b>PHP's MySQL Extension</b>
PHP version introduced	5.0	5.0	Prior to 3.0
Included with PHP 5.x	yes	yes	Yes
MySQL development status	Active development	Active development as of PHP 5.3	Maintenance only
Recommended by MySQL for new projects	Yes - preferred option	Yes	No
API supports Charsets	Yes	Yes	No
API supports server-side Prepared Statements	Yes	Yes	No
API supports client-side Prepared Statements	No	Yes	No
API supports Stored Procedures	Yes	Yes	No
API supports Multiple Statements	Yes	Most	No
Supports all MySQL 4.1+ functionality	Yes	Most	No

### 21.10.2.3. Installing/Configuring

[Copyright 1997-2010 the PHP Documentation Group.](#)

#### 21.10.2.3.1. Requirements

[Copyright 1997-2010 the PHP Documentation Group.](#)

In order to have these functions available, you must compile PHP with support for the mysqli extension.

**Note**

The mysqli extension is designed to work with MySQL version 4.1.13 or newer, or 5.0.7 or newer. For previous versions, please see the [MySQL](#) extension documentation.

#### 21.10.2.3.2. Installation

[Copyright 1997-2010 the PHP Documentation Group.](#)

The [mysqli](#) extension was introduced with PHP version 5.0.0. The MySQL Native Driver was included in PHP version 5.3.0.

##### 21.10.2.3.2.1. Installation on Linux

[Copyright 1997-2010 the PHP Documentation Group.](#)

The common Unix distributions include binary versions of PHP that can be installed. Although these binary versions are typically built with support for MySQL extensions enabled, the extension libraries themselves may need to be installed using an additional package. Check the package manager than comes with your chosen distribution for availability.

Unless your Unix distribution comes with a binary package of PHP with the [mysqli](#) extension available, you will need to build PHP from source code. Building PHP from source allows you to specify the MySQL extensions you want to use, as well as your choice of client library for each extension.

### 21.10.2.3.2.1.1. PHP 5.0, 5.1, 5.2

[Copyright 1997-2010 the PHP Documentation Group.](#)

If building from source code, to ensure that the `mysqli` extension for PHP is enabled, you will need to configure the PHP source code to use `mysqli`. This is achieved by running the `configure` script with the option `--with-mysqli=mysql_config_path/mysql_config`, prior to building PHP. This will enable `mysqli` and it will use the MySQL Client Library (`libmysql`) to communicate with the MySQL Server.

The `mysql_config_path` represents the location of the `mysql_config` program that comes with MySQL Server.

### 21.10.2.3.2.1.2. PHP 5.3.0+

[Copyright 1997-2010 the PHP Documentation Group.](#)

With versions of PHP 5.3.0 and newer, `mysqli` uses MySQL Native Driver by default. This gives a number of benefits over `libmysql`.

This is the recommended option, as using the MySQL Native Driver results in improved performance and gives access to features not available when using the MySQL Client Library. Refer to [What is PHP's MySQL Native Driver?](#) for a brief overview of the advantages of MySQL Native Driver.

To use MySQL Native Driver with `mysqli` you need to configure the PHP source code using the `--with-mysqli=mysqlnd` option, prior to building PHP.

Note that it is possible to freely mix MySQL extensions and client libraries. For example, it is possible to enable the MySQL extension to use the MySQL Client Library (`libmysql`), while configuring the `mysqli` extension to use the MySQL Native Driver. However, all permutations of extension and client library are possible.

The following example builds the MySQL extension to use the MySQL Client Library, and the `mysqli` and PDO MYSQL extensions to use the MySQL Native Driver:

```
./configure --with-mysql=/usr/bin/mysql_config \
--with-mysqli=mysqlnd \
--with-pdo-mysql=mysqlnd
[other options]
```

## 21.10.2.3.2.2. Installation on Windows Systems

[Copyright 1997-2010 the PHP Documentation Group.](#)

On Windows, PHP is most commonly installed using the binary installer.

### 21.10.2.3.2.2.1. PHP 5.0, 5.1, 5.2

[Copyright 1997-2010 the PHP Documentation Group.](#)

Once PHP has been installed, some configuration is required to enable `mysqli` and specify the client library you want it to use.

The `mysqli` extension is not enabled by default, so the `php_mysqli.dll` DLL must be enabled inside of `php.ini`. In order to do this you need to find the `php.ini` file (typically located in `c:\php`), and make sure you remove the comment (semi-colon) from the start of the line `extension=php_mysqli.dll`, in the section marked `[PHP_MYSQLI]`.

Also, if you want to use the MySQL Client Library with `mysqli`, you need to make sure PHP can access the client library file. The MySQL Client Library is included as a file named `libmysql.dll` in the Windows PHP distribution. This file needs to be available in the Windows system's `PATH` environment variable, so that it can be successfully loaded. See the FAQ titled "[How do I add my PHP directory to the PATH on Windows](#)" for information on how to do this. Copying `libmysql.dll` to the Windows system directory (typically `c:\Windows\system`) also works, as the system directory is by default in the system's `PATH`. However, this practice is strongly discouraged.

As with enabling any PHP extension (such as `php_mysqli.dll`), the PHP directive `extension_dir` should be set to the directory where the PHP extensions are located. See also the [Manual Windows Installation Instructions](#). An example `extension_dir` value for PHP 5 is `c:\php\ext`.

### Note

If when starting the web server an error similar to the following occurs: "Unable to load dynamic library '.../php\_mysqli.dll'", this is because `php_mysqli.dll` and/or `libmysql.dll` cannot be found by the system.

### 21.10.2.3.2.2.2. PHP 5.3.0+

[Copyright 1997-2010 the PHP Documentation Group.](#)

On Windows, for PHP versions 5.3 and newer, the `mysqli` extension is enabled and uses the MySQL Native Driver by default. This means you don't need to worry about configuring access to `libmysql.dll`.

### 21.10.2.3.3. Runtime Configuration

[Copyright 1997-2010 the PHP Documentation Group.](#)

The behaviour of these functions is affected by settings in `php.ini`.

**Table 21.7. MySQLi Configuration Options**

Name	Default	Changeable	Changelog
<code>mysqli.allow_persistent</code>	"1"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqli.max_persistent</code>	"-1"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqli.max_links</code>	"-1"	PHP_INI_SYSTEM	Available since PHP 5.0.0.
<code>mysqli.default_port</code>	"3306"	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_socket</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_host</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_user</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_pw</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.reconnect</code>	"0"	PHP_INI_SYSTEM	Available since PHP 4.3.5.
<code>mysqli.allow_local_infile</code>	"1"	PHP_INI_SYSTEM	Available since PHP 5.2.4.
<code>mysqli.cache_size</code>	"2000"	PHP_INI_SYSTEM	Available since PHP 5.3.0.

For further details and definitions of the preceding PHP\_INI\_\* constants, see the chapter on [configuration changes](#).

Here's a short explanation of the configuration directives.

<code>mysqli.allow_persistent</code> integer	Enable the ability to create persistent connections using <code>mysqli_connect</code> .
<code>mysqli.max_persistent</code> integer	Maximum of persistent connections that can be made. Set to 0 for unlimited.
<code>mysqli.max_links</code> integer	The maximum number of MySQL connections per process.
<code>mysqli.default_port</code> integer	The default TCP port number to use when connecting to the database server if no other port is specified. If no default is specified, the port will be obtained from the <code>MYSQL_TCP_PORT</code> environment variable, the <code>mysql-tcp</code> entry in <code>/etc/services</code> or the compile-time <code>MYSQL_PORT</code> constant, in that order. Win32 will only use the <code>MYSQL_PORT</code> constant.
<code>mysqli.default_socket</code> string	The default socket name to use when connecting to a local database server if no other socket name is specified.
<code>mysqli.default_host</code> string	The default server host to use when connecting to the database server if no other host is specified. Doesn't apply in <a href="#">safe mode</a> .
<code>mysqli.default_user</code> string	The default user name to use when connecting to the database server if no other name is specified. Doesn't apply in <a href="#">safe mode</a> .
<code>mysqli.default_pw</code> string	The default password to use when connecting to the database server if no other password is specified. Doesn't apply in <a href="#">safe mode</a> .
<code>mysqli.reconnect</code> integer	Automatically reconnect if the connection was lost.
<code>mysqli.allow_local_infile</code> <code>mysqli.cache_size</code> integer	Available only with <code>mysqld</code> .

Users cannot set `MYSQL_OPT_READ_TIMEOUT` through an API call or runtime configuration setting. Note that if it were possible there would be differences between how `libmysql` and streams would interpret the value of `MYSQL_OPT_READ_TIMEOUT`.

#### 21.10.2.3.4. Resource Types

Copyright 1997-2010 the PHP Documentation Group.

This extension has no resource types defined.

#### 21.10.2.4. The mysqli Extension and Persistent Connections

Copyright 1997-2010 the PHP Documentation Group.

Persistent connection support was introduced in PHP 5.3 for the `mysqli` extension. Support was already present in PDO MySQL and ext/mysql. The idea behind persistent connections is that a connection between a client process and a database can be reused by a client process, rather than being created and destroyed multiple times. This reduces the overhead of creating fresh connections every time one is required, as unused connections are cached and ready to be reused.

Unlike the mysql extension, mysqli does not provide a separate function for opening persistent connections. To open a persistent connection you must prepend `p:` to the hostname when connecting.

The problem with persistent connections is that they can be left in unpredictable states by clients. For example, a table lock might be activated before a client terminates unexpectedly. A new client process reusing this persistent connection will get the connection “as is”. Any cleanup would need to be done by the new client process before it could make good use of the persistent connection, increasing the burden on the programmer.

The persistent connection of the `mysqli` extension however provides built-in cleanup handling code. The cleanup carried out by `mysqli` includes:

- Rollback active transactions
- Close and drop temporary tables
- Unlock tables
- Reset session variables
- Close prepared statements (always happens with PHP)
- Close handler
- Release locks acquired with `GET_LOCK`

This ensures that persistent connections are in a clean state on return from the connection pool, before the client process uses them.

The `mysqli` extension does this cleanup by automatically calling the C-API function `mysql_change_user()`.

The automatic cleanup feature has advantages and disadvantages though. The advantage is that the programmer no longer needs to worry about adding cleanup code, as it is called automatically. However, the disadvantage is that the code could *potentially* be a little slower, as the code to perform the cleanup needs to run each time a connection is returned from the connection pool.

It is possible to switch off the automatic cleanup code, by compiling PHP with `MYSQLI_NO_CHANGE_USER_ON_PCONNECT` defined.

##### Note

The `mysqli` extension supports persistent connections when using either MySQL Native Driver or MySQL Client Library.

#### 21.10.2.5. Predefined Constants

Copyright 1997-2010 the PHP Documentation Group.

`MYSQLI_READ_DEFAULT_GROUP` Read options from the named group from `my.cnf` or the file specified with `P`  
`MYSQLI_READ_DEFAULT_FILE`

`MYSQLI_READ_DEFAULT_FILE` Read options from the named option file instead of from `my.cnf`

`MYSQLI_OPT_CONNECT_TIMEOUT` Connect timeout in seconds  
`UT`

`MYSQLI_OPT_LOCAL_INFILE` Enables command `LOAD LOCAL INFILE`

<code>MYSQLI_INIT_COMMAND</code>	Command to execute when connecting to MySQL server. Will automatically be re-executed when reconnecting.
<code>MYSQLI_CLIENT_SSL</code>	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the MySQL client library
<code>MYSQLI_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQLI_CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection. The client's session <code>wait_timeout</code> variable will be set to the value of the session <code>interactive_timeout</code> variable.
<code>MYSQLI_CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all functions names reserved words.
<code>MYSQLI_CLIENT_NO_SCHEMA</code>	Don't allow the <code>db_name.tbl_name.col_name</code> syntax.
<code>MYSQLI_CLIENT_MULTI_QUERIES</code>	Allows multiple semicolon-delimited queries in a single <code>mysqli_query</code> call.
<code>MYSQLI_STORE_RESULT</code>	For using buffered resultsets
<code>MYSQLI_USE_RESULT</code>	For using unbuffered resultsets
<code>MYSQLI_ASSOC</code>	Columns are returned into the array having the fieldname as the array index.
<code>MYSQLI_NUM</code>	Columns are returned into the array having an enumerated index.
<code>MYSQLI_BOTH</code>	Columns are returned into the array having both a numerical index and the fieldname as the associative index.
<code>MYSQLI_NOT_NULL_FLAG</code>	Indicates that a field is defined as <code>NOT NULL</code>
<code>MYSQLI_PRI_KEY_FLAG</code>	Field is part of a primary index
<code>MYSQLI_UNIQUE_KEY_FLAG</code>	Field is part of a unique index.
<code>MYSQLI_MULTIPLE_KEY_FLAG</code>	Field is part of an index.
<code>MYSQLI_BLOB_FLAG</code>	Field is defined as <code>BLOB</code>
<code>MYSQLI_UNSIGNED_FLAG</code>	Field is defined as <code>UNSIGNED</code>
<code>MYSQLI_ZEROFILL_FLAG</code>	Field is defined as <code>ZEROFILL</code>
<code>MYSQLI_AUTO_INCREMENT_FLAG</code>	Field is defined as <code>AUTO_INCREMENT</code>
<code>MYSQLI_TIMESTAMP_FLAG</code>	Field is defined as <code>TIMESTAMP</code>
<code>MYSQLI_SET_FLAG</code>	Field is defined as <code>SET</code>
<code>MYSQLI_NUM_FLAG</code>	Field is defined as <code>NUMERIC</code>
<code>MYSQLI_PART_KEY_FLAG</code>	Field is part of an multi-index
<code>MYSQLI_GROUP_FLAG</code>	Field is part of <code>GROUP BY</code>
<code>MYSQLI_TYPE_DECIMAL</code>	Field is defined as <code>DECIMAL</code>
<code>MYSQLI_TYPE_NEWDECIMAL</code>	Precision math <code>DECIMAL</code> or <code>NUMERIC</code> field (MySQL 5.0.3 and up)
<code>MYSQLI_TYPE_BIT</code>	Field is defined as <code>BIT</code> (MySQL 5.0.3 and up)
<code>MYSQLI_TYPE_TINY</code>	Field is defined as <code>TINYINT</code>
<code>MYSQLI_TYPE_SHORT</code>	Field is defined as <code>SMALLINT</code>
<code>MYSQLI_TYPE_LONG</code>	Field is defined as <code>INT</code>
<code>MYSQLI_TYPE_FLOAT</code>	Field is defined as <code>FLOAT</code>
<code>MYSQLI_TYPE_DOUBLE</code>	Field is defined as <code>DOUBLE</code>
<code>MYSQLI_TYPE_NULL</code>	Field is defined as <code>DEFAULT NULL</code>

<code>MYSQLI_TYPE_TIMESTAMP</code>	Field is defined as <code>TIMESTAMP</code>
<code>MYSQLI_TYPE_LONGLONG</code>	Field is defined as <code>BIGINT</code>
<code>MYSQLI_TYPE_INT24</code>	Field is defined as <code>MEDIUMINT</code>
<code>MYSQLI_TYPE_DATE</code>	Field is defined as <code>DATE</code>
<code>MYSQLI_TYPE_TIME</code>	Field is defined as <code>TIME</code>
<code>MYSQLI_TYPE_DATETIME</code>	Field is defined as <code>DATETIME</code>
<code>MYSQLI_TYPE_YEAR</code>	Field is defined as <code>YEAR</code>
<code>MYSQLI_TYPE_NEWDATE</code>	Field is defined as <code>DATE</code>
<code>MYSQLI_TYPE_INTERVAL</code>	Field is defined as <code>INTERVAL</code>
<code>MYSQLI_TYPE_ENUM</code>	Field is defined as <code>ENUM</code>
<code>MYSQLI_TYPE_SET</code>	Field is defined as <code>SET</code>
<code>MYSQLI_TYPE_TINY_BLOB</code>	Field is defined as <code>TINYBLOB</code>
<code>MYSQLI_TYPE_MEDIUM_BLOB</code>	Field is defined as <code>MEDIUMBLOB</code>
<code>MYSQLI_TYPE_LONG_BLOB</code>	Field is defined as <code>LONGBLOB</code>
<code>MYSQLI_TYPE_BLOB</code>	Field is defined as <code>BLOB</code>
<code>MYSQLI_TYPE_VAR_STRING</code>	Field is defined as <code>VARCHAR</code>
<code>MYSQLI_TYPE_STRING</code>	Field is defined as <code>STRING</code>
<code>MYSQLI_TYPE_CHAR</code>	Field is defined as <code>CHAR</code>
<code>MYSQLI_TYPE_GEOMETRY</code>	Field is defined as <code>GEOMETRY</code>
<code>MYSQLI_NEED_DATA</code>	More data available for bind variable
<code>MYSQLI_NO_DATA</code>	No more data available for bind variable
<code>MYSQLI_DATA_TRUNCATED</code>	Data truncation occurred. Available since PHP 5.1.0 and MySQL 5.0.5.
<code>MYSQLI_ENUM_FLAG</code>	Field is defined as <code>ENUM</code> . Available since PHP 5.3.0.
<code>MYSQLI_CURSOR_TYPE_FOR_UPDATE</code> <code>MYSQLI_CURSOR_TYPE_NO_CURSOR</code> <code>MYSQLI_CURSOR_TYPE_READ_DEFAULT</code> <code>MYSQLI_CURSOR_TYPE_SCROLLABLE</code> <code>MYSQLI_STMT_ATTR_CURSOR_TYPE</code> <code>MYSQLI_STMT_ATTR_PREFETCH_ROWS</code> <code>MYSQLI_STMT_ATTR_UPDATE_MAX_LENGTH</code> <code>MYSQLI_CHARSET_NAME</code>	

### 21.10.2.6. The MySQLi Extension Function Summary

Copyright 1997-2010 the PHP Documentation Group.

MySQLi Class			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
<code>\$mysqli-&gt;affected_rows</code>	<code>mysqli_affected_rows</code>	N/A	Gets the number of affected rows in a previous MySQL operation
<code>\$mysqli-&gt;client_info</code>	<code>mysqli_get_client_info</code>	N/A	Returns the MySQL client version as a string
<code>\$mysqli-&gt;client_version</code>	<code>mysqli_get_client_version</code>	N/A	Returns MySQL client version info as an integer

MySQLi Class			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<code>\$mysqli-&gt;connect_errno</code>	<code>mysqli_connect_errno</code>	N/A	Returns the error code from last connect call
<code>\$mysqli-&gt;connect_error</code>	<code>mysqli_connect_error</code>	N/A	Returns a string description of the last connect error
<code>\$mysqli-&gt;errno</code>	<code>mysqli_errno</code>	N/A	Returns the error code for the most recent function call
<code>\$mysqli-&gt;error</code>	<code>mysqli_error</code>	N/A	Returns a string description of the last error
<code>\$mysqli-&gt;field_count</code>	<code>mysqli_field_count</code>	N/A	Returns the number of columns for the most recent query
<code>\$mysqli-&gt;host_info</code>	<code>mysqli_get_host_info</code>	N/A	Returns a string representing the type of connection used
<code>\$mysqli-&gt;protocol_version</code>	<code>mysqli_get_proto_info</code>	N/A	Returns the version of the MySQL protocol used
<code>\$mysqli-&gt;server_info</code>	<code>mysqli_get_server_info</code>	N/A	Returns the version of the MySQL server
<code>\$mysqli-&gt;server_version</code>	<code>mysqli_get_server_version</code>	N/A	Returns the version of the MySQL server as an integer
<code>\$mysqli-&gt;info</code>	<code>mysqli_info</code>	N/A	Retrieves information about the most recently executed query
<code>\$mysqli-&gt;insert_id</code>	<code>mysqli_insert_id</code>	N/A	Returns the auto generated id used in the last query
<code>\$mysqli-&gt;sqlstate</code>	<code>mysqli_sqlstate</code>	N/A	Returns the SQLSTATE error from previous MySQL operation
<code>\$mysqli-&gt;warning_count</code>	<code>mysqli_warning_count</code>	N/A	Returns the number of warnings from the last query for the given link
<i>Methods</i>			
<code>mysqli-&gt;autocommit</code>	<code>mysqli_autocommit</code>	N/A	Turns on or off auto-committing database modifications
<code>mysqli-&gt;change_user</code>	<code>mysqli_change_user</code>	N/A	Changes the user of the specified database connection
<code>mysqli-&gt;character_set_name, mysqli-&gt;client_encoding</code>	<code>mysqli_character_set_name</code>	<code>mysqli_client_encoding</code>	Returns the default character set for the database connection
<code>mysqli-&gt;close</code>	<code>mysqli_close</code>	N/A	Closes a previously opened database connection
<code>mysqli-&gt;commit</code>	<code>mysqli_commit</code>	N/A	Commits the current transaction
<code>mysqli::__construct</code>	<code>mysqli_connect</code>	N/A	Open a new connection to the MySQL server [Note: static (i.e. class) method]
<code>mysqli-&gt;debug</code>	<code>mysqli_debug</code>	N/A	Performs debugging operations
<code>mysqli-&gt;dump_debug_info</code>	<code>mysqli_dump_debug_info</code>	N/A	Dump debugging information into the log
<code>mysqli-&gt;get_charset</code>	<code>mysqli_get_charset</code>	N/A	Returns a character set object
<code>mysqli-&gt;get_connection_stats</code>	<code>mysqli_get_connection_stats</code>	N/A	Returns client connection statistics. Available only with <code>mysqld</code> .
<code>mysqli-&gt;get_client_info</code>	<code>mysqli_get_client_info</code>	N/A	Returns the MySQL client version as a string
<code>mysqli-&gt;get_client_stats</code>	<code>mysqli_get_client_stats</code>	N/A	Returns client per-process statistics. Available only with <code>mysqld</code> .

MySQLi Class			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<code>mysqli-&gt;get_cache_stats</code>	<code>mysqli_get_cache_stats</code>	N/A	Returns client Zval cache statistics. Available only with <code>mysqld</code> .
<code>mysqli-&gt;get_server_info</code>	<code>mysqli_get_server_info</code>	N/A	NOT DOCUMENTED
<code>mysqli-&gt;get_warnings</code>	<code>mysqli_get_warnings</code>	N/A	NOT DOCUMENTED
<code>mysqli::init</code>	<code>mysqli_init</code>	N/A	Initializes MySQLi and returns a resource for use with <code>mysqli_real_connect</code> . [Not called on an object, as it returns a \$mysqli object.]
<code>mysqli-&gt;kill</code>	<code>mysqli_kill</code>	N/A	Asks the server to kill a MySQL thread
<code>mysqli-&gt;more_results</code>	<code>mysqli_more_results</code>	N/A	Check if there are any more query results from a multi query
<code>mysqli-&gt;multi_query</code>	<code>mysqli_multi_query</code>	N/A	Performs a query on the database
<code>mysqli-&gt;next_result</code>	<code>mysqli_next_result</code>	N/A	Prepare next result from <code>multi_query</code>
<code>mysqli-&gt;options</code>	<code>mysqli_options</code>	<code>mysqli_set_opt</code>	Set options
<code>mysqli-&gt;ping</code>	<code>mysqli_ping</code>	N/A	Pings a server connection, or tries to reconnect if the connection has gone down
<code>mysqli-&gt;prepare</code>	<code>mysqli_prepare</code>	N/A	Prepare an SQL statement for execution
<code>mysqli-&gt;query</code>	<code>mysqli_query</code>	N/A	Performs a query on the database
<code>mysqli-&gt;real_connect</code>	<code>mysqli_real_connect</code>	N/A	Opens a connection to a mysql server
<code>mysqli-&gt;real_escape_string, mysqli-&gt;escape_string</code>	<code>mysqli_real_escape_string</code>	<code>mysqli_escape_string</code>	Escapes special characters in a string for use in an SQL statement, taking into account the current charset of the connection
<code>mysqli-&gt;real_query</code>	<code>mysqli_real_query</code>	N/A	Execute an SQL query
<code>mysqli-&gt;rollback</code>	<code>mysqli_rollback</code>	N/A	Rolls back current transaction
<code>mysqli-&gt;select_db</code>	<code>mysqli_select_db</code>	N/A	Selects the default database for database queries
<code>mysqli-&gt;set_charset</code>	<code>mysqli_set_charset</code>	N/A	Sets the default client character set
<code>mysqli-&gt;set_local_infile_default</code>	<code>mysqli_set_local_infile_default</code>	N/A	Unsets user defined handler for load local infile command
<code>mysqli-&gt;set_local_infile_handler</code>	<code>mysqli_set_local_infile_handler</code>	N/A	Set callback function for LOAD DATA LOCAL INFILE command
<code>mysqli-&gt;ssl_set</code>	<code>mysqli_ssl_set</code>	N/A	Used for establishing secure connections using SSL
<code>mysqli-&gt;stat</code>	<code>mysqli_stat</code>	N/A	Gets the current system status
<code>mysqli-&gt;stmt_init</code>	<code>mysqli_stmt_init</code>	N/A	Initializes a statement and returns an object for use with <code>mysqli_stmt_prepare</code>
<code>mysqli-&gt;store_result</code>	<code>mysqli_store_result</code>	N/A	Transfers a result set from the last query
<code>mysqli-&gt;thread_id</code>	<code>mysqli_thread_id</code>	N/A	Returns the thread ID for the

MySQLi Class			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
			current connection
<code>mysqli-&gt;thread_safe</code>	<code>mysqli_thread_safe</code>	N/A	Returns whether thread safety is given or not
<code>mysqli-&gt;use_result</code>	<code>mysqli_use_result</code>	N/A	Initiate a result set retrieval

MySQL_STMT			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
<code>\$mysqli_stmt-&gt;affected_rows</code>	<code>mysqli_stmt_affected_rows</code>	N/A	Returns the total number of rows changed, deleted, or inserted by the last executed statement
<code>\$mysqli_stmt-&gt;errno</code>	<code>mysqli_stmt_errno</code>	N/A	Returns the error code for the most recent statement call
<code>\$mysqli_stmt-&gt;error</code>	<code>mysqli_stmt_error</code>	N/A	Returns a string description for last statement error
<code>\$mysqli_stmt-&gt;field_count</code>	<code>mysqli_stmt_field_count</code>	N/A	Returns the number of field in the given statement - not documented
<code>\$mysqli_stmt-&gt;insert_id</code>	<code>mysqli_stmt_insert_id</code>	N/A	Get the ID generated from the previous INSERT operation
<code>\$mysqli_stmt-&gt;num_rows</code>	<code>mysqli_stmt_num_rows</code>	N/A	Return the number of rows in statements result set
<code>\$mysqli_stmt-&gt;param_count</code>	<code>mysqli_stmt_param_count</code>	<code>mysqli_param_count</code>	Returns the number of parameter for the given statement
<code>\$mysqli_stmt-&gt;sqlstate</code>	<code>mysqli_stmt_sqlstate</code>	N/A	Returns SQLSTATE error from previous statement operation
<i>Methods</i>			
<code>mysqli_stmt-&gt;attr_get</code>	<code>mysqli_stmt_attr_get</code>	N/A	Used to get the current value of a statement attribute
<code>mysqli_stmt-&gt;attr_set</code>	<code>mysqli_stmt_attr_set</code>	N/A	Used to modify the behavior of a prepared statement
<code>mysqli_stmt-&gt;bind_param</code>	<code>mysqli_stmt_bind_param</code>	<code>mysqli_bind_param</code>	Binds variables to a prepared statement as parameters
<code>mysqli_stmt-&gt;bind_result</code>	<code>mysqli_stmt_bind_result</code>	<code>mysqli_bind_result</code>	Binds variables to a prepared statement for result storage
<code>mysqli_stmt-&gt;close</code>	<code>mysqli_stmt_close</code>	N/A	Closes a prepared statement
<code>mysqli_stmt-&gt;data_seek</code>	<code>mysqli_stmt_data_seek</code>	N/A	Seeks to an arbitrary row in statement result set
<code>mysqli_stmt-&gt;execute</code>	<code>mysqli_stmt_execute</code>	<code>mysqli_execute</code>	Executes a prepared Query
<code>mysqli_stmt-&gt;fetch</code>	<code>mysqli_stmt_fetch</code>	<code>mysqli_fetch</code>	Fetch results from a prepared statement into the bound variables
<code>mysqli_stmt-&gt;free_result</code>	<code>mysqli_stmt_free_result</code>	N/A	Frees stored result memory for the given statement handle
<code>\$mysqli_stmt-&gt;get_result()</code>	<code>mysqli_stmt_get_result</code>	N/A	NOT DOCUMENTED Available only with <code>mysqld</code> .
<code>mysqli_stmt-&gt;get_warnings</code>	<code>mysqli_stmt_get_warnings</code>	N/A	NOT DOCUMENTED
<code>\$mysqli_stmt-&gt;more_results()</code>	<code>mysqli_stmt_more_results()</code>	N/A	NOT DOCUMENTED Available only with <code>mysqld</code> .
<code>\$mysqli_stmt-&gt;next_result()</code>	<code>mysqli_stmt_next_result()</code>	N/A	NOT DOCUMENTED Available only with <code>mysqld</code> .

<b>MySQL_STMT</b>			
<b>OOP Interface</b>	<b>Procedural Interface</b>	<b>Alias (Do not use)</b>	<b>Description</b>
<code>mysqli_stmt-&gt;num_rows</code>	<code>mysqli_stmt_num_rows</code>	N/A	See also property <code>\$mysqli_stmt-&gt;num_rows</code>
<code>mysqli_stmt-&gt;prepare</code>	<code>mysqli_stmt_prepare</code>	N/A	Prepare an SQL statement for execution
<code>mysqli_stmt-&gt;reset</code>	<code>mysqli_stmt_reset</code>	N/A	Resets a prepared statement
<code>mysqli_stmt-&gt;result_metadata</code>	<code>mysqli_stmt_result_metadata</code>	<code>mysqli_get_metadata</code>	Returns result set metadata from a prepared statement
<code>mysqli_stmt-&gt;send_long_data</code>	<code>mysqli_stmt_send_long_data</code>	<code>mysqli_send_long_data</code>	Send data in blocks
<code>mysqli_stmt-&gt;store_result</code>	<code>mysqli_stmt_store_result</code>	N/A	Transfers a result set from a prepared statement

<b>MySQLi_RESULT</b>			
<b>OOP Interface</b>	<b>Procedural Interface</b>	<b>Alias (Do not use)</b>	<b>Description</b>
<i>Properties</i>			
<code>\$mysqli_result-&gt;current_field</code>	<code>mysqli_field_tell</code>	N/A	Get current field offset of a result pointer
<code>\$mysqli_result-&gt;field_count</code>	<code>mysqli_num_fields</code>	N/A	Get the number of fields in a result
<code>\$mysqli_result-&gt;lengths</code>	<code>mysqli_fetch_lengths</code>	N/A	Returns the lengths of the columns of the current row in the result set
<code>\$mysqli_result-&gt;num_rows</code>	<code>mysqli_num_rows</code>	N/A	Gets the number of rows in a result
<i>Methods</i>			
<code>mysqli_result-&gt;data_seek</code>	<code>mysqli_data_seek</code>	N/A	Adjusts the result pointer to an arbitrary row in the result
<code>mysqli_result-&gt;fetch_all</code>	<code>mysqli_fetch_all</code>	N/A	Fetches all result rows and returns the result set as an associative array, a numeric array, or both. Available only with <code>mysqlnd</code> .
<code>mysqli_result-&gt;fetch_array</code>	<code>mysqli_fetch_array</code>	N/A	Fetch a result row as an associative, a numeric array, or both
<code>mysqli_result-&gt;fetch_assoc</code>	<code>mysqli_fetch_assoc</code>	N/A	Fetch a result row as an associative array
<code>mysqli_result-&gt;fetch_field_direct</code>	<code>mysqli_fetch_field_direct</code>	N/A	Fetch meta-data for a single field
<code>mysqli_result-&gt;fetch_field</code>	<code>mysqli_fetch_field</code>	N/A	Returns the next field in the result set
<code>mysqli_result-&gt;fetch_fields</code>	<code>mysqli_fetch_fields</code>	N/A	Returns an array of objects representing the fields in a result set
<code>mysqli_result-&gt;fetch_object</code>	<code>mysqli_fetch_object</code>	N/A	Returns the current row of a result set as an object
<code>mysqli_result-&gt;fetch_row</code>	<code>mysqli_fetch_row</code>	N/A	Get a result row as an enumerated array
<code>mysqli_result-&gt;field_seek</code>	<code>mysqli_field_seek</code>	N/A	Set result pointer to a specified field offset
<code>mysqli_result-&gt;free,</code> <code>mysqli_result-&gt;close,</code> <code>mysqli_result-&gt;free_result</code>	<code>mysqli_free_result</code>	N/A	Frees the memory associated with a result

MySQL_Driver			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
N/A			
<i>Methods</i>			
<code>mysqli_driver-&gt;embedd ed_server_end</code>	<code>mysqli_embedded_serve r_end</code>	N/A	NOT DOCUMENTED
<code>mysqli_driver-&gt;embedd ed_server_start</code>	<code>mysqli_embedded_serve r_start</code>	N/A	NOT DOCUMENTED

**Note**

Alias functions are provided for backward compatibility purposes only. Do not use them in new projects.

### 21.10.2.7. The MySQLi class ([MySQLi](#))

Copyright 1997-2010 the PHP Documentation Group.

Represents a connection between PHP and a MySQL database.

```
MySQLi {
MySQLi

 Properties

 int affected_rows ;

 string client_info ;

 int client_version ;

 string connect_errno ;

 string connect_error ;

 int errno ;

 string error ;

 int field_count ;

 int client_version ;

 string host_info ;

 string protocol_version ;

 string server_info ;

 int server_version ;

 string info ;

 mixed insert_id ;

 string sqlstate ;

 int thread_id ;

 int warning_count ;
```

## Methods

```

int mysqli_affected_rows(mysqli link);

bool mysqli::autocommit(bool mode);

bool mysqli::change_user(string user,
 string password,
 string database);

string mysqli::character_set_name();

string mysqli_get_client_info(mysqli link);

int mysqli_get_client_version(mysqli link);

bool mysqli::close();

bool mysqli::commit();

int mysqli_connect_errno();

string mysqli_connect_error();

mysqli mysqli_connect(string host= ini_get("mysqli.default_host"),
 string username= ini_get("mysqli.default_user"),
 string passwd= ini_get("mysqli.default_pw"),
 string dbname= "",
 int port= ini_get("mysqli.default_port"),
 string socket= ini_get("mysqli.default_socket"));

bool mysqli::debug(string message);

bool mysqli::dump_debug_info();

int mysqli_errno(mysqli link);

string mysqli_error(mysqli link);

int mysqli_field_count(mysqli link);

object mysqli::get_charset();

string mysqli::get_client_info();

int mysqli_get_client_version(mysqli link);

bool mysqli::get_connection_stats();

string mysqli_get_host_info(mysqli link);

int mysqli_get_proto_info(mysqli link);

string mysqli_get_server_info(mysqli link);

int mysqli_get_server_version(mysqli link);

mysqli_warning mysqli::get_warnings();

string mysqli_info(mysqli link);

mysqli mysqli::init();

```

```
mixed mysqli_insert_id(mysqli link);

### 21.10.2.7.1. `mysqli->affected_rows`, `mysqli_affected_rows`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->affected_rows`
- `mysqli_affected_rows`

Gets the number of affected rows in a previous MySQL operation

#### Description

Object oriented style

```

mysqli {
 int affected_rows ;
}

```

Procedural style

```
int mysqli_affected_rows(mysqli link);
```

Returns the number of rows affected by the last `INSERT`, `UPDATE`, `REPLACE` or `DELETE` query.

For SELECT statements `mysqli_affected_rows` works like `mysqli_num_rows`.

#### Parameters

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

#### Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an UPDATE statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query returned an error.

#### Note

If the number of affected rows is greater than maximal int value, the number of affected rows will be returned as a string.

#### Examples

##### Example 21.70. `mysqli->affected_rows` example

Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
}

```

```

 exit();
}

/* Insert rows */
$mysqli->query("CREATE TABLE Language SELECT * from CountryLanguage");
printf("Affected rows (INSERT): %d\n", $mysqli->affected_rows);

$mysqli->query("ALTER TABLE Language ADD Status int default 0");

/* update rows */
$mysqli->query("UPDATE Language SET Status=1 WHERE Percentage > 50");
printf("Affected rows (UPDATE): %d\n", $mysqli->affected_rows);

/* delete rows */
$mysqli->query("DELETE FROM Language WHERE Percentage < 50");
printf("Affected rows (DELETE): %d\n", $mysqli->affected_rows);

/* select all rows */
$result = $mysqli->query("SELECT CountryCode FROM Language");
printf("Affected rows (SELECT): %d\n", $mysqli->affected_rows);

$result->close();

/* Delete table Language */
$mysqli->query("DROP TABLE Language");

/* close connection */
$mysqli->close();
?>

```

### Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

if (!$link) {
 printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
 exit();
}

/* Insert rows */
mysqli_query($link, "CREATE TABLE Language SELECT * from CountryLanguage");
printf("Affected rows (INSERT): %d\n", mysqli_affected_rows($link));

mysqli_query($link, "ALTER TABLE Language ADD Status int default 0");

/* update rows */
mysqli_query($link, "UPDATE Language SET Status=1 WHERE Percentage > 50");
printf("Affected rows (UPDATE): %d\n", mysqli_affected_rows($link));

/* delete rows */
mysqli_query($link, "DELETE FROM Language WHERE Percentage < 50");
printf("Affected rows (DELETE): %d\n", mysqli_affected_rows($link));

/* select all rows */
$result = mysqli_query($link, "SELECT CountryCode FROM Language");
printf("Affected rows (SELECT): %d\n", mysqli_affected_rows($link));

mysqli_free_result($result);

/* Delete table Language */
mysqli_query($link, "DROP TABLE Language");

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Affected rows (INSERT): 984
Affected rows (UPDATE): 168
Affected rows (DELETE): 815
Affected rows (SELECT): 169

```

**mysqli\_info****21.10.2.7.2. mysqli::autocommit, mysqli\_autocommit**

Copyright 1997-2010 the PHP Documentation Group.

- **mysqli::autocommit**

**mysqli\_autocommit**

Turns on or off auto-committing database modifications

**Description**

Object oriented style

```
bool mysqli::autocommit(bool mode);
```

Procedural style

```
bool mysqli_autocommit(mysqli link,
 bool mode);
```

Turns on or off auto-commit mode on queries for the database connection.

To determine the current state of autocommit use the SQL command `SELECT @@autocommit`.

**Parameters**

*link* Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

*mode* Whether to turn on auto-commit or not.

**Return Values**

Returns `TRUE` on success or `FALSE` on failure.

**Notes****Note**

This function doesn't work with non transactional table types (like MyISAM or ISAM).

**Examples****Example 21.71. mysqli::autocommit example**

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

/* turn autocommit on */
$mysqli->autocommit(TRUE);

if ($result = $mysqli->query("SELECT @@autocommit")) {
 $row = $result->fetch_row();
 printf("Autocommit is %s\n", $row[0]);
 $result->free();
}

/* close connection */
$mysqli->close();
?>
```

### Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
if (!$link) {
 printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
 exit();
}
/* turn autocommit on */
mysqli_autocommit($link, TRUE);
if ($result = mysqli_query($link, "SELECT @@autocommit")) {
 $row = mysqli_fetch_row($result);
 printf("Autocommit is %s\n", $row[0]);
 mysqli_free_result($result);
}
/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Autocommit is 1
```

### See Also

[mysqli\\_commit](#)  
[mysqli\\_rollback](#)

### 21.10.2.7.3. `mysqli::change_user`, `mysqli_change_user`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::change\\_user](#)

[mysqli\\_change\\_user](#)

Changes the user of the specified database connection

### Description

Object oriented style

```
bool mysqli::change_user(string user,
 string password,
 string database);
```

### Procedural style

```
bool mysqli_change_user(mysqli link,
 string user,
 string password,
 string database);
```

Changes the user of the specified database connection and sets the current database.

In order to successfully change users a valid `username` and `password` parameters must be provided and that user must have sufficient permissions to access the desired database. If for any reason authorization fails, the current user authentication will remain.

### Parameters

---

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<code>user</code>	The MySQL user name.
<code>password</code>	The MySQL password.
<code>database</code>	The database to change to.
	If desired, the <code>NULL</code> value may be passed resulting in only changing the user and not selecting a database. To select a database in this case use the <code>mysqli_select_db</code> function.

## Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Notes

#### Note

Using this command will always cause the current database connection to behave as if it was a completely new database connection, regardless of if the operation was completed successfully. This reset includes performing a rollback on any active transactions, closing all temporary tables, and unlocking all locked tables.

### Examples

#### Example 21.72. `mysqli::change_user` example

Object oriented style

```
<?php
/* connect database test */
$link = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if ($link->connect_error()) {
 printf("Connect failed: %s\n", $link->connect_error());
 exit();
}

/* Set Variable a */
$link->query("SET @a:=1");

/* reset all and select a new database */
$link->change_user("my_user", "my_password", "world");

if ($result = $link->query("SELECT DATABASE()")) {
 $row = $result->fetch_row();
 printf("Default database: %s\n", $row[0]);
 $result->close();
}

if ($result = $link->query("SELECT @a")) {
 $row = $result->fetch_row();
 if ($row[0] === NULL) {
 printf("Value of variable a is NULL\n");
 }
 $result->close();
}

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
/* connect database test */
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (!$link) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}
```

```

/* Set Variable a */
mysqli_query($link, "SET @a:=1");

/* reset all and select a new database */
mysqli_change_user($link, "my_user", "my_password", "world");

if ($result = mysqli_query($link, "SELECT DATABASE()")) {
 $row = mysqli_fetch_row($result);
 printf("Default database: %s\n", $row[0]);
 mysqli_free_result($result);
}

if ($result = mysqli_query($link, "SELECT @a")) {
 $row = mysqli_fetch_row($result);
 if ($row[0] === NULL) {
 printf("Value of variable a is NULL\n");
 }
 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Default database: world
Value of variable a is NULL

```

### 21.10.2.7.4. `mysqli::character_set_name`, `mysqli_character_set_name`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::character\\_set\\_name](#)  
[mysqli\\_character\\_set\\_name](#)

Returns the default character set for the database connection

#### Description

Object oriented style

```
string mysqli::character_set_name();
```

Procedural style

```
string mysqli_character_set_name(mysqli link);
```

Returns the current character set for the database connection.

#### Parameters

*link*

Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

#### Return Values

The default character set for the current connection

### Examples

#### Example 21.73. `mysqli::character_set_name` example

Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

/* Print current character set */
$charset = $mysqli->character_set_name();
printf ("Current character set is %s\n", $charset);

$mysqli->close();
?>
```

Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* Print current character set */
$charset = mysqli_character_set_name($link);
printf ("Current character set is %s\n", $charset);

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Current character set is latin1_swedish_ci
```

#### 21.10.2.7.5. `mysqli->client_info`, `mysqli_get_client_info`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->client\\_info](#)
- [mysqli\\_get\\_client\\_info](#)

Returns the MySQL client version as a string

## Description

Object oriented style

```
mysqli {
 string client_info ;
}
```

Procedural style

```
string mysqli_get_client_info(mysqli link);
```

Returns a string that represents the MySQL client library version.

## Return Values

A string that represents the MySQL client library version

## Examples

### Example 21.74. mysqli\_get\_client\_info

```
<?php
/* We don't need a connection to determine
 the version of mysql client library */
printf("Client library version: %s\n", mysqli_get_client_info());
?>
```

## See Also

[mysqli\\_get\\_client\\_version](#)  
[mysqli\\_get\\_server\\_info](#)  
[mysqli\\_get\\_server\\_version](#)

## 21.10.2.7.6. mysqli->client\_version, mysqli\_get\_client\_version

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->client\\_version](#)
- [mysqli\\_get\\_client\\_version](#)

Get MySQL client info

## Description

Object oriented style

```
mysqli {
 int client_version ;
}
```

Procedural style

```
int mysqli_get_client_version(mysqli link);
```

Returns client version number as an integer.

## Return Values

A number that represents the MySQL client library version in format: `main_version*10000 + minor_version *100 + sub_version`. For example, 4.1.0 is returned as 40100.

This is useful to quickly determine the version of the client library to know if some capability exists.

## Examples

### Example 21.75. mysqli\_get\_client\_version

```
<?php
/* We don't need a connection to determine
 the version of mysql client library */
printf("Client library version: %d\n", mysqli_get_client_version());
?>
```

## 21.10.2.7.7. mysqli::close, mysqli\_close

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::close](#)  
[mysqli\\_close](#)

Closes a previously opened database connection

### Description

Object oriented style

```
bool mysqli::close();
```

Procedural style

```
bool mysqli_close(mysqli link);
```

Closes a previously opened database connection.

### Parameters

*link*

Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

## Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

## Examples

See [mysqli\\_connect](#).

## See Also

```
mysqli_connect
mysqli_init

```

### 21.10.2.7.8. mysqli::commit, mysqli\_commit

Copyright 1997-2010 the PHP Documentation Group.

- **mysqli::commit**

```
mysqli_commit
```

Commits the current transaction

#### Description

Object oriented style

```
bool mysqli::commit();
```

Procedural style

```
bool mysqli_commit(mysqli link);
```

Commits the current transaction for the database connection.

#### Parameters

*link* Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

#### Return Values

Returns `TRUE` on success or `FALSE` on failure.

#### Examples

##### Example 21.76. mysqli::commit example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

$mysqli->query("CREATE TABLE Language LIKE CountryLanguage");

/* set autocommit to off */
$mysqli->autocommit(FALSE);

/* Insert some values */
$mysqli->query("INSERT INTO Language VALUES ('DEU', 'Bavarian', 'F', 11.2)");
$mysqli->query("INSERT INTO Language VALUES ('DEU', 'Swabian', 'F', 9.4)");

/* commit transaction */
$mysqli->commit();

/* drop table */
$mysqli->query("DROP TABLE Language");

/* close connection */
$mysqli->close();
?>
```

## Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (!$link) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* set autocommit to off */
mysqli_autocommit($link, FALSE);

mysqli_query($link, "CREATE TABLE Language LIKE CountryLanguage");

/* Insert some values */
mysqli_query($link, "INSERT INTO Language VALUES ('DEU', 'Bavarian', 'F', 11.2)");
mysqli_query($link, "INSERT INTO Language VALUES ('DEU', 'Swabian', 'F', 9.4)");

/* commit transaction */
mysqli_commit($link);

/* close connection */
mysqli_close($link);
?>
```

### 21.10.2.7.9. `mysqli->connect_errno`, `mysqli_connect_errno`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->connect\\_errno](#)

[mysqli\\_connect\\_errno](#)

Returns the error code from last connect call

## Description

### Object oriented style

```
mysqli {
 string connect_errno ;
}
```

### Procedural style

```
int mysqli_connect_errno();
```

Returns the last error code number from the last call to [mysqli\\_connect](#).

#### Note

Client error message numbers are listed in the MySQL `errmsg.h` header file, server error message numbers are listed in `mysqld_error.h`. In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld\\_error.txt](#).

### Return Values

An error code value for the last call to [mysqli\\_connect](#), if it failed. zero means no error occurred.

### Examples

**Example 21.77. mysqli->connect\_errno example**

Object oriented style

```
<?php
$mysqli = @new mysqli('localhost', 'fake_user', 'my_password', 'my_db');

if ($mysqli->connect_errno) {
 die('Connect Error: ' . $mysqli->connect_errno);
}
?>
```

Procedural style

```
<?php
$link = @mysqli_connect('localhost', 'fake_user', 'my_password', 'my_db');

if (!$link) {
 die('Connect Error: ' . mysqli_connect_errno());
}
?>
```

The above examples will output:

```
Connect Error: 1045
```

**See Also**

[mysqli\\_connect](#)  
[mysqli\\_connect\\_error](#)  
[mysqli\\_errno](#)  
[mysqli\\_error](#)  
[mysqli\\_sqlstate](#)

**21.10.2.7.10. mysqli->connect\_error, mysqli\_connect\_error**

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->connect\\_error](#)  
[mysqli\\_connect\\_error](#)

Returns a string description of the last connect error

**Description**

Object oriented style

```
mysqli {
 string connect_error ;
}
```

Procedural style

```
string mysqli_connect_error();
```

Returns the last error message string from the last call to [mysqli\\_connect](#).

## Return Values

A string that describes the error. `NULL` is returned if no error occurred.

## Examples

### Example 21.78. `mysqli->connect_error` example

Object oriented style

```
<?php
$mysqli = @new mysqli('localhost', 'fake_user', 'my_password', 'my_db');

// Works as of PHP 5.2.9 and 5.3.0.
if ($mysqli->connect_error) {
 die('Connect Error: ' . $mysqli->connect_error);
}
?>
```

Procedural style

```
<?php
$link = @mysqli_connect('localhost', 'fake_user', 'my_password', 'my_db');

if (!$link) {
 die('Connect Error: ' . mysqli_connect_error());
}
?>
```

The above examples will output:

```
Connect Error: Access denied for user 'fake_user'@'localhost' (using password: YES)
```

## Notes

### Warning

The `mysqli->connect_error` property only works properly as of PHP versions 5.2.9 and 5.3.0. Use the `mysqli_connect_error` function if compatibility with earlier PHP versions is required.

## 21.10.2.7.11. `mysqli::__construct`, `mysqli_connect`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::\\_\\_construct](#)

[mysqli\\_connect](#)

Open a new connection to the MySQL server

## Description

Object oriented style

```
mysqli::__construct(string host= ini_get("mysqli.default_host"),
 string username= ini_get("mysqli.default_user"),
 string passwd= ini_get("mysqli.default_pw"),
 string dbname= "",
 int port= ini_get("mysqli.default_port"),
 string socket= ini_get("mysqli.default_socket"));
```

Procedural style

```
mysqli mysqli_connect(string host= ini_get("mysqli.default_host"),
 string username= ini_get("mysqli.default_user"),
 string passwd= ini_get("mysqli.default_pw"),
 string dbname= "",
 int port= ini_get("mysqli.default_port"),
 string socket= ini_get("mysqli.default_socket"));
```

Opens a connection to the MySQL Server running on.

#### Parameters

*host*

Can be either a host name or an IP address. Passing the `NULL` value or the string "localhost" to this parameter, the local host is assumed. When possible, pipes will be used instead of the TCP/IP protocol.

Prepending host by `p`: opens a persistent connection. `mysqli_change_user` is automatically called on connections opened from the connection pool.

*username*

The MySQL user name.

*passwd*

If not provided or `NULL`, the MySQL server will attempt to authenticate the user against those user records which have no password only. This allows one username to be used with different permissions (depending on if a password as provided or not).

*dbname*

If provided will specify the default database to be used when performing queries.

*port*

Specifies the port number to attempt to connect to the MySQL server.

*socket*

Specifies the socket or named pipe that should be used.

#### Note

Specifying the `socket` parameter will not explicitly determine the type of connection to be used when connecting to the MySQL server. How the connection is made to the MySQL database is determined by the `host` parameter.

#### Return Values

Returns an object which represents the connection to a MySQL Server.

#### Changelog

Version	Description
5.3.0	Added the ability of persistent connections.

#### Examples

##### Example 21.79. `mysqli::__construct` example

Object oriented style

```
<?php
$mysqli = new mysqli('localhost', 'my_user', 'my_password', 'my_db');

/*
 * This is the "official" OO way to do it,
 * BUT $connect_error was broken until PHP 5.2.9 and 5.3.0.
```

```

/*
if ($mysqli->connect_error) {
 die('Connect Error (' . $mysqli->connect_errno . ') '
 . $mysqli->connect_error);
}

/*
 * Use this instead of $connect_error if you need to ensure
 * compatibility with PHP versions prior to 5.2.9 and 5.3.0.
*/
if (mysqli_connect_error()) {
 die('Connect Error (' . mysqli_connect_errno() . ') '
 . mysqli_connect_error());
}

echo 'Success... ' . $mysqli->host_info . "\n";
$mysqli->close();
?>

```

Object oriented style when extending mysqli class

```

<?php

class foo_mysqli extends mysqli {
 public function __construct($host, $user, $pass, $db) {
 parent::__construct($host, $user, $pass, $db);

 if (mysqli_connect_error()) {
 die('Connect Error (' . mysqli_connect_errno() . ') '
 . mysqli_connect_error());
 }
 }

$db = new foo_mysqli('localhost', 'my_user', 'my_password', 'my_db');

echo 'Success... ' . $db->host_info . "\n";
$db->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'my_db');

if (!$link) {
 die('Connect Error (' . mysqli_connect_errno() . ') '
 . mysqli_connect_error());
}

echo 'Success... ' . mysqli_get_host_info($link) . "\n";
mysqli_close($link);
?>

```

The above examples will output:

```
Success... MySQL host info: localhost via TCP/IP
```

## Notes

### Note

OO syntax only: If a connection fails an object is still returned. To check if the connection failed then use either the `mysqli_connect_error` function or the `mysql->connect_error` property as in the preceding examples.

### Note

If it is necessary to set options, such as the connection timeout, `mysqli_real_connect` must be used instead.

### Note

Calling the constructor with no parameters is the same as calling `mysqli_init`.

### Note

Error "Can't create TCP/IP socket (10106)" usually means that the `variables_order` configure directive doesn't contain character `E`. On Windows, if the environment is not copied the `SYSTEMROOT` environment variable won't be available and PHP will have problems loading Winsock.

## 21.10.2.7.12. `mysqli::debug`, `mysqli_debug`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::debug`

`mysqli_debug`

Performs debugging operations

### Description

Object oriented style

```
bool mysqli::debug(string message);
```

Procedural style

```
bool mysqli_debug(string message);
```

Performs debugging operations using the Fred Fish debugging library.

### Parameters

`message`

A string representing the debugging operation to perform

### Return Values

Returns `TRUE`.

### Notes

#### Note

To use the `mysqli_debug` function you must compile the MySQL client library to support debugging.

### Examples

#### Example 21.80. Generating a Trace File

```
<?php
```

---

```
/* Create a trace file in '/tmp/client.trace' on the local (client) machine: */
mysqli_debug("d:t:o,/tmp/client.trace");
?>
```

- [mysqli::dump\\_debug\\_info](#)

[mysqli\\_dump\\_debug\\_info](#)

Dump debugging information into the log

**Description**

Object oriented style

```
bool mysqli::dump_debug_info();
```

Procedural style

```
bool mysqli_dump_debug_info(mysqli link);
```

This function is designed to be executed by an user with the SUPER privilege and is used to dump debugging information into the log for the MySQL Server relating to the connection.

**Parameters**

*link*

Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

**Return Values**

Returns [TRUE](#) on success or [FALSE](#) on failure.

**See Also**

[mysqli\\_debug](#)

**21.10.2.7.14. mysqli->errno, mysqli\_errno**

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->errno](#)

[mysqli\\_errno](#)

Returns the error code for the most recent function call

**Description**

Object oriented style

```
mysqli {
```

```

 int errno ;
}
```

Procedural style

```
int mysqli_errno(mysqli link);
```

Returns the last error code for the most recent MySQLi function call that can succeed or fail.

Client error message numbers are listed in the MySQL [errmsg.h](#) header file, server error message numbers are listed in [mysqld\\_error.h](#). In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld\\_error.txt](#).

### Parameters

<a href="#">link</a>	Procedural style only: A link identifier returned by <a href="#">mysqli_connect</a> or <a href="#">mysqli_init</a>
----------------------	--------------------------------------------------------------------------------------------------------------------

### Return Values

An error code value for the last call, if it failed. zero means no error occurred.

### Examples

#### Example 21.81. [mysqli->errno](#) example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
 printf("Connect failed: %s\n", $link->connect_error);
 exit();
}

if (!$link->query("SET a=1")) {
 printf("Errorcode: %d\n", $link->errno);
}

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

if (!mysqli_query($link, "SET a=1")) {
 printf("Errorcode: %d\n", mysqli_errno($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Errorcode: 1193
```

**See Also**

`mysqli_connect_errno`  
`mysqli_connect_error`  
`mysqli_error`  
`mysqli_sqlstate`

**21.10.2.7.15. `mysqli->error`, `mysqli_error`**

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->error`

`mysqli_error`

Returns a string description of the last error

**Description**

Object oriented style

```
mysqli {
 string error ;
}
```

Procedural style

```
string mysqli_error(mysqli link);
```

Returns the last error message for the most recent MySQLi function call that can succeed or fail.

**Parameters**

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

**Return Values**

A string that describes the error. An empty string if no error occurred.

**Examples****Example 21.82. `mysqli->error` example**

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

if (!$mysqli->query("SET a=1")) {
 printf("Error message: %s\n", $mysqli->error);
}

/* close connection */
$mysqli->close();
?>
```

### Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

if (!mysqli_query($link, "SET a=1")) {
 printf("Errormessage: %s\n", mysqli_error($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Errormessage: Unknown system variable 'a'
```

## 21.10.2.7.16. `mysqli->field_count`, `mysqli_field_count`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->field\\_count](#)  
[mysqli\\_field\\_count](#)

Returns the number of columns for the most recent query

### Description

Object oriented style

```
mysqli_result {
 int field_count ;
}
```

### Procedural style

```
int mysqli_field_count(mysqli link);
```

Returns the number of columns for the most recent query on the connection represented by the `link` parameter. This function can be useful when using the [mysqli\\_store\\_result](#) function to determine if the query should have produced a non-empty result set or not without knowing the nature of the query.

### Parameters

[link](#) Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

### Return Values

An integer representing the number of fields in a result set.

### Examples

#### Example 21.83. `mysqli->field_count` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "test");

$link->query("DROP TABLE IF EXISTS friends");
$link->query("CREATE TABLE friends (id int, name varchar(20))");

$link->query("INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$link->real_query("SELECT * FROM friends");

if ($link->field_count) {
 /* this was a select/show or describe query */
 $result = $link->store_result();

 /* process resultset */
 $row = $result->fetch_row();

 /* free resultset */
 $result->close();
}

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");

mysqli_query($link, "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

mysqli_real_query($link, "SELECT * FROM friends");

if (mysqli_field_count($link)) {
 /* this was a select/show or describe query */
 $result = mysqli_store_result($link);

 /* process resultset */
 $row = mysqli_fetch_row($result);

 /* free resultset */
 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

## 21.10.2.7.17. `mysqli::get_charset`, `mysqli_get_charset`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::get_charset`  
`mysqli_get_charset`

Returns a character set object

## Description

Object oriented style

```
object mysqli::get_charset();
```

Procedural style

```
object mysqli_get_charset(mysqli link);
```

Returns a character set object providing several properties of the current active character set.

## Parameters

*link*

Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

## Return Values

The function returns a character set object with the following properties:

<i>charset</i>	Character set name
<i>collation</i>	Collation name
<i>dir</i>	Directory the charset description was fetched from (?) or "" for built-in character sets
<i>min_length</i>	Minimum character length in bytes
<i>max_length</i>	Maximum character length in bytes
<i>number</i>	Internal character set number
<i>state</i>	Character set status (?)

## Examples

### Example 21.84. `mysqli::get_charset` example

Object oriented style

```
<?php
$db = mysqli_init();
$db->real_connect("localhost", "root", "", "test");
var_dump($db->get_charset());
?>
```

Procedural style

```
<?php
$db = mysqli_init();
mysqli_real_connect($db, "localhost", "root", "", "test");
var_dump($db->get_charset());
?>
```

The above examples will output:

```
object(stdClass)#2 (7) {
 ["charset"]=>
 string(6) "latin1"
 ["collation"]=>
 string(17) "latin1_swedish_ci"
```

```

["dir"]=>
string(0) ""
["min_length"]=>
int(1)
["max_length"]=>
int(1)
["number"]=>
int(8)
["state"]=>
int(801)
}

```

**21.10.2.7.18. mysqli->get\_client\_info, mysqli\_get\_client\_info**

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->get\\_client\\_info](#)

[mysqli\\_get\\_client\\_info](#)

Returns the MySQL client version as a string

**Description**

Object oriented style

```
string mysqli::get_client_info();
```

Procedural style

```
string mysqli_get_client_info(mysqli link);
```

Returns a string that represents the MySQL client library version.

**Return Values**

A string that represents the MySQL client library version

**Examples****Example 21.85. mysqli\_get\_client\_info**

```
<?php
/* We don't need a connection to determine
 the version of mysql client library */
printf("Client library version: %s\n", mysqli_get_client_info());
?>
```

**See Also**

[mysqli\\_get\\_client\\_version](#)  
[mysqli\\_get\\_server\\_info](#)  
[mysqli\\_get\\_server\\_version](#)

### 21.10.2.7.19. `mysqli->client_version`, `mysqli_get_client_version`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->client_version`  
`mysqli_get_client_version`  
Get MySQL client info

#### Description

Object oriented style

```
mysqli {
 int client_version ;
}
```

Procedural style

```
int mysqli_get_client_version(mysqli link);
```

Returns client version number as an integer.

#### Return Values

A number that represents the MySQL client library version in format: `main_version*10000 + minor_version *100 + sub_version`. For example, 4.1.0 is returned as 40100.

This is useful to quickly determine the version of the client library to know if some capability exists.

#### Examples

#### Example 21.86. `mysqli_get_client_version`

```
<?php
/* We don't need a connection to determine
 the version of mysql client library */
printf("Client library version: %d\n", mysqli_get_client_version());
?>
```

### 21.10.2.7.20. `mysqli::get_connection_stats`, `mysqli_get_connection_stats`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::get_connection_stats`  
`mysqli_get_connection_stats`  
Returns statistics about the client connection

#### Description

Object oriented style

```
bool mysqli::get_connection_stats();
```

Procedural style

```
array mysqli_get_connection_stats(mysqli link);
```

## Warning

This function is currently not documented; only its argument list is available.

Returns statistics about the client connection. Available only with [mysqld](#).

### Parameters

*link* Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

### Return Values

Returns an array with connection stats if success, [FALSE](#) otherwise.

### Examples

#### Example 21.87. A `mysqli_get_connection_stats` example

```
<?php
$link = mysqli_connect();
print_r(mysqli_get_connection_stats($link));
?>
```

The above example will output something similar to:

```

[Stats description](#)

**21.10.2.7.21. `mysqli->host_info`, `mysqli_get_host_info`**

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->host_info`  
`mysqli_get_host_info`  
 Returns a string representing the type of connection used

### Description

Object oriented style

```
mysqli {
 string host_info ;
}
```

Procedural style

```
string mysqli_get_host_info(mysqli link);
```

Returns a string describing the connection represented by the `link` parameter (including the server host name).

### Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

### Return Values

A character string representing the server hostname and the connection type.

### Examples

#### Example 21.88. `mysqli->host_info` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* print host information */
printf("Host info: %s\n", $link->host_info);

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* print host information */
printf("Host info: %s\n", mysqli_get_host_info($link));

/* close connection */
mysqli_close($link);
```

```
?>
```

The above examples will output:

```
Host info: Localhost via UNIX socket
```

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->protocol\\_version](#)

[mysqli\\_get\\_proto\\_info](#)

Returns the version of the MySQL protocol used

#### Description

Object oriented style

```
mysqli {
 string protocol_version ;
}
```

Procedural style

```
int mysqli_get_proto_info(mysqli link);
```

Returns an integer representing the MySQL protocol version used by the connection represented by the `link` parameter.

#### Parameters

`link`

Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

#### Return Values

Returns an integer representing the protocol version.

#### Examples

##### Example 21.89. `mysqli->protocol_version` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");
/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}
```

```
/* print protocol version */
printf("Protocol version: %d\n", $mysqli->protocol_version);

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* print protocol version */
printf("Protocol version: %d\n", mysqli_get_proto_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Protocol version: 10
```

- [mysqli\\_get\\_server\\_info](#)

Returns the version of the MySQL server

## Description

Object oriented style

```
mysqli {
 string server_info ;
}
```

Procedural style

```
string mysqli_get_server_info(mysqli link);
```

Returns a string representing the version of the MySQL server that the MySQLi extension is connected to.

## Parameters

---

<a href="#">link</a>	Procedural style only: A link identifier returned by <a href="#">mysqli_connect</a> or <a href="#">mysqli_init</a>
----------------------	--------------------------------------------------------------------------------------------------------------------

### Return Values

A character string representing the server version.

### Examples

#### Example 21.90. [mysqli->server\\_info](#) example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* print server version */
printf("Server version: %s\n", $link->server_info);

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* print server version */
printf("Server version: %s\n", mysqli_get_server_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Server version: 4.1.2-alpha-debug
```

#### 21.10.2.7.24. [mysqli->server\\_version](#), [mysqli\\_get\\_server\\_version](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->server\\_version](#)
- [mysqli\\_get\\_server\\_version](#)

Returns the version of the MySQL server as an integer

### Description

Object oriented style

```
mysqli {
 int server_version ;
}
```

Procedural style

```
int mysqli_get_server_version(mysqli link);
```

The `mysqli_get_server_version` function returns the version of the server connected to (represented by the `link` parameter) as an integer.

### Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

### Return Values

An integer representing the server version.

The form of this version number is `main_version * 10000 + minor_version * 100 + sub_version` (i.e. version 4.1.0 is 40100).

### Examples

#### Example 21.91. `mysqli->server_version` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

/* print server version */
printf("Server version: %d\n", $mysqli->server_version);

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

/* print server version */
printf("Server version: %d\n", mysqli_get_server_version($link));

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Server version: 40102
```

### 21.10.2.7.25. `mysqli::get_warnings`, `mysqli_get_warnings`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::get\\_warnings](#)  
[mysqli\\_get\\_warnings](#)

Get result of SHOW WARNINGS

#### Description

Object oriented style

```
mysqli_warning mysqli::get_warnings();
```

Procedural style

```
mysqli_warning mysqli_get_warnings(mysqli link);
```

#### Warning

This function is currently not documented; only its argument list is available.

### 21.10.2.7.26. `mysqli->info`, `mysqli_info`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->info](#)  
[mysqli\\_info](#)

Retrieves information about the most recently executed query

#### Description

Object oriented style

```
mysqli {
 string info ;
}
```

Procedural style

```
string mysqli_info(mysqli link);
```

The `mysqli_info` function returns a string providing information about the last query executed. The nature of this string is provided below:

**Table 21.8. Possible mysqli\_info return values**

Query type	Example result string
INSERT INTO...SELECT...	Records: 100 Duplicates: 0 Warnings: 0
INSERT INTO...VALUES (...),(...),(...)	Records: 3 Duplicates: 0 Warnings: 0
LOAD DATA INFILE ...	Records: 1 Deleted: 0 Skipped: 0 Warnings: 0
ALTER TABLE ...	Records: 3 Duplicates: 0 Warnings: 0
UPDATE ...	Rows matched: 40 Changed: 40 Warnings: 0

### Note

Queries which do not fall into one of the preceding formats are not supported. In these situations, `mysqli_info` will return an empty string.

### Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

### Return Values

A character string representing additional information about the most recently executed query.

### Examples

#### Example 21.92. `mysqli->info` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
 printf("Connect failed: %s\n", $link->connect_error);
 exit();
}

$link->query("CREATE TEMPORARY TABLE t1 LIKE City");

/* INSERT INTO .. SELECT */
$link->query("INSERT INTO t1 SELECT * FROM City ORDER BY ID LIMIT 150");
printf("%s\n", $link->info);

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

mysqli_query($link, "CREATE TEMPORARY TABLE t1 LIKE City");

/* INSERT INTO .. SELECT */
mysqli_query($link, "INSERT INTO t1 SELECT * FROM City ORDER BY ID LIMIT 150");
printf("%s\n", mysqli_info($link));
```

```
/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Records: 150 Duplicates: 0 Warnings: 0
```

### 21.10.2.7.27. `mysqli::init`, `mysqli_init`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::init](#)  
[mysqli\\_init](#)

Initializes MySQLi and returns a resource for use with `mysqli_real_connect()`

#### Description

Object oriented style

```
mysqli mysqli::init();
```

Procedural style

```
mysqli mysqli_init();
```

Allocates or initializes a MySQL object suitable for `mysqli_options` and `mysqli_real_connect`.

#### Note

Any subsequent calls to any mysqli function (except `mysqli_options`) will fail until `mysqli_real_connect` was called.

#### Return Values

Returns an object.

#### Examples

See [mysqli\\_real\\_connect](#).

#### See Also

### 21.10.2.7.28. `mysqli->insert_id`, `mysqli_insert_id`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->insert_id`
- `mysqli_insert_id`

Returns the auto generated id used in the last query

### Description

Object oriented style

```
mysqli {
 mixed insert_id ;
}
```

Procedural style

```
mixed mysqli_insert_id(mysqli link);
```

The `mysqli_insert_id` function returns the ID generated by a query on a table with a column having the `AUTO_INCREMENT` attribute. If the last query wasn't an `INSERT` or `UPDATE` statement or if the modified table does not have a column with the `AUTO_INCREMENT` attribute, this function will return zero.

### Note

Performing an `INSERT` or `UPDATE` statement using the `LAST_INSERT_ID()` function will also modify the value returned by the `mysqli_insert_id` function.

### Parameters

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

### Return Values

The value of the `AUTO_INCREMENT` field that was updated by the previous query. Returns zero if there was no previous query on the connection or if the query did not update an `AUTO_INCREMENT` value.

### Note

If the number is greater than maximal int value, `mysqli_insert_id` will return a string.

### Examples

#### Example 21.93. `mysqli->insert_id` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

$query = "INSERT INTO myCity VALUES (NULL, 'Stuttgart', 'DEU', 'Stuttgart', 617000)";
$mysqli->query($query);

printf ("New Record has id %d.\n", $mysqli->insert_id);

/* drop table */
$mysqli->query("DROP TABLE myCity");

/* close connection */
$mysqli->close();
?>
```

### Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}
mysqli_query($link, "CREATE TABLE myCity LIKE City");
$query = "INSERT INTO myCity VALUES (NULL, 'Stuttgart', 'DEU', 'Stuttgart', 617000)";
mysqli_query($link, $query);
printf ("New Record has id %d.\n", mysqli_insert_id($link));
/* drop table */
mysqli_query($link, "DROP TABLE myCity");
/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
New Record has id 1.
```

## 21.10.2.7.29. `mysqli::kill`, `mysqli_kill`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::kill`  
`mysqli_kill`

Asks the server to kill a MySQL thread

### Description

Object oriented style

```
bool mysqli::kill(int processid);
```

Procedural style

```
bool mysqli_kill(mysqli link,
 int processid);
```

This function is used to ask the server to kill a MySQL thread specified by the `processid` parameter. This value must be retrieved by calling the `mysqli_thread_id` function.

To stop a running query you should use the SQL command `KILL QUERY processid`.

### Parameters

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

## Examples

### Example 21.94. `mysqli::kill` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

/* determine our thread id */
$thread_id = $mysqli->thread_id;

/* Kill connection */
$mysqli->kill($thread_id);

/* This should produce an error */
if (!$mysqli->query("CREATE TABLE myCity LIKE City")) {
 printf("Error: %s\n", $mysqli->error);
 exit();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
 printf("Error: %s\n", mysqli_error($link));
 exit();
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Error: MySQL server has gone away
```

## See Also

[mysqli\\_thread\\_id](#)

### 21.10.2.7.30. `mysqli::more_results`, `mysqli_more_results`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::more_results`  
`mysqli_more_results`

Check if there are any more query results from a multi query

### Description

Object oriented style

```
bool mysqli::more_results();
```

Procedural style

```
bool mysqli_more_results(mysqli link);
```

Indicates if one or more result sets are available from a previous call to `mysqli_multi_query`.

### Parameters

*link* Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Examples

See `mysqli_multi_query`.

### See Also

`mysqli_multi_query`  
`mysqli_next_result`  
`mysqli_store_result`  
`mysqli_use_result`

## 21.10.2.7.31. `mysqli::multi_query`, `mysqli_multi_query`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::multi_query`  
`mysqli_multi_query`

Performs a query on the database

### Description

Object oriented style

```
bool mysqli::multi_query(string query);
```

Procedural style

```
bool mysqli_multi_query(mysqli link,
 string query);
```

Executes one or multiple queries which are concatenated by a semicolon.

To retrieve the resultset from the first query you can use `mysqli_use_result` or `mysqli_store_result`. All subsequent query results can be processed using `mysqli_more_results` and `mysqli_next_result`.

## Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code> .
<i>query</i>	The query, as a string.
	Data inside the query should be <a href="#">properly escaped</a> .

## Return Values

Returns `FALSE` if the first statement failed. To retrieve subsequent errors from other statements you have to call `mysqli_next_result` first.

## Examples

### Example 21.95. `mysqli::multi_query` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
 printf("Connect failed: %s\n", $link->connect_error);
 exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($link->multi_query($query)) {
 do {
 /* store first result set */
 if ($result = $link->store_result()) {
 while ($row = $result->fetch_row()) {
 printf("%s\n", $row[0]);
 }
 $result->free();
 }
 /* print divider */
 if ($link->more_results()) {
 printf("-----\n");
 }
 } while ($link->next_result());
}

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
 do {
 /* store first result set */
 if ($result = mysqli_store_result($link)) {
 while ($row = mysqli_fetch_row($result)) {
 printf("%s\n", $row[0]);
 }
 mysqli_free_result($result);
 }
 /* print divider */
 if (mysqli_more_results($link)) {
 printf("-----\n");
 }
 } while (mysqli_next_result($link));
}
```

```

 }
 } while (mysqli_next_result($link));
/* close connection */
mysqli_close($link);
?>

```

The above examples will output something similar to:

```

my_user@localhost

Amersfoort
Maastricht
Dordrecht
Leiden
Haarlemmermeer

```

### 21.10.2.7.32. `mysqli::next_result`, `mysqli_next_result`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::next\\_result](#)  
[mysqli\\_next\\_result](#)  
 Prepare next result from multi\_query

#### Description

Object oriented style

```
bool mysqli::next_result();
```

Procedural style

```
bool mysqli_next_result(mysqli link);
```

Prepares next result set from a previous call to [mysqli\\_multi\\_query](#) which can be retrieved by [mysqli\\_store\\_result](#) or [mysqli\\_use\\_result](#).

#### Parameters

`link`

Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

#### Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

#### Examples

See [mysqli\\_multi\\_query](#).

**21.10.2.7.33. mysqli::options, mysqli\_options**

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::options](#)

[mysqli\\_options](#)

Set options

**Description**

Object oriented style

```
bool mysqli::options(
 int option,
 mixed value);
```

Procedural style

```
bool mysqli_options(mysqli link,
 int option,
 mixed value);
```

Used to set extra connect options and affect behavior for a connection.

This function may be called multiple times to set several options.

[mysqli\\_options](#) should be called after [mysqli\\_init](#) and before [mysqli\\_real\\_connect](#).

**Parameters**

*link* Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

*option* The option that you want to set. It can be one of the following values:

**Table 21.9. Valid options**

Name	Description
<code>MYSQLI_OPT_CONNECT_TIMEOUT</code>	connection timeout in seconds (supported on Windows with TCP/IP since PHP 5.3.1)
<code>MYSQLI_OPT_LOCAL_INFILE</code>	enable/disable use of <a href="#">LOAD LOCAL INFILE</a>
<code>MYSQLI_INIT_COMMAND</code>	command to execute after when connecting to MySQL server
<code>MYSQLI_READ_DEFAULT_FILE</code>	Read options from named option file instead of <a href="#">my.cnf</a>
<code>MYSQLI_READ_DEFAULT_GROUP</code>	Read options from the named group from <a href="#">my.cnf</a> or the file specified with <code>MYSQL_READ_DEFAULT_FILE</code> .

*value* The value for the option.

**Return Values**

Returns `TRUE` on success or `FALSE` on failure.

**Examples**

See [mysqli\\_real\\_connect](#).

#### See Also

### 21.10.2.7.34. [mysqli::ping](#), [mysqli\\_ping](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::ping](#)

[mysqli\\_ping](#)

Pings a server connection, or tries to reconnect if the connection has gone down

#### Description

Object oriented style

```
bool mysqli::ping();
```

Procedural style

```
bool mysqli_ping(mysqli link);
```

Checks whether the connection to the server is working. If it has gone down, and global option [mysqli.reconnect](#) is enabled an automatic reconnection is attempted.

This function can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

#### Parameters

*link*

Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

#### Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

#### Examples

##### Example 21.96. [mysqli::ping](#) example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error);
 exit();
}

/* check if server is alive */
if ($mysqli->ping()) {
 printf ("Our connection is ok!\n");
} else {
 printf ("Error: %s\n", $mysqli->error);
}

/* close connection */
$mysqli->close();
?>
```

### Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* check if server is alive */
if (mysqli_ping($link)) {
 printf ("Our connection is ok!\n");
} else {
 printf ("Error: %s\n", mysqli_error($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Our connection is ok!
```

### 21.10.2.7.35. `mysqli::poll`, `mysqli_poll`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::poll`

`mysqli_poll`

Poll connections

#### Description

Object oriented style

```
public int mysqli::poll(array read,
 array error,
 array reject,
 int sec,
 int usec);
```

### Procedural style

```
int mysqli_poll(array read,
 array error,
 array reject,
 int sec,
 int usec);
```

#### Warning

This function is currently not documented; only its argument list is available.

Poll connections. Available only with `mysqlnd`.

#### Parameters

```
read
error
reject
```

---

<code>sec</code>	Number of seconds to wait, must be non-negative.
<code>usec</code>	Number of microseconds to wait, must be non-negative.

### Return Values

Returns number of ready connections in success, `FALSE` otherwise.

### Examples

#### Example 21.97. A `mysqli_poll` example

```
<?php
$link1 = mysqli_connect();
$link1->query("SELECT 'test'", MYSQLI_ASYNC);
$all_links = array($link1);
$processed = 0;
do {
 $links = $errors = $reject = array();
 foreach ($all_links as $link) {
 $links[] = $errors[] = $reject[] = $link;
 }
 if (!mysqli_poll($links, $errors, $reject, 1)) {
 continue;
 }
 foreach ($links as $link) {
 if ($result = $link->reap_async_query()) {
 print_r($result->fetch_row());
 mysqli_free_result($result);
 $processed++;
 }
 }
} while ($processed < count($all_links));
?>
```

The above example will output:

```
Array
(
 [0] => test
)
```

### See Also

#### 21.10.2.7.36. `mysqli::prepare`, `mysqli_prepare`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::prepare](#)
- [mysqli\\_prepare](#)

Prepare an SQL statement for execution

### Description

Object oriented style

```
mysqli_stmt mysqli::prepare(string query);
```

Procedural style

```
mysqli_stmt mysqli_prepare(mysqli link,
 string query);
```

Prepares the SQL query, and returns a statement handle to be used for further operations on the statement. The query must consist of a single SQL statement.

The parameter markers must be bound to application variables using `mysqli_stmt_bind_param` and/or `mysqli_stmt_bind_result` before executing the statement or fetching rows.

### Parameters

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<code>query</code>	The query, as a string.

#### Note

You should not add a terminating semicolon or `\g` to the statement.

This parameter can include one or more parameter markers in the SQL statement by embedding question mark (?) characters at the appropriate positions.

#### Note

The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value.

However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a `SELECT` statement, or to specify both operands of a binary operator such as the = equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. It's not allowed to compare marker with `NULL` by ? `IS NULL` too. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

### Return Values

`mysqli_prepare` returns a statement object or `FALSE` if an error occurred.

### Examples

#### Example 21.98. `mysqli::prepare` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

$city = "Amersfoort";

/* create a prepared statement */
if ($stmt = $mysqli->prepare("SELECT District FROM City WHERE Name=?")) {

 /* bind parameters for markers */
 $stmt->bind_param("s", $city);

 /* execute query */
 $stmt->execute();

 /* bind result variables */
 $stmt->bind_result($district);

 /* fetch value */
 $stmt->fetch();

 printf("%s is in district %s\n", $city, $district);
}

/* close statement */
$stmt->close();
```

```

}

/* close connection */
$mysqli->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$city = "Amersfoort";

/* create a prepared statement */
if ($stmt = mysqli_prepare($link, "SELECT District FROM City WHERE Name=?")) {

 /* bind parameters for markers */
 mysqli_stmt_bind_param($stmt, "s", $city);

 /* execute query */
 mysqli_stmt_execute($stmt);

 /* bind result variables */
 mysqli_stmt_bind_result($stmt, $district);

 /* fetch value */
 mysqli_stmt_fetch($stmt);

 printf("%s is in district %s\n", $city, $district);

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Amersfoort is in district Utrecht
```

## See Also

[mysqli\\_stmt\\_execute](#)

### 21.10.2.7.37. `mysqli::query`, `mysqli_query`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::query](#)

[mysqli\\_query](#)

Performs a query on the database

## Description

Object oriented style

```
mixed mysqli::query(string query,
 int resultmode);
```

Procedural style

```
mixed mysqli_query(mysqli link,
 string query,
 int resultmode);
```

Performs a `query` against the database.

Functionally, using this function is identical to calling `mysqli_real_query` followed either by `mysqli_use_result` or `mysqli_store_result`.

### Note

In the case where you pass a statement to `mysqli_query` that is longer than `max_allowed_packet` of the server, the returned error codes are different depending on whether you are using MySQL Native Driver (`mysqlnd`) or MySQL Client Library (`libmysql`). The behavior is as follows:

- `mysqlnd` on Linux returns an error code of 1153. The error message means “got a packet bigger than `max_allowed_packet` bytes”.
- `mysqlnd` on Windows returns an error code 2006. This error message means “server has gone away”.
- `libmysql` on all platforms returns an error code 2006. This error message means “server has gone away”.

### Parameters

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<code>query</code>	The query string.
	Data inside the query should be <a href="#">properly escaped</a> .
<code>resultmode</code>	Either the constant <code>MYSQLI_USE_RESULT</code> or <code>MYSQLI_STORE_RESULT</code> depending on the desired behavior. By default, <code>MYSQLI_STORE_RESULT</code> is used.
	If you use <code>MYSQLI_USE_RESULT</code> all subsequent calls will return error <a href="#">Commands out of sync</a> unless you call <code>mysqli_free_result</code>
	With <code>MYSQLI_ASYNC</code> (available with mysqlnd), it is possible to perform query asynchronously. <code>mysqli_poll</code> is then used to get results from such queries.

### Return Values

Returns `FALSE` on failure. For successful `SELECT`, `SHOW`, `DESCRIBE` or `EXPLAIN` queries `mysqli_query` will return a result object. For other successful queries `mysqli_query` will return `TRUE`.

### Changelog

Version	Description
5.3.0	Added the ability of async queries.

### Examples

#### Example 21.99. `mysqli::query` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

/* Create table doesn't return a resultset */
if ($mysqli->query("CREATE TEMPORARY TABLE myCity LIKE City") === TRUE) {
 printf("Table myCity successfully created.\n");
}

/* Select queries return a resultset */
if ($result = $mysqli->query("SELECT Name FROM City LIMIT 10")) {
 printf("Select returned %d rows.\n", $result->num_rows);

 /* free result set */
 $result->close();
}

/* If we have to retrieve large amount of data we use MYSQLI_USE_RESULT */
if ($result = $mysqli->query("SELECT * FROM City", MYSQLI_USE_RESULT)) {

 /* Note, that we can't execute any functions which interact with the
 server until result set was closed. All calls will return an
 'out of sync' error */
 if (!$mysqli->query("SET @a:='this will not work'")) {
 printf("Error: %s\n", $mysqli->error);
 }
 $result->close();
}

$mysqli->close();
?>
```

### Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
 printf("Connect failed: %s\n", $link->connect_error());
 exit();
}

/* Create table doesn't return a resultset */
if ($link->query("CREATE TEMPORARY TABLE myCity LIKE City") === TRUE) {
 printf("Table myCity successfully created.\n");
}

/* Select queries return a resultset */
if ($result = $link->query("SELECT Name FROM City LIMIT 10")) {
 printf("Select returned %d rows.\n", mysqli_num_rows($result));

 /* free result set */
 mysqli_free_result($result);
}

/* If we have to retrieve large amount of data we use MYSQLI_USE_RESULT */
if ($result = $link->query("SELECT * FROM City", MYSQLI_USE_RESULT)) {

 /* Note, that we can't execute any functions which interact with the
 server until result set was closed. All calls will return an
 'out of sync' error */
 if (!$link->query("SET @a:='this will not work'")) {
 printf("Error: %s\n", mysqli_error($link));
 }
 mysqli_free_result($result);
}

mysqli_close($link);
?>
```

The above examples will output:

```
Table myCity successfully created.
Select returned 10 rows.
Error: Commands out of sync; You can't run this command now
```

[mysqli\\_free\\_result](#)

**21.10.2.7.38. mysqli::real\_connect, mysqli\_real\_connect**

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::real\\_connect](#)

[mysqli\\_real\\_connect](#)

Opens a connection to a mysql server

**Description**

Object oriented style

```
bool mysqli::real_connect(string host,
 string username,
 string passwd,
 string dbname,
 int port,
 string socket,
 int flags);
```

Procedural style

```
bool mysqli_real_connect(mysqli link,
 string host,
 string username,
 string passwd,
 string dbname,
 int port,
 string socket,
 int flags);
```

Establish a connection to a MySQL database engine.

This function differs from [mysqli\\_connect](#):

- [mysqli\\_real\\_connect](#) needs a valid object which has to be created by function [mysqli\\_init](#).
- With the [mysqli\\_options](#) function you can set various options for connection.
- There is a *flags* parameter.

**Parameters**

<i>link</i>	Procedural style only: A link identifier returned by <a href="#">mysqli_connect</a> or <a href="#">mysqli_init</a>
<i>host</i>	Can be either a host name or an IP address. Passing the <a href="#">NULL</a> value or the string "localhost" to this parameter, the local host is assumed. When possible, pipes will be used instead of the TCP/IP protocol.
<i>username</i>	The MySQL user name.
<i>passwd</i>	If provided or <a href="#">NULL</a> , the MySQL server will attempt to authenticate the user against those user records which have no password only. This allows one username to be used with different permissions (depending on if a password as provided or not).
<i>dbname</i>	If provided will specify the default database to be used when performing queries.
<i>port</i>	Specifies the port number to attempt to connect to the MySQL server.

`socket` Specifies the socket or named pipe that should be used.

### Note

Specifying the `socket` parameter will not explicitly determine the type of connection to be used when connecting to the MySQL server. How the connection is made to the MySQL database is determined by the `host` parameter.

`flags` With the parameter `flags` you can set different connection options:

**Table 21.10. Supported flags**

Name	Description
<code>MYSQLI_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQLI_CLIENT_FOUND_ROWS</code>	return number of matched rows, not the number of affected rows
<code>MYSQLI_CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all function names reserved words.
<code>MYSQLI_CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection
<code>MYSQLI_CLIENT_SSL</code>	Use SSL (encryption)

### Note

For security reasons the `MULTI_STATEMENT` flag is not supported in PHP. If you want to execute multiple queries use the `mysqli_multi_query` function.

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Examples

#### Example 21.100. `mysqli::real_connect` example

Object oriented style

```
<?php
$mysqli = mysqli_init();
if (!$mysqli) {
 die('mysqli_init failed');
}

if (!$mysqli->options(MYSQLI_INIT_COMMAND, 'SET AUTOCOMMIT = 0')) {
 die('Setting MYSQLI_INIT_COMMAND failed');
}

if (!$mysqli->options(MYSQLI_OPT_CONNECT_TIMEOUT, 5)) {
 die('Setting MYSQLI_OPT_CONNECT_TIMEOUT failed');
}

if (!$mysqli->real_connect('localhost', 'my_user', 'my_password', 'my_db')) {
 die('Connect Error (' . mysqli_connect_errno() . ') '
 . mysqli_connect_error());
}

echo 'Success... ' . $mysqli->host_info . "\n";
$mysqli->close();
?>
```

Object oriented style when extending mysqli class

```
<?php
class foo_mysqli extends mysqli {
 public function __construct($host, $user, $pass, $db) {
 parent::__construct($host, $user, $pass, $db);
 }
}
```

```

if (!parent::options(MYSQLI_INIT_COMMAND, 'SET AUTOCOMMIT = 0')) {
 die('Setting MYSQLI_INIT_COMMAND failed');
}

if (!parent::options(MYSQLI_OPT_CONNECT_TIMEOUT, 5)) {
 die('Setting MYSQLI_OPT_CONNECT_TIMEOUT failed');
}

if (!parent::real_connect($host, $user, $pass, $db)) {
 die('Connect Error (' . mysqli_connect_errno() . ') '
 . mysqli_connect_error());
}
}

$db = new foo_mysqli('localhost', 'my_user', 'my_password', 'my_db');

echo 'Success... ' . $db->host_info . "\n";

$db->close();
?>

```

### Procedural style

```

<?php

$link = mysqli_init();
if (!$link) {
 die('mysqli_init failed');
}

if (!mysqli_options($link, MYSQLI_INIT_COMMAND, 'SET AUTOCOMMIT = 0')) {
 die('Setting MYSQLI_INIT_COMMAND failed');
}

if (!mysqli_options($link, MYSQLI_OPT_CONNECT_TIMEOUT, 5)) {
 die('Setting MYSQLI_OPT_CONNECT_TIMEOUT failed');
}

if (!mysqli_real_connect($link, 'localhost', 'my_user', 'my_password', 'my_db')) {
 die('Connect Error (' . mysqli_connect_errno() . ') '
 . mysqli_connect_error());
}

echo 'Success... ' . mysqli_get_host_info($link) . "\n";

mysqli_close($link);
?>

```

The above examples will output:

```
Success... MySQL host info: localhost via TCP/IP
```

Escapes special characters in a string for use in an SQL statement, taking into account the current charset of the connection

## Description

Object oriented style

```
string mysqli::escape_string(string escapestr);
```

```
string mysqli::real_escape_string(string escapestr);
```

Procedural style

```
string mysqli_real_escape_string(mysqli link,
 string escapestr);
```

This function is used to create a legal SQL string that you can use in an SQL statement. The given string is encoded to an escaped SQL string, taking into account the current character set of the connection.

## Parameters

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<code>escapestr</code>	The string to be escaped.
	Characters encoded are <code>NUL</code> (ASCII 0), <code>\n</code> , <code>\r</code> , <code>\</code> , <code>'</code> , <code>"</code> , and <code>Control-Z</code> .

## Return Values

Returns an escaped string.

## Examples

### Example 21.101. `mysqli::real_escape_string` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno()) {
 printf("Connect failed: %s\n", $link->connect_error());
 exit();
}

$link->query("CREATE TEMPORARY TABLE myCity LIKE City");

$city = "'s Hertogenbosch";

/* this query will fail, cause we didn't escape $city */
if (!$link->query("INSERT into myCity (Name) VALUES ('$city')")) {
 printf("Error: %s\n", $link->sqlstate);
}

$city = $link->real_escape_string($city);

/* this query with escaped $city will work */
if ($link->query("INSERT into myCity (Name) VALUES ('$city')")) {
 printf("%d Row inserted.\n", $link->affected_rows);
}

$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}
```

```

mysqli_query($link, "CREATE TEMPORARY TABLE myCity LIKE City");
$city = "'s Hertogenbosch";

/* this query will fail, cause we didn't escape $city */
if (!mysqli_query($link, "INSERT into myCity (Name) VALUES ('$city')")) {
 printf("Error: %s\n", mysqli_sqlstate($link));
}

$city = mysqli_real_escape_string($link, $city);

/* this query with escaped $city will work */
if (mysqli_query($link, "INSERT into myCity (Name) VALUES ('$city')")) {
 printf("%d Row inserted.\n", mysqli_affected_rows($link));
}

mysqli_close($link);
?>

```

The above examples will output:

```
Error: 42000
1 Row inserted.
```

### 21.10.2.7.40. `mysqli::real_query`, `mysqli_real_query`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::real\\_query](#)
- [mysqli\\_real\\_query](#)

Execute an SQL query

#### Description

Object oriented style

```
bool mysqli::real_query(string query);
```

Procedural style

```
bool mysqli_real_query(mysqli link,
 string query);
```

Executes a single query against the database whose result can then be retrieved or stored using the [mysqli\\_store\\_result](#) or [mysqli\\_use\\_result](#) functions.

In order to determine if a given query should return a result set or not, see [mysqli\\_field\\_count](#).

#### Parameters

*link*

Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

*query*

The query, as a string.

Data inside the query should be [properly escaped](#).

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### See Also

`mysqli_query`  
`mysqli_store_result`  
`mysqli_use_result`

## 21.10.2.7.41. `mysqli::reap_async_query`, `mysqli_reap_async_query`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::reap_async_query`  
`mysqli_reap_async_query`

Get result from async query

### Description

Object oriented style

```
public mysqli_result mysqli::reap_async_query();
```

Procedural style

```
mysqli_result mysqli_reap_async_query(mysqli link);
```

### Warning

This function is currently not documented; only its argument list is available.

Get result from async query. Available only with `mysqlnd`.

### Parameters

*link* Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

### Return Values

Returns `mysqli_result` in success, `FALSE` otherwise.

### See Also

`mysqli_poll`

## 21.10.2.7.42. `mysqli::rollback`, `mysqli_rollback`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::rollback`  
`mysqli_rollback`

Rolls back current transaction

### Description

Object oriented style

```
bool mysqli::rollback();
```

#### Procedural style

```
bool mysqli_rollback(mysqli link);
```

Rollbacks the current transaction for the database.

#### Parameters

*link*

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

#### Return Values

Returns `TRUE` on success or `FALSE` on failure.

#### Examples

##### Example 21.102. `mysqli::rollback` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

/* disable autocommit */
$mysqli->autocommit(FALSE);

$mysqli->query("CREATE TABLE myCity LIKE City");
$mysqli->query("ALTER TABLE myCity Type=InnoDB");
$mysqli->query("INSERT INTO myCity SELECT * FROM City LIMIT 50");

/* commit insert */
$mysqli->commit();

/* delete all rows */
$mysqli->query("DELETE FROM myCity");

if ($result = $mysqli->query("SELECT COUNT(*) FROM myCity")) {
 $row = $result->fetch_row();
 printf("%d rows in table myCity.\n", $row[0]);
 /* Free result */
 $result->close();
}

/* Rollback */
$mysqli->rollback();

if ($result = $mysqli->query("SELECT COUNT(*) FROM myCity")) {
 $row = $result->fetch_row();
 printf("%d rows in table myCity (after rollback).\n", $row[0]);
 /* Free result */
 $result->close();
}

/* Drop table myCity */
$mysqli->query("DROP TABLE myCity");

$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
 printf("Connect failed: %s\n", $link->connect_error());
 exit();
}
```

```

}

/* disable autocommit */
mysqli_autocommit($link, FALSE);

mysqli_query($link, "CREATE TABLE myCity LIKE City");
mysqli_query($link, "ALTER TABLE myCity Type=InnoDB");
mysqli_query($link, "INSERT INTO myCity SELECT * FROM City LIMIT 50");

/* commit insert */
mysqli_commit($link);

/* delete all rows */
mysqli_query($link, "DELETE FROM myCity");

if ($result = mysqli_query($link, "SELECT COUNT(*) FROM myCity")) {
 $row = mysqli_fetch_row($result);
 printf("%d rows in table myCity.\n", $row[0]);
 /* Free result */
 mysqli_free_result($result);
}

/* Rollback */
mysqli_rollback($link);

if ($result = mysqli_query($link, "SELECT COUNT(*) FROM myCity")) {
 $row = mysqli_fetch_row($result);
 printf("%d rows in table myCity (after rollback).\n", $row[0]);
 /* Free result */
 mysqli_free_result($result);
}

/* Drop table myCity */
mysqli_query($link, "DROP TABLE myCity");

mysqli_close($link);
?>

```

The above examples will output:

```

0 rows in table myCity.
50 rows in table myCity (after rollback).

```

### 21.10.2.7.43. `mysqli::select_db`, `mysqli_select_db`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::select\\_db](#)
- [mysqli\\_select\\_db](#)

Selects the default database for database queries

#### Description

Object oriented style

```
bool mysqli::select_db(string dbname);
```

Procedural style

```
bool mysqli_select_db(mysqli link,
 string dbname);
```

Selects the default database to be used when performing queries against the database connection.

**Note**

This function should only be used to change the default database for the connection. You can select the default database with 4th parameter in `mysqli_connect`.

**Parameters**

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<code>dbname</code>	The database name.

**Return Values**

Returns `TRUE` on success or `FALSE` on failure.

**Examples****Example 21.103. `mysqli::select_db` example**

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if ($link->connect_errno) {
 printf("Connect failed: %s\n", $link->connect_error);
 exit();
}

/* return name of current default database */
if ($result = $link->query("SELECT DATABASE()")) {
 $row = $result->fetch_row();
 printf("Default database is %s.\n", $row[0]);
 $result->close();
}

/* change db to world db */
$link->select_db("world");

/* return name of current default database */
if ($result = $link->query("SELECT DATABASE()")) {
 $row = $result->fetch_row();
 printf("Default database is %s.\n", $row[0]);
 $result->close();
}

$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* return name of current default database */
if ($result = mysqli_query($link, "SELECT DATABASE()")) {
 $row = mysqli_fetch_row($result);
 printf("Default database is %s.\n", $row[0]);
 mysqli_free_result($result);
}

/* change db to world db */
mysqli_select_db($link, "world");

/* return name of current default database */
if ($result = mysqli_query($link, "SELECT DATABASE()")) {
 $row = mysqli_fetch_row($result);
 printf("Default database is %s.\n", $row[0]);
 mysqli_free_result($result);
}
```

```
mysqli_close($link);
?>
```

The above examples will output:

Default database is test.  
Default database is world.

### **See Also**

```
mysqli_connect
mysqli_real_connect
```

#### 21.10.2.7.44. `mysqli::set_charset`, `mysqli_set_charset`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::set_charset`

Sets the default client character set

## Description

### Object oriented style

```
bool mysql::set_charset(string charset);
```

### Procedural style

```
bool mysqli_set_charset(mysqli link,
 string charset);
```

Sets the default character set to be used when sending data from and to the database server.

### Parameters

[link](#)

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

charser

The charset to be set as default

## Return Values

Returns **TRUE** on success or **FALSE** on failure.

## Notes

## Note

To use this function on a Windows platform you need MySQL client library version 4.1.11 or above (for MySQL 5.0 you need 5.0.6 or above).

## Note

This is the preferred way to change the charset. Using `mysqli::query` to execute `SET NAMES ...` is not recommended.

## Examples

### Example 21.104. `mysqli::set_charset` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

/* change character set to utf8 */
if (!$mysqli->set_charset("utf8")) {
 printf("Error loading character set utf8: %s\n", $mysqli->error);
} else {
 printf("Current character set: %s\n", $mysqli->character_set_name());
}

$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'test');

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* change character set to utf8 */
if (!mysqli_set_charset($link, "utf8")) {
 printf("Error loading character set utf8: %s\n", mysqli_error($link));
} else {
 printf("Current character set: %s\n", mysqli_character_set_name($link));
}

mysqli_close($link);
?>
```

The above examples will output:

```
Current character set: utf8
```

### 21.10.2.7.45. `mysqli::set_local_infile_default`, `mysqli_set_local_infile_default`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::set\\_local\\_infile\\_default](#)  
[mysqli\\_set\\_local\\_infile\\_default](#)

Unsets user defined handler for load local infile command

## Description

```
void mysqli_set_local_infile_default(mysqli link);
```

Deactivates a `LOAD DATA INFILE LOCAL` handler previously set with `mysqli_set_local_infile_handler`.

## Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

## Return Values

No value is returned.

## Examples

See `mysqli_set_local_infile_handler` examples

## See Also

`mysqli_set_local_infile_handler`

## 21.10.2.7.46. `mysqli::set_local_infile_handler`, `mysqli_set_local_infile_handler`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::set_local_infile_handler`

`mysqli_set_local_infile_handler`

Set callback function for LOAD DATA LOCAL INFILE command

## Description

Object oriented style

```
bool mysqli::set_local_infile_handler(mysqli link,
 callback read_func);
```

Procedural style

```
bool mysqli_set_local_infile_handler(mysqli link,
 callback read_func);
```

Set callback function for LOAD DATA LOCAL INFILE command

The callbacks task is to read input from the file specified in the `LOAD DATA LOCAL INFILE` and to reformat it into the format understood by `LOAD DATA INFILE`.

The returned data needs to match the format specified in the `LOAD DATA`

## Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

`read_func` A callback function or object method taking the following parameters:

`stream`

A PHP stream associated with the SQL commands INFILE

`&buffer`

A string buffer to store the rewritten input into

`buflen`

The maximum number of characters to be stored in the

buffer

`&errormsg`

If an error occurs you can store an error message in here

The callback function should return the number of characters stored in the `buffer` or a negative value if an error occurred.

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Examples

#### Example 21.105. `mysqli::set_local_infile_handler` example

Object oriented style

```
<?php
$db = mysqli_init();
$db->real_connect("localhost", "root", "", "test");

function callme($stream, &$buffer, $buflen, &$errormsg)
{
 $buffer = fgets($stream);

 echo $buffer;

 // convert to upper case and replace "," delimiter with [TAB]
 $buffer = strtoupper(str_replace(",", "\t", $buffer));

 return strlen($buffer);
}

echo "Input:\n";

$db->set_local_infile_handler("callme");
$db->query("LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
$db->set_local_infile_default();

$res = $db->query("SELECT * FROM t1");

echo "\nResult:\n";
while ($row = $res->fetch_assoc()) {
 echo join(", ", $row)."\n";
}
?>
```

Procedural style

```
<?php
$db = mysqli_init();
mysqli_real_connect($db, "localhost", "root", "", "test");

function callme($stream, &$buffer, $buflen, &$errormsg)
{
 $buffer = fgets($stream);

 echo $buffer;

 // convert to upper case and replace "," delimiter with [TAB]
 $buffer = strtoupper(str_replace(",", "\t", $buffer));

 return strlen($buffer);
}

echo "Input:\n";

mysqli_set_local_infile_handler($db, "callme");
mysqli_query($db, "LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
mysqli_set_local_infile_default($db);

$res = mysqli_query($db, "SELECT * FROM t1");

echo "\nResult:\n";
while ($row = mysqli_fetch_assoc($res)) {
 echo join(", ", $row)."\n";
}
?>
```

The above examples will output:

```
Input:
23,foo
42,bar

Output:
23,FOO
42,BAR
```

## See Also

### 21.10.2.7.47. `mysqli->sqlstate`, `mysqli_sqlstate`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->sqlstate](#)
- [mysqli\\_sqlstate](#)

Returns the SQLSTATE error from previous MySQL operation

## Description

Object oriented style

```
mysqli {
 string sqlstate ;
}
```

Procedural style

```
string mysqli_sqlstate(mysqli link);
```

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see <http://dev.mysql.com/doc/mysql/en/error-handling.html>.

## Note

Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for unmapped errors.

## Parameters

`link`

Procedural style only: A link identifier returned by [mysqli\\_connect](#) or [mysqli\\_init](#)

## Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error.

## Examples

**Example 21.106. `mysqli->sqlstate` example**

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

/* Table City already exists, so we should get an error */
if (!$mysqli->query("CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
 printf("Error - SQLSTATE %s.\n", $mysqli->sqlstate);
}

$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
 printf("Connect failed: %s\n", $link->connect_error);
 exit();
}

/* Table City already exists, so we should get an error */
if (!mysqli_query($link, "CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
 printf("Error - SQLSTATE %s.\n", mysqli_sqlstate($link));
}

mysqli_close($link);
?>
```

The above examples will output:

```
Error - SQLSTATE 42S01.
```

**See Also**

[mysqli\\_errno](#)  
[mysqli\\_error](#)

**21.10.2.7.48. `mysqli::ssl_set`, `mysqli_ssl_set`**

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::ssl\\_set](#)
- [mysqli\\_ssl\\_set](#)

Used for establishing secure connections using SSL

**Description**

Object oriented style

```
bool mysqli::ssl_set(string key,
```

```
 string cert,
 string ca,
 string capath,
 string cipher);
```

Procedural style

```
bool mysqli_ssl_set(mysqli link,
 string key,
 string cert,
 string ca,
 string capath,
 string cipher);
```

Used for establishing secure connections using SSL. It must be called before [mysqli\\_real\\_connect](#). This function does nothing unless OpenSSL support is enabled.

Note that MySQL Native Driver does not support SSL, so calling this function when using MySQL Native Driver will result in an error. MySQL Native Driver is enabled by default on Microsoft Windows from PHP version 5.3 onwards.

### Parameters

<i>link</i>	Procedural style only: A link identifier returned by <a href="#">mysqli_connect</a> or <a href="#">mysqli_init</a>
<i>key</i>	The path name to the key file.
<i>cert</i>	The path name to the certificate file.
<i>ca</i>	The path name to the certificate authority file.
<i>capath</i>	The pathname to a directory that contains trusted SSL CA certificates in PEM format.
<i>cipher</i>	A list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as [NULL](#)

### Return Values

This function always returns [TRUE](#) value. If SSL setup is incorrect [mysqli\\_real\\_connect](#) will return an error when you attempt to connect.

### See Also

[mysqli\\_options](#)  
[mysqli\\_real\\_connect](#)

## 21.10.2.7.49. [mysqli::stat](#), [mysqli\\_stat](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::stat](#)  
[mysqli\\_stat](#)  
Gets the current system status

### Description

Object oriented style

```
string mysqli::stat();
```

Procedural style

```
string mysqli_stat(mysqli link);
```

`mysqli_stat` returns a string containing information similar to that provided by the 'mysqladmin status' command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

## Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

## Return Values

A string describing the server status. `FALSE` if an error occurred.

## Examples

### Example 21.107. `mysqli::stat` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
 printf("Connect failed: %s\n", $link->connect_error);
 exit();
}

printf ("System status: %s\n", $link->stat());
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

printf("System status: %s\n", mysqli_stat($link));
mysqli_close($link);
?>
```

The above examples will output:

```
System status: Uptime: 272 Threads: 1 Questions: 5340 Slow queries: 0
Opens: 13 Flush tables: 1 Open tables: 0 Queries per second avg: 19.632
Memory in use: 8496K Max memory used: 8560K
```

### 21.10.2.7.50. `mysqli::stmt_init`, `mysqli_stmt_init`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::stmt_init`

`mysqli_stmt_init`

Initializes a statement and returns an object for use with `mysqli_stmt_prepare`

### Description

Object oriented style

```
mysqli_stmt mysqli::stmt_init();
```

Procedural style

```
mysqli_stmt mysqli_stmt_init(mysqli link);
```

Allocates and initializes a statement object suitable for `mysqli_stmt_prepare`.

### Note

Any subsequent calls to any `mysqli_stmt` function will fail until `mysqli_stmt_prepare` was called.

### Parameters

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

### Return Values

Returns an object.

### See Also

`mysqli_stmt_prepare`

## 21.10.2.7.51. `mysqli::store_result`, `mysqli_store_result`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::store_result`

`mysqli_store_result`

Transfers a result set from the last query

### Description

Object oriented style

```
mysqli_result mysqli::store_result();
```

Procedural style

```
mysqli_result mysqli_store_result(mysqli link);
```

Transfers the result set from the last query on the database connection represented by the `link` parameter to be used with the `mysqli_data_seek` function.

### Parameters

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

## Return Values

Returns a buffered result object or `FALSE` if an error occurred.

### Note

`mysqli_store_result` returns `FALSE` in case the query didn't return a result set (if the query was, for example an INSERT statement). This function also returns `FALSE` if the reading of the result set failed. You can check if you have got an error by checking if `mysqli_error` doesn't return an empty string, if `mysqli_errno` returns a non zero value, or if `mysqli_field_count` returns a non zero value. Also possible reason for this function returning `FALSE` after successful call to `mysqli_query` can be too large result set (memory for it cannot be allocated). If `mysqli_field_count` returns a non-zero value, the statement should have produced a non-empty result set.

## Notes

### Note

Although it is always good practice to free the memory used by the result of a query using the `mysqli_free_result` function, when transferring large result sets using the `mysqli_store_result` this becomes particularly important.

## Examples

See [mysqli\\_multi\\_query](#).

## See Also

[mysqli\\_real\\_query](#)  
[mysqli\\_use\\_result](#)

## 21.10.2.7.52. `mysqli->thread_id`, `mysqli_thread_id`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->thread\\_id](#)  
[mysqli\\_thread\\_id](#)

Returns the thread ID for the current connection

## Description

Object oriented style

```
mysqli {
 int thread_id ;
}
```

Procedural style

```
int mysqli_thread_id(mysqli link);
```

The `mysqli_thread_id` function returns the thread ID for the current connection which can then be killed using the `mysqli_kill` function. If the connection is lost and you reconnect with `mysqli_ping`, the thread ID will be other. Therefore you should get the thread ID only when you need it.

### Note

The thread ID is assigned on a connection-by-connection basis. Hence, if the connection is broken and then re-established a new thread ID will be assigned.

To kill a running query you can use the SQL command `KILL QUERY processid`.

## Parameters

[link](#) Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

### Return Values

Returns the Thread ID for the current connection.

### Examples

#### Example 21.108. `mysqli->thread_id` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* determine our thread id */
$thread_id = $link->thread_id;

/* Kill connection */
$link->kill($thread_id);

/* This should produce an error */
if (!$link->query("CREATE TABLE myCity LIKE City")) {
 printf("Error: %s\n", $link->error);
 exit();
}

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
 printf("Error: %s\n", mysqli_error($link));
 exit();
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Error: MySQL server has gone away
```

### See Also

---

```
mysqli_kill
```

### 21.10.2.7.53. mysqli::thread\_safe, mysqli\_thread\_safe

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::thread\\_safe](#)

```
mysqli_thread_safe
```

Returns whether thread safety is given or not

#### Description

Procedural style

```
bool mysqli_thread_safe();
```

Tells whether the client library is compiled as thread-safe.

#### Return Values

[TRUE](#) if the client library is thread-safe, otherwise [FALSE](#).

### 21.10.2.7.54. mysqli::use\_result, mysqli\_use\_result

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::use\\_result](#)

```
mysqli_use_result
```

Initiate a result set retrieval

#### Description

Object oriented style

```
mysqli_result mysqli::use_result();
```

Procedural style

```
mysqli_result mysqli_use_result(mysqli link);
```

Used to initiate the retrieval of a result set from the last query executed using the [mysqli\\_real\\_query](#) function on the database connection.

Either this or the [mysqli\\_store\\_result](#) function must be called before the results of a query can be retrieved, and one or the other must be called to prevent the next query on that database connection from failing.

#### Note

The [mysqli\\_use\\_result](#) function does not transfer the entire result set from the database and hence cannot be used functions such as [mysqli\\_data\\_seek](#) to move to a particular row within the set. To use this functionality, the result set must be stored using [mysqli\\_store\\_result](#). One should not use [mysqli\\_use\\_result](#) if a lot of processing on the client side is performed, since this will tie up the server and prevent other threads from updating any tables from which the data is being fetched.

#### Return Values

Returns an unbuffered result object or [FALSE](#) if an error occurred.

#### Examples

**Example 21.109. `mysqli::use_result` example**

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($mysqli->multi_query($query)) {
 do {
 /* store first result set */
 if ($result = $mysqli->use_result()) {
 while ($row = $result->fetch_row()) {
 printf("%s\n", $row[0]);
 }
 $result->close();
 }
 /* print divider */
 if ($mysqli->more_results()) {
 printf("-----\n");
 }
 } while ($mysqli->next_result());
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
 do {
 /* store first result set */
 if ($result = mysqli_use_result($link)) {
 while ($row = mysqli_fetch_row($result)) {
 printf("%s\n", $row[0]);
 }
 mysqli_free_result($result);
 }
 /* print divider */
 if (mysqli_more_results($link)) {
 printf("-----\n");
 }
 } while (mysqli_next_result($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
my_user@localhost

Amersfoort
Maastricht
Dordrecht
Leiden
```

```
Haarlemmermeer
```

### 21.10.2.7.55. mysqli->warning\_count, mysqli\_warning\_count

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->warning\\_count](#)
- [mysqli\\_warning\\_count](#)

Returns the number of warnings from the last query for the given link

#### Description

Object oriented style

```
mysqli {
 int warning_count ;
}
```

Procedural style

```
int mysqli_warning_count(mysqli link);
```

Returns the number of warnings from the last query in the connection.

#### Note

For retrieving warning messages you can use the SQL command `SHOW WARNINGS [limit row_count]`.

#### Parameters

*link*

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

#### Return Values

Number of warnings or zero if there are no warnings.

#### Examples

##### Example 21.110. mysqli->warning\_count example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}
$mysqli->query("CREATE TABLE myCity LIKE City");
/* a remarkable city in Wales */
```

```
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
 'Llanfairpwllgwyngyllgogerychwyrndrobwllllantysiliogogoch')";

$mysqli->query($query);

if ($mysqli->warning_count) {
 if ($result = $mysqli->query("SHOW WARNINGS")) {
 $row = $result->fetch_row();
 printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
 $result->close();
 }
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* a remarkable long city name in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
 'Llanfairpwllgwyngyllgogerychwyrndrobwllllantysiliogogoch')";

mysqli_query($link, $query);

if (mysqli_warning_count($link)) {
 if ($result = mysqli_query($link, "SHOW WARNINGS")) {
 $row = mysqli_fetch_row($result);
 printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
 mysqli_free_result($result);
 }
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Warning (1264): Data truncated for column 'Name' at row 1
```

### 21.10.2.8.1. `mysqli_stmt->affected_rows`, `mysqli_stmt_affected_rows`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt->affected_rows`  
`mysqli_stmt_affected_rows`

Returns the total number of rows changed, deleted, or inserted by the last executed statement

#### Description

Object oriented style

```

mysqli_stmt {
 int affected_rows ;
}

```

Procedural style

```
int mysqli_stmt_affected_rows(mysqli_stmt stmt);
```

Returns the number of rows affected by `INSERT`, `UPDATE`, or `DELETE` query.

This function only works with queries which update a table. In order to get the number of rows from a `SELECT` query, use `mysqli_stmt_num_rows` instead.

#### Parameters

`stmt`

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

#### Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE/DELETE` statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query has returned an error. `NULL` indicates an invalid argument was supplied to the function.

#### Note

If the number of affected rows is greater than maximal PHP int value, the number of affected rows will be returned as a string value.

#### Examples

##### Example 21.111. Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error);
 exit();
}

/* create temp table */
$query = "CREATE TEMPORARY TABLE myCountry LIKE Country";
$mysqli->query($query);

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";
/* prepare statement */
if ($stmt = $mysqli->prepare($query)) {

```

```

 /* Bind variable for placeholder */
$code = 'A%';
$stmt->bind_param("s", $code);

/* execute statement */
$stmt->execute();

printf("rows inserted: %d\n", $stmt->affected_rows);

/* close statement */
$stmt->close();
}

/* close connection */
$mysqli->close();
?>

```

### Example 21.112. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* create temp table */
mysqli_query($link, "CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = mysqli_prepare($link, $query)) {

 /* Bind variable for placeholder */
 $code = 'A%';
 mysqli_stmt_bind_param($stmt, "s", $code);

 /* execute statement */
 mysqli_stmt_execute($stmt);

 printf("rows inserted: %d\n", mysqli_stmt_affected_rows($stmt));

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
rows inserted: 17
```

#### See Also

[mysqli\\_stmt\\_num\\_rows](#)

#### 21.10.2.8.2. `mysqli_stmt::attr_get`, `mysqli_stmt_attr_get`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::attr\\_get](#)
- [mysqli\\_stmt\\_attr\\_get](#)

Used to get the current value of a statement attribute

### Description

Object oriented style

```
int mysqli_stmt::attr_get(int attr);
```

Procedural style

```
int mysqli_stmt_attr_get(mysqli_stmt stmt,
 int attr);
```

Gets the current value of a statement attribute.

### Parameters

<i>stmt</i>	Procedural style only: A statement identifier returned by <a href="#">mysqli_stmt_init</a> .
<i>attr</i>	The attribute that you want to get.

### Return Values

Returns [FALSE](#) if the attribute is not found, otherwise returns the value of the attribute.

## 21.10.2.8.3. [mysqli\\_stmt::attr\\_set](#), [mysqli\\_stmt\\_attr\\_set](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::attr\\_set](#)
- [mysqli\\_stmt\\_attr\\_set](#)

Used to modify the behavior of a prepared statement

### Description

Object oriented style

```
bool mysqli_stmt::attr_set(int attr,
 int mode);
```

Procedural style

```
bool mysqli_stmt_attr_set(mysqli_stmt stmt,
 int attr,
 int mode);
```

Used to modify the behavior of a prepared statement. This function may be called multiple times to set several attributes.

### Parameters

<i>stmt</i>	Procedural style only: A statement identifier returned by <a href="#">mysqli_stmt_init</a> .
<i>attr</i>	The attribute that you want to set. It can have one of the following values:

**Table 21.11. Attribute values**

Character	Description
MYSQLI_STMT_ATTR_UPDATE_MAX_LENGTH	If set to 1, causes <a href="#">mysqli_stmt_store_result</a> to update the metadata <a href="#">MYSQL_FIELD-&gt;max_length</a> value.

Character	Description
MYSQLI_STMT_ATTR_CURSOR_TYPE	Type of cursor to open for statement when <code>mysqli_stmt_execute</code> is invoked. <code>mode</code> can be <code>MYSQLI_CURSOR_TYPE_NO_CURSOR</code> (the default) or <code>MYSQLI_CURSOR_TYPE_READ_ONLY</code> .
MYSQLI_STMT_ATTR_PREFETCH_ROWS	Number of rows to fetch from server at a time when using a cursor. <code>mode</code> can be in the range from 1 to the maximum value of unsigned long. The default is 1.

If you use the `MYSQLI_STMT_ATTR_CURSOR_TYPE` option with `MYSQLI_CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysqli_stmt_execute`. If there is already an open cursor from a previous `mysqli_stmt_execute` call, it closes the cursor before opening a new one. `mysqli_stmt_reset` also closes any open cursor before preparing the statement for re-execution. `mysqli_stmt_free_result` closes any open cursor.

If you open a cursor for a prepared statement, `mysqli_stmt_store_result` is unnecessary.

`mode`

The value to assign to the attribute.

#### 21.10.2.8.4. `mysqli_stmt::bind_param`, `mysqli_stmt_bind_param`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::bind_param`
- `mysqli_stmt_bind_param`

Binds variables to a prepared statement as parameters

#### Description

Object oriented style

```
bool mysqli_stmt::bind_param(string types,
 mixed var1,
 mixed ...);
```

Procedural style

```
bool mysqli_stmt_bind_param(mysqli_stmt stmt,
 string types,
 mixed var1,
 mixed ...);
```

Bind variables for the parameter markers in the SQL statement that was passed to `mysqli_prepare`.

#### Note

If data size of a variable exceeds max. allowed packet size (`max_allowed_packet`), you have to specify `b` in `types` and use `mysqli_stmt_send_long_data` to send the data in packets.

#### Note

Care must be taken when using `mysqli_stmt_bind_param` in conjunction with `call_user_func_array`. Note that `mysqli_stmt_bind_param` requires parameters to be passed by reference, whereas `call_user_func_array` can accept as a parameter a list of variables that can represent references or values.

#### Parameters

`stmt`

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

`types`

A string that contains one or more characters which specify the types for the corresponding

bind variables:

**Table 21.12. Type specification chars**

Character	Description
i	corresponding variable has type integer
d	corresponding variable has type double
s	corresponding variable has type string
b	corresponding variable is a blob and will be sent in packets

`var1`

The number of variables and length of string `types` must match the parameters in the statement.

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Examples

#### Example 21.113. Object oriented style

```
<?php
$mysqli = new mysqli('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if ($mysqli->connect_errno()) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$stmt = $mysqli->prepare("INSERT INTO CountryLanguage VALUES (?, ?, ?, ?, ?)");
$stmt->bind_param('sssd', $code, $language, $official, $percent);

$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
$stmt->execute();

printf("%d Row inserted.\n", $stmt->affected_rows);

/* close statement and connection */
$stmt->close();

/* Clean up table CountryLanguage */
$mysqli->query("DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", $mysqli->affected_rows);

/* close connection */
$mysqli->close();
?>
```

#### Example 21.114. Procedural style

```
<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (!$link) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$stmt = mysqli_prepare($link, "INSERT INTO CountryLanguage VALUES (?, ?, ?, ?, ?)");
mysqli_stmt_bind_param($stmt, 'sssd', $code, $language, $official, $percent);

$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;
```

```

/* execute prepared statement */
mysqli_stmt_execute($stmt);

printf("%d Row inserted.\n", mysqli_stmt_affected_rows($stmt));

/* close statement and connection */
mysqli_stmt_close($stmt);

/* Clean up table CountryLanguage */
mysqli_query($link, "DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", mysqli_affected_rows($link));

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

1 Row inserted.
1 Row deleted.

```

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::bind\\_result](#)  
[mysqli\\_stmt\\_bind\\_result](#)

Binds variables to a prepared statement for result storage

#### Description

Object oriented style

```

bool mysqli_stmt::bind_result(mixed var1,
 mixed ...);

```

Procedural style

```

bool mysqli_stmt_bind_result(mysqli_stmt stmt,
 mixed var1,
 mixed ...);

```

Binds columns in the result set to variables.

When `mysqli_stmt_fetch` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified variables `var1`, ....

#### Note

Note that all columns must be bound after `mysqli_stmt_execute` and prior to calling `mysqli_stmt_fetch`. Depending on column types bound variables can silently change to the corresponding PHP type.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysqli_stmt_fetch` is called.

## Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> .
<code>var1</code>	The variable to be bound.

## Return Values

Returns `TRUE` on success or `FALSE` on failure.

## Examples

### Example 21.115. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

/* prepare statement */
if ($stmt = $mysqli->prepare("SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
 $stmt->execute();

 /* bind variables to prepared statement */
 $stmt->bind_result($col1, $col2);

 /* fetch values */
 while ($stmt->fetch()) {
 printf("%s %s\n", $col1, $col2);
 }

 /* close statement */
 $stmt->close();
}
/* close connection */
$mysqli->close();

?>
```

### Example 21.116. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

/* prepare statement */
if ($stmt = mysqli_prepare($link, "SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
 mysqli_stmt_execute($stmt);

 /* bind variables to prepared statement */
 mysqli_stmt_bind_result($stmt, $col1, $col2);

 /* fetch values */
 while (mysqli_stmt_fetch($stmt)) {
 printf("%s %s\n", $col1, $col2);
 }

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
AFG Afghanistan
ALB Albania
DZA Algeria
ASM American Samoa
AND Andorra
```

- [mysqli\\_stmt::close](#)

`mysqli_stmt_close`

Closes a prepared statement

### Description

Object oriented style

```
bool mysqli_stmt::close();
```

Procedural style

```
bool mysqli_stmt_close(mysqli_stmt $stmt);
```

Closes a prepared statement. `mysqli_stmt_close` also deallocates the statement handle. If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

### Parameters

`stmt`

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### See Also

[mysqli\\_prepare](#)

## 21.10.2.8.7. `mysqli_stmt::data_seek`, `mysqli_stmt_data_seek`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::data_seek`

### `mysqli_stmt_data_seek`

Seeks to an arbitrary row in statement result set

## Description

Object oriented style

```
void mysqli_stmt::data_seek(int offset);
```

Procedural style

```
void mysqli_stmt_data_seek(mysqli_stmt stmt,
 int offset);
```

Seeks to an arbitrary result pointer in the statement result set.

`mysqli_stmt_store_result` must be called prior to `mysqli_stmt_data_seek`.

## Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> .
<code>offset</code>	Must be between zero and the total number of rows minus one (0.. <code>mysqli_stmt_num_rows</code> - 1).

## Return Values

No value is returned.

## Examples

### Example 21.117. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

 /* execute query */
 $stmt->execute();

 /* bind result variables */
 $stmt->bind_result($name, $code);

 /* store result */
 $stmt->store_result();

 /* seek to row no. 400 */
 $stmt->data_seek(399);

 /* fetch values */
 $stmt->fetch();

 printf ("City: %s Countrycode: %s\n", $name, $code);

 /* close statement */
 $stmt->close();
}

/* close connection */
$mysqli->close();
```

```
?>
```

### Example 21.118. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

 /* execute query */
 mysqli_stmt_execute($stmt);

 /* bind result variables */
 mysqli_stmt_bind_result($stmt, $name, $code);

 /* store result */
 mysqli_stmt_store_result($stmt);

 /* seek to row no. 400 */
 mysqli_stmt_data_seek($stmt, 399);

 /* fetch values */
 mysqli_stmt_fetch($stmt);

 printf ("City: %s Countrycode: %s\n", $name, $code);

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
City: Benin City Countrycode: NGA
```

### See Also

[mysqli\\_prepare](#)

#### 21.10.2.8.8. `mysqli_stmt->errno`, `mysqli_stmt_errno`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt->errno](#)
- [mysqli\\_stmt\\_errno](#)

Returns the error code for the most recent statement call

### Description

Object oriented style

```
mysqli_stmt {
```

```

 int errno ;
}
```

### Procedural style

```
int mysqli_stmt_errno(mysqli_stmt stmt);
```

Returns the error code for the most recently invoked statement function that can succeed or fail.

Client error message numbers are listed in the MySQL [errmsg.h](#) header file, server error message numbers are listed in [mysqld\\_error.h](#). In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld\\_error.txt](#).

### Parameters

*stmt* Procedural style only: A statement identifier returned by [mysqli\\_stmt\\_init](#).

### Return Values

An error code value. Zero means no error occurred.

### Examples

#### Example 21.119. Object oriented style

```

<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

 /* drop table */
 $mysqli->query("DROP TABLE myCountry");

 /* execute query */
 $stmt->execute();

 printf("Error: %d.\n", $stmt->errno);

 /* close statement */
 $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

#### Example 21.120. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
```

```

mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {
 /* drop table */
 mysqli_query($link, "DROP TABLE myCountry");

 /* execute query */
 mysqli_stmt_execute($stmt);

 printf("Error: %d.\n", mysqli_stmt_errno($stmt));

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Error: 1146.
```

## See Also

[mysqli\\_stmt\\_error](#)  
[mysqli\\_stmt\\_sqlstate](#)

### 21.10.2.8.9. `mysqli_stmt->error`, `mysqli_stmt_error`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt->error](#)
- [mysqli\\_stmt\\_error](#)

Returns a string description for last statement error

#### Description

Object oriented style

```

mysqli_stmt {
 string error ;
}

```

Procedural style

```
string mysqli_stmt_error(mysqli_stmt stmt);
```

Returns a containing the error message for the most recently invoked statement function that can succeed or fail.

#### Parameters

`stmt`

Procedural style only: A statement identifier returned by [mysqli\\_stmt\\_init](#).

#### Return Values

A string that describes the error. An empty string if no error occurred.

### Examples

#### Example 21.121. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

 /* drop table */
 $mysqli->query("DROP TABLE myCountry");

 /* execute query */
 $stmt->execute();

 printf("Error: %s.\n", $stmt->error);

 /* close statement */
 $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

#### Example 21.122. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

 /* drop table */
 mysqli_query($link, "DROP TABLE myCountry");

 /* execute query */
 mysqli_stmt_execute($stmt);

 printf("Error: %s.\n", mysqli_stmt_error($stmt));

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Error: Table 'world.myCountry' doesn't exist.
```

**See Also**

[mysqli\\_stmt\\_errno](#)  
[mysqli\\_stmt\\_sqlstate](#)

**21.10.2.8.10. mysqli\_stmt::execute, mysqli\_stmt\_execute**

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::execute](#)

[mysqli\\_stmt\\_execute](#)

Executes a prepared Query

**Description**

Object oriented style

```
bool mysqli_stmt::execute();
```

Procedural style

```
bool mysqli_stmt_execute(mysqli_stmt stmt);
```

Executes a query that has been previously prepared using the [mysqli\\_prepare](#) function. When executed any parameter markers which exist will automatically be replaced with the appropriate data.

If the statement is [UPDATE](#), [DELETE](#), or [INSERT](#), the total number of affected rows can be determined by using the [mysqli\\_stmt\\_affected\\_rows](#) function. Likewise, if the query yields a result set the [mysqli\\_stmt\\_fetch](#) function is used.

**Note**

When using [mysqli\\_stmt\\_execute](#), the [mysqli\\_stmt\\_fetch](#) function must be used to fetch the data prior to performing any additional queries.

**Parameters**

*stmt*

Procedural style only: A statement identifier returned by [mysqli\\_stmt\\_init](#).

**Return Values**

Returns [TRUE](#) on success or [FALSE](#) on failure.

**Examples****Example 21.123. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
```

```

$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?, ?, ?)";
$stmt = $mysqli->prepare($query);

$stmt->bind_param("sss", $val1, $val2, $val3);

$val1 = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
$stmt->execute();

$val1 = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
$stmt->execute();

/* close statement */
$stmt->close();

/* retrieve all rows from myCity */
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = $mysqli->query($query)) {
 while ($row = $result->fetch_row()) {
 printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
 }
 /* free result set */
 $result->close();
}

/* remove table */
$mysqli->query("DROP TABLE myCity");

/* close connection */
$mysqli->close();
?>

```

### Example 21.124. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?, ?, ?)";
$stmt = mysqli_prepare($link, $query);

mysqli_stmt_bind_param($stmt, "sss", $val1, $val2, $val3);

$val1 = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
mysqli_stmt_execute($stmt);

$val1 = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
mysqli_stmt_execute($stmt);

/* close statement */
mysqli_stmt_close($stmt);

/* retrieve all rows from myCity */
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = mysqli_query($link, $query)) {
 while ($row = mysqli_fetch_row($result)) {
 printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
 }
 /* free result set */
 mysqli_free_result($result);
}

/* remove table */
mysqli_query($link, "DROP TABLE myCity");

```

```
/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Stuttgart (DEU,Baden-Wuerttemberg)
Bordeaux (FRA,Aquitaine)
```

### 21.10.2.8.11. mysqli\_stmt::fetch, mysqli\_stmt\_fetch

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::fetch](#)  
[mysqli\\_stmt\\_fetch](#)

Fetch results from a prepared statement into the bound variables

#### Description

Object oriented style

```
bool mysqli_stmt::fetch();
```

Procedural style

```
bool mysqli_stmt_fetch(mysqli_stmt $stmt);
```

Fetch the result from a prepared statement into the variables bound by [mysqli\\_stmt\\_bind\\_result](#).

#### Note

Note that all columns must be bound by the application before calling [mysqli\\_stmt\\_fetch](#).

#### Note

Data are transferred unbuffered without calling [mysqli\\_stmt\\_store\\_result](#) which can decrease performance (but reduces memory cost).

#### Parameters

`stmt` Procedural style only: A statement identifier returned by [mysqli\\_stmt\\_init](#).

#### Return Values

**Table 21.13. Return Values**

Value	Description
<code>TRUE</code>	Success. Data has been fetched
<code>FALSE</code>	Error occurred

Value	Description
NULL	No more rows/data exists or data truncation occurred

### Examples

#### Example 21.125. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = $mysqli->prepare($query)) {
 /* execute statement */
 $stmt->execute();

 /* bind result variables */
 $stmt->bind_result($name, $code);

 /* fetch values */
 while ($stmt->fetch()) {
 printf ("%s (%s)\n", $name, $code);
 }

 /* close statement */
 $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

#### Example 21.126. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = mysqli_prepare($link, $query)) {

 /* execute statement */
 mysqli_stmt_execute($stmt);

 /* bind result variables */
 mysqli_stmt_bind_result($stmt, $name, $code);

 /* fetch values */
 while (mysqli_stmt_fetch($stmt)) {
 printf ("%s (%s)\n", $name, $code);
 }

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Rockford (USA)
Tallahassee (USA)
Salinas (USA)
Santa Clarita (USA)
Springfield (USA)
```

### 21.10.2.8.12. mysqli\_stmt->field\_count, mysqli\_stmt\_field\_count

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt->field\\_count](#)
- [mysqli\\_stmt\\_field\\_count](#)

Returns the number of field in the given statement

#### Description

Object oriented style

```
mysqli_stmt {
 int field_count ;
}
```

Procedural style

```
int mysqli_stmt_field_count(mysqli_stmt stmt);
```

#### Warning

This function is currently not documented; only its argument list is available.

### 21.10.2.8.13. mysqli\_stmt::free\_result, mysqli\_stmt\_free\_result

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::free\\_result](#)
- [mysqli\\_stmt\\_free\\_result](#)

Frees stored result memory for the given statement handle

#### Description

Object oriented style

```
void mysqli_stmt::free_result();
```

Procedural style

```
void mysqli_stmt_free_result(mysqli_stmt stmt);
```

Frees the result memory associated with the statement, which was allocated by [mysqli\\_stmt\\_store\\_result](#).

**Parameters**

*stmt* Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

**Return Values**

No value is returned.

**See Also**

`mysqli_stmt_store_result`

**21.10.2.8.14. `mysqli_stmt::get_warnings`, `mysqli_stmt_get_warnings`**

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::get_warnings`

`mysqli_stmt_get_warnings`

Get result of SHOW WARNINGS

**Description**

Object oriented style

```
object mysqli_stmt::get_warnings(mysqli_stmt stmt);
```

Procedural style

```
object mysqli_stmt_get_warnings(mysqli_stmt stmt);
```

**Warning**

This function is currently not documented; only its argument list is available.

**21.10.2.8.15. `mysqli_stmt->insert_id`, `mysqli_stmt_insert_id`**

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt->insert_id`

`mysqli_stmt_insert_id`

Get the ID generated from the previous INSERT operation

**Description**

Object oriented style

```
mysqli_stmt {
 int insert_id ;
}
```

Procedural style

```
mixed mysqli_stmt_insert_id(mysqli_stmt stmt);
```

**Warning**

This function is currently not documented; only its argument list is available.

## 21.10.2.8.16. mysqli\_stmt::num\_rows, mysqli\_stmt\_num\_rows

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::num_rows`

`mysqli_stmt_num_rows`

Return the number of rows in statements result set

### Description

Object oriented style

```
mysqli_stmt {
 int num_rows ;
}
```

Procedural style

```
int mysqli_stmt_num_rows(mysqli_stmt stmt);
```

Returns the number of rows in the result set. The use of `mysqli_stmt_num_rows` depends on whether or not you used `mysqli_stmt_store_result` to buffer the entire result set in the statement handle.

If you use `mysqli_stmt_store_result`, `mysqli_stmt_num_rows` may be called immediately.

### Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> .
-------------------	-------------------------------------------------------------------------------------------

### Return Values

An integer representing the number of rows in result set.

### Examples

#### Example 21.127. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

 /* execute query */
 $stmt->execute();

 /* store result */
 $stmt->store_result();

 printf("Number of rows: %d.\n", $stmt->num_rows);

 /* close statement */
 $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

### Example 21.128. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

 /* execute query */
 mysqli_stmt_execute($stmt);

 /* store result */
 mysqli_stmt_store_result($stmt);

 printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Number of rows: 20.
```

#### See Also

#### 21.10.2.8.17. [mysqli\\_stmt->param\\_count](#), [mysqli\\_stmt\\_param\\_count](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt->param\\_count](#)

[mysqli\\_stmt\\_param\\_count](#)

Returns the number of parameter for the given statement

#### Description

Object oriented style

```
mysqli_stmt {
 int param_count ;
}
```

Procedural style

```
int mysqli_stmt_param_count(mysqli_stmt stmt);
```

Returns the number of parameter markers present in the prepared statement.

### Parameters

`stmt` Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

### Return Values

Returns an integer representing the number of parameters.

### Examples

#### Example 21.129. Object oriented style

```
<?php
$stmt = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}
if ($stmt = $mysqli->prepare("SELECT Name FROM Country WHERE Name=? OR Code=?")) {
 $marker = $stmt->param_count;
 printf("Statement has %d markers.\n", $marker);
 /* close statement */
 $stmt->close();
}
/* close connection */
$mysqli->close();
?>
```

#### Example 21.130. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}
if ($stmt = mysqli_prepare($link, "SELECT Name FROM Country WHERE Name=? OR Code=?")) {
 $marker = mysqli_stmt_param_count($stmt);
 printf("Statement has %d markers.\n", $marker);
 /* close statement */
 mysqli_stmt_close($stmt);
}
/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Statement has 2 markers.
```

**See Also**

[mysqli\\_prepare](#)

### 21.10.2.8.18. `mysqli_stmt::prepare`, `mysqli_stmt_prepare`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::prepare](#)

[mysqli\\_stmt\\_prepare](#)

Prepare an SQL statement for execution

**Description**

Object oriented style

```
mixed mysqli_stmt::prepare(string query);
```

Procedural style

```
bool mysqli_stmt_prepare(mysqli_stmt stmt,
 string query);
```

Prepares the SQL query pointed to by the null-terminated string `query`.

The parameter markers must be bound to application variables using [mysqli\\_stmt\\_bind\\_param](#) and/or [mysqli\\_stmt\\_bind\\_result](#) before executing the statement or fetching rows.

**Note**

In the case where you pass a statement to [mysqli\\_stmt\\_prepare](#) that is longer than `max_allowed_packet` of the server, the returned error codes are different depending on whether you are using MySQL Native Driver ([mysqlnd](#)) or MySQL Client Library ([libmysql](#)). The behavior is as follows:

- `mysqlnd` on Linux returns an error code of 1153. The error message means “got a packet bigger than `max_allowed_packet` bytes”.
- `mysqlnd` on Windows returns an error code 2006. This error message means “server has gone away”.
- `libmysql` on all platforms returns an error code 2006. This error message means “server has gone away”.

**Parameters**

`stmt`

Procedural style only: A statement identifier returned by [mysqli\\_stmt\\_init](#).

`query`

The query, as a string. It must consist of a single SQL statement.

You can include one or more parameter markers in the SQL statement by embedding question mark (?) characters at the appropriate positions.

**Note**

You should not add a terminating semicolon or \g to the statement.

**Note**

The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value.

However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a `SELECT` statement), or to specify both operands of a binary operator such as the = equal

sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Examples

#### Example 21.131. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = $mysqli->stmt_init();
if ($stmt->prepare("SELECT District FROM City WHERE Name=?")) {

 /* bind parameters for markers */
 $stmt->bind_param("s", $city);

 /* execute query */
 $stmt->execute();

 /* bind result variables */
 $stmt->bind_result($district);

 /* fetch value */
 $stmt->fetch();

 printf("%s is in district %s\n", $city, $district);
}

/* close statement */
$stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

#### Example 21.132. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = mysqli_stmt_init($link);
if (mysqli_stmt_prepare($stmt, 'SELECT District FROM City WHERE Name=?')) {

 /* bind parameters for markers */
 mysqli_stmt_bind_param($stmt, "s", $city);

 /* execute query */
 mysqli_stmt_execute($stmt);

 /* bind result variables */
 mysqli_stmt_bind_result($stmt, $district);

 /* fetch value */
 mysqli_stmt_fetch($stmt);

 printf("%s is in district %s\n", $city, $district);
}
```

```

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Amersfoort is in district Utrecht
```

### 21.10.2.8.19. `mysqli_stmt::reset`, `mysqli_stmt_reset`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::reset](#)

[mysqli\\_stmt\\_reset](#)

Resets a prepared statement

#### Description

Object oriented style

```
bool mysqli_stmt::reset();
```

Procedural style

```
bool mysqli_stmt_reset(mysqli_stmt $stmt);
```

Resets a prepared statement on client and server to state after prepare.

It resets the statement on the server, data sent using [mysqli\\_stmt\\_send\\_long\\_data](#), unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To prepare a statement with another query use function [mysqli\\_stmt\\_prepare](#).

#### Parameters

`stmt`

Procedural style only: A statement identifier returned by [mysqli\\_stmt\\_init](#).

#### Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

## See Also

[mysqli\\_prepare](#)

### 21.10.2.8.20. `mysqli_stmt::result_metadata`, `mysqli_stmt_result_metadata`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::result_metadata`

`mysqli_stmt_result_metadata`

Returns result set metadata from a prepared statement

## Description

Object oriented style

```
mysqli_result mysqli_stmt::result_metadata();
```

Procedural style

```
mysqli_result mysqli_stmt_result_metadata(mysqli_stmt stmt);
```

If a statement passed to `mysqli_prepare` is one that produces a result set, `mysqli_stmt_result_metadata` returns the result object that can be used to process the meta information such as total number of fields and individual field information.

### Note

This result set pointer can be passed as an argument to any of the field-based functions that process result set metadata, such as:

- `mysqli_num_fields`
- `mysqli_fetch_field`
- `mysqli_fetch_field_direct`
- `mysqli_fetch_fields`
- `mysqli_field_count`
- `mysqli_field_seek`
- `mysqli_field_tell`
- `mysqli_free_result`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysqli_free_result`

### Note

The result set returned by `mysqli_stmt_result_metadata` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysqli_stmt_fetch`.

## Parameters

`stmt` Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

## Return Values

Returns a result object or `FALSE` if an error occurred.

## Examples

### Example 21.133. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");
```

```
$mysqli->query("DROP TABLE IF EXISTS friends");
$mysqli->query("CREATE TABLE friends (id int, name varchar(20))");

$stmt = $mysqli->prepare("SELECT id, name FROM friends");
$stmt->execute();

/* get resultset for metadata */
$result = $stmt->result_metadata();

/* retrieve field information from metadata result set */
$field = $result->fetch_field();

printf("Fieldname: %s\n", $field->name);

/* close resultset */
$result->close();

/* close connection */
$mysqli->close();
?>
```

**Example 21.134. Procedural style**

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");

mysqli_query($link, "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = mysqli_prepare($link, "SELECT id, name FROM friends");
mysqli_stmt_execute($stmt);

/* get resultset for metadata */
$result = mysqli_stmt_result_metadata($stmt);

/* retrieve field information from metadata result set */
$field = mysqli_fetch_field($result);

printf("Fieldname: %s\n", $field->name);

/* close resultset */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>
```

**21.10.2.8.21. mysqli\_stmt::send\_long\_data, mysqli\_stmt\_send\_long\_data**

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::send\\_long\\_data](#)

[mysqli\\_stmt\\_send\\_long\\_data](#)

Send data in blocks

**Description**

Object oriented style

```
bool mysqli_stmt::send_long_data(int param_nr,
 string data);
```

### Procedural style

```
bool mysqli_stmt_send_long_data(mysqli_stmt stmt,
 int param_nr,
 string data);
```

Allows to send parameter data to the server in pieces (or chunks), e.g. if the size of a blob exceeds the size of [max\\_allowed\\_packet](#). This function can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the TEXT or BLOB datatypes.

### Parameters

<i>stmt</i>	Procedural style only: A statement identifier returned by <a href="#">mysqli_stmt_init</a> .
<i>param_nr</i>	Indicates which parameter to associate the data with. Parameters are numbered beginning with 0.
<i>data</i>	A string containing data to be sent.

### Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

### Examples

#### Example 21.135. Object oriented style

```
<?php
$stmt = $mysqli->prepare("INSERT INTO messages (message) VALUES (?)");
$stmt->bind_param("b", $null);
$fp = fopen("messages.txt", "r");
while (!feof($fp)) {
 $stmt->send_long_data(0, fread($fp, 8192));
}
fclose($fp);
$stmt->execute();
?>
```

### 21.10.2.8.22. [mysqli\\_stmt::sqlstate](#), [mysqli\\_stmt\\_sqlstate](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::sqlstate](#)
- [mysqli\\_stmt\\_sqlstate](#)

Returns SQLSTATE error from previous statement operation

### Description

Object oriented style

```
mysqli_stmt {
 string sqlstate ;
}
```

### Procedural style

```
string mysqli_stmt_sqlstate(mysqli_stmt stmt);
```

Returns a string containing the SQLSTATE error code for the most recently invoked prepared statement function that can succeed or fail. The error code consists of five characters. '00000' means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see <http://dev.mysql.com/doc/mysql/en/error-handling.html>.

### Parameters

**stmt** Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

### Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error.

### Notes

#### Note

Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for unmapped errors.

### Examples

#### Example 21.136. Object oriented style

```
<?php
/* Open a connection */
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno()) {
 printf("Connect failed: %s\n", $link->connect_error());
 exit();
}

$link->query("CREATE TABLE myCountry LIKE Country");
$link->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
$stmt = $link->prepare($query);

/* drop table */
$link->query("DROP TABLE myCountry");

/* execute query */
$stmt->execute();

printf("Error: %s.\n", $stmt->sqlstate);

/* close statement */
$stmt->close();
}

/* close connection */
$link->close();
?>
```

### Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");
```

```
$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

 /* drop table */
 mysqli_query($link, "DROP TABLE myCountry");

 /* execute query */
 mysqli_stmt_execute($stmt);

 printf("Error: %s.\n", mysqli_stmt_sqlstate($stmt));

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Error: 42S02.
```

### 21.10.2.8.23. `mysqli_stmt::store_result`, `mysqli_stmt_store_result`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_stmt::store\\_result](#)  
[mysqli\\_stmt\\_store\\_result](#)

Transfers a result set from a prepared statement

#### Description

Object oriented style

```
bool mysqli_stmt::store_result();
```

Procedural style

```
bool mysqli_stmt_store_result(mysqli_stmt stmt);
```

You must call `mysqli_stmt_store_result` for every query that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`), and only if you want to buffer the complete result set by the client, so that the subsequent `mysqli_stmt_fetch` call returns buffered data.

#### Note

It is unnecessary to call `mysqli_stmt_store_result` for other queries, but if you do, it will not harm or cause any notable performance in all cases. You can detect whether the query produced a result set by checking if `mysqli_stmt_result_metadata` returns `NULL`.

#### Parameters

`stmt`

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

## Return Values

Returns **TRUE** on success or **FALSE** on failure.

## Examples

### Example 21.137. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
$stmt = $mysqli->prepare($query);

/* execute query */
$stmt->execute();

/* store result */
$stmt->store_result();

printf("Number of rows: %d.\n", $stmt->num_rows);

/* free result */
$stmt->free_result();

/* close statement */
$stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

## Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

 /* execute query */
 mysqli_stmt_execute($stmt);

 /* store result */
 mysqli_stmt_store_result($stmt);

 printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

 /* free result */
 mysqli_stmt_free_result($stmt);

 /* close statement */
 mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Number of rows: 20.
```

 mixed mysqli_result::fetch_row();

 int mysqli_num_fields(mysqli_result result);

 bool mysqli_result::field_seek(int fieldnr);

 void mysqli_result::free();

 array mysqli_fetch_lengths(mysqli_result result);

 int mysqli_num_rows(mysqli_result result);
}
```

#### 21.10.2.9.1. [mysqli\\_result->current\\_field](#), [mysqli\\_field\\_tell](#)

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result->current_field`  
`mysqli_field_tell`

Get current field offset of a result pointer

### Description

Object oriented style

```
mysqli_result {
 int current_field ;
}
```

Procedural style

```
int mysqli_field_tell(mysqli_result result);
```

Returns the position of the field cursor used for the last `mysqli_fetch_field` call. This value can be used as an argument to `mysqli_field_seek`.

### Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

### Return Values

Returns current offset of field cursor.

### Examples

#### Example 21.138. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $mysqli->query($query)) {

 /* Get field information for all columns */
 while ($finfo = $result->fetch_field()) {

 /* get fieldpointer offset */
 $currentfield = $result->current_field;

 printf("Column %d:\n", $currentfield);
 printf("Name: %s\n", $finfo->name);
 printf("Table: %s\n", $finfo->table);
 printf("max. Len: %d\n", $finfo->max_length);
 printf("Flags: %d\n", $finfo->flags);
 printf("Type: %d\n", $finfo->type);
 }
 $result->close();
}

/* close connection */
$mysqli->close();
?>
```

### Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

 /* Get field information for all fields */
 while ($finfo = mysqli_fetch_field($result)) {

 /* get fieldpointer offset */
 $currentfield = mysqli_field_tell($result);

 printf("Column %d:\n", $currentfield);
 printf("Name: %s\n", $finfo->name);
 printf("Table: %s\n", $finfo->table);
 printf("max. Len: %d\n", $finfo->max_length);
 printf("Flags: %d\n", $finfo->flags);
 printf("Type: %d\n\n", $finfo->type);
 }
 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Column 1:
Name: Name
Table: Country
max. Len: 11
Flags: 1
Type: 254

Column 2:
Name: SurfaceArea
Table: Country
max. Len: 10
Flags: 32769
Type: 4
```

### See Also

## 21.10.2.9.2. `mysqli_result::data_seek`, `mysqli_data_seek`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_result::data\\_seek](#)  
[mysqli\\_data\\_seek](#)

Adjusts the result pointer to an arbitrary row in the result

### Description

Object oriented style

```
bool mysqli_result::data_seek(int offset);
```

### Procedural style

```
bool mysqli_data_seek(mysqli_result result,
 int offset);
```

The `mysqli_data_seek` function seeks to an arbitrary result pointer specified by the `offset` in the result set.

#### Parameters

`result` Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

`offset` The field offset. Must be between zero and the total number of rows minus one (`0..mysqli_num_rows - 1`).

#### Return Values

Returns `TRUE` on success or `FALSE` on failure.

#### Notes

##### Note

This function can only be used with buffered results attained from the use of the `mysqli_store_result` or `mysqli_query` functions.

#### Examples

##### Example 21.139. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($result = $mysqli->query($query)) {

 /* seek to row no. 400 */
 $result->data_seek(399);

 /* fetch row */
 $row = $result->fetch_row();

 printf ("City: %s Countrycode: %s\n", $row[0], $row[1]);

 /* free result set*/
 $result->close();
}

/* close connection */
$mysqli->close();
?>
```

### Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($result = mysqli_query($link, $query)) {
```

```

/* seek to row no. 400 */
mysqli_data_seek($result, 399);

/* fetch row */
$row = mysqli_fetch_row($result);

printf ("City: %s Countrycode: %s\n", $row[0], $row[1]);

/* free result set*/
mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
City: Benin City Countrycode: NGA
```

## See Also

[mysqli\\_query](#)  
[mysqli\\_num\\_rows](#)

### 21.10.2.9.3. `mysqli_result::fetch_all`, `mysqli_fetch_all`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_result::fetch\\_all](#)

[mysqli\\_fetch\\_all](#)

Fetches all result rows as an associative array, a numeric array, or both

#### Description

Object oriented style

```
mixed mysqli_result::fetch_all(int resulttype= MYSQLI_NUM);
```

Procedural style

```
mixed mysqli_fetch_all(mysqli_result result,
 int resulttype= MYSQLI_NUM);
```

[mysqli\\_fetch\\_all](#) fetches all result rows and returns the result set as an associative array, a numeric array, or both.

#### Parameters

*result*

Procedural style only: A result set identifier returned by [mysqli\\_query](#), [mysqli\\_store\\_result](#) or [mysqli\\_use\\_result](#).

*resulttype*

This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants [MYSQLI\\_ASSOC](#), [MYSQLI\\_NUM](#), or [MYSQLI\\_BOTH](#).

## Return Values

Returns an array of associative or numeric arrays holding result rows.

### MySQL Native Driver Only

Available only with [mysqlnd](#).

As [mysqli\\_fetch\\_all](#) returns all the rows as an array in a single step, it may consume more memory than some similar functions such as [mysqli\\_fetch\\_array](#), which only returns one row at a time from the result set. Further, if you need to iterate over the result set, you will need a looping construct that will further impact performance. For these reasons [mysqli\\_fetch\\_all](#) should only be used in those situations where the fetched result set will be sent to another layer for processing.

### See Also

[mysqli\\_fetch\\_array](#)  
[mysqli\\_query](#)

## 21.10.2.9.4. [mysqli\\_result::fetch\\_array](#), [mysqli\\_fetch\\_array](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_result::fetch\\_array](#)  
[mysqli\\_fetch\\_array](#)

Fetch a result row as an associative, a numeric array, or both

### Description

Object oriented style

```
mixed mysqli_result::fetch_array(int resulttype= MYSQLI_BOTH);
```

Procedural style

```
mixed mysqli_fetch_array(mysqli_result $result,
 int $resulttype= MYSQLI_BOTH);
```

Returns an array that corresponds to the fetched row or [NULL](#) if there are no more rows for the resultset represented by the [result](#) parameter.

[mysqli\\_fetch\\_array](#) is an extended version of the [mysqli\\_fetch\\_row](#) function. In addition to storing the data in the numeric indices of the result array, the [mysqli\\_fetch\\_array](#) function can also store the data in associative indices, using the field names of the result set as keys.

### Note

Field names returned by this function are *case-sensitive*.

### Note

This function sets NULL fields to the PHP [NULL](#) value.

If two or more columns of the result have the same field names, the last column will take precedence and overwrite the earlier data. In order to access multiple columns with the same name, the numerically indexed version of the row must be used.

### Parameters

**`result`** Procedural style only: A result set identifier returned by [mysqli\\_query](#), [mysqli\\_store\\_result](#) or [mysqli\\_use\\_result](#).

**`resulttype`** This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants [MYSQLI\\_ASSOC](#), [MYSQLI\\_NUM](#), or [MYSQLI\\_BOTH](#).

By using the `MYSQLI_ASSOC` constant this function will behave identically to the `mysqli_fetch_assoc`, while `MYSQLI_NUM` will behave identically to the `mysqli_fetch_row` function. The final option `MYSQLI_BOTH` will create a single array with the attributes of both.

## Return Values

Returns an array of strings that corresponds to the fetched row or `NULL` if there are no more rows in resultset.

## Examples

### Example 21.140. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = $mysqli->query($query);

/* numeric array */
$row = $result->fetch_array(MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = $result->fetch_array(MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = $result->fetch_array(MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
$result->close();

/* close connection */
$mysqli->close();
?>
```

## Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = mysqli_query($link, $query);

/* numeric array */
$row = mysqli_fetch_array($result, MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = mysqli_fetch_array($result, MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = mysqli_fetch_array($result, MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Kabul (AFG)
Qandahar (AFG)
Herat (AFG)
```

**See Also**

[mysqli\\_fetch\\_assoc](#)  
[mysqli\\_fetch\\_row](#)  
[mysqli\\_fetch\\_object](#)  
[mysqli\\_query](#)  
[mysqli\\_data\\_seek](#)

**21.10.2.9.5. mysqli\_result::fetch\_assoc, mysqli\_fetch\_assoc**

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_result::fetch\\_assoc](#)

[mysqli\\_fetch\\_assoc](#)

Fetch a result row as an associative array

**Description**

Object oriented style

```
array mysqli_result::fetch_assoc();
```

Procedural style

```
array mysqli_fetch_assoc(mysqli_result $result);
```

Returns an associative array that corresponds to the fetched row or [NULL](#) if there are no more rows.

**Note**

Field names returned by this function are *case-sensitive*.

**Note**

This function sets NULL fields to the PHP [NULL](#) value.

**Parameters**

***result*** Procedural style only: A result set identifier returned by [mysqli\\_query](#), [mysqli\\_store\\_result](#) or [mysqli\\_use\\_result](#).

**Return Values**

Returns an associative array of strings representing the fetched row in the result set, where each key in the array represents the name of one of the result set's columns or [NULL](#) if there are no more rows in resultset.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using [mysqli\\_fetch\\_row](#) or add alias names.

**Examples**

### Example 21.141. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

 /* fetch associative array */
 while ($row = $result->fetch_assoc()) {
 printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
 }

 /* free result set */
 $result->close();
}

/* close connection */
$mysqli->close();
?>
```

### Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

 /* fetch associative array */
 while ($row = mysqli_fetch_assoc($result)) {
 printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
 }

 /* free result set */
 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

## 21.10.2.9.6. `mysqli_result::fetch_field_direct`, `mysqli_fetch_field_direct`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::fetch_field_direct`

`mysqli_fetch_field_direct`

Fetch meta-data for a single field

### Description

Object oriented style

```
object mysqli_result::fetch_field_direct(int fieldnr);
```

Procedural style

```
object mysqli_fetch_field_direct(mysqli_result result,
 int fieldnr);
```

Returns an object which contains field definition information from the specified result set.

### Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

`fieldnr`

The field number. This value must be in the range from 0 to `number of fields - 1`.

### Return Values

Returns an object which contains field definition information or `FALSE` if no field information for specified `fieldnr` is available.

**Table 21.14. Object attributes**

Attribute	Description
<code>name</code>	The name of the column
<code>orgname</code>	Original column name if an alias was specified
<code>table</code>	The name of the table this field belongs to (if not calculated)
<code>orgtable</code>	Original table name if an alias was specified
<code>def</code>	The default value for this field, represented as a string
<code>max_length</code>	The maximum width of the field for the result set.
<code>length</code>	The width of the field, as specified in the table definition.
<code>charsetnr</code>	The character set number for the field.
<code>flags</code>	An integer representing the bit-flags for the field.
<code>type</code>	The data type used for this field
<code>decimals</code>	The number of decimals used (for integer fields)

### Examples

#### Example 21.142. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
```

```

if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = $mysqli->query($query)) {

 /* Get field information for column 'SurfaceArea' */
 $finfo = $result->fetch_field_direct(1);

 printf("Name: %s\n", $finfo->name);
 printf("Table: %s\n", $finfo->table);
 printf("max. Len: %d\n", $finfo->max_length);
 printf("Flags: %d\n", $finfo->flags);
 printf("Type: %d\n", $finfo->type);

 $result->close();
}

/* close connection */
$mysqli->close();
?>

```

### Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = mysqli_query($link, $query)) {

 /* Get field information for column 'SurfaceArea' */
 $finfo = mysqli_fetch_field_direct($result, 1);

 printf("Name: %s\n", $finfo->name);
 printf("Table: %s\n", $finfo->table);
 printf("max. Len: %d\n", $finfo->max_length);
 printf("Flags: %d\n", $finfo->flags);
 printf("Type: %d\n", $finfo->type);

 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Name: SurfaceArea
Table: Country
max. Len: 10
Flags: 32769
Type: 4

```

### 21.10.2.9.7. `mysqli_result::fetch_field`, `mysqli_fetch_field`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::fetch_field`

`mysqli_fetch_field`

Returns the next field in the result set

### Description

Object oriented style

```
object mysqli_result::fetch_field();
```

Procedural style

```
object mysqli_fetch_field(mysqli_result result);
```

Returns the definition of one column of a result set as an object. Call this function repeatedly to retrieve information about all columns in the result set.

### Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

### Return Values

Returns an object which contains field definition information or `FALSE` if no field information is available.

**Table 21.15. Object properties**

Property	Description
<code>name</code>	The name of the column
<code>orgname</code>	Original column name if an alias was specified
<code>table</code>	The name of the table this field belongs to (if not calculated)
<code>orgtable</code>	Original table name if an alias was specified
<code>max_length</code>	The maximum width of the field for the result set.
<code>length</code>	The width of the field, as specified in the table definition.
<code>charsetnr</code>	The character set number for the field.
<code>flags</code>	An integer representing the bit-flags for the field.
<code>type</code>	The data type used for this field
<code>decimals</code>	The number of decimals used (for integer fields)

### Examples

#### Example 21.143. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
 printf("Connect failed: %s\n", $mysqli_connect_error());
 exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

 /* Get field information for all columns */
 while ($finfo = $result->fetch_field()) {
```

```

 printf("Name: %s\n", $finfo->name);
 printf("Table: %s\n", $finfo->table);
 printf("max. Len: %d\n", $finfo->max_length);
 printf("Flags: %d\n", $finfo->flags);
 printf("Type: %d\n\n", $finfo->type);
 }
 $result->close();
}

/* close connection */
$mysqli->close();
?>

```

### Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

 /* Get field information for all fields */
 while ($finfo = mysqli_fetch_field($result)) {

 printf("Name: %s\n", $finfo->name);
 printf("Table: %s\n", $finfo->table);
 printf("max. Len: %d\n", $finfo->max_length);
 printf("Flags: %d\n", $finfo->flags);
 printf("Type: %d\n\n", $finfo->type);
 }
 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Name: Name
Table: Country
max. Len: 11
Flags: 1
Type: 254

Name: SurfaceArea
Table: Country
max. Len: 10
Flags: 32769
Type: 4

```

## 21.10.2.9.8. `mysqli_result::fetch_fields`, `mysqli_fetch_fields`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_result::fetch\\_fields](#)

**mysqli\_fetch\_fields**

Returns an array of objects representing the fields in a result set

**Description**

Object oriented style

```
array mysqli_result::fetch_fields();
```

Procedural style

```
array mysqli_fetch_fields(mysqli_result $result);
```

This function serves an identical purpose to the [mysqli\\_fetch\\_field](#) function with the single difference that, instead of returning one object at a time for each field, the columns are returned as an array of objects.

**Parameters**

`result` Procedural style only: A result set identifier returned by [mysqli\\_query](#), [mysqli\\_store\\_result](#) or [mysqli\\_use\\_result](#).

**Return Values**

Returns an array of objects which contains field definition information or [FALSE](#) if no field information is available.

**Table 21.16. Object properties**

Property	Description
<code>name</code>	The name of the column
<code>orgname</code>	Original column name if an alias was specified
<code>table</code>	The name of the table this field belongs to (if not calculated)
<code>orgtable</code>	Original table name if an alias was specified
<code>max_length</code>	The maximum width of the field for the result set.
<code>length</code>	The width of the field, as specified in the table definition.
<code>charsetnr</code>	The character set number for the field.
<code>flags</code>	An integer representing the bit-flags for the field.
<code>type</code>	The data type used for this field
<code>decimals</code>	The number of decimals used (for integer fields)

**Examples****Example 21.144. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error);
 exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $mysqli->query($query)) {

 /* Get field information for all columns */
 $finfo = $result->fetch_fields();

 foreach ($finfo as $val) {
```

```

 printf("Name: %s\n", $val->name);
 printf("Table: %s\n", $val->table);
 printf("max. Len: %d\n", $val->max_length);
 printf("Flags: %d\n", $val->flags);
 printf("Type: %d\n\n", $val->type);
 }
 $result->close();
}

/* close connection */
$mysqli->close();
?>

```

### Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

 /* Get field information for all columns */
 $finfo = mysqli_fetch_fields($result);

 foreach ($finfo as $val) {
 printf("Name: %s\n", $val->name);
 printf("Table: %s\n", $val->table);
 printf("max. Len: %d\n", $val->max_length);
 printf("Flags: %d\n", $val->flags);
 printf("Type: %d\n\n", $val->type);
 }
 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Name: Name
Table: Country
max. Len: 11
Flags: 1
Type: 254

Name: SurfaceArea
Table: Country
max. Len: 10
Flags: 32769
Type: 4

```

## 21.10.2.9.9. `mysqli_result::fetch_object`, `mysqli_fetch_object`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_result::fetch\\_object](#)

**mysqli\_fetch\_object**

Returns the current row of a result set as an object

**Description**

Object oriented style

```
object mysqli_result::fetch_object(string class_name,
 array params);
```

Procedural style

```
object mysqli_fetch_object(mysqli_result result,
 string class_name,
 array params);
```

The `mysqli_fetch_object` will return the current row result set as an object where the attributes of the object represent the names of the fields found within the result set.

**Parameters**

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

`class_name`

The name of the class to instantiate, set the properties of and return. If not specified, a `stdClass` object is returned.

`params`

An optional array of parameters to pass to the constructor for `class_name` objects.

**Return Values**

Returns an object with string properties that corresponds to the fetched row or `NULL` if there are no more rows in resultset.

**Note**

Field names returned by this function are *case-sensitive*.

**Note**

This function sets NULL fields to the PHP `NULL` value.

**Changelog**

Version	Description
5.0.0	Added the ability to return as a different object.

**Examples****Example 21.145. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}
$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = $mysqli->query($query)) {
 /* fetch object array */
 while ($obj = $result->fetch_object()) {
```

```

 } printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
}

/* free result set */
$result->close();
}

/* close connection */
$mysqli->close();
?>

```

### Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

 /* fetch associative array */
 while ($obj = mysqli_fetch_object($result)) {
 printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
 }

 /* free result set */
 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)

```

## 21.10.2.9.10. `mysqli_result::fetch_row`, `mysqli_fetch_row`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_result::fetch\\_row](#)

[mysqli\\_fetch\\_row](#)

Get a result row as an enumerated array

### Description

Object oriented style

```
mixed mysqli_result::fetch_row();
```

Procedural style

```
mixed mysqli_fetch_row(mysqli_result result);
```

Fetches one row of data from the result set and returns it as an enumerated array, where each column is stored in an array offset starting from 0 (zero). Each subsequent call to this function will return the next row within the result set, or `NULL` if there are no more rows.

### Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

### Return Values

`mysqli_fetch_row` returns an array of strings that corresponds to the fetched row or `NULL` if there are no more rows in result set.

#### Note

This function sets NULL fields to the PHP `NULL` value.

### Examples

#### Example 21.146. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

 /* fetch object array */
 while ($row = $result->fetch_row()) {
 printf ("%s (%s)\n", $row[0], $row[1]);
 }

 /* free result set */
 $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
 printf("Connect failed: %s\n", $link->connect_error());
 exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

 /* fetch associative array */
 while ($row = mysqli_fetch_row($result)) {
```

```

 printf ("%s (%s)\n", $row[0], $row[1]);
}

/* free result set */
mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)

```

## See Also

### 21.10.2.9.11. `mysqli_result->field_count`, `mysqli_num_fields`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_result->field\\_count](#)  
[mysqli\\_num\\_fields](#)

Get the number of fields in a result

#### Description

Object oriented style

```

mysqli_result {
 int field_count ;
}

```

Procedural style

```

int mysqli_num_fields(mysqli_result result);

```

Returns the number of fields from specified result set.

#### Parameters

`result`

Procedural style only: A result set identifier returned by [mysqli\\_query](#), [mysqli\\_store\\_result](#) or [mysqli\\_use\\_result](#).

#### Return Values

The number of fields from a result set.

## Examples

### Example 21.147. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

if ($result = $mysqli->query("SELECT * FROM City ORDER BY ID LIMIT 1")) {
 /* determine number of fields in result set */
 $field_cnt = $result->field_count;

 printf("Result set has %d fields.\n", $field_cnt);

 /* close result set */
 $result->close();
}

/* close connection */
$mysqli->close();
?>
```

### Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
 printf("Connect failed: %s\n", $link->connect_error());
 exit();
}

if ($result = mysqli_query($link, "SELECT * FROM City ORDER BY ID LIMIT 1")) {
 /* determine number of fields in result set */
 $field_cnt = mysqli_num_fields($result);

 printf("Result set has %d fields.\n", $field_cnt);

 /* close result set */
 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Result set has 5 fields.
```

### See Also

[mysqli\\_fetch\\_field](#)

### 21.10.2.9.12. [mysqli\\_result::field\\_seek](#), [mysqli\\_field\\_seek](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_result::field\\_seek](#)

**mysqli\_field\_seek**

Set result pointer to a specified field offset

**Description**

Object oriented style

```
bool mysqli_result::field_seek(int fieldnr);
```

Procedural style

```
bool mysqli_field_seek(mysqli_result result,
 int fieldnr);
```

Sets the field cursor to the given offset. The next call to [mysqli\\_fetch\\_field](#) will retrieve the field definition of the column associated with that offset.

**Note**

To seek to the beginning of a row, pass an offset value of zero.

**Parameters**

*result* Procedural style only: A result set identifier returned by [mysqli\\_query](#), [mysqli\\_store\\_result](#) or [mysqli\\_use\\_result](#).

*fieldnr* The field number. This value must be in the range from 0 to [number of fields - 1](#).

**Return Values**

Returns [TRUE](#) on success or [FALSE](#) on failure.

**Examples****Example 21.148. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error);
 exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {
 /* Get field information for 2nd column */
 $result->field_seek(1);
 $finfo = $result->fetch_field();

 printf("Name: %s\n", $finfo->name);
 printf("Table: %s\n", $finfo->table);
 printf("max. Len: %d\n", $finfo->max_length);
 printf("Flags: %d\n", $finfo->flags);
 printf("Type: %d\n\n", $finfo->type);

 $result->close();
}
/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

 /* Get field information for 2nd column */
 mysqli_field_seek($result, 1);
 $finfo = mysqli_fetch_field($result);

 printf("Name: %s\n", $finfo->name);
 printf("Table: %s\n", $finfo->table);
 printf("max. Len: %d\n", $finfo->max_length);
 printf("Flags: %d\n", $finfo->flags);
 printf("Type: %d\n\n", $finfo->type);

 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Name: SurfaceArea
Table: Country
max. Len: 10
Flags: 32769
Type: 4
```

### 21.10.2.9.13. `mysqli_result::free`, `mysqli_free_result`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli\\_result::free](#)
- [mysqli\\_free\\_result](#)

Frees the memory associated with a result

#### Description

Object oriented style

```
void mysqli_result::free();

void mysqli_result::close();

void mysqli_result::free_result();
```

Procedural style

```
void mysqli_free_result(mysqli_result result);
```

Frees the memory associated with the result.

### Note

You should always free your result with `mysqli_free_result`, when your result object is not needed anymore.

#### Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

#### Return Values

No value is returned.

#### See Also

`mysqli_query`  
`mysqli_stmt_store_result`  
`mysqli_store_result`  
`mysqli_use_result`

## 21.10.2.9.14. `mysqli_result->lengths`, `mysqli_fetch_lengths`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result->lengths`
- `mysqli_fetch_lengths`

Returns the lengths of the columns of the current row in the result set

#### Description

Object oriented style

```
mysqli_result {
 array lengths ;
}
```

Procedural style

```
array mysqli_fetch_lengths(mysqli_result result);
```

The `mysqli_fetch_lengths` function returns an array containing the lengths of every column of the current row within the result set.

#### Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

#### Return Values

An array of integers representing the size of each column (not including any terminating null characters). `FALSE` if an error occurred.

`mysqli_fetch_lengths` is valid only for the current row of the result set. It returns `FALSE` if you call it before calling `mysqli_fetch_row`/array/object or after retrieving all rows in the result.

#### Examples

**Example 21.149. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = $mysqli->query($query)) {
 $row = $result->fetch_row();

 /* display column lengths */
 foreach ($result->lengths as $i => $val) {
 printf("Field %2d has Length %2d\n", $i+1, $val);
 }
 $result->close();
}

/* close connection */
$mysqli->close();
?>
```

## Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = mysqli_query($link, $query)) {
 $row = mysqli_fetch_row($result);

 /* display column lengths */
 foreach (mysqli_fetch_lengths($result) as $i => $val) {
 printf("Field %2d has Length %2d\n", $i+1, $val);
 }
 mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Field 1 has Length 3
Field 2 has Length 5
Field 3 has Length 13
Field 4 has Length 9
Field 5 has Length 6
Field 6 has Length 1
Field 7 has Length 6
Field 8 has Length 4
Field 9 has Length 6
Field 10 has Length 6
Field 11 has Length 5
Field 12 has Length 44
Field 13 has Length 7
Field 14 has Length 3
Field 15 has Length 2
```

**21.10.2.9.15. `mysqli_result->num_rows`, `mysqli_num_rows`**

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result->num_rows`

`mysqli_num_rows`

Gets the number of rows in a result

## Description

Object oriented style

```
mysqli_result {
 int num_rows ;
}
```

Procedural style

```
int mysqli_num_rows(mysqli_result result);
```

Returns the number of rows in the result set.

The use of `mysqli_num_rows` depends on whether you use buffered or unbuffered result sets. In case you use unbuffered result sets `mysqli_num_rows` will not return the correct number of rows until all the rows in the result have been retrieved.

## Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

## Return Values

Returns number of rows in the result set.

### Note

If the number of rows is greater than maximal int value, the number will be returned as a string.

## Examples

### Example 21.150. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error);
 exit();
}

if ($result = $mysqli->query("SELECT Code, Name FROM Country ORDER BY Name")) {

 /* determine number of rows result set */
 $row_cnt = $result->num_rows;

 printf("Result set has %d rows.\n", $row_cnt);

 /* close result set */
 $result->close();
}

/* close connection */
$mysqli->close();
?>
```

### Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}
if ($result = mysqli_query($link, "SELECT Code, Name FROM Country ORDER BY Name")) {
 /* determine number of rows result set */
 $row_cnt = mysqli_num_rows($result);
 printf("Result set has %d rows.\n", $row_cnt);
 /* close result set */
 mysqli_free_result($result);
}
/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Result set has 239 rows.
```

## 21.10.2.10. The MySQLi\_Driver class ([MySQLi\\_Driver](#))

Copyright 1997-2010 the PHP Documentation Group.

MySQLi Driver.

```
MySQLi_Driver {
 MySQLi_Driver

 Properties

 public readonly string client_info ;

 public readonly string client_version ;

 public readonly string driver_version ;

 public readonly string embedded ;

 public bool reconnect ;

 public int report_mode ;

 Methods

 void mysqli_driver::embedded_server_end();

 bool mysqli_driver::embedded_server_start(bool start,
 array arguments,
 array groups);
```

```
}
```

<code>client_info</code>	The Client API header version
<code>client_version</code>	The Client version
<code>driver_version</code>	The MySQLi Driver version
<code>embedded</code>	Whether MySQLi Embedded support is enabled
<code>reconnect</code>	Allow or prevent reconnect (see the <code>mysqli.reconnect</code> INI directive)
<code>report_mode</code>	Set to <code>MYSQLI_REPORT_OFF</code> , <code>MYSQLI_REPORT_ALL</code> or any combination of <code>MYSQLI_REPORT_STRICT</code> (throw Exceptions for errors), <code>MYSQLI_REPORT_ERROR</code> (report errors) and <code>MYSQLI_REPORT_INDEX</code> (errors regarding indexes). See also <code>mysqli_report</code> .

### 21.10.2.10.1. `mysqli_driver::embedded_server_end`, `mysqli_embedded_server_end`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_driver::embedded_server_end`  
`mysqli_embedded_server_end`  
Stop embedded server

#### Description

Object oriented style

```
void mysqli_driver::embedded_server_end();
```

Procedural style

```
void mysqli_embedded_server_end();
```

#### Warning

This function is currently not documented; only its argument list is available.

- `mysqli_driver::embedded_server_start`  
`mysqli_embedded_server_start`  
Initialize and start embedded server

#### Description

Object oriented style

```
bool mysqli_driver::embedded_server_start(bool start,
 array arguments,
 array groups);
```

Procedural style

```
bool mysqli_embedded_server_start(bool start,
 array arguments,
 array groups);
```

**Warning**

This function is currently not documented; only its argument list is available.

### 21.10.2.11. The MySQLi\_Warning class ([MySQLi\\_Warning](#))

Copyright 1997-2010 the PHP Documentation Group.

Represents a MySQL warning.

```
mysqli_warning {
 mysqli_warning

 Properties

 public message;

 public sqlstate;

 public errno;

 Methods

 __construct();

 public void next();
}
```

**message** Message string

**sqlstate** SQL state

**errno** Error number

- [mysqli\\_get\\_cache\\_stats](#)  
Returns client Zval cache statistics

#### Description

```
array mysqli_get_cache_stats();
```

##### Warning

This function is currently not documented; only its argument list is available.

Returns client Zval cache statistics. Available only with [mysqlnd](#).

#### Parameters

**Return Values**

Returns an array with client Zval cache stats if success, `FALSE` otherwise.

**Examples****Example 21.151. A `mysqli_get_cache_stats` example**

```
<?php
$link = mysqli_connect();
print_r(mysqli_get_cache_stats());
?>
```

The above example will output something similar to:

```

### 21.10.2.12.17. `mysqli_report`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_report`

Enables or disables internal report functions

#### Description

```
bool mysqli_report(int flags);
```

`mysqli_report` is a powerful function to improve your queries and code during development and testing phase. Depending on the flags it reports errors from mysqli function calls or queries which don't use an index (or use a bad index).

#### Parameters

*flags***Table 21.17. Supported flags**

Name	Description
MYSQLI_REPORT_OFF	Turns reporting off
MYSQLI_REPORT_ERROR	Report errors from mysqli function calls
MYSQLI_REPORT_STRICT	Throw <code>mysqli_sql_exception</code> for errors instead of warnings
MYSQLI_REPORT_INDEX	Report if no index or bad index was used in a query
MYSQLI_REPORT_ALL	Set all options (report all)

**Return Values**

Returns `TRUE` on success or `FALSE` on failure.

**Changelog**

Version	Description
5.2.15 & 5.3.4	Changing the reporting mode is now be per-request, rather than per-process.

**Examples****Example 21.153. Object oriented style**

```
<?php
/* activate reporting */
mysqli_report(MYSQLI_REPORT_ALL);

$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
 printf("Connect failed: %s\n", $mysqli->connect_error());
 exit();
}

/* this query should report an error */
$result = $mysqli->query("SELECT Name FROM Nonexistingtable WHERE population > 50000");

/* this query should report a bad index */
$result = $mysqli->query("SELECT Name FROM City WHERE population > 50000");
$result->close();

$mysqli->close();
?>
```

## 21.10.3. MySQL Native Driver ([Mysqlind](#))

Copyright 1997-2010 the PHP Documentation Group.

This section of the manual provides an overview of the MySQL Native Driver.

### 21.10.3.1. Overview

Copyright 1997-2010 the PHP Documentation Group.

MySQL Native Driver is a replacement for the MySQL Client Library (libmysql). MySQL Native Driver is part of the official PHP sources as of PHP 5.3.0.

The MySQL database extensions MySQL extension, [mysqli](#) and PDO MYSQL all communicate with the MySQL server. In the past, this was done by the extension using the services provided by the MySQL Client Library. The extensions were compiled against the MySQL Client Library in order to use its client-server protocol.

With MySQL Native Driver there is now an alternative, as the MySQL database extensions can be compiled to use MySQL Native Driver instead of the MySQL Client Library.

MySQL Native Driver is written in C as a PHP extension.

#### *What it is not*

Although MySQL Native Driver is written as a PHP extension, it is important to note that it does not provide a new API to the PHP programmer. The programmer APIs for MySQL database connectivity are provided by the MySQL extension, [mysqli](#) and PDO MYSQL. These extensions can now use the services of MySQL Native Driver to communicate with the MySQL Server. Therefore, you should not think of MySQL Native Driver as an API.

#### *Why use it?*

Using the MySQL Native Driver offers a number of advantages over using the MySQL Client Library.

Because MySQL Native Driver is written as a PHP extension, it is tightly coupled to the workings of PHP. This leads to gains in efficiency, especially when it comes to memory usage, as the driver uses the PHP memory management system. It also supports the PHP memory limit. Using MySQL Native Driver leads to comparable or better performance than using MySQL Client Library, it always ensures the most efficient use of memory. One example of the memory efficiency is the fact that when using the MySQL Client Library, each row is stored in memory twice, whereas with the MySQL Native Driver each row is only stored once in memory.

Also, in the past, you needed to build the MySQL database extensions against a copy of the MySQL Client Library. This typically meant you needed to have MySQL installed on a machine where you were building the PHP source code. Also, when your PHP application was running, the MySQL database extensions would call down to the MySQL Client library file at run time, so the file

needed to be installed on your system. With MySQL Native Driver that is no longer the case as it is included as part of the standard distribution. So you do not need MySQL installed in order to build PHP or run PHP database applications.

With MySQL Native Driver it is also possible to write plugins. These are PHP extensions written to use the MySQL Native Driver Plugin API, and they can extend the functionality of the driver without requiring changes to application level code.

The older MySQL Client Library was written by MySQL AB (now Oracle Corporation) and so was released under the MySQL license. This ultimately led to MySQL support being disabled by default in PHP. However, the MySQL Native Driver has been developed as part of the PHP project, and is therefore released under the PHP license. This removes licensing issues that have been problematic in the past.

#### *Special features*

MySQL Native Driver also provides some special features not available when the MySQL database extensions use MySQL Client Library. These special features are listed below:

- Improved persistent connections
- The special function `mysqli_fetch_all`
- Performance statistics calls: `mysqli_get_cache_stats`, `mysqli_get_client_stats`, `mysqli_get_connection_stats`
- Asynchronous queries: `mysqli_poll`, `mysqli_reap_async_query`

The performance statistics facility can prove to be very useful in identifying performance bottlenecks.

MySQL Native Driver also allows for persistent connections when used with the `mysqli` extension.

#### *SSL Support*

MySQL Native Driver supports SSL from PHP version 5.3.3.

#### *Compressed Protocol Support*

As of PHP 5.3.2 MySQL Native Driver supports the compressed client server protocol. MySQL Native Driver did not support this in 5.3.0 and 5.3.1. Extensions such as `ext/mysql`, `ext/mysqli`, `PDO_MYSQL`, that are configured to use MySQL Native Driver, can also take advantage of this feature.

### **21.10.3.2. Installation**

[Copyright 1997-2010 the PHP Documentation Group.](#)

#### *Installation on Unix*

By default the MySQL database extensions are configured to use MySQL Client Library. In order to use the MySQL Native Driver, PHP needs to be built specifying that the MySQL database extensions are compiled with MySQL Native Driver support. This is done through configuration options prior to building the PHP source code.

For example, to build the MySQL extension, `mysqli` and PDO MYSQL using the MySQL Native Driver, the following command would be given:

```
./configure --with-mysql=mysqlnd \
--with-mysqli=mysqlnd \
--with-pdo-mysql=mysqlnd \
[other options]
```

#### *Installation on Windows*

In the official PHP distributions from 5.3 onwards, MySQL Native Driver is enabled by default, so no additional configuration is required to use it. All MySQL database extensions will use MySQL Native Driver in this case.

### **21.10.3.3. Runtime Configuration**

[Copyright 1997-2010 the PHP Documentation Group.](#)

The behaviour of these functions is affected by settings in `php.ini`.

**Table 21.18. MySQL Native Driver Configuration Options**

Name	Default	Changeable	Changelog
<code>mysqlnd.collect_statistics</code>	"1"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqlnd.collect_memory_statistics</code>	"0"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqlnd.log_mask</code>	"0"	PHP_INI_SYSTEM	Available since PHP 5.3.0.

For further details and definitions of the PHP\_INI\_\* modes, see the [configuration.changes.modes](#).

Here's a short explanation of the configuration directives.

<code>mysqlnd.collect_statistics</code> boolean	Enables the collection of various client statistics which can be accessed through <code>mysqli_get_client_stats</code> , <code>mysqli_get_connection_stats</code> , <code>mysqli_get_cache_stats</code> and are shown in <code>mysqlnd</code> section of the output of the <code>phpinfo</code> function as well.
<code>mysqlnd.collect_memory_statistics</code> boolean	This configuration setting enables all <a href="#">MySQL Native Driver statistics</a> except those relating to memory management.
<code>mysqlnd.log_mask</code> integer	Enable the collection of various memory statistics which can be accessed through <code>mysqli_get_client_stats</code> , <code>mysqli_get_connection_stats</code> , <code>mysqli_get_cache_stats</code> and are shown in <code>mysqlnd</code> section of the output of the <code>phpinfo</code> function as well.
	This configuration setting enables the memory management statistics within the overall set of <a href="#">MySQL Native Driver statistics</a> .

The PHP configuration setting `mysqlnd.log_mask` defines which queries will be logged. The default is `mysqlnd.log_mask = "0"`, which disables logging.

This setting can have values assigned according to the following table:

<code>SERVER_STATUS_IN_TRANS</code>	1
<code>SERVER_STATUS_AUTOCOMMIT</code>	2
<code>SERVER_MORE_RESULTS_EXISTS</code>	8
<code>SERVER_QUERY_NO_GOOD_INDEX_USED</code>	16
<code>SERVER_QUERY_NO_INDEX_USED</code>	32
<code>SERVER_STATUS_CURSOR_EXISTS</code>	64
<code>SERVER_STATUS_LAST_ROW_SENT</code>	128
<code>SERVER_STATUS_DB_DROPPED</code>	256
<code>SERVER_STATUS_NO_BACKSLASH_ESCAPES</code>	512
<code>SERVER_QUERY_WAS_SLOW</code>	1024

It is possible to add the values together, to log multiple query types. For example, you can set it to  $16 + 32 = 48$  to log slow queries which either use no good index (`SERVER_QUERY_NO_GOOD_INDEX_USED = 16`) or no index at all (`SERVER_QUERY_NO_INDEX_USED = 32`).

Note, the SERVER\_\* constants are MySQL internal (C-level) constants, not exported to the PHP userland. There are no corresponding PHP constants. However, you can look up the values in the table which has been created by inspecting the MySQL Native Driver source.

#### 21.10.3.4. Persistent Connections

[Copyright 1997-2010 the PHP Documentation Group](#).

*Using Persistent Connections*

The MySQL database extensions do not support persistent connections when used with the MySQL Client Library. However, they

do when using MySQL Native Driver. When creating a connection the hostname is prepended with “p:”. This is demonstrated by the following code snippet, which creates a new connection using [mysqli](#):

```
<?php
$host = "p:localhost";
$port = 3306;
$socket = "/tmp/mysql.sock";
$user = "root";
$password = "password";
$dbname = "test";

$conn = new mysqli($host, $user, $password, $dbname, $port, $socket)
 or die('Could not connect to the database server' . mysqli_connect_error());
?>
```

## 21.10.3.5. Statistics

[Copyright 1997-2010 the PHP Documentation Group.](#)

*Using Statistical Data*

MySQL Native Driver contains support for gathering statistics on the communication between the client and the server. The statistics gathered are of three main types:

- Client statistics
- Connection statistics
- Zval cache statistics

If you are using the [mysqli](#) extension, these statistics can be obtained through three API calls:

- [mysqli\\_get\\_client\\_stats](#)
- [mysqli\\_get\\_connection\\_stats](#)
- [mysqli\\_get\\_cache\\_stats](#)

### Note

Statistics are aggregated among all extensions that use MySQL Native Driver. For example, when compiling both [ext/mysql](#) and [ext/mysqli](#) against MySQL Native Driver, both function calls of [ext/mysql](#) and [ext/mysqli](#) will change the statistics. There is no way to find out how much a certain API call of any extension that has been compiled against MySQL Native Driver has impacted a certain statistic. You can configure the PDO MySQL Driver, [ext/mysql](#) and [ext/mysqli](#) to optionally use the MySQL Native Driver. When doing so, all three extensions will change the statistics.

*Accessing Client Statistics*

To access client statistics, you need to call [mysqli\\_get\\_client\\_stats](#). The function call does not require any parameters.

The function returns an associative array that contains the name of the statistic as the key and the statistical data as the value.

Client statistics can also be accessed by calling the [phpinfo](#) function.

*Accessing Connection Statistics*

To access connection statistics call [mysqli\\_get\\_connection\\_stats](#). This takes the database connection handle as the parameter.

The function returns an associative array that contains the name of the statistic as the key and the statistical data as the value.

*Accessing Zval Cache Statistics*

The MySQL Native Driver also collects statistics from its internal Zval cache. These statistics can be accessed by calling [mysqli\\_get\\_cache\\_stats](#).

The Zval cache statistics obtained may lead to a tweaking of `php.ini` settings related to the Zval cache, resulting in better performance.

#### *Buffered and Unbuffered Result Sets*

Result sets can be buffered or unbuffered. Using default settings, `ext/mysql` and `ext/mysqli` work with buffered result sets for normal (non prepared statement) queries. Buffered result sets are cached on the client. After the query execution all results are fetched from the MySQL Server and stored in a cache on the client. The big advantage of buffered result sets is that they allow the server to free all resources allocated to a result set, once the results have been fetched by the client.

Unbuffered result sets on the other hand are kept much longer on the server. If you want to reduce memory consumption on the client, but increase load on the server, use unbuffered results. If you experience a high server load and the figures for unbuffered result sets are high, you should consider moving the load to the clients. Clients typically scale better than servers. “Load” does not only refer to memory buffers - the server also needs to keep other resources open, for example file handles and threads, before a result set can be freed.

Prepared Statements use unbuffered result sets by default. However, you can use `mysqli_stmt_store_result` to enable buffered result sets.

#### *Statistics returned by MySQL Native Driver*

The following tables show a list of statistics returned by the `mysqli_get_client_stats`, `mysqli_get_connection_stats` and `mysqli_get_cache_stats` functions.

#### *Network*

Statistic	Scope	Description	Notes
<code>bytes_sent</code>	Connection	Number of bytes sent from PHP to the MySQL server	Can be used to check the efficiency of the compression protocol
<code>bytes_received</code>	Connection	Number of bytes received from MySQL server	Can be used to check the efficiency of the compression protocol
<code>packets_sent</code>	Connection	Number of MySQL Client Server protocol packets sent	Used for debugging Client Server protocol implementation
<code>packets_received</code>	Connection	Number of MySQL Client Server protocol packets received	Used for debugging Client Server protocol implementation
<code>protocol_overhead_in</code>	Connection	MySQL Client Server protocol overhead in bytes for incoming traffic. Currently only the Packet Header (4 bytes) is considered as overhead. <code>protocol_overhead_in</code> = <code>packets_received</code> * 4	Used for debugging Client Server protocol implementation
<code>protocol_overhead_out</code>	Connection	MySQL Client Server protocol overhead in bytes for outgoing traffic. Currently only the Packet Header (4 bytes) is considered as overhead. <code>protocol_overhead_out</code> = <code>packets_sent</code> * 4	Used for debugging Client Server protocol implementation
<code>bytes_received_ok_packet</code>	Connection	Total size of bytes of MySQL Client Server protocol OK packets received. OK packets can contain a status message. The length of the status message can vary and thus the size of an OK packet is not fixed.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>packets_received_ok</code>	Connection	Number of MySQL Client Server protocol OK packets received.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>bytes_received_eof_packet</code>	Connection	Total size in bytes of MySQL Client Server protocol EOF	Used for debugging CS protocol implementation. Note that

Statistic	Scope	Description	Notes
		packets received. EOF can vary in size depending on the server version. Also, EOF can transport an error message.	the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>packets_received_eof</code>	Connection	Number of MySQL Client Server protocol EOF packets. Like with other packet statistics the number of packets will be increased even if PHP does not receive the expected packet but, for example, an error message.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>bytes_received_rset_header_packet</code>	Connection	Total size in bytes of MySQL Client Server protocol result set header packets. The size of the packets varies depending on the payload ( <code>LOAD LOCAL INFILE</code> , <code>INSERT</code> , <code>UPDATE</code> , <code>SELECT</code> , error message).	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>packets_received_rset_header</code>	Connection	Number of MySQL Client Server protocol result set header packets.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>bytes_received_rset_field_meta_packet</code>	Connection	Total size in bytes of MySQL Client Server protocol result set meta data (field information) packets. Of course the size varies with the fields in the result set. The packet may also transport an error or an EOF packet in case of <code>COM_LIST_FIELDS</code> .	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>packets_received_rset_field_meta</code>	Connection	Number of MySQL Client Server protocol result set meta data (field information) packets.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>bytes_received_rset_row_packet</code>	Connection	Total size in bytes of MySQL Client Server protocol result set row data packets. The packet may also transport an error or an EOF packet. You can reverse engineer the number of error and EOF packets by subtracting <code>rows_fetched_from_server_normal</code> and <code>rows_fetched_from_server_ps</code> from <code>bytes_received_rset_row_packet</code> .	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>packets_received_rset_row</code>	Connection	Number of MySQL Client Server protocol result set row data packets and their total size in bytes.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>bytes_received_prepare_response_packet</code>	Connection	Total size in bytes of MySQL Client Server protocol OK for Prepared Statement Initialization packets (prepared statement init packets). The packet	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).

Statistic	Scope	Description	Notes
		may also transport an error. The packet size depends on the MySQL version: 9 bytes with MySQL 4.1 and 12 bytes from MySQL 5.0 on. There is no safe way to know how many errors happened. You may be able to guess that an error has occurred if, for example, you always connect to MySQL 5.0 or newer and, <code>bytes_received_prepare_response_packet != pack-ets_received_prepare_response * 12.</code> See also <code>ps_prepared_never_executed,</code> <code>ps_prepared_once_executed.</code>	overhead).
<code>pack-ets_received_prepare_response</code>	Connection	Number of MySQL Client Server protocol OK for Prepared Statement Initialization packets (prepared statement init packets).	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>bytes_received_change_user_packet</code>	Connection	Total size in bytes of MySQL Client Server protocol COM_CHANGE_USER packets. The packet may also transport an error or EOF.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>pack-ets_received_change_user</code>	Connection	Number of MySQL Client Server protocol COM_CHANGE_USER packets	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>packets_sent_command</code>	Connection	Number of MySQL Client Server protocol commands sent from PHP to MySQL. There is no way to know which specific commands and how many of them have been sent. At its best you can use it to check if PHP has sent any commands to MySQL to know if you can consider to disable MySQL support in your PHP binary. There is also no way to reverse engineer the number of errors that may have occurred while sending data to MySQL. The only error recorded is command_buffer_too_small (see below).	Only useful for debugging CS protocol implementation.

*Result Set*

Statistic	Scope	Description	Notes
<code>result_set_queries</code>	Connection	Number of queries that have generated a result set. Examples of queries that generate a result set: <code>SELECT</code> , <code>SHOW</code> .	You may use it as an indirect measure for the number of queries PHP has sent to MySQL, for example, to identi-

Statistic	Scope	Description	Notes
		The statistic will not be incremented if there is an error reading the result set header packet from the line.	fy a client that causes a high database load.
<a href="#">non_result_set_queries</a>	Connection	Number of queries that did not generate a result set. Examples of queries that do not generate a result set: <a href="#">INSERT</a> , <a href="#">UPDATE</a> , <a href="#">LOAD DATA</a> , <a href="#">SHOW</a> . The statistic will not be incremented if there is an error reading the result set header packet from the line.	You may use it an an indirect measure for the number of queries PHP has sent to MySQL, for example, to identify a client that causes a high database load.
<a href="#">no_index_used</a>	Connection	Number of queries that have generated a result set but did not use an index (see also mysqld start option <code>--log-queries-not-using-indexes</code> ). If you want these queries to be reported you can use <a href="#">mysqli_report(MYSQLI_REPORT_INDEX)</a> to make ext/mysqli throw an exception. If you prefer a warning instead of an exception use <a href="#">mysqli_report(MYSQLI_REPORT_INDEX ^ MYSQLI_REPORT_STRICT)</a> .	
<a href="#">bad_index_used</a>	Connection	Number of queries that have generated a result set and did not use a good index (see also mysqld start option <code>--log-slow-queries</code> ).	If you want these queries to be reported you can use <a href="#">mysqli_report(MYSQLI_REPORT_INDEX)</a> to make ext/mysqli throw an exception. If you prefer a warning instead of an exception use <a href="#">mysqli_report(MYSQLI_REPORT_INDEX ^ MYSQLI_REPORT_STRICT)</a>
<a href="#">slow_queries</a>	Connection	SQL statements that took more than <a href="#">long_query_time</a> seconds to execute and required at least <a href="#">min_examined_row_limit</a> rows to be examined.	Not reported through <a href="#">mysqli_report</a>
<a href="#">buffered_sets</a>	Connection	Number of buffered result sets returned by “normal” queries. “Normal” means “not prepared statement” in the following notes.	Examples of API calls that will buffer result sets on the client: <a href="#">mysql_query</a> , <a href="#">mysqli_query</a> , <a href="#">mysqli_store_result</a> , <a href="#">mysqli_stmt_get_result</a> . Buffering result sets on the client ensures that server resources are freed as soon as possible and it makes result set scrolling easier. The downside is the additional memory consumption on the client for buffering data. Note that mysqld (unlike the MySQL Client Library) respects the PHP memory limit because it uses PHP internal memory management functions to allocate memory. This is also the reason why <a href="#">memory_get_usage</a> reports

Statistic	Scope	Description	Notes
			a higher memory consumption when using mysqlnd instead of the MySQL Client Library. <a href="#">memory_get_usage</a> does not measure the memory consumption of the MySQL Client Library at all because the MySQL Client Library does not use PHP internal memory management functions monitored by the function!
<a href="#">unbuffered_sets</a>	Connection	Number of unbuffered result sets returned by normal (non prepared statement) queries.	Examples of API calls that will not buffer result sets on the client: <a href="#">mysqli_use_result</a>
<a href="#">ps_buffered_sets</a>	Connection	Number of buffered result sets returned by prepared statements. By default prepared statements are unbuffered.	Examples of API calls that will not buffer result sets on the client: <a href="#">mysqli_stmt_store_result</a>
<a href="#">ps_unbuffered_sets</a>	Connection	Number of unbuffered result sets returned by prepared statements.	By default prepared statements are unbuffered.
<a href="#">flushed_normal_sets</a>	Connection	Number of result sets from normal (non prepared statement) queries with unread data which have been flushed silently for you. Flushing happens only with unbuffered result sets.	Unbuffered result sets must be fetched completely before a new query can be run on the connection otherwise MySQL will throw an error. If the application does not fetch all rows from an unbuffered result set, mysqlnd does implicitly fetch the result set to clear the line. See also <a href="#">rows_skipped_normal</a> , <a href="#">rows_skipped_ps</a> . Some possible causes for an implicit flush: <ul style="list-style-type: none"> <li>• Faulty client application</li> <li>• Client stopped reading after it found what it was looking for but has made MySQL calculate more records than needed</li> <li>• Client application has stopped unexpectedly</li> </ul>
<a href="#">flushed_ps_sets</a>	Connection	Number of result sets from prepared statements with unread data which have been flushed silently for you. Flushing happens only with unbuffered result sets.	Unbuffered result sets must be fetched completely before a new query can be run on the connection otherwise MySQL will throw an error. If the application does not fetch all rows from an unbuffered result set, mysqlnd does implicitly fetch the result set to clear the line. See also <a href="#">rows_skipped_normal</a> , <a href="#">rows_skipped_ps</a> . Some possible causes for an implicit flush: <ul style="list-style-type: none"> <li>• Faulty client application</li> </ul>

Statistic	Scope	Description	Notes
			<ul style="list-style-type: none"> <li>Client stopped reading after it found what it was looking for but has made MySQL calculate more records than needed</li> <li>Client application has stopped unexpectedly</li> </ul>
<code>ps_prepared_never_executed</code>	Connection	Number of statements prepared but never executed.	Prepared statements occupy server resources. You should not prepare a statement if you do not plan to execute it.
<code>ps_prepared_once_executed</code>	Connection	Number of prepared statements executed only once.	One of the ideas behind prepared statements is that the same query gets executed over and over again (with different parameters) and some parsing and other preparation work can be saved, if statement execution is split up in separate prepare and execute stages. The idea is to prepare once and "cache" results, for example, the parse tree to be reused during multiple statement executions. If you execute a prepared statement only once the two stage processing can be inefficient compared to "normal" queries because all the caching means extra work and it takes (limited) server resources to hold the cached information. Consequently, prepared statements that are executed only once may cause performance hurts.
<code>rows_fetched_from_server_normal,</code> <code>rows_fetched_from_server_ps</code>	Connection	Total number of result set rows successfully fetched from MySQL regardless if the client application has consumed them or not. Some of the rows may not have been fetched by the client application but have been flushed implicitly.	See also <a href="#">pack-sets_received_rset_row</a>
<code>rows_buffered_from_client_normal,</code> <code>rows_buffered_from_client_ps</code>	Connection	Total number of successfully buffered rows originating from a "normal" query or a prepared statement. This is the number of rows that have been fetched from MySQL and buffered on client. Note that there are two distinct statistics on rows that have been buffered (MySQL to mysqlnd internal buffer) and buffered rows that have been fetched by the client application (mysqlnd internal buffer to client application). If the number of buffered rows is higher than the number of fetched buffered rows it can mean that the client application runs queries that cause larger result sets	Examples of queries that will buffer results: <a href="#">mysqli_query</a> , <a href="#">mysqli_store_result</a>

Statistic	Scope	Description	Notes
		than needed resulting in rows not read by the client.	
<code>rows_fetched_from_client_normal_buffered,</code> <code>rows_fetched_from_client_ps_buffered</code>	Connection	Total number of rows fetched by the client from a buffered result set created by a normal query or a prepared statement.	
<code>rows_fetched_from_client</code>	Connection	Total number of rows fetched by the client from an unbuffered result set created by a "normal" query or a prepared statement.	

Statistic	Scope	Description	Notes
<code>, rows_fetched_from_client_ps_unbuffered</code>			
<code>rows_fetched_from_client_ps_cursor</code>	Connection	Total number of rows fetch by the client from a cursor created by a prepared statement.	
<code>rows_skipped_normal, rows_skipped_ps</code>	Connection	Reserved for future use (currently not supported)	
<code>copy_on_write_saved, copy_on_write_performed</code>	Process	With mysqlnd, variables returned by the extensions point into mysqlnd internal network result buffers. If you do not change the variables, fetched data will be kept only once in memory. If you change the variables, mysqlnd has to perform a copy-on-write to protect the internal network result buffers from being changed. With the MySQL Client Library you always hold fetched data twice in memory. Once in the internal MySQL Client Library buffers and once in the variables returned by the extensions. In theory mysqlnd can save up to 40% memory. However, note that the memory saving cannot be measured using <code>memory_get_usage</code> .	
<code>explicit_free_result, implicit_free_result</code>	Connection, Process (only during prepared statement cleanup)	Total number of freed result sets.	The free is always considered explicit but for result sets created by an init command, for example, <code>mysqli_options(MYSQLI_INIT_COMMAND , ...)</code>
<code>proto_text_fetched_null, proto_text_fetched_bit, proto_text_fetched_tinyint proto_text_fetched_short, proto_text_fetched_int24, proto_text_fetched_int proto_text_fetched_bigint, proto_text_fetched_decimal, proto_text_fetched_float proto_text_fetched_double, proto_text_fetched_date, proto_text_fetched_year proto_text_fetched_time, proto_text_fetched_datetime, proto_text_fetched_timestamp</code>	Connection	Total number of columns of a certain type fetched from a normal query (MySQL text protocol).	Mapping from C API / MySQL meta data type to statistics name: <ul style="list-style-type: none"> <li>• <code>MYSQL_TYPE_NULL</code> - <code>proto_text_fetched_null</code></li> <li>• <code>MYSQL_TYPE_BIT</code> - <code>proto_text_fetched_bit</code></li> <li>• <code>MYSQL_TYPE_TINY</code> - <code>proto_text_fetched_tinyint</code></li> <li>• <code>MYSQL_TYPE_SHORT</code> - <code>proto_text_fetched_short</code></li> <li>• <code>MYSQL_TYPE_INT24</code> - <code>proto_text_fetched_int24</code></li> <li>• <code>MYSQL_TYPE_LONG</code> - <code>proto_text_fetched_int</code></li> <li>• <code>MYSQL_TYPE_LONGLONG</code> - <code>proto_text_fetched_bigint</code></li> <li>• <code>MYSQL_TYPE_DECIMAL</code>, <code>MYSQL_TYPE_NEWDECIMAL</code> -</li> </ul>

Statistic	Scope	Description	Notes
<code>mestamp</code> <code>proto_text_fetched_string,</code> <code>proto_text_fetched_blob,</code> <code>proto_text_fetched_enum</code> <code>proto_text_fetched_set,</code> <code>proto_text_fetched_geometry,</code> <code>proto_text_fetched_other</code>			<p>proto_text_fetched_decimal</p> <ul style="list-style-type: none"> <li>• <code>MYSQL_TYPE_FLOAT</code> - <code>proto_text_fetched_float</code></li> <li>• <code>MYSQL_TYPE_DOUBLE</code> - <code>proto_text_fetched_double</code></li> <li>• <code>MYSQL_TYPE_DATE</code>, <code>MYSQL_TYPE_NEWDATE</code> - <code>proto_text_fetched_date</code></li> <li>• <code>MYSQL_TYPE_YEAR</code> - <code>proto_text_fetched_year</code></li> <li>• <code>MYSQL_TYPE_TIME</code> - <code>proto_text_fetched_time</code></li> <li>• <code>MYSQL_TYPE_DATETIME</code> - <code>proto_text_fetched_datetime</code></li> <li>• <code>MYSQL_TYPE_TIMESTAMP</code> - <code>proto_text_fetched_timestamp</code></li> <li>• <code>MYSQL_TYPE_STRING</code>, <code>MYSQL_TYPE_VARSTRING</code>, <code>MYSQL_TYPE_VARCHAR</code> - <code>proto_text_fetched_string</code></li> <li>• <code>MYSQL_TYPE_TINY_BLOB</code>, <code>MYSQL_TYPE_MEDIUM_BLOB</code>, <code>MYSQL_TYPE_LONG_BLOB</code>, <code>MYSQL_TYPE_BLOB</code> - <code>proto_text_fetched_blob</code></li> <li>• <code>MYSQL_TYPE_ENUM</code> - <code>proto_text_fetched_enum</code></li> <li>• <code>MYSQL_TYPE_SET</code> - <code>proto_text_fetched_set</code></li> <li>• <code>MYSQL_TYPE_GEOMETRY</code> - <code>proto_text_fetched_geometry</code></li> <li>• Any <code>MYSQL_TYPE_*</code> not listed before (there should be none) - <code>proto_text_fetched_other</code></li> </ul> <p>Note that the <code>MYSQL_*</code>-type constants may not be associated with the very same SQL column types in every version of MySQL.</p>
<code>proto_binary_fetched_null,</code> <code>proto_binary_fetched_bit,</code>	Connection	Total number of columns of a certain type fetched from a prepared statement (MySQL binary protocol).	For type mapping see <code>proto_text_*</code> described in the preceding text.

Statistic	Scope	Description	Notes
<code>proto_binary_fetched_tinyint</code> <code>proto_binary_fetched_short</code> , <code>proto_binary_fetched_int24</code> , <code>proto_binary_fetched_int</code> , <code>proto_binary_fetched_bigint</code> , <code>proto_binary_fetched_decimal</code> , <code>proto_binary_fetched_float</code> , <code>proto_binary_fetched_double</code> , <code>proto_binary_fetched_date</code> , <code>proto_binary_fetched_year</code> , <code>proto_binary_fetched_time</code> , <code>proto_binary_fetched_datetime</code> , <code>proto_binary_fetched_timestamp</code> , <code>proto_binary_fetched_string</code> , <code>proto_binary_fetched_blob</code> , <code>proto_binary_fetched_enum</code> , <code>proto_binary_fetched_set</code> , <code>proto_binary_fetched_geometry</code> , <code>proto_binary_fetched_other</code>			

*Connection*

Statistic	Scope	Description	Notes
<code>connect_success</code> , <code>connect_failure</code>	Connection	Total number of successful / failed connection attempt.	Reused connections and all other kinds of connections are included.
<code>reconnect</code>	Process	Total number of (real_)connect attempts made on an already opened connection handle.	The code sequence <code>\$link = new mysqli(...); \$link-&gt;real_connect(...)</code> will cause a reconnect. But <code>\$link = new mysqli(...); \$link-&gt;connect(...)</code> will not because <code>\$link-&gt;connect(...)</code> will explicitly close the existing connection before a new connection is established.
<code>pconnect_success</code>	Connection	Total number of successful persistent connection attempts.	Note that <code>connect_success</code> holds the sum of successful persistent and non-persistent connection attempts. The number of successful non-persistent connection attempts is <code>connect_success - pconnect_success</code> .

Statistic	Scope	Description	Notes
			nect_success.
active_connections	Connection	Total number of active persistent and non-persistent connections.	
act_ive_persistent_connec_tions	Connection	Total number of active persistent connections.	The total number of active non-persistent connections is <code>active_connections - active_persistent_connections</code> .
explicit_close	Connection	Total number of explicitly closed connections (ext/mysql only).	Examples of code snippets that cause an explicit close :  <pre>\$link = new mysqli(...); \$link-&gt;close(); \$link = new mysqli(...); \$link-&gt;conn</pre>
implicit_close	Connection	Total number of implicitly closed connections (ext/mysql only).	Examples of code snippets that cause an implicit close :  <ul style="list-style-type: none"> <li><code>\$link = new mysqli(...); \$link-&gt;real_connect(...)</code></li> <li><code>unset(\$link)</code></li> <li>Persistent connection: pooled connection has been created with <code>real_connect</code> and there may be unknown options set - close implicitly to avoid returning a connection with unknown options</li> <li>Persistent connection: ping/ <code>change_user</code> fails and ext/ <code>mysqli</code> closes the connection</li> <li>end of script execution: close connections that have not been closed by the user</li> </ul>
disconnect_close	Connection	Connection failures indicated by the C API call <code>mysql_real_connect</code> during an attempt to establish a connection.	It is called <code>disconnect_close</code> because the connection handle passed to the C API call will be closed.
in_middle_of_command_close	Process	A connection has been closed in the middle of a command execution (outstanding result sets not fetched, after sending a query and before retrieving an answer, while fetching data, while transferring data with LOAD DATA).	Unless you use asynchronous queries this should only happen if your script stops unexpectedly and PHP shuts down the connections for you.
init_command_executed_count	Connection	Total number of init command executions, for example, <code>mysqli_options(MYSQLI_INIT_COMMAND , ...)</code> .	The number of successful executions is <code>init_command_executed_count - init_command_failed_count</code> .
init_command_failed_c	Connection	Total number of failed init	

Statistic	Scope	Description	Notes
<code>count</code>		commands.	

*COM\_\** Commands

Statistic	Scope	Description	Notes
<code>com_quit, com_init_db, com_query, com_field_list, com_create_db, com_drop_db, com_refresh, com_shutdown, com_statistics, com_process_info, com_connect, com_process_kill, com_debug, com_ping, com_time, com_delayed_insert, com_change_user, com_binlog_dump, com_table_dump, com_connect_out, com_register_slave, com_stmt_prepare, com_stmt_execute, com_stmt_send_long_data, com_stmt_close, com_stmt_reset, com_stmt_set_option, com_stmt_fetch, com_daemon</code>	Connection	Total number of attempts to send a certain COM_* command from PHP to MySQL.	<p>The statistics are incremented after checking the line and immediately before sending the corresponding MySQL client server protocol packet. If mysqld fails to send the packet over the wire the statistics will not be decremented. In case of a failure mysqld emits a PHP warning “Error while sending %s packet. PID=%d.”</p> <p>Usage examples:</p> <ul style="list-style-type: none"> <li>Check if PHP sends certain commands to MySQL, for example, check if a client sends <code>COM_PROCESS_KILL</code></li> <li>Calculate the average number of prepared statement executions by comparing <code>COM_EXECUTE</code> with <code>COM_PREPARE</code></li> <li>Check if PHP has run any non-prepared SQL statements by checking if <code>COM_QUERY</code> is zero</li> <li>Identify PHP scripts that run an excessive number of SQL statements by checking <code>COM_QUERY</code> and <code>COM_EXECUTE</code></li> </ul>

## Miscellaneous

Statistic	Scope	Description	Notes
<code>explicit_stmt_close, implicit_stmt_close</code>	Process	Total number of close prepared statements.	A close is always considered explicit but for a failed prepare.
<code>mem_emalloc_count, mem_emalloc_amount, mem_ecalloc_count, mem_ecalloc_amount, mem_erealloc_count, mem_erealloc_amount, mem_efree_count, mem_malloc_count, mem_malloc_amount, mem_calloc_count, mem_calloc_amount, mem_realloc_count, mem_realloc_amount, mem_free_count</code>	Process	Memory management calls.	Development only.

Statistic	Scope	Description	Notes
<code>com-command_buffer_too_small</code>	Connection	<p>Number of network command buffer extensions while sending commands from PHP to MySQL.</p>	<p>mysqld allocates an internal command/network buffer of <code>mysqlnd.net_cmd_buffer_size (php.ini)</code> bytes for every connection. If a MySQL Client Server protocol command, for example, <code>COM_QUERY</code> (normal query), does not fit into the buffer, mysqld will grow the buffer to what is needed for sending the command. Whenever the buffer gets extended for one connection <code>com-command_buffer_too_small</code> will be incremented by one.</p> <p>If mysqld has to grow the buffer beyond its initial size of <code>mysqlnd.net_cmd_buffer_size (php.ini)</code> bytes for almost every connection, you should consider to increase the default size to avoid re-allocations.</p> <p>The default buffer size is 2048 bytes in PHP 5.3.0. In future versions the default will be 4kB or larger. The default can changed either through the <code>php.ini</code> setting <code>mysqlnd.net_cmd_buffer_size</code> or using <code>mysqli_options(MYSQLI_OPT_NET_CMD_BUFFER_SIZE, int size)</code>.</p> <p>It is recommended to set the buffer size to no less than 4096 bytes because mysqld also uses it when reading certain communication packet from MySQL. In PHP 5.3.0, mysqld will not grow the buffer if MySQL sends a packet that is larger than the current size of the buffer. As a consequence mysqld is unable to decode the packet and the client application will get an error. There are only two situations when the packet can be larger than the 2048 bytes default of <code>mysqlnd.net_cmd_buffer_size</code> in PHP 5.3.0: the packet transports a very long error message or the packet holds column meta data from <code>COM_LIST_FIELD (mysql_list_fields)</code> and the meta data comes from a string column with a very long default value (&gt;1900 bytes). No bug report on this exists - it should happen rarely.</p>

Statistic	Scope	Description	Notes
			As of PHP 5.3.2 mysqld does not allow setting buffers smaller than 4096 bytes.
<a href="#">connection_reused</a>			

### 21.10.3.6. Notes

[Copyright 1997-2010 the PHP Documentation Group.](#)

This section provides a collection of miscellaneous notes on MySQL Native Driver usage.

- Using [mysqld](#) means using PHP streams for underlying connectivity. For [mysqld](#), the PHP streams documentation ([book.stream](#)) should be consulted on such details as timeout settings, not the documentation for the MySQL Client Library.

### 21.10.4. MySQL Functions (PDO\_MYSQL)

[Copyright 1997-2010 the PHP Documentation Group.](#)

PDO\_MYSQL is a driver that implements the [PHP Data Objects \(PDO\) interface](#) to enable access from PHP to MySQL 3.x, 4.x and 5.x databases.

PDO\_MYSQL will take advantage of native prepared statement support present in MySQL 4.1 and higher. If you're using an older version of the mysql client libraries, PDO will emulate them for you.

#### Warning

Beware: Some MySQL table types (storage engines) do not support transactions. When writing transactional database code using a table type that does not support transactions, MySQL will pretend that a transaction was initiated successfully. In addition, any DDL queries issued will implicitly commit any pending transactions.

The constants below are defined by this driver, and will only be available when the extension has been either compiled into PHP or dynamically loaded at runtime. In addition, these driver-specific constants should only be used if you are using this driver. Using driver-specific attributes with another driver may result in unexpected behaviour. [PDO::getAttribute](#) may be used to obtain the [PDO\\_ATTR\\_DRIVER\\_NAME](#) attribute to check the driver, if your code can run against multiple drivers.

**PDO::MYSQL\_ATTR\_USE\_BUFFERED\_QUERY (integer)** If this attribute is set to [TRUE](#) on a [PDOStatement](#), the MySQL driver will use the buffered versions of the MySQL API. If you're writing portable code, you should use [PDOStatement::fetchAll](#) instead.

#### Example 21.154. Forcing queries to be buffered in mysql

```
<?php
if ($db->getAttribute(PDO::ATTR_DRIVER_NAME) == 'mysql') {
 $stmt = $db->prepare('select * from foo',
 array(PDO::MYSQL_ATTR_USE_BUFFERED_QUERY => true));
} else {
 die("my application only works with mysql; I should use \$stmt->fetchAll() instead");
?>
```

**PDO::MYSQL\_ATTR\_LOCAL\_INFILE (integer)** Enable [LOAD LOCAL INFILE](#).

**PDO::MYSQL\_ATTR\_INIT\_COMMAND (integer)** Command to execute when connecting to the MySQL server. Will automatically be re-executed when reconnecting.

**PDO::MYSQL\_ATTR\_READ\_DEFAULT\_FILE (integer)** Read options from the named option file instead of from [my.cnf](#). This option is not available if mysqld is used, because mysqld does not read the mysql configuration files.

<code>AULT_GROUP</code> (integer)	Read options from the named group from <code>my.cnf</code> or the file specified with <code>MYSQL_READ_DEFAULT_FILE</code> . This option is not available if mysqlnd is used, because mysqlnd does not read the mysql configuration files.
<code>PDO::MYSQL_ATTR_MAX_BUFFER</code> (integer)	Maximum buffer size. Defaults to 1 MiB.
<code>PDO::MYSQL_ATTR_DIRECT_QUERY</code> (integer)	Perform direct queries, don't use prepared statements.
<code>QUERY</code> (integer)	

## 21.10.4.1. PDO\_MYSQL DSN

Copyright 1997-2010 the PHP Documentation Group.

- [PDO\\_MYSQL DSN](#)

Connecting to MySQL databases

### Description

The PDO\_MYSQL Data Source Name (DSN) is composed of the following elements:

DSN prefix	The DSN prefix is <code>mysql:</code> .
<code>host</code>	The hostname on which the database server resides.
<code>port</code>	The port number where the database server is listening.
<code>dbname</code>	The name of the database.
<code>unix_socket</code>	The MySQL Unix socket (shouldn't be used with <code>host</code> or <code>port</code> ).

### Examples

#### Example 21.155. PDO\_MYSQL DSN examples

The following example shows a PDO\_MYSQL DSN for connecting to MySQL databases:

```
mysql:host=localhost;dbname=testdb
```

More complete examples:

```
mysql:host=localhost;port=3307;dbname=testdb
mysql:unix_socket=/tmp/mysql.sock;dbname=testdb
```

## 21.10.5. Connector/PHP

The MySQL Connector/PHP is a version of the `mysql` and `mysqli` extensions for PHP optimized for the Windows operating system. Later versions of the main PHP `mysql/mysqli` drivers are compatible with Windows and a separate, Windows specific driver is no longer required.

For PHP for all platforms, including Windows, you should use the `mysql` or `mysqli` extensions shipped with the PHP sources. See [Section 21.10, “MySQL PHP API”](#).

## 21.10.6. Common Problems with MySQL and PHP

- [Error: Maximum Execution Time Exceeded](#): This is a PHP limit; go into the `php.ini` file and set the maximum execution time up from 30 seconds to something higher, as needed. It is also not a bad idea to double the RAM allowed per script to 16MB instead of 8MB.

- **Fatal error: Call to unsupported or undefined function mysql\_connect() in ...:** This means that your PHP version isn't compiled with MySQL support. You can either compile a dynamic MySQL module and load it into PHP or recompile PHP with built-in MySQL support. This process is described in detail in the PHP manual.
- **Error: Undefined reference to 'uncompress':** This means that the client library is compiled with support for a compressed client/server protocol. The fix is to add `-lz` last when linking with `-lmysqlclient`.
- **Error: Client does not support authentication protocol:** This is most often encountered when trying to use the older `mysql` extension with MySQL 4.1.1 and later. Possible solutions are: downgrade to MySQL 4.0; switch to PHP 5 and the newer `mysqli` extension; or configure the MySQL server with `--old-passwords`. (See [Section B.5.2.4, “Client does not support authentication protocol”](#), for more information.)

Those with PHP4 legacy code can make use of a compatibility layer for the old and new MySQL libraries, such as this one: <http://www.coggeshall.org/oss/mysql2i>.

## 21.10.7. Enabling Both `mysql` and `mysqli` in PHP

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, you should try the following procedure.

1. Configure PHP like this:

```
./configure --with-mysqli=/usr/bin/mysql_config --with-mysql=/usr
```

2. Edit the `Makefile` and search for a line that starts with `EXTRA_LIBS`. It might look like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
-lxml2 -lz -lm -lxml2 -lz -lm -lmysqlclient -lz -lcrypt -lnsl -lm
-lxml2 -lz -lm -lcrypt -lxml2 -lz -lm -lcrypt
```

Remove all duplicates, so that the line looks like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
-lxml2
```

3. Build and install PHP:

```
make
make install
```

## 21.11. MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a `DBI` script that works with many different database engines without change. To use `DBI`, you must install the `DBI` module, as well as a DataBase Driver (DBD) module for each type of server you want to access. For MySQL, this driver is the `DBD::mysql` module.

Perl `DBI` is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

Installation instructions for Perl `DBI` support are given in [Section 2.15, “Perl Installation Notes”](#).

`DBI` information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI::FAQ
shell> perldoc DBD::mysql
```

You can also use `pod2man`, `pod2html`, and so forth to translate this information into other formats.

- For online information about Perl `DBI`, visit the `DBI` Web site, <http://dbi.perl.org/>. That site hosts a general `DBI` mailing list. Oracle Corporation hosts a list specifically about `DBD::mysql`; see [Section 1.6.1, “MySQL Mailing Lists”](#).
- For printed information, the official `DBI` book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly &

Associates, 2000). Information about the book is available at the DBI Web site, <http://dbi.perl.org/>.

For information that focuses specifically on using DBI with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is <http://www.kitebird.com/mysql-perl/>.

## 21.12. MySQL Python API

[MySQLdb](#) provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

## 21.13. MySQL Ruby APIs

Two APIs available for Ruby programmers. The MySQL/Ruby API is based on the [libmysql](#) API library. The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver).

For more information on Ruby, see [Ruby Programming Language](#).

For information on installing and using the MySQL/Ruby API, see [Section 21.13.1, “The MySQL/Ruby API”](#).

For information on installing and using the Ruby/MySQL API, see [Section 21.13.2, “The Ruby/MySQL API”](#).

### 21.13.1. The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through [libmysql](#).

For information on installing the module, and the functions exposed, see [MySQL/Ruby](#).

### 21.13.2. The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see [Ruby/MySQL](#).

## 21.14. MySQL Tcl API

[MySQLtcl](#) is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at <http://www.xdobry.de/mysqltcl/>.

## 21.15. MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

---

# Chapter 22. Extending MySQL

## 22.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. If you plan to contribute to MySQL development, want to have access to the bleeding-edge versions of the code, or just want to keep track of development, follow the instructions in [Section 2.3.4, “Installing from the Development Source Tree”](#). If you are interested in MySQL internals, you should also subscribe to our [internals](#) mailing list. This list has relatively low traffic. For details on how to subscribe, please see [Section 1.6.1, “MySQL Mailing Lists”](#). Many MySQL developers at Oracle Corporation are on the [internals](#) list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

### 22.1.1. MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

For information about tuning the parameters that control thread resources, see [Section 7.9.4, “How MySQL Uses Threads for Client Connections”](#).

- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If `InnoDB` is used, there will be 4 additional threads by default. Those are file I/O threads, controlled by the `innodb_file_io_threads` parameter. See [Section 13.6.3, “InnoDB Startup Options and System Variables”](#).
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread. See [Section 12.2.5.2, “`INSERT DELAYED` Syntax”](#).
- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See [Section 19.4.1, “Event Scheduler Overview”](#).

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, replication, and event threads.

### 22.1.2. MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information about the MySQL Test Framework, including system requirements, see the manual available at <http://dev.mysql.com/doc/>.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.7, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, NDB, and Instance Manager). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL `internals` mailing list. See [Section 1.6.1, “MySQL Mailing Lists”](#). This list does not accept attachments, so you should FTP all the relevant files to: <ftp://ftp.mysql.com/pub/mysql/upload/>

## 22.2. The MySQL Plugin API

MySQL 5.1 and up supports a plugin API that enables creation of server components. Plugins can be loaded at server startup, or loaded and unloaded at runtime without restarting the server. The API is generic and does not specify what plugins can do. The components supported by this interface include, but are not limited to, full-text parser plugins, storage-engines and server extensions. In MySQL 5.1, the storage engines can be included in the server as plugins.

Full-text parser plugins can be used to replace or augment the built-in full-text parser. For example, a plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is intended as the successor to the older user-defined function (UDF) interface.

The plugin interface uses the `plugin` table in the `mysql` database to record information about plugins. This table is created as part of the MySQL installation process. If you are upgrading from a version of MySQL older than 5.1, you should run the `mysql_upgrade` command to create this table. See [Section 4.4.8, “mysql\\_upgrade — Check Tables for MySQL Upgrade”](#).

### 22.2.1. Plugin API Characteristics

The plugin API has these characteristics:

- All plugins have several things in common.

Each plugin has a name that it can be referred to in SQL statements, as well as other metadata such as an author and a description that provide other information. This information can be examined in the `INFORMATION_SCHEMA.PLUGINS` table or using the `SHOW PLUGINS` statement.

- The plugin framework is extendable to accommodate different kinds of plugins.

Although some aspects of the plugin API are common to all types of plugins, the API also permits type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Interfaces for several types of plugins exist, such as storage engines, full-text parser, and `INFORMATION_SCHEMA` tables. Others can be added.

- Plugins can expose information to users.

A plugin can implement system and status variables that are available through the `SHOW VARIABLES` and `SHOW STATUS`

statements.

- The plugin API includes versioning information.

The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, a library containing a full-text parsing plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- The plugin API implements security restrictions.

A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

In some respects, the plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface. For example, UDFs had no versioning information. Also, the newer plugin interface eliminates the security issues of the older UDF interface. The older interface for writing nonplugin UDFs permitted libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively nonspecific.

## 22.2.2. Plugin API Components

The plugin implementation comprises several components.

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `mysql.plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `mysql.plugin` table and unloads the plugin code.
- The `WITH PARSE` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about server plugins.

Command-line options and system variables:

- The `--plugin-load` option enables plugins to be loaded at server startup time.
- The `plugin_dir` system variable indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=path` option. `mysql_config --plugindir` displays the default plugin directory path name.

For additional information about plugin loading, see [Section 12.4.3.1, “Installing and Uninstalling Plugins”](#).

Source files (the locations indicate where the files are found in MySQL source distributions):

- In the `include/mysql` directory, `plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library. `plugin_xxx.h` files provide additional information that pertains to specific types of plugins.
- In the `sql` directory, `sql_plugin.h` and `sql_plugin.cc` comprise the internal plugin implementation. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.

Plugin-related tables:

- The `INFORMATION_SCHEMA.PLUGINS` table contains plugin information.

- The `mysql.plugin` table lists each plugin that was installed with `INSTALL PLUGIN` and is required for plugin use. For new MySQL installations, this table is created during the installation process. If you are upgrading from a version of MySQL older than 5.1, you should run `mysql_upgrade` to update your system tables and create the `plugin` table (see [Section 4.4.8, “mysql\\_upgrade — Check Tables for MySQL Upgrade”](#)).

## 22.2.3. Types of Plugins

The plugin API enables creation of several types of plugins. This section provides an overview of some of them.

### 22.2.3.1. Storage Engine Plugins

The pluggable storage engine architecture used by MySQL Server enables storage engines to be written as plugins and loaded into and unloaded from a running server. For a description of this architecture, see [Section 13.4, “Overview of MySQL Storage Engine Architecture”](#).

For more information on how the Plugin API can be used to write storage engines, see [MySQL Internals: Custom Engine](#).

### 22.2.3.2. Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). For full-text processing, “parsing” means extracting words from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in [Section 11.9, “Full-Text Search Functions”](#). These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables such as `ft_min_word_len` and `ft_max_word_len` that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored.

The plugin API enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for word accumulation).

One reason to use a parser this way is that you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. In particular, this parsing will be affected by the `ft_xxx` system variables and the stopword list.

One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from nonplaintext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSER` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
 doc CHAR(255),
 FULLTEXT INDEX (doc) WITH PARSER my_parser
);
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER my_parser;
```

The only SQL change for associating the parser with the index is the `WITH PARSER` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use it a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

For more information about full-text plugins, see [Section 22.2.5.1, “Writing Full-Text Parser Plugins”](#).

## 22.2.4. Plugin Data Structures and Functions

Every plugin must have a general descriptor that provides information to the plugin API, and a type-specific descriptor that provides information about the plugin interface for a given type of plugin. The structure of the general descriptor is the same for all plugin types. The structure of the type-specific descriptor varies among plugin types and is determined by the requirements of what the given type needs to do. The plugin interface also enables plugins to expose status and system variables.

### 22.2.4.1. General Plugin Data Structures and Functions

Every plugin must have a general descriptor that provides information to the plugin API. The structure of the general descriptor is the same for all plugin types. This descriptor is defined by the `st_mysql_plugin` structure in the `plugin.h` file:

```
struct st_mysql_plugin
{
 int type; /* the plugin type (a MYSQL_XXX_PLUGIN value) */
 void *info; /* pointer to type-specific plugin descriptor */
 const char *name; /* plugin name */
 const char *author; /* plugin author (for SHOW PLUGINS) */
 const char *descr; /* general descriptive text (for SHOW PLUGINS) */
 int license; /* the plugin license (PLUGIN_LICENSE_XXX) */
 int (*init)(void *); /* the function to invoke when plugin is loaded */
 int (*deinit)(void *);/* the function to invoke when plugin is unloaded */
 unsigned int version; /* plugin version (for SHOW PLUGINS) */
 struct st_mysql_show_var *status_vars;
 struct st_mysql_sys_var **system_vars;
 void * __reserved1; /* reserved for dependency checking */
};
```

The `st_mysql_plugin` descriptor structure members should be filled in as follows:

- **`type`**

The plugin type. This must be one of the plugin-type values from `plugin.h`:

```
/*
 * The allowable types of plugins
 */
#define MYSQL_UDF_PLUGIN 0 /* User-defined function */
#define MYSQL_STORAGE_ENGINE_PLUGIN 1 /* Storage Engine */
#define MYSQL_FTPARSER_PLUGIN 2 /* Full-text parser plugin */
#define MYSQL_DAEMON_PLUGIN 3 /* The daemon/raw plugin type */
#define MYSQL_INFORMATION_SCHEMA_PLUGIN 4 /* The I_S plugin type */
...
```

For example, for a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- **`info`**

A pointer to the type-specific descriptor for the plugin. This descriptor's structure depends on the particular type of plugin, unlike that of the general plugin descriptor structure. Each type-specific descriptor has a version number that indicates the API version for that type of plugin, plus any other members needed. See [Section 22.2.4.2, “Type-Specific Plugin Data Structures and Functions”](#).

- **`name`**

A string that gives the plugin name. This is the name that will be listed in the `mysql.plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`, or with the `--plugin-load` option. The name is also visible in the `INFORMATION_SCHEMA.PLUGINS` table or the output from `SHOW PLUGINS`.

- **`author`**

A string naming the plugin author. This can be whatever you like.

- **`desc`**

A string that provides a general description of the plugin. This can be whatever you like.

- **license**

The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.

- **init**

A once-only initialization function. The server executes this function when it loads the plugin, which happens for `INSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server startup. The function takes no arguments. It returns zero for success and nonzero for failure. If no `init` function is needed for a plugin, it can be specified as 0.

- **deinit**

A once-only deinitialization function. The server executes this function when it unloads the plugin, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server shutdown. The function takes no arguments. It returns zero for success and nonzero for failure. If no `deinit` function is needed for a plugin, it can be specified as 0.

- **version**

The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0xMMNN`, where `MM` and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.

- **status\_vars**

A pointer to a structure for status variables associated with the plugin, or 0 if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

The `status_vars` member, if not 0, points to an array of `st_mysql_show_var` structures that describe status variables. See [Section 22.2.4.3, “Plugin Status and System Variables”](#).

- **system\_vars**

A pointer to a structure for system variables associated with the plugin, or 0 if there are no such variables. These options and system variables can be used to help initialize variables within the plugin.

The `system_vars` member, if not 0, points to an array of `st_mysql_sys_var` structures that describe system variables. See [Section 22.2.4.3, “Plugin Status and System Variables”](#).

- **\_\_reserved1**

A placeholder for the future. Currently, it should be set to `NULL`.

The `init` and `deinit` functions in the general plugin descriptor are invoked only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

## 22.2.4.2. Type-Specific Plugin Data Structures and Functions

Each type of plugin has its own type-specific structures and functions. The primary structure is the type-specific plugin descriptor. This is pointed to by the `info` member of the `st_mysql_plugin` general plugin descriptor, but has a structure determined by the requirements of the plugin type.

For version-control purposes, the first member of the type-specific descriptor for every plugin type is expected to be the interface version for the type. This enables the server to check the type-specific version for every plugin no matter its type. The type-specific descriptor commonly includes callback functions and other information needed by the server to invoke the plugin properly.

### 22.2.4.2.1. Full-Text Parser Plugin Data Structures and Functions

The following discussion describes the full-text parser type-specific plugin descriptor.

For a full-text parser plugin, the type-specific descriptor is an instance of the `st_mysql_ftparser` structure in the `plugin.h` file:

```
struct st_mysql_ftparser
{
 int interface_version;
 int (*parse)(MYSQL_FTPARSER_PARAM *param);
```

```

 int (*init)(MYSQL_FTPARSER_PARAM *param);
 int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};

```

As shown by the structure definition, the descriptor has an interface version number and contains pointers to three functions. The version is specified using a symbol of the form `MYSQL_xxx_INTERFACE_VERSION` (such as `MYSQL_FTPARSER_INTERFACE_VERSION` for full-text parser plugins). The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

The plugin declaration in the general plugin descriptor has `init` and `deinit` members that point initialization and deinitialization functions, and so does the type-specific plugin descriptor to which it points. However, these pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the general plugin descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the type-specific plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```

typedef struct st_mysql_ftparser_param
{
 int (*mysql_parse)(struct st_mysql_ftparser_param *,
 char *doc, int doc_len);
 int (*mysql_add_word)(struct st_mysql_ftparser_param *,
 char *word, int word_len,
 MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
 void *ftparser_state;
 void *mysql_ftparam;
 struct charset_info_st *cs;
 char *doc;
 int length;
 int flags;
 enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;

```

### Note

The definition shown is current as of MySQL 5.1.12. It is incompatible with versions of MySQL 5.1 older than 5.1.12.

The structure members are used as follows:

- `mysql_parse`

A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_parse(param, ...);
```

A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in pars-

er a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- **mysql\_add\_word**

A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_add_word(param, ...);
```

- **ftparser\_state**

This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.

- **mysql\_ftparam**

This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

- **cs**

A pointer to information about the character set of the text, or 0 if no information is available.

- **doc**

A pointer to the text to be parsed.

- **length**

The length of the text to be parsed, in bytes.

- **flags**

Parser flags. This is zero if there are no special flags. Currently, the only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.) This member was added in MySQL 5.1.12.

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- **mode**

The parsing mode. This value will be one of the following constants:

- **MYSQL\_FTPARSER\_SIMPLE\_MODE**

Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.

- **MYSQL\_FTPARSER\_WITH\_STOPWORDS**

Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.

- **MYSQL\_FTPARSER\_FULL\_BOOLEAN\_INFO**

Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens using the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
 enum enum_ft_token_type type;
```

```

int yesno;
int weight_adjust;
bool wasign;
bool trunc;
/* These are parser state and must be removed. */
byte prev;
byte *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;

```

The parser should fill in the structure members as follows:

- **`type`**

The token type. This should be one of values shown in the following table.

Type	Meaning
<code>FT_TOKEN_EOF</code>	End of data
<code>FT_TOKEN_WORD</code>	A regular word
<code>FT_TOKEN_LEFT_PAREN</code>	The beginning of a group or subexpression
<code>FT_TOKEN_RIGHT_PAREN</code>	The end of a group or subexpression
<code>FT_TOKEN_STOPWORD</code>	A stopword

- **`yesno`**

Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.

- **`weight_adjust`**

A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at [Section 11.9.2, “Boolean Full-Text Searches”](#), that use the `<` and `>` operators illustrate how weighting works.

- **`wasign`**

The sign of the weighting factor. A negative value acts like the `~` boolean-search operator, which causes the word's contribution to the relevance to be negative.

- **`trunc`**

Whether matching should be done as if the boolean-mode `*` truncation operator had been given.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

#### 22.2.4.3. Plugin Status and System Variables

The plugin interface enables plugins to expose status and system variables using the `status_vars` and `system_vars` members of the general plugin descriptor.

The `status_vars` member of the general plugin descriptor, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```

struct st_mysql_show_var {
 const char *name;
 char *value;
 enum enum_mysql_show_type type;
};

```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`.

The following table shows the permissible status variable `type` values and what the corresponding variable should be.

Type	Meaning
------	---------

SHOW_BOOL	Pointer to a boolean variable
SHOW_INT	Pointer to an integer variable
SHOW_LONG	Pointer to a long integer variable
SHOW_LONGLONG	Pointer to a longlong integer variable
SHOW_CHAR	A string
SHOW_CHAR_PTR	Pointer to a string
SHOW_ARRAY	Pointer to another <code>st_mysql_show_var</code> array
SHOW_FUNC	Pointer to a function
SHOW_DOUBLE	Pointer to a double

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this signature:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024
typedef int (*mysql_show_var_func) (void *thd,
 struct st_mysql_show_var *out,
 char *buf);
```

The `system_vars` member, if not 0, points to an array of `st_mysql_sys_var` structures, each of which describes one system variable (which can also be set from the command-line or configuration file), followed by a structure with all members set to 0. The `st_mysql_sys_var` structure is defined as follows:

```
struct st_mysql_sys_var {
 int flags;
 const char *name, *comment;
 int (*check)(THD*, struct st_mysql_sys_var *, void*, st_mysql_value*);
 void (*update)(THD*, struct st_mysql_sys_var *, void*, const void*);
};
```

Additional fields are append as required depending upon the flags.

For convenience, a number of macros are defined that make creating new system variables within a plugin much simpler.

Throughout the macros, the following fields are available:

- `name`: An unquoted identifier for the system variable.
- `varname`: The identifier for the static variable. Where not available, it is the same as the `name` field.
- `opt`: Additional use flags for the system variable. Supported flags are shown in the following table.

Flag	Description
<code>PLUGIN_VAR_READONLY</code>	The system variable is read only
<code>PLUGIN_VAR_NOSYSVAR</code>	The system variable is not user visible at runtime
<code>PLUGIN_VAR_NOCMDOPT</code>	The system variable is not configurable from the command line
<code>PLUGIN_VAR_NOCMDARG</code>	No argument is required at the command line (typically used for boolean variables)
<code>PLUGIN_VAR_RQCMDARG</code>	An argument is required at the command line (this is the default)
<code>PLUGIN_VAR_OPCMDARG</code>	An argument is optional at the command line
<code>PLUGIN_VAR_MEMALLOC</code>	Used for string variables; indicates that memory is to be allocated for storage of the string

- `comment`: A descriptive comment to be displayed in the server help message. `NULL` if this variable is to be hidden.
- `check`: The check function, `NULL` for default.
- `update`: The update function, `NULL` for default.
- `default`: The variable default value.
- `minimum`: The variable minimum value.
- `maximum`: The variable maximum value.

- **blocksize**: The variable block size. When the value is set, it is rounded to the nearest multiple of **blocksize**.

A system variable may be accessed either by using the static variable directly or by using the `SYSVAR()` accessor macro. The `SYSVAR()` macro is provided for completeness. Usually it should be used only when the code cannot directly access the underlying variable.

For example:

```
static int my_foo;
static MYSQL_SYSVAR_INT(foo_var, my_foo,
 PLUGIN_VAR_RQCMDARG, "foo comment",
 NULL, NULL, 0, 0, INT_MAX, 0);
...
SYSVAR(foo_var)= value;
value= SYSVAR(foo_var);
my_foo= value;
value= my_foo;
```

Session variables may be accessed only through the `THDVAR()` accessor macro. For example:

```
static MYSQL_THDVAR_BOOL(some_flag,
 PLUGIN_VAR_NOCMDARG, "flag comment",
 NULL, NULL, FALSE);
...
if (THDVAR(thd, some_flag))
{
 do_something();
 THDVAR(thd, some_flag)= FALSE;
}
```

All global and session system variables must be published to `mysqld` before use. This is done by constructing a `NULL`-terminated array of the variables and linking to it in the plugin public interface. For example:

```
static struct st_mysql_sys_var *my_plugin_vars[] = {
 MYSQL_SYSVAR(my_foo),
 MYSQL_SYSVAR(some_flag),
 NULL
};
mysql_declare_plugin(fooplug)
{
 MYSQL_PLUGIN,
 &plugin_data,
 "fooplug",
 "foo author",
 "This does foo!",
 PLUGIN_LICENSE_GPL,
 foo_init,
 foo_fini,
 0x0001,
 NULL,
 my_plugin_vars,
 NULL
}
mysql_declare_plugin_end;
```

The following convenience macros enable you to declare different types of system variables:

- Boolean system variables of type `my_bool`, which is a 1-byte boolean. (0 = FALSE, 1 = TRUE)

```
MYSQL_THDVAR_BOOL(name, opt, comment, check, update, default)
MYSQL_SYSVAR_BOOL(name, varname, opt, comment, check, update, default)
```

- String system variables of type `char*`, which is a pointer to a null-terminated string.

```
MYSQL_THDVAR_STR(name, opt, comment, check, update, default)
MYSQL_SYSVAR_STR(name, varname, opt, comment, check, update, default)
```

- Integer system variables, of which there are several varieties.

- An `int` system variable, which is typically a 4-byte signed word.

```
MYSQL_THDVAR_INT(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_INT(name, varname, opt, comment, check, update, default,
 minimum, maximum, blocksize)
```

- An `unsigned int` system variable, which is typically a 4-byte unsigned word.

```
MYSQL_THDVAR_UINT(name, opt, comment, check, update, default, min, max, blk)
```

```
MYSQL_SYSVAR_UINT(name, varname, opt, comment, check, update, default,
 minimum, maximum, blocksize)
```

- A `long` system variable, which is typically either a 4- or 8-byte signed word.

```
MYSQL_THDVAR_LONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_LONG(name, varname, opt, comment, check, update, default,
 minimum, maximum, blocksize)
```

- An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word.

```
MYSQL_THDVAR ULONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR ULONG(name, varname, opt, comment, check, update, default,
 minimum, maximum, blocksize)
```

- A `long long` system variable, which is typically an 8-byte signed word.

```
MYSQL_THDVAR_LONGLONG(name, opt, comment, check, update,
 default, minimum, maximum, blocksize)
MYSQL_SYSVAR_LONGLONG(name, varname, opt, comment, check, update,
 default, minimum, maximum, blocksize)
```

- An `unsigned long long` system variable, which is typically an 8-byte unsigned word.

```
MYSQL_THDVAR_ULONGLONG(name, opt, comment, check, update,
 default, minimum, maximum, blocksize)
MYSQL_SYSVAR_ULONGLONG(name, varname, opt, comment, check, update,
 default, minimum, maximum, blocksize)
```

- An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word. The range of possible values is an ordinal of the number of elements in the `typelib`, starting from 0.

```
MYSQL_THDVAR_ENUM(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_ENUM(name, varname, opt, comment, check, update,
 default, typelib)
```

- An `unsigned long long` system variable, which is typically an 8-byte unsigned word. Each bit represents an element in the `typelib`.

```
MYSQL_THDVAR_SET(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_SET(name, varname, opt, comment, check, update,
 default, typelib)
```

Internally, all mutable and plugin system variables are stored in a [HASH](#).

Display of the server command-line help text is handled by compiling a [DYNAMIC\\_ARRAY](#) of all variables relevant to command-line options, sorting them, and then iterating through them to display each option.

When a command-line option has been handled, it is then removed from the `argv` by the `handle_option()` function (`my_getopt.c`); in effect, it is consumed.

The processing of command-line options is performed during the plugin installation process, immediately after the plugin has been successfully loaded but before the plugin initialization function has been called.

Plugins loaded at runtime do not benefit from any configuration options and must have usable defaults. Once they are installed, they are loaded at `mysqld` initialization time and configuration options can be set at the command line or within `my.cnf`.

Plugins should consider the `thd` parameter to be read only.

## 22.2.5. Writing Plugins

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

A plugin contains code that becomes part of the running server, so when you write a plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins originally written for older servers. For information about these constraints, see [Section 2.3.3, “Typical](#)

[configure Options](#), and [Section 2.3.5, “Dealing with Problems Compiling MySQL”](#).

This section provides a step-by-step guide to creating a plugin library. It shows how to develop a library that contains a full-text parsing plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are nonempty runs of whitespace characters. For example plugin source code, see the `plugin/fulltext` directory of MySQL source distributions.

Each plugin library has the following contents:

- A general plugin descriptor that indicates the version number of the general plugin API that the library uses and that contains a general declaration for each plugin in the library. The framework for this descriptor is supplied by referring to macros that expand to provide the API version automatically.
- Each general plugin descriptor contains information that is common to all types of plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; and pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin.
- The general plugin descriptor also contains a pointer to a type-specific plugin descriptor. The structure of the type-specific descriptors varies from one plugin type to another because each type of plugin can have its own API. A type-specific plugin descriptor contains an API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.
- The plugin library contains the interface functions that are referenced by the general and type-specific descriptors for each plugin in the library.

The easiest way to follow the instructions in this section is to use the source code in the `plugin/fulltext` directory of MySQL source distributions. The instructions assume that you make a copy of that directory and use it to build the plugin library. To make a copy of the directory, use the following commands, which assume that the MySQL source tree is in a directory named `mysql-5.1` under your current directory:

```
shell> mkdir fulltext_plugin
shell> cp mysql-5.1/plugin/fulltext/* fulltext_plugin
```

If you are copying files from a Bazaar source tree, `cp` will display an error message about the `SCCS` directory, which you can ignore.

After copying the source files, use the following procedure to create a plugin library:

1. Change location into the `fulltext_plugin` directory:

```
shell> cd fulltext_plugin
```

2. The plugin source file should include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

```
#include <stdlib.h>
#include <ctype.h>
#include <mysql/plugin.h>
```

3. Set up the general plugin descriptor for the plugin library file.

Every plugin library must include a general descriptor that must define two symbols:

- `_mysql_plugin_interface_version_` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
- `_mysql_plugin_declarations_` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each plugin in the library.

If the server does not find these two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The standard (and most convenient) way to define the two required symbols is by using the `mysql_declare_plugin` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```
mysql_declare_plugin(name)
... one or more plugin declarations here ...
mysql_declare_plugin_end;
```

For example, the general plugin descriptor for a library that contains a single plugin named `simple_parser` looks like this:

```
mysql_declare_plugin(ftexample)
{
 MYSQL_FTPARSER_PLUGIN, /* type */ */
 &simple_parser_descriptor, /* descriptor */ */
 "simple_parser", /* name */ */
 "Oracle Corporation", /* author */ */
 "Simple Full-Text Parser", /* description */ */
 PLUGIN_LICENSE_GPL, /* plugin license */
 simple_parser_plugin_init, /* init function (when loaded) */
 simple_parser_plugin_deinit, /* deinit function (when unloaded) */
 0x0001, /* version */ */
 simple_status, /* status variables */
 simple_system_variables, /* system variables */
 NULL
}
mysql_declare_plugin_end;
```

For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

`plugin.h` defines the `mysql_declare_plugin` and `mysql_declare_plugin_end` macros like this:

```
#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS)
int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION;
int PSIZE= sizeof(struct st_mysql_plugin);
struct st_mysql_plugin DECLS[] = {
#endif
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
int __mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION; \
int __mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin); \
struct st_mysql_plugin __mysql_plugin_declarations_[] = {
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
 builtin_ ## NAME ## __plugin_interface_version, \
 builtin_ ## NAME ## __sizeof_struct_st_plugin, \
 builtin_ ## NAME ## __plugin)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0}
```

## Note

Those declarations define the `_mysql_plugin_interface_version` symbol only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that you must provide `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command to build the plugin as a shared library.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version` and `_mysql_plugin_declarations`):

```
int __mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION;
int __mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin);
struct st_mysql_plugin __mysql_plugin_declarations_[] = {
{
 MYSQL_FTPARSER_PLUGIN, /* type */ */
 &simple_parser_descriptor, /* descriptor */ */
 "simple_parser", /* name */ */
 "Oracle Corporation", /* author */ */
 "Simple Full-Text Parser", /* description */ */
 PLUGIN_LICENSE_GPL, /* plugin license */
 simple_parser_plugin_init, /* init function (when loaded) */
 simple_parser_plugin_deinit, /* deinit function (when unloaded) */
 0x0001, /* version */ */
 simple_status, /* status variables */
 simple_system_variables, /* system variables */
 NULL
}, {0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0}
```

The preceding example declares a single plugin in the general descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin` and `mysql_declare_plugin_end`, separated by commas.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). If you write a C++ plugin, one C++ feature that you should not use is nonconstant variables to initialize global structures. Members of structures such as the `st_mysql_plugin` structure should be initialized only with constant variables. The `simple_parser` descriptor shown earlier is permissible in a C++ plugin because it satisfies that requirement:

```

mysql_declare_plugin
{
 MYSQL_FTPARSER_PLUGIN, /* type
 &simple_parser_descriptor, /* descriptor
 "simple_parser", /* name
 "Oracle Corporation", /* author
 "Simple Full-Text Parser", /* description
 PLUGIN_LICENSE_GPL, /* plugin license
 simple_parser_plugin_init, /* init function (when loaded)
 simple_parser_plugin_deinit,/* deinit function (when unloaded)
 0x0001, /* version
 simple_status, /* status variables
 simple_system_variables, /* system variables
 NULL
}
mysql_declare_plugin_end;

```

Here is another valid way to write the general descriptor. It uses constant variables to indicate the plugin name, author, and description:

```

const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "Oracle Corporation";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin
{
 MYSQL_FTPARSER_PLUGIN, /* type
 &simple_parser_descriptor, /* descriptor
 simple_parser_name, /* name
 simple_parser_author, /* author
 simple_parser_description, /* description
 PLUGIN_LICENSE_GPL, /* plugin license
 simple_parser_plugin_init, /* init function (when loaded)
 simple_parser_plugin_deinit,/* deinit function (when unloaded)
 0x0001, /* version
 simple_status, /* status variables
 simple_system_variables, /* system variables
 NULL
}
mysql_declare_plugin_end;

```

However, the following general descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```

typedef struct
{
 const char *name;
 const char *author;
 const char *description;
} plugin_info;

plugin_info parser_info = {
 "simple_parser",
 "Oracle Corporation",
 "Simple Full-Text Parser"
};

mysql_declare_plugin
{
 MYSQL_FTPARSER_PLUGIN, /* type
 &simple_parser_descriptor, /* descriptor
 parser_info.name, /* name
 parser_info.author, /* author
 parser_info.description, /* description
 PLUGIN_LICENSE_GPL, /* plugin license
 simple_parser_plugin_init, /* init function (when loaded)
 simple_parser_plugin_deinit,/* deinit function (when unloaded)
 0x0001, /* version
 simple_status, /* status variables
 simple_system_variables, /* system variables
 NULL
}
mysql_declare_plugin_end;

```

#### 4. Set up the type-specific plugin descriptor.

Each plugin declaration in the library descriptor points to a type-specific descriptor for the corresponding plugin. In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

```

static struct st_mysql_ftparser simple_parser_descriptor=
{
 MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version */
 simple_parser_parse, /* parsing function */
 simple_parser_init, /* parser init function */
 simple_parser_deinit /* parser deinit function */
}

```

```
};
```

## 5. Set up the plugin interface functions.

The general plugin descriptor in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```
static int simple_parser_plugin_init(void)
{
 return(0);
}

static int simple_parser_plugin_deinit(void)
{
 return(0);
}
```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param)
{
 return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param)
{
 return(0);
}
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers nonempty runs of whitespace characters to be words, so it identifies words like this:

```
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
 char *end, *start, *docend= param->doc + param->length;

 for (end= start= param->doc; end++)
 {
 if (end == docend)
 {
 if (end > start)
 add_word(param, start, end - start);
 break;
 }
 else if (isspace(*end))
 {
 if (end > start)
 add_word(param, start, end - start);
 start= end + 1;
 }
 }
 return(0);
}
```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```
static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
 MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
 { FT_TOKEN_WORD, 0, 0, 0, 0, ' ', 0 };

 param->mysql_add_word(param, word, len, &bool_info);
}
```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described in [Section 22.2.4.2.1, “Full-Text Parser Plugin Data Structures and Functions”](#).

6. Set up the status variables, if there are any. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```
long number_of_calls= 0;
struct st_mysql_show_var simple_status[]=
{
 {"static", (char *)"just a static text", SHOW_CHAR},
 {"called", (char *)&number_of_calls, SHOW_LONG},
 {0,0,0}
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`. For the array just shown, the resulting status variable names are `simple_parser_static` and `simple_parser_called`. This convention means that you can easily display the variables for a plugin using its name:

```
mysql> SHOW STATUS LIKE 'simple_parser%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| simple_parser_static | just a static text |
| simple_parser_called | 0 |
+-----+-----+
```

7. Compile the plugin library as a shared library and install it in the plugin directory.

### Note

As mentioned earlier, be sure to specify `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

The procedure for compiling shared objects varies from system to system. If you build your library using the GNU autotools, `libtool` should be able to generate the correct compilation commands for your system. If the library is named `mypluglib`, you should end up with a shared object file that has a name something like `libmypluglib.so`. (The file name might have a different extension on your system.)

To use the autotools, you'll need to make a few changes to the configuration files at this point to enable the plugin to be compiled and installed. Assume that your MySQL distribution is installed at a base directory of `/usr/local/mysql` and that its header files are located in the `include` directory under the base directory.

Edit `Makefile.am`, which should look something like this:

```
#Makefile.am example for a plugin
pkgplugindir=$(libdir)/mysql/plugin
INCLUDES= -I$(top_builddir)/include -I$(top_srcdir)/include
#noinst_LTLIBRARIES= mypluglib.la
pkgplugin_LTLIBRARIES= mypluglib.la
mypluglib_la_SOURCES= plugin_example.c
mypluglib_la_LDFLAGS= -module -rpath $(pkgplugindir)
mypluglib_la_CFLAGS= -DMYSQL_DYNAMIC_PLUGIN
```

The `mypluglib_la_CFLAGS` line takes care of passing the `-DMYSQL_DYNAMIC_PLUGIN` flag to the compilation command.

Adjust the `INCLUDES` line to specify the path name to the installed MySQL header files. Edit it to look like this:

```
INCLUDES= -I/usr/local/mysql/include
```

Make sure that the `noinst_LTLIBRARIES` line is commented out or remove it. Make sure that the `pkglib_LTLIBRARIES` line is not commented out; it enables the `make install` command.

Set up the files needed for the `configure` command, invoke it, and run `make`:

```
shell> autoreconf --force --install --symlink
shell> ./configure --prefix=/usr/local/mysql
shell> make
```

The `--prefix` option to `configure` indicates the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'basedir';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| base | /usr/local/mysql |
```

```
+-----+-----+
|
```

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| plugin_dir | /usr/local/mysql/lib/mysql/plugin |
+-----+-----+
```

To install the plugin library, use `make`:

```
shell> make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions permit it to be executed by the server.

#### 8. Register the plugin with the server.

The `INSTALL PLUGIN` statement causes the server to register the plugin in the `mysql.plugin` table and to load the plugin code from the library file. Use that statement to register `simple_parser` with the server, and then verify that the plugin is listed in the `mysql.plugin` table:

```
mysql> INSTALL PLUGIN simple_parser SONAME 'libmypluglib.so';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM mysql.plugin;
+-----+-----+
| name | dl |
+-----+-----+
| simple_parser | libmypluglib.so |
+-----+-----+
1 row in set (0.00 sec)
```

For additional information about plugin loading, see [Section 12.4.3.1, “Installing and Uninstalling Plugins”](#).

#### 9. Try the plugin.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
-> FULLTEXT (c) WITH PARSER simple_parser;
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all nonwhitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
-> ('latin1_general_cs is a case-sensitive collation'),
-> ('I\'d like a case of oranges'),
-> ('this is sensitive information'),
-> ('another row'),
-> ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT c FROM t;
+-----+
| c |
+-----+
| latin1_general_cs is a case-sensitive collation |
| I'd like a case of oranges |
| this is sensitive information |
| another row |
| yet another row |
+-----+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-----+
| MATCH(c) AGAINST('case') |
+-----+
| 0 |
| 1.2968142032623 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.00 sec)
```

```

mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('sensitive') |
+-----+
| 0 |
| 0 |
| 1.3253291845322 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('case-sensitive') |
+-----+
| 1.3109166622162 |
| 0 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('I\d') FROM t;
+-----+
| MATCH(c) AGAINST('I\d') |
+-----+
| 0 |
| 1.2968142032623 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)

```

Note how neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

### 22.2.5.1. Writing Full-Text Parser Plugins

A plugin that requires those elements must be compiled against MySQL source for which the value of `MYSQL_AUDIT_INTERFACE_VERSION`, the type-specific interface version, is `0x0200` or greater.

A full-text parser plugin can be used to replace or modify the built-in full-text parser. The procedure described in [Section 22.2.5, “Writing Plugins”](#), demonstrates how to write such a plugin.

## 22.3. Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See [Section 12.4.3.2, “CREATE FUNCTION Syntax”](#).
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See [Section 19.2, “Using Stored Routines \(Procedures and Functions\)”](#).

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()`

or `SOUNDEX()`.

See [Section 8.2.4, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

## 22.3.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

## 22.3.2. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. MySQL source distributions include a file `sql/udf_example.c` that defines 5 new functions. Consult this file to see how UDF calling conventions work. The `include/mysql_com.h` header file defines UDF-related symbols and data structures. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see [Section 2.3.3, “Typical configure Options”](#), and [Section 2.3.5, “Dealing with Problems Compiling MySQL”](#).

To be able to use UDFs, you need to link `mysqld` dynamically. Don't configure MySQL using `-with-mysqld-ldflags=-all-static`. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.c` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`). If you plan to use UDFs, the rule of thumb is to configure MySQL with `-with-mysqld-ldflags=-rdynamic` unless you have a very good reason not to.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “`xxx`” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

### Note

When using C++ you can encapsulate your C functions within:

```
extern "C" { ... }
```

This will ensure that your C++ function names remain readable in the completed UDF.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.

SQL Type	C/C++ Type
<code>STRING</code>	<code>char *</code>
<code>INTEGER</code>	<code>long long</code>

REAL	double
------	--------

It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()` (optional)

The initialization function for `xxx()`. It can be used for the following purposes:

- To check the number of arguments to `xxx()`.
  - To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
  - To allocate any memory required by the main function.
  - To specify the maximum length of the result.
  - To specify (for `REAL` functions) the maximum number of decimal places in the result.
  - To specify whether the result can be `NULL`.
- `xxx_deinit()` (optional)

The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`

Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()`

Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat steps 3 to 5 until all rows have been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not permitted to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

### 22.3.2.1. UDF Calling Sequences for Simple Functions

---

This section describes the different functions that you need to define when you create a simple UDF. [Section 22.3.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
 char *result, unsigned long *length,
 char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
 char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
 char *is_null, char *error);
```

`DECIMAL` functions return string values and should be declared the same way as `STRING` functions. `ROW` functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

`xxx_init()` should set `maybe_null` to 1 if `xxx()` can return `NULL`. The default value is 1 if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.

For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals permitted for the `DECIMAL`, `FLOAT`, and `DOUBLE` data types.

A `decimals` value of 31 is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10, 3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other nonnumber arguments that might be converted within the function to numeric form.

The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is 31 for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate alloc-

ated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`  
`xxx_init()` should set `const_item` to `1` if `xxx()` always returns the same value and to `0` otherwise.

## 22.3.2.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. [Section 22.3.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```
void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
 char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 5.1, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 5.1.

- `xxx_add()`

This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
 char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a nonaggregate UDF. See [Section 22.3.2.1, “UDF Calling Sequences for Simple Functions”](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a nonaggregate UDF. See [Section 22.3.2.4, “UDF Return Values and Error Handling”](#).

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for nonaggregate UDFs. See [Section 22.3.2.3, “UDF Argument Processing”](#).

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error!` `error` points to a single-byte variable, not to a string buffer.

\*`is_null` is reset for each group (before calling `xxx_clear()`). \*`error` is never reset.

If \*`is_null` or \*`error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

### 22.3.2.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
 strcpy(message,"XXX() requires two arguments");
 return 1;
}
```

For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count` – 1.

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
 args->arg_type[1] != INT_RESULT)
{
 strcpy(message,"XXX() requires a string and an integer");
 return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See later for instructions on how to access the value properly.) For a nonconstant argument, `args->args[i]` is `0`. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A nonconstant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with nonconstant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (`0`). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to enable handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.

- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.

- `ROW_RESULT` arguments are not implemented.

- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

`args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5
args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6
args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

The `attribute_lengths` array indicates the length of each argument name.

#### 22.3.2.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function using the `result` parameter. This buffer is sufficiently long to hold 255 characters, which can be multi-byte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See [Section 22.3.2.1, “UDF Calling Sequences for Simple Functions”](#).

To indicate a return value of `NULL` in the main function, set `*is_null` to 1:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to 1:

```
*error = 1;
```

If `xxx()` sets `*error` to 1 for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

## 22.3.2.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in MySQL source distributions.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP number for a host name.
- `reverse_lookup()` returns the host name for an IP number. The function may be called either with a single string argument of the form '`xxx.xxx.xxx.xxx`' or with four numbers.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `configure` and `libtool` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example.la
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Compiling the shared object using `make` produces a file named something like `udf_example.so.0.0.0` in the `.libs` directory (the exact name may vary from platform to platform). Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

### Note

This is a change in MySQL 5.1. For earlier versions of MySQL, the shared object can be located in any directory that is searched by your system's dynamic linker.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. You need to obtain the Bazaar source repository for MySQL 5.1. See [Section 2.3.4, “Installing from the Development Source Tree”](#).
2. You must obtain the CMake build utility from <http://www.cmake.org>. (Version 2.4.2 or later is required).
3. In the source repository, look in the `sql` directory. There are files named `udf_example.def` `udf_example.c` there. Copy both files from this directory to your working directory.
4. Create a CMake `makefile` (`CMakeLists.txt`) with these contents:

```
PROJECT(udf_example)
Path for MySQL include directory
INCLUDE_DIRECTORIES("c:/mysql/include")

ADD_DEFINITIONS("-DHAVE_DOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
TARGET_LINK_LIBRARIES(udf_example ws2_32)
```

5. Create the VC project and solution files:

```
cmake -G "<Generator>"
```

Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared object file has been installed, notify `mysqld` about the new functions with these statements:

```
mysql> CREATE FUNCTION metaphor RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION reverse_lookup
 -> RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE AGGREGATE FUNCTION avgcost
 -> RETURNS REAL SONAME 'udf_example.dll';
```

Functions can be deleted using `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphor;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` and `DELETE` privileges for the `mysql` database to create and drop functions.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

If the new function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

### 22.3.2.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

#### Note

This is a change in MySQL 5.1. For earlier versions of MySQL, the shared object can be located in any directory that is searched by your system's dynamic linker.

### 22.3.3. Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory. For MySQL 5.1, the first two steps apply only as of 5.1.13. For older versions, see the instructions in the corresponding section of the MySQL 5.0 manual.

1. Create a subclass for the function in `item_create.cc`:

- If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.
- If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.

2. To provide a name by which the function can be referred to in SQL statements, register the name in `item_create.cc` by adding a line to this array:

```
static Native_func_registry func_array[]
```

You can register several names for the same function. For example, see the lines for `"LCASE"` and `"LOWER"`, which are aliases for `Create_func_lcase`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double Item_func_newname::val()
longlong Item_func_newname::val_int()
String *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is nondeterministic, include the following statement in the item constructor to indicate that function results should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is nondeterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

## 22.4. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

### 22.4.1. PROCEDURE ANALYSE

```
ANALYSE([max_elements[,max_memory]])
```

`ANALYSE()` is defined in the `sql/sql_analyse.cc` source file, which serves as an example of how to create a procedure for use with the `PROCEDURE` clause of `SELECT` statements. `ANALYSE()` is built in and is available by default; other procedures can be created using the format demonstrated in the source file.

`ANALYSE()` examines the result from a query and returns an analysis of the results that suggests optimal data types for each column that may help reduce table sizes. To obtain this analysis, append `PROCEDURE ANALYSE` to the end of a `SELECT` statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements,[max_memory]])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that `PROCEDURE ANALYSE()` does not suggest the `ENUM` data type when it is not appropriate.

The arguments are optional and are used as follows:

- `max_elements` (default 256) is the maximum number of distinct values that `ANALYSE()` notices per column. This is used by `ANALYSE()` to check whether the optimal data type should be of type `ENUM`; if there are more than `max_elements` distinct values, then `ENUM` is not a suggested type.
- `max_memory` (default 8192) is the maximum amount of memory that `ANALYSE()` should allocate per column while trying to find all distinct values.

## 22.4.2. Writing a Procedure

You can find information about procedures by examining the following source files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

See also [Writing a Procedure](#) at MySQL Forge.

## 22.5. Debugging and Porting MySQL

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See [Section 2.1, “General Installation Guidance”](#). If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (<http://www.mysql.com/>), recommending it to other users.

Note: If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server. On Solaris 2.5 we use Sun PThreads (the native thread support in 2.4 and earlier versions is not good enough), on Linux we use LinuxThreads by Xavier Leroy, [<Xavier.Leroy@inria.fr>](mailto:<Xavier.Leroy@inria.fr>).

The hard part of porting to a new Unix variant without good native thread support is probably to port MIT-pthreads. See [mit-pthreads/README](#) and Programming POSIX Threads (<http://www.humanfactor.com/pthreads/>).

Up to MySQL 4.0.2, the MySQL distribution included a patched version of Chris Provenzano's Pthreads from MIT (see the MIT Pthreads Web page at <http://www.mit.edu/afs/sipb/project/pthreads/> and a programming introduction at [http://www.mit.edu:8001/people/proven/IAP\\_2000/](http://www.mit.edu:8001/people/proven/IAP_2000/)). These can be used for some operating systems that do not have POSIX threads.

It is also possible to use another user level thread package named FSU Pthreads (see <http://moss.csc.ncsu.edu/~mueller/pthreads/>). This implementation is being used for the SCO port.

See the `thr_lock.c` and `thr_alarm.c` programs in the `mysys` directory for some tests/examples of these problems.

Both the server and the client need a working C++ compiler. We use `gcc` on many platforms. Other compilers that are known to work are Sun Studio, HP-UX `aCC`, IBM AIX `xlc_r`, Intel `ecc/icc`. With previous versions on the respective platforms, we also used Irix `cc` and Compaq `cxx`.

### Important

If you are trying to build MySQL 5.1 with `icc` on the IA64 platform, and need support for MySQL Cluster, you should first ensure that you are using `icc` version 9.1.043 or later. (For details, see [Bug#21875](#).)

To compile only the client use `./configure --without-server`.

There is currently no support for only compiling the server, nor is it likely to be added unless someone has a good reason for it.

If you want/need to change any `Makefile` or the configure script you also need GNU Automake and Autoconf. See [Section 2.3.4, “Installing from the Development Source Tree”](#).

All steps needed to remake everything from the most basic files.

```
/bin/rm */*.deps/*.*.P
/bin/rm -f config.cache
aclocal
autoheader
aclocal
automake
autoconf
./configure --with-debug=full --prefix='your installation directory'
The makefiles generated above need GNU make 3.75 or newer.
(called gmake below)
gmake clean all install init-db
```

If you run into problems with a new port, you may have to do some debugging of MySQL! See [Section 22.5.1, “Debugging a MySQL Server”](#).

**Note**

Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

## 22.5.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See [Section B.5.4.2, “What to Do If MySQL Keeps Crashing”](#).

Binary distributions of MySQL server from Oracle include a specific debug binary, `mysqld-debug`. This is a build including the debugging information and is built in the same way as the debug build format described in [Section 22.5.1.1, “Compiling MySQL for Debugging”](#). You should use this build when debugging the MySQL server.

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`.

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See [Chapter 5, MySQL Server Administration](#). You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See [Section 2.1, “General Installation Guidance”](#).

### 22.5.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `--with-debug` or the `--with-debug=full` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If you are using `gcc`, the recommended `configure` line is:

```
CC=gcc CFLAGS="-O2" CXX=gcc CXXFLAGS="-O2 -felide-constructors \
-fno-exceptions -fno-rtti" ./configure --prefix=/usr/local/mysql \
--with-debug --with-extra-charset=complex
```

This avoids problems with the `libstdc++` library and with C++ exceptions (many compilers have problems with C++ exceptions in threaded code) and compile a MySQL version with support for all character sets.

If you suspect a memory overrun error, you can configure MySQL with `--with-debug=full`, which installs a memory allocation (`SAFE_MALLOC`) checker. However, running with `SAFE_MALLOC` is quite slow, so if you get performance problems you should start `mysqld` with the `--skip-safemalloc` option. This disables the memory overrun checks for each call to `malloc()` and `free()`.

If `mysqld` stops crashing when you compile it with `--with-debug`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` variables above and not use `--with-debug`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See [Section 1.6.1, “MySQL Mailing Lists”](#). If you believe that you have found a bug, please use the instructions at [Section 1.7, “How to Report Bugs or Problems”](#).

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

### 22.5.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

Note that the trace file become **very big!** If you want to generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:0,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to <ftp://ftp.mysql.com/pub/mysql/upload/> so that a MySQL developer can take a look at it.

The trace file is made with the **DBUG** package by Fred Fish. See [Section 22.5.3, “The DBUG Package”](#).

### 22.5.1.3. Using `pdb` to create a Windows crashdump

Starting with MySQL 5.1.12 the Program Database files (extension `pdb`) are included in the Noinstall distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem.

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with Dr Watson, `WinDbg` and Visual Studio to debug `mysqld`.

For more information on PDB files, see [Microsoft Knowledge Base Article 121366](#). For more information on the debugging options available, see [Debugging Tools for Windows](#).

Dr Watson is installed with all Windows distributions, but if you have installed Windows development tools, Dr Watson may have been replaced with WinDbg, the debugger included with Visual Studio, or the debugging tools provided with Borland or Delphi.

To generate a crash file using Dr Watson, follow these steps:

1. Start Dr Watson by running `drwtsn32.exe` interactively using the `-i` option:

```
C:\> drwtsn32 -i
```

2. Set the **LOG FILE PATH** to the directory where you want to store trace files.
3. Make sure **DUMP ALL THREAD CONTEXTS** and **APPEND TO EXISTING LOG FILE**.
4. Uncheck **DUMP SYMBOL TABLE**, **VISUAL NOTIFICATION**, **SOUND NOTIFICATION** and **CREATE CRASH DUMP FILE**.
5. Set the **NUMBER OF INSTRUCTIONS** to a suitable value to capture enough calls in the stacktrace. A value of at 25 should be enough.

Note that the file generated can be very large.

### 22.5.1.4. Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. It is best to upgrade to `gdb` 5.1 because thread debugging works much bet-

ter with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections + 1`. In most cases just using `--thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a `SIGSEGV` signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See [Section B.5.4.2, “What to Do If MySQL Keeps Crashing”](#).

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download `gdb` 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in [Section 1.7, “How to Report Bugs or Problems”](#).

If `mysqld` hangs you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

## 22.5.1.5. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See [Section 5.2.2, “The Error Log”](#). To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to `gcc`. See [Section 22.5.1.1, “Compiling MySQL for Debugging”](#).

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32) [0x9da402]
mysqld(handle_segfault+0x28a) [0x6648e9]
/lib/libpthread.so.0 [0x7f1a5af000f0]
/lib/libc.so.6(strncmp+0x2) [0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPKcS2__Pcj+0x7c) [0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0) [0x688354]
mysqld(_Z17sql_set_variablesP3THDP4ListI12set_var_baseE+0x68) [0x688494]
mysqld(_Z21mysql_execute_commandP3THD+0x41a0) [0x67a170]
mysqld(_Z11mysql_parseP3THDPKcjpS2_+0x282) [0x67f0ad]
mysqld(_Z16dispatch_command19enum_server_commandP3THDPcj+0xbb7 [0x67fdf8]
mysqld(_Z10do_commandP3THD+0x24d) [0x6811b6]
mysqld(handle_one_connection+0x11c) [0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5a10f0f2]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fdf8]
[0x6811b6]
[0x66e05e]
```

In the latter case, you can use the `resolve_stack_dump` utility to determine where `mysqld` died by using the following procedure:

1. Copy the numbers from the stack trace to a file, for example `mysqld.stack`. The numbers should not include the surrounding square brackets:

```
0x9da402
0x6648e9
0x7f1a5af000f0
0x7f1a5a10f0f2
0x7412cb
0x688354
0x688494
0x67a170
0x67f0ad
0x67fdf8
0x6811b6
0x66e05e
```

2. Make a symbol file for the `mysqld` server:

```
shell> nm -n libexec/mysqld > /tmp/mysqld.sym
```

If `mysqld` is not linked statically, use the following command instead:

```
shell> nm -D -n libexec/mysqld > /tmp/mysqld.sym
```

If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this option, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

3. Execute the following command:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
```

If you were not able to include demangled C++ names in your symbol file, process the `resolve_stack_dump` output using `c++filt`:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack | c++filt
```

This prints out where `mysqld` died. If that does not help you find out why `mysqld` died, you should create a bug report and include the output from the preceding command with the bug report.

However, in most cases it does not help us to have just a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, in most cases we need to know the statement that killed `mysqld` and preferably a test case so that we can repeat the problem! See [Section 1.7, “How to Report Bugs or Problems”](#).

### 22.5.1.6. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See [Chapter 5, MySQL Server Administration](#).

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See [Section 5.2.3, “The General Query Log”](#). When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as `host_name.log`. In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 12.8.2, “EXPLAIN Syntax”](#).

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See [Section 5.2.5, “The Slow Query Log”](#).

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, MySQL Server Administration](#)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at <http://lists.mysql.com/>, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file '`Warning: Checking table ...`' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See [Section 5.1.2, “Server Command Options”](#).

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

### 22.5.1.7. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).
- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/* .MYI`. Repair any wrong tables with `myisamchk -r database/table.MYI`.
- Make a second backup of the tables.
- Remove (or move away) any old log files from the MySQL data directory if you need more space.
- Start `mysqld` with the binary log enabled. If you want to find a query that crashes `mysqld`, you should start the server with both the general query log enabled as well. See [Section 5.2.3, “The General Query Log”](#), and [Section 5.2.4, “The Binary Log”](#).
- When you have gotten a crashed table, stop the `mysqld` server.
- Restore the backup.
- Restart the `mysqld` server **without** the binary log enabled.
- Re-execute the commands with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.NNNNNN`.

- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found reproducible bug that should be easy to fix! FTP the tables and the binary log to <ftp://ftp.mysql.com/pub/mysql/upload/> and report it in our bugs database using the instructions given in [Section 1.7, “How to Report Bugs or Problems”](#). (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center <https://support.mysql.com/> to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

## 22.5.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `--with-debug` or `--with-debug=full`. See [Section 2.3.3, “Typical configure Options”](#).

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See [Section 1.7, “How to Report Bugs or Problems”](#).

If your client crashes at some ‘legal’ looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

## 22.5.3. The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See [Section 22.5.1.2, “Creating Trace Files”](#).

This section summaries the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `dbug` directory of MySQL source distributions. It is best to use a recent distribution to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `--debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional “,” and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The following table shows the currently recognized flag characters.

Flag	Description
<code>d</code>	Enable output from DBUG_<N> macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
<code>D</code>	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, <code>-#D,20</code> specifies a delay of two seconds.
<code>f</code>	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.
<code>F</code>	Identify the source file name for each line of debug or trace output.

<code>i</code>	Identify the process with the PID or thread ID for each line of debug or trace output.
<code>g</code>	Enable profiling. Create a file called <code>debugmon.out</code> containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
<code>L</code>	Identify the source file line number for each line of debug or trace output.
<code>n</code>	Print the current function nesting depth for each line of debug or trace output.
<code>N</code>	Number each line of debug output.
<code>o</code>	Redirect the debugger output stream to the specified file. The default output is <code>stderr</code> .
<code>O</code>	Like <code>o</code> , but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
<code>P</code>	Limit debugger actions to specified processes. A process must be identified with the <code>DBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.
<code>P</code>	Print the current process name for each line of debug or trace output.
<code>r</code>	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
<code>S</code>	Do function <code>_sanity(_file_,_line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0. (Mostly used with <code>safemalloc</code> to find memory leaks)
<code>t</code>	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

Some examples of debug control strings that might appear on a shell command line (the `-#` is typically used to introduce a control string to an application program) are:

```
-#d:t
-#d:f,main,subr1:F:L:t,20
-#d,input,output,files:n
-#d:t:i:O,\mysqld.trace
```

In MySQL, common tags to print (with the `d` option) are `enter`, `exit`, `error`, `warning`, `info`, and `loop`.

## 22.5.4. Comments about RTS Threads

I have tried to use the RTS thread packages with MySQL but stumbled on the following problems:

They use old versions of many POSIX calls and it is very tedious to make wrappers for all functions. I am inclined to think that it would be easier to change the thread libraries to the newest POSIX specification.

Some wrappers are currently written. See `mysys/my_pthread.c` for more info.

At least the following should be changed:

`pthread_get_specific` should use one argument. `sigwait` should take two arguments. A lot of functions (at least `pthread_cond_wait`, `pthread_cond_timedwait()`) should return the error code on error. Now they return -1 and set `errno`.

Another problem is that user-level threads use the `ALRM` signal and this aborts a lot of functions (`read`, `write`, `open...`). MySQL should do a retry on interrupt on all of these but it is not that easy to verify it.

The biggest unsolved problem is the following:

To get thread-level alarms I changed `mysys/thr_alarm.c` to wait between alarms with `pthread_cond_timedwait()`, but this aborts with error `EINTR`. I tried to debug the thread library as to why this happens, but couldn't find any easy solution.

If someone wants to try MySQL with RTS threads I suggest the following:

- Change functions MySQL uses from the thread library to POSIX. This shouldn't take that long.
- Compile all libraries with the `-DHAVE_rts_threads`.
- Compile `thr_alarm`.
- If there are some small differences in the implementation, they may be fixed by changing `my_pthread.h` and `my_pthread.c`.

- Run `thr_alarm`. If it runs without any “warning,” “error,” or aborted messages, you are on the right track. Here is a successful run on Solaris:

```
Main thread: 1
Thread 0 (5) started
Thread: 5 Waiting
process_alarm
Thread 1 (6) started
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 1 (1) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 2 (2) sec
Thread: 6 Simulation of no alarm needed
Thread: 6 Slept for 0 (3) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 4 (4) sec
Thread: 6 Waiting
process_alarm
thread_alarm
Thread: 5 Slept for 10 (10) sec
Thread: 5 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 5 (5) sec
Thread: 6 Waiting
process_alarm
process_alarm

...
thread_alarm
Thread: 5 Slept for 0 (1) sec
end
```

## 22.5.5. Differences Between Thread Packages

MySQL is very dependent on the thread package used. So when choosing a good platform for MySQL, the thread package is very important.

There are at least three types of thread packages:

- User threads in a single process. Thread switching is managed with alarms and the threads library manages all nonthread-safe functions with locks. Read, write and select operations are usually managed with a thread-specific select that switches to another thread if the running threads have to wait for data. If the user thread packages are integrated in the standard libs (FreeBSD and BSDI threads) the thread package requires less overhead than thread packages that have to map all unsafe calls (MIT-pthreads, FSU Pthreads and RTS threads). In some environments (for example, SCO), all system calls are thread-safe so the mapping can be done very easily (FSU Pthreads on SCO). Downside: All mapped calls take a little time and it is quite tricky to be able to handle all situations. There are usually also some system calls that are not handled by the thread package (like MIT-pthreads and sockets). Thread scheduling isn't always optimal.
- User threads in separate processes. Thread switching is done by the kernel and all data are shared between threads. The thread package manages the standard thread calls to enable sharing data between threads. LinuxThreads is using this method. Downside: Lots of processes. Thread creating is slow. If one thread dies the rest are usually left hanging and you must kill them all before restarting. Thread switching is somewhat expensive.
- Kernel threads. Thread switching is handled by the thread library or the kernel and is very fast. Everything is done in one process, but on some systems, `ps` may show the different threads. If one thread aborts, the whole process aborts. Most system calls are thread-safe and should require very little overhead. Solaris, HP-UX, AIX and OSF/1 have kernel threads.

In some systems kernel threads are managed by integrating user level threads in the system libraries. In such cases, the thread switching can only be done by the thread library and the kernel isn't really “thread aware.”

---

# Appendix A. MySQL 5.1 Frequently Asked Questions

## A.1. MySQL 5.1 FAQ: General

### Questions

- [24.1.1: Which version of MySQL is production-ready \(GA\)?](#)
- [24.1.2: What is the state of development \(non-GA\) versions?](#)
- [24.1.3: Can MySQL 5.1 do subqueries?](#)
- [24.1.4: Can MySQL 5.1 perform multiple-table inserts, updates, and deletes?](#)
- [24.1.5: Does MySQL 5.1 have a Query Cache? Does it work on Server, Instance or Database?](#)
- [24.1.6: Does MySQL 5.1 have Sequences?](#)
- [24.1.7: Does MySQL 5.1 have a `NOW\(\)` function with fractions of seconds?](#)
- [24.1.8: Does MySQL 5.1 work with multi-core processors?](#)
- [24.1.9: Why do I see multiple processes for `mysqld`?](#)
- [24.1.10: Is there a hot backup tool for MyISAM like InnoDB Hot Backup?](#)
- [24.1.11: Have there been any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?](#)
- [24.1.12: Can MySQL 5.1 perform ACID transactions?](#)

### Questions and Answers

#### **24.1.1: Which version of MySQL is production-ready (GA)?**

Currently, both MySQL 5.0 and MySQL 5.1 are supported for production use.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008.

#### **24.1.2: What is the state of development (non-GA) versions?**

MySQL follows a milestone release model that introduces pre-production-quality features and stabilizes them to release quality (see [http://forge.mysql.com/wiki/Development\\_Cycle](http://forge.mysql.com/wiki/Development_Cycle)). This process then repeats, so releases cycle between pre-production and release quality status. Please check the change logs to identify the status of a given release.

MySQL 5.4 was a development series. Work on this series has ceased.

MySQL 5.5 is being actively developed using the milestone release methodology described above.

MySQL 5.6 is being actively developed using the milestone release methodology described above.

MySQL 6.0 was a development series. Work on this series has ceased.

#### **24.1.3: Can MySQL 5.1 do subqueries?**

Yes. See [Section 12.2.9, “Subquery Syntax”](#).

#### **24.1.4: Can MySQL 5.1 perform multiple-table inserts, updates, and deletes?**

Yes. For the syntax required to perform multiple-table updates, see [Section 12.2.11, “UPDATE Syntax”](#); for that required to perform multiple-table deletes, see [Section 12.2.2, “DELETE Syntax”](#).

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN ... END` block. See [Section 19.3, “Using Triggers”](#).

**24.1.5: Does MySQL 5.1 have a Query Cache? Does it work on Server, Instance or Database?**

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See [Section 7.6.3, “The MySQL Query Cache”](#).

**24.1.6: Does MySQL 5.1 have Sequences?**

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 5.1 can also handle inserts in a multi-master replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

**24.1.7: Does MySQL 5.1 have a `NOW()` function with fractions of seconds?**

No. This is on the MySQL roadmap as a “rolling feature”. This means that it is not a flagship feature, but will be implemented, development time permitting. Specific customer demand may change this scheduling.

However, MySQL does parse time strings with a fractional component. See [Section 10.3.2, “The TIME Type”](#).

**24.1.8: Does MySQL 5.1 work with multi-core processors?**

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

**24.1.9: Why do I see multiple processes for `mysqld`?**

When using LinuxThreads, you should see a minimum of three `mysqld` processes running. These are in fact threads. There is one thread for the LinuxThreads manager, one thread to handle connections, and one thread to handle alarms and signals.

**24.1.10: Is there a hot backup tool for MyISAM like InnoDB Hot Backup?**

This is currently under development for a future MySQL release.

**24.1.11: Have there been any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?**

The foreign key support in `InnoDB` has seen improvements in each major version of MySQL. Foreign key support generic to all storage engines is scheduled for MySQL 6.x; this should resolve any inadequacies in the current storage engine specific implementation.

**24.1.12: Can MySQL 5.1 perform ACID transactions?**

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The `NDB` storage engine supports the `READ COMMITTED` transaction isolation level only.

## A.2. MySQL 5.1 FAQ: Storage Engines

### Questions

- [24.2.1: Are there any new storage engines in MySQL 5.1?](#)
- [24.2.2: Do the new features in MySQL 5.1 apply to all storage engines?](#)
- [24.2.3: What are the unique benefits of the `ARCHIVE` storage engine?](#)
- [24.2.4: Have any storage engines been removed in MySQL 5.1?](#)
- [24.2.5: Where can I obtain complete documentation for MySQL storage engines and the pluggable storage engine architecture?](#)

### Questions and Answers

**24.2.1: Are there any new storage engines in MySQL 5.1?**

Yes, the `IBMDB2I` storage engine is included in the IBM i5/OS (TAR packages) and IBM i5/OS (SAVF packages). Also, there have been significant improvements in existing storage engines, in particular for the `NDB` storage engine that forms the basis for MySQL Cluster. Also, the `InnoDB Plugin` is available as an alternative to the built-in version of the `InnoDB` storage engine.

#### 24.2.2: Do the new features in MySQL 5.1 apply to all storage engines?

The general new features such as views, stored procedures, triggers, [INFORMATION\\_SCHEMA](#), precision math ([DECIMAL](#) column type), and the [BIT](#) column type, apply to all storage engines. There are also additions and changes for specific storage engines.

#### 24.2.3: What are the unique benefits of the [ARCHIVE](#) storage engine?

The [ARCHIVE](#) storage engine is ideally suited for storing large amounts of data without indexes; it has a very small footprint, and performs selects using table scans. See [Section 13.12, “The ARCHIVE Storage Engine”](#), for details.

#### 24.2.4: Have any storage engines been removed in MySQL 5.1?

Yes. MySQL 5.1 no longer supports the [BDB](#) storage engine. Any existing [BDB](#) tables should be converted to another storage engine before upgrading to MySQL 5.1.

#### 24.2.5: Where can I obtain complete documentation for MySQL storage engines and the pluggable storage engine architecture?

See [Chapter 13, Storage Engines](#). That chapter contains information about all MySQL storage engines except for the [NDB](#) storage engine used for MySQL Cluster; [NDB](#) is covered in [Chapter 17, MySQL Cluster NDB 6.X/7.X](#).

## A.3. MySQL 5.1 FAQ: Server SQL Mode

### Questions

- [24.3.1: How many server SQL modes are there?](#)
- [24.3.2: Is the mode dependent on the database or connection?](#)
- [24.3.3: What are server SQL modes?](#)
- [24.3.4: Does strict mode impact performance?](#)
- [24.3.5: How do you determine the server SQL mode?](#)
- [24.3.6: What is the default server SQL mode when MySQL 5.1 is installed?](#)
- [24.3.7: Can the rules for strict mode be extended?](#)

### Questions and Answers

#### 24.3.1: How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 5.1.7, “Server SQL Modes”](#), for a complete list of available modes.

#### 24.3.2: Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. You can change these settings using [SET \[GLOBAL|SESSION\] sql\\_mode='modes'](#).

#### 24.3.3: What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server applies these modes individually to different clients. For more information, see [Section 5.1.7, “Server SQL Modes”](#).

#### 24.3.4: Does strict mode impact performance?

The intensive validation of input data that some settings require more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However—if you do require it—strict mode can provide such validation.

#### 24.3.5: How do you determine the server SQL mode?

You can set the default SQL mode (for [mysqld](#) startup) with the [--sql-mode](#) option. Using the statement [SET \[GLOBAL|SESSION\] sql\\_mode='modes'](#), you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a [SELECT @@sql\\_mode](#) statement.

**24.3.6: What is the default server SQL mode when MySQL 5.1 is installed?**

By default, no special modes are enabled. See [Section 5.1.7, “Server SQL Modes”](#), for information about all available modes and MySQL's default behavior.

**24.3.7: Can the rules for strict mode be extended?**

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add restrictions to a mode. See [Section 5.1.7, “Server SQL Modes”](#), for more information.

## A.4. MySQL 5.1 FAQ: Stored Procedures and Functions

### Questions

- [24.4.1: How are actions that take place inside stored procedures and functions replicated?](#)
- [24.4.2: Can I pass an array as input to a stored procedure?](#)
- [24.4.3: Is there a MySQL equivalent to using `mod\_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?](#)
- [24.4.4: Do stored procedures provide exception handling?](#)
- [24.4.5: Are stored procedures and functions created on a master server replicated to a slave?](#)
- [24.4.6: Can a stored procedure call another stored procedure?](#)
- [24.4.7: Where can I find the ANSI SQL 2003 specification for stored procedures?](#)
- [24.4.8: Does MySQL 5.1 support stored procedures and functions?](#)
- [24.4.9: Can a stored procedure call a trigger?](#)
- [24.4.10: Can I print out a variable's value within a stored routine for debugging purposes?](#)
- [24.4.11: Is there a discussion forum for MySQL stored procedures?](#)
- [24.4.12: What limitations exist for replicating stored procedure and function actions?](#)
- [24.4.13: Can MySQL 5.1 stored routines return result sets?](#)
- [24.4.14: Do MySQL 5.1 stored procedures and functions work with replication?](#)
- [24.4.15: Can I pass a cursor as an `IN` parameter to a stored procedure?](#)
- [24.4.16: Are there special security requirements for using stored procedures and functions together with replication?](#)
- [24.4.17: Can I commit or roll back transactions inside a stored procedure?](#)
- [24.4.18: Is it possible to group stored procedures or stored functions into packages?](#)
- [24.4.19: How do you manage stored routines?](#)
- [24.4.20: Can I return a cursor as an `OUT` parameter from a stored procedure?](#)
- [24.4.21: Is there a way to view all stored procedures and stored functions in a given database?](#)
- [24.4.22: Can a stored procedure access tables?](#)
- [24.4.23: Is `WITH RECOMPILE` supported for stored procedures?](#)
- [24.4.24: Do stored procedures have a statement for raising application errors?](#)
- [24.4.25: Where are stored procedures stored?](#)
- [24.4.26: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?](#)
- [24.4.27: What is being done to correct the aforementioned limitations?](#)

- [24.4.28](#): Where can I find documentation for MySQL stored procedures and stored functions?

## Questions and Answers

### 24.4.1: How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

### 24.4.2: Can I pass an array as input to a stored procedure?

Not in MySQL 5.1.

### 24.4.3: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 5.1.

### 24.4.4: Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 12.7.4.2, “DECLARE for Handlers”](#), for details.

### 24.4.5: Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

### 24.4.6: Can a stored procedure call another stored procedure?

Yes.

### 24.4.7: Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books—such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer—which give a comprehensive overview of the standard, including coverage of stored procedures.

### 24.4.8: Does MySQL 5.1 support stored procedures and functions?

Yes. MySQL 5.1 supports two types of stored routines—stored procedures and stored functions.

### 24.4.9: Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

### 24.4.10: Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that—for instance—in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

### 24.4.11: Is there a discussion forum for MySQL stored procedures?

Yes. See <http://forums.mysql.com/list.php?98>.

### 24.4.12: What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Note that declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master

that cause errors are ignored and updates that do not cause errors are replicated to the slave.

#### 24.4.13: Can MySQL 5.1 stored routines return result sets?

*Stored procedures* can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that—for instance—in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

#### 24.4.14: Do MySQL 5.1 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in [Section 19.7, “Binary Logging of Stored Programs”](#).

#### 24.4.15: Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 5.1, cursors are available inside stored procedures only.

#### 24.4.16: Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

#### 24.4.17: Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

#### 24.4.18: Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 5.1.

#### 24.4.19: How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 20.14, “The INFORMATION\\_SCHEMA ROUTINES Table”](#)).

#### 24.4.20: Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 5.1, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See [Section 12.2.8, “SELECT Syntax”](#).

#### 24.4.21: Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named `dbname`, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
 FROM INFORMATION_SCHEMA.ROUTINES
 WHERE ROUTINE_SCHEMA = 'dbname' ;
```

For more information, see [Section 20.14, “The INFORMATION\\_SCHEMA ROUTINES Table”](#).

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 12.4.5.11, “SHOW CREATE PROCEDURE Syntax”](#), for more information.

#### 24.4.22: Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

#### 24.4.23: Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 5.1.

#### 24.4.24: Do stored procedures have a statement for raising application errors?

Not in MySQL 5.1. The SQL standard `SIGNAL` and `RESIGNAL` statements are implemented in MySQL 5.5.

#### **24.4.25: Where are stored procedures stored?**

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 12.4.5.11, “SHOW CREATE PROCEDURE Syntax”](#), for more information about these statements.

You can also query the `ROUTINES` table in the `INFORMATION_SCHEMA` database—see [Section 20.14, “The INFORMATION\\_SCHEMA ROUTINES Table”](#), for information about this table.

#### **24.4.26: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?**

The same limitations that affect replication do affect point-in-time recovery.

#### **24.4.27: What is being done to correct the aforementioned limitations?**

As of MySQL 5.1.5, you can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

Beginning with MySQL 5.1.8, *mixed* replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid, “smart” form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see [Section 16.1.2, “Replication Formats”](#).

#### **24.4.28: Where can I find documentation for MySQL stored procedures and stored functions?**

See [Section 19.2, “Using Stored Routines \(Procedures and Functions\)”](#).

## A.5. MySQL 5.1 FAQ: Triggers

### Questions

- [24.5.1: Is it possible for a trigger to update tables on a remote server?](#)
- [24.5.2: Can a trigger call a stored procedure?](#)
- [24.5.3: Is there a way to view all triggers in a given database?](#)
- [24.5.4: Where can I find the documentation for MySQL 5.1 triggers?](#)
- [24.5.5: Does MySQL 5.1 have statement-level or row-level triggers?](#)
- [24.5.6: Where are triggers stored?](#)
- [24.5.7: How are triggers managed in MySQL?](#)
- [24.5.8: Are there any default triggers?](#)
- [24.5.9: Can triggers access tables?](#)
- [24.5.10: How are actions carried out through triggers on a master replicated to a slave?](#)
- [24.5.11: Is there a discussion forum for MySQL Triggers?](#)
- [24.5.12: Can triggers call an external application through a UDF?](#)
- [24.5.13: Do triggers work with replication?](#)

### Questions and Answers

#### **24.5.1: Is it possible for a trigger to update tables on a remote server?**

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 13.11, “The FEDERATED Storage Engine”](#)).

#### **24.5.2: Can a trigger call a stored procedure?**

Yes.

#### 24.5.3: Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
 FROM INFORMATION_SCHEMA.TRIGGERS
 WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see [Section 20.16, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 12.4.5.40, “SHOW TRIGGERS Syntax”](#).

#### 24.5.4: Where can I find the documentation for MySQL 5.1 triggers?

See [Section 19.3, “Using Triggers”](#).

#### 24.5.5: Does MySQL 5.1 have statement-level or row-level triggers?

In MySQL 5.1, all triggers are `FOR EACH ROW`—that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 5.1 does not support triggers using `FOR EACH STATEMENT`.

#### 24.5.6: Where are triggers stored?

Triggers for a table are currently stored in `.TRG` files, with one such file one per table.

#### 24.5.7: How are triggers managed in MySQL?

In MySQL 5.1, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 12.1.19, “CREATE TRIGGER Syntax”](#), and [Section 12.1.30, “DROP TRIGGER Syntax”](#), for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 20.16, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

#### 24.5.8: Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

#### 24.5.9: Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

#### 24.5.10: How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

**Statement-based replication.** First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

**Row-based replication.** When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and—in addition—the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the

slave.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see [Section 16.4.1.29, “Replication and Triggers”](#).

#### **24.5.11: Is there a discussion forum for MySQL Triggers?**

Yes. It is available at <http://forums.mysql.com/list.php?99>.

#### **24.5.12: Can triggers call an external application through a UDF?**

Yes. For example, a trigger could invoke the `sys_exec()` UDF available at MySQL Forge here: <http://forge.mysql.com/projects/project.php?id=211>

#### **24.5.13: Do triggers work with replication?**

Yes. However, the way in which they work depends whether you are using MySQL's “classic” statement-based replication available in all versions of MySQL, or the row-based replication format introduced in MySQL 5.1.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see [Section 16.4.1.29, “Replication and Triggers”](#).

## **A.6. MySQL 5.1 FAQ: Views**

### **Questions**

- [24.6.1: Can you insert into views that are based on joins?](#)
- [24.6.2: Is there a discussion forum for MySQL Views?](#)
- [24.6.3: What happens to a view if an underlying table is dropped or renamed?](#)
- [24.6.4: Does MySQL 5.1 have materialized views?](#)
- [24.6.5: Does MySQL 5.1 have table snapshots?](#)
- [24.6.6: Where can I find documentation covering MySQL Views?](#)

### **Questions and Answers**

#### **24.6.1: Can you insert into views that are based on joins?**

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

#### **24.6.2: Is there a discussion forum for MySQL Views?**

Yes. See <http://forums.mysql.com/list.php?100>

#### **24.6.3: What happens to a view if an underlying table is dropped or renamed?**

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See [Section 12.4.2.3, “CHECK TABLE Syntax”](#).)

#### **24.6.4: Does MySQL 5.1 have materialized views?**

No.

**24.6.5: Does MySQL 5.1 have table snapshots?**

No.

**24.6.6: Where can I find documentation covering MySQL Views?**

See [Section 19.5, “Using Views”](#).

## A.7. MySQL 5.1 FAQ: INFORMATION\_SCHEMA

### Questions

- [24.7.1: Can I add to or otherwise modify the tables found in the INFORMATION\\_SCHEMA database?](#)
- [24.7.2: Where can I find the ANSI SQL 2003 specification for INFORMATION\\_SCHEMA?](#)
- [24.7.3: Where can I find documentation for the MySQL INFORMATION\\_SCHEMA database?](#)
- [24.7.4: What is the difference between the Oracle Data Dictionary and MySQL's INFORMATION\\_SCHEMA?](#)
- [24.7.5: Is there a discussion forum for INFORMATION\\_SCHEMA?](#)

### Questions and Answers

**24.7.1: Can I add to or otherwise modify the tables found in the INFORMATION\_SCHEMA database?**

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying INFORMATION\_SCHEMA tables or data*.

**24.7.2: Where can I find the ANSI SQL 2003 specification for INFORMATION\_SCHEMA?**

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available—such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer—which give a comprehensive overview of the standard, including INFORMATION\_SCHEMA.

**24.7.3: Where can I find documentation for the MySQL INFORMATION\_SCHEMA database?**

See [Chapter 20, INFORMATION\\_SCHEMA Tables](#)

**24.7.4: What is the difference between the Oracle Data Dictionary and MySQL's INFORMATION\_SCHEMA?**

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support INFORMATION\_SCHEMA as defined in the SQL standard.

**24.7.5: Is there a discussion forum for INFORMATION\_SCHEMA?**

See <http://forums.mysql.com/list.php?101>.

## A.8. MySQL 5.1 FAQ: Migration

### Questions

- [24.8.1: Where can I find information on how to migrate from MySQL 5.0 to MySQL 5.1?](#)
- [24.8.2: How has storage engine \(table type\) support changed in MySQL 5.1 from previous versions?](#)

### Questions and Answers

**24.8.1: Where can I find information on how to migrate from MySQL 5.0 to MySQL 5.1?**

For detailed upgrade information, see [Section 2.12.1, “Upgrading MySQL”](#). Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will save time and trouble—if you encounter problems during the upgrade, their origin will be easier to identify, either by you or—if you have a MySQL Enterprise subscription—by MySQL support.

#### 24.8.2: How has storage engine (table type) support changed in MySQL 5.1 from previous versions?

Storage engine support has changed as follows:

- Support for `ISAM` tables was removed in MySQL 5.0 and you should now use the `MyISAM` storage engine in place of `ISAM`. To convert a table `tblname` from `ISAM` to `MyISAM`, simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal `RAID` for `MyISAM` tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as `MERGE` tables and views.
- The `VARCHAR` column type now retains trailing spaces in all storage engines.
- `MEMORY` tables (formerly known as `HEAP` tables) can also contain `VARCHAR` columns.

## A.9. MySQL 5.1 FAQ: Security

### Questions

- [24.9.1: Does MySQL 5.1 have native support for SSL?](#)
- [24.9.2: Does MySQL 5.1 have built-in authentication against LDAP directories?](#)
- [24.9.3: Does MySQL 5.1 include support for Roles Based Access Control \(RBAC\)?](#)
- [24.9.4: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?](#)
- [24.9.5: Where can I find documentation that addresses security issues for MySQL?](#)

### Questions and Answers

#### 24.9.1: Does MySQL 5.1 have native support for SSL?

Most 5.1 binaries have support for SSL connections between the client and server. We can't currently build with the new YaSSL library everywhere, as it is still quite new and does not compile on all platforms yet. See [Section 5.5.6, “Using SSL for Secure Connections”](#).

You can also tunnel a connection using SSH, if (for example) the client application doesn't support SSL connections. For an example, see [Section 5.5.7, “Connecting to MySQL Remotely from Windows with SSH”](#).

#### 24.9.2: Does MySQL 5.1 have built-in authentication against LDAP directories?

No. Support for external authentication methods is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

#### 24.9.3: Does MySQL 5.1 include support for Roles Based Access Control (RBAC)?

No. Support for roles is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

#### 24.9.4: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 5.1 binaries have SSL enabled for client-server connections that are secured, authenticated, or both. However, the YaSSL library currently does not compile on all platforms. See [Section 5.5.6, “Using SSL for Secure Connections”](#), for a complete listing of supported and unsupported platforms.

#### 24.9.5: Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Section 5.3, “General Security Issues”](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 5.3.1, “General Security Guidelines”](#).

- [Section 5.3.3, “Making MySQL Secure Against Attackers”.](#)
- [Section B.5.4.1, “How to Reset the Root Password”.](#)
- [Section 5.3.6, “How to Run MySQL as a Normal User”.](#)
- [Section 22.3.2.6, “User-Defined Function Security Precautions”.](#)
- [Section 5.3.4, “Security-Related `mysqld` Options”.](#)
- [Section 5.3.5, “Security Issues with `LOAD DATA LOCAL`”.](#)
- [Section 2.13, “Post-Installation Setup and Testing”.](#)
- [Section 5.5.6.1, “Basic SSL Concepts”.](#)

## A.10. MySQL 5.1 FAQ: MySQL Cluster

In the following section, we answer questions that are frequently asked about MySQL Cluster and the `NDBCLUSTER` storage engine.

### Questions

- [24.10.1: How do I handle MySQL users in a MySQL Cluster having multiple MySQL servers?](#)
- [24.10.2: How much RAM do I need to use MySQL Cluster? Is it possible to use disk memory at all?](#)
- [24.10.3: What data types are supported by MySQL Cluster?](#)
- [24.10.4: Is MySQL Cluster transaction-safe? What isolation levels are supported?](#)
- [24.10.5: With which operating systems can I use Cluster?](#)
- [24.10.6: How do I back up and restore a MySQL Cluster?](#)
- [24.10.7: What is the difference between using MySQL Cluster \*vs\* using MySQL replication?](#)
- [24.10.8: Can I run MySQL Cluster nodes inside virtual machines \(such as those created by VMWare, Parallels, or Xen\)?](#)
- [24.10.9: Can I use host names with MySQL Cluster?](#)
- [24.10.10: Can I run two data nodes on a single host? Two SQL nodes?](#)
- [24.10.11: Do I need to do any special networking to run MySQL Cluster? How do computers in a cluster communicate?](#)
- [24.10.12: How do I continue to send queries in the event that one of the SQL nodes fails?](#)
- [24.10.13: What do “NDB” and “NDBCLUSTER” mean?](#)
- [24.10.14: What file systems can I use with MySQL Cluster? What about network file systems or network shares?](#)
- [24.10.15: What happened to MySQL Cluster NDB 6.4?](#)
- [24.10.16: What is an \*arbitrator\*?](#)
- [24.10.17: When I run the `SHOW` command in the MySQL Cluster management client, I see a line of output that looks like this:](#)

```
id=2 @10.100.10.32 (Version: 5.1.52, Nodegroup: 0, Master)
```

What is a “master node”, and what does it do? How do I configure a node so that it is the master?

- [24.10.18: MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?](#)
- [24.10.19: How do I find out what an error or warning message means when using MySQL Cluster?](#)

- [24.10.31](#): What are the hardware requirements for running MySQL Cluster?
- [24.10.32](#): I am trying to populate a MySQL Cluster database. The loading process terminates prematurely and I get an error message like this one: `ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL` Why is this happening?
- [24.10.33](#): In the event of a catastrophic failure—say, for instance, the whole city loses power *and* my UPS fails—would I lose all my data?
- [24.10.34](#): What storage engines are supported by MySQL Cluster?
- [24.10.35](#): How do I import an existing MySQL database into a MySQL Cluster?
- [24.10.36](#): Does MySQL Cluster support IPv6?
- [24.10.37](#): Do I have to learn a new programming or query language to use MySQL Cluster?
- [24.10.38](#): Can I mix different kinds of hardware and operating systems in one MySQL Cluster?
- [24.10.39](#): How many computers do I need to run a MySQL Cluster, and why?

## Questions and Answers

### 24.10.1: How do I handle MySQL users in a MySQL Cluster having multiple MySQL servers?

MySQL user accounts and privileges are *not* automatically propagated between different MySQL servers accessing the same MySQL Cluster. Therefore, you must make sure that these are copied between the SQL nodes yourself. You can do this manually, or automate the task with scripts.

#### Warning

Do not attempt to work around this issue by converting the MySQL system tables to use the `NDBCLUSTER` storage engine. Only the `MyISAM` storage engine is supported for these tables.

### 24.10.2: How much RAM do I need to use MySQL Cluster? Is it possible to use disk memory at all?

In MySQL 5.1, Cluster is in-memory only. This means that all table data (including indexes) is stored in RAM. Therefore, if your data takes up 1 GB of space and you want to replicate it once in the cluster, you need 2 GB of memory to do so (1 GB per replica). This is in addition to the memory required by the operating system and any applications running on the cluster computers.

If a data node's memory usage exceeds what is available in RAM, then the system will attempt to use swap space up to the limit set for `DataMemory`. However, this will at best result in severely degraded performance, and may cause the node to be dropped due to slow response time (missed heartbeats). We do not recommend on relying on disk swapping in a production environment for this reason. In any case, once the `DataMemory` limit is reached, any operations requiring additional memory (such as inserts) will fail.

We have implemented disk data storage for MySQL Cluster in MySQL 5.1 and later but we have no plans to add this capability in MySQL 5.1. See [Section 17.5.10, “MySQL Cluster Disk Data Tables”](#), for more information.

You can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space

required per row (see [Section 10.5, “Data Type Storage Requirements”](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an `NDBCLUSTER` table requires 21–25 bytes per record. These indexes use `IndexMemory`.
- Each ordered index requires 10 bytes storage per record, using `DataMemory`.
- Creating a primary key or unique index also creates an ordered index, unless this index is created with `USING HASH`. In other words:
  - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
  - However, if the primary key or unique index is created with `USING HASH`, then it requires only 21 to 25 bytes per record.

Note that creating MySQL Cluster tables with `USING HASH` for all primary keys and unique indexes will generally cause table updates to run more quickly—in some cases by as much as 20 to 30 percent faster than updates on tables where `USING HASH` was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the `ndb_size.pl` utility which is available in recent MySQL 5.1 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the `NDBCLUSTER` storage engine. For more information, see [Section 17.4.21, “`ndb\_size.pl` — NDBCLUSTER Size Requirement Estimator”](#).

It is especially important to keep in mind that *every MySQL Cluster table must have a primary key*. The `NDB` storage engine creates a primary key automatically if none is defined; this primary key is created without `USING HASH`.

There is no easy way to determine exactly how much memory is being used for storage of Cluster indexes at any given time; however, warnings are written to the Cluster log when 80% of available `DataMemory` or `IndexMemory` is in use, and again when use reaches 85%, 90%, and so on.

#### 24.10.3: What data types are supported by MySQL Cluster?

MySQL Cluster NDB 6.x and later supports all of the usual MySQL data types, including those associated with MySQL's spatial extensions; however, the `NDB` storage engine does not support spatial indexes. (Spatial indexes are supported only by `MyISAM`; see [Section 11.17, “Spatial Extensions”](#), for more information.) In addition, there are some differences with regard to indexes when used with `NDB` tables.

##### Note

MySQL Cluster Disk Data tables (that is, tables created with `TABLESPACE ... STORAGE DISK ENGINE=NDB` or `TABLESPACE ... STORAGE DISK ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each Disk Data table record containing a `VARCHAR(255)` column requires space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein.

See [Section 17.1.5, “Known Limitations of MySQL Cluster”](#), for more information about these issues.

#### 24.10.4: Is MySQL Cluster transaction-safe? What isolation levels are supported?

Yes. For tables created with the `NDB` storage engine, transactions are supported. Currently, MySQL Cluster supports only the `READ COMMITTED` transaction isolation level.

#### 24.10.5: With which operating systems can I use Cluster?

MySQL Cluster is supported on most Unix-like operating systems, including Linux, Mac OS X, and Solaris. Beginning with MySQL Cluster NDB 7.1.3, MySQL Cluster is also supported in production on Microsoft Windows operating systems.

For more detailed information concerning the level of support which is offered for MySQL Cluster on various operating system versions, operating system distributions, and hardware platforms, please refer to <http://www.mysql.com/support/supportedplatforms/cluster.html>.

#### 24.10.6: How do I back up and restore a MySQL Cluster?

You can use the NDB native backup and restore functionality in the MySQL Cluster management client and the `ndb_restore` program. See [Section 17.5.3, “Online Backup of MySQL Cluster”](#), and [Section 17.4.17, “`ndb\_restore` — Restore a MySQL Cluster Backup”](#).

You can also use the traditional functionality provided for this purpose in `mysqldump` and the MySQL server. See [Section 4.5.4, “`mysqldump` — A Database Backup Program”](#), for more information.

#### **24.10.7: What is the difference between using MySQL Cluster vs using MySQL replication?**

In traditional MySQL replication, a master MySQL server updates one or more slaves. Transactions are committed sequentially, and a slow transaction can cause the slave to lag behind the master. This means that if the master fails, it is possible that the slave might not have recorded the last few transactions. If a transaction-safe engine such as `InnoDB` is being used, a transaction will either be complete on the slave or not applied at all, but replication does not guarantee that all data on the master and the slave will be consistent at all times. In MySQL Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is *asynchronous*, MySQL Cluster is *synchronous*.

We have implemented (asynchronous) replication for Cluster in MySQL 5.1 and later. *MySQL Cluster Replication* (also sometimes known as “geo-replication”) includes the capability to replicate both between two MySQL Clusters, and from a MySQL Cluster to a non-Cluster MySQL server. However, we do *not* plan to backport this functionality to MySQL 5.1. See [Section 17.6, “MySQL Cluster Replication”](#).

#### **24.10.8: Can I run MySQL Cluster nodes inside virtual machines (such as those created by VMWare, Parallels, or Xen)?**

This is possible but not recommended for a production environment.

We have found that running MySQL Cluster processes inside a virtual machine can give rise to issues with timing and disk subsystems that have a strong negative impact on the operation of the cluster. The behavior of the cluster is often unpredictable in these cases.

If an issue can be reproduced outside the virtual environment, then we may be able to provide assistance. Otherwise, we cannot support it at this time.

#### **24.10.9: Can I use host names with MySQL Cluster?**

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, you should use fixed (numeric) IP addresses, since making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional potential points of failure.

#### **24.10.10: Can I run two data nodes on a single host? Two SQL nodes?**

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port. However, in MySQL 5.1, running more than one cluster node of a given type per machine is generally not encouraged or supported for production use.

We also advise against running data nodes and SQL nodes together on the same host, since the `ndbd` and `mysqld` processes may compete for memory.

#### **24.10.11: Do I need to do any special networking to run MySQL Cluster? How do computers in a cluster communicate?**

MySQL Cluster is intended to be used in a high-bandwidth environment, with computers connecting using TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for MySQL Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

The faster SCI protocol is also supported, but requires special hardware. See [Section 17.3.5, “Using High-Speed Interconnects with MySQL Cluster”](#), for more information about SCI.

#### **24.10.12: How do I continue to send queries in the event that one of the SQL nodes fails?**

MySQL Cluster does not provide any sort of automatic failover between SQL nodes. Your application must be prepared to handle the loss of SQL nodes and to fail over between them.

#### **24.10.13: What do “NDB” and “NDBCLUSTER” mean?**

“NDB” stands for “Network Database”. `NDB` and `NDBCLUSTER` are both names for the storage engine that enables clustering support in MySQL. While our developers prefer `NDB`, either name is correct; both names appear in our documentation, and either name can be used in the `ENGINE` option of a `CREATE TABLE` statement for creating a MySQL Cluster table.

#### **24.10.14: What file systems can I use with MySQL Cluster? What about network file systems or network shares?**

Generally, any file system that is native to the host operating system should work well with MySQL Cluster. If you find that a given file system works particularly well (or not so especially well) with MySQL Cluster, we invite you to discuss your findings in the

## MySQL Cluster Forums.

For Windows, we recommend that you use [NTFS](#) file systems for MySQL Cluster, just as we do for standard MySQL. We do not test MySQL Cluster with [FAT](#) or [VFAT](#) file systems. Because of this, we do not recommend their use with MySQL or MySQL Cluster.

MySQL Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network file systems is not supported for MySQL Cluster. This also applies to shared storage devices such as SANs.

### 24.10.15: What happened to MySQL Cluster NDB 6.4?

Because of the number and impact of new features introduced into MySQL Cluster following the General Availability of MySQL Cluster NDB 6.3, it was decided that the following release series represented a “major” new release series rather than a “minor” one, and should be known as MySQL Cluster 7.0.

The earliest development versions of MySQL Cluster NDB 7.0 were originally designated “MySQL Cluster 6.4”, and the first four releases in this series were identified as MySQL Cluster NDB 6.4.0 through NDB 6.4.3. MySQL Cluster NDB 7.0.4 is the fifth MySQL Cluster NDB 7.0 release; it is the successor to MySQL Cluster NDB 6.4.3.

For more information about MySQL Cluster NDB 7.0, see [Section 17.1.4.2, “MySQL Cluster Development in MySQL Cluster NDB 7.0”](#), and [Section 17.7.2, “Changes in MySQL Cluster NDB 7.0”](#).

### 24.10.16: What is an *arbitrator*?

If one or more data nodes in a cluster fail, it is possible that not all cluster data nodes will be able to “see” one another. In fact, it is possible that two sets of data nodes might become isolated from one another in a network partitioning, also known as a “split-brain” scenario. This type of situation is undesirable because each set of data nodes tries to behave as though it is the entire cluster. An arbitrator is required to decide between the competing sets of data nodes.

When all data nodes in at least one node group are alive, network partitioning is not an issue, because no single subset of the cluster can form a functional cluster on its own. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbitrator is required. All cluster nodes recognize the same node as the arbitrator, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbitrator instead. The arbitrator accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbitrator selection is controlled by the [ArbitrationRank](#) configuration parameter for MySQL Server and management server nodes. In MySQL Cluster NDB 7.0.7 and later, you can also use the [ArbitrationRank](#) configuration parameter to control the arbitrator selection process. For more information about these parameters, see [Section 17.3.2.5, “Defining a MySQL Cluster Management Server”](#).

The role of arbitrator does not in and of itself impose any heavy demands upon the host so designated, and thus the arbitrator host does not need to be particularly fast or to have extra memory especially for this purpose.

### 24.10.17: When I run the `SHOW` command in the MySQL Cluster management client, I see a line of output that looks like this:

```
id=2 @10.100.10.32 (Version: 5.1.52, Nodegroup: 0, Master)
```

#### What is a “master node”, and what does it do? How do I configure a node so that it is the master?

The simplest answer is, “It’s not something you can control, and it’s nothing that you need to worry about in any case, unless you’re a software engineer writing or analyzing the MySQL Cluster source code”.

If you don’t find that answer satisfactory, here’s a longer and more technical version:

A number of mechanisms in MySQL Cluster require distributed coordination among the data nodes. These distributed algorithms and protocols include global checkpointing, DDL (schema) changes, and node restart handling. To make this coordination simpler, the data nodes “elect” one of their number to be a “master”. There is no user-facing mechanism for influencing this selection, which is completely automatic; the fact that it is automatic is a key part of MySQL Cluster’s internal architecture.

When a node acts as a master for any of these mechanisms, it is usually the point of coordination for the activity, and the other nodes act as “servants”, carrying out their parts of the activity as directed by the master. If the node acting as master fails, then the remaining nodes elect a new master. Tasks in progress that were being coordinated by the old master may either fail or be continued by the new master, depending on the actual mechanism involved.

It is possible for some of these different mechanisms and protocols to have different master nodes, but in general the same master is chosen for all of them. The node indicated as the master in the output of `SHOW` in the management client is actually the [DICT](#) master (see [The DBDICT Block](#), in the *MySQL Cluster API Developer Guide*, for more information), responsible for coordinating DDL and metadata activity.

MySQL Cluster is designed in such a way that the choice of master has no discernable effect outside the cluster itself. For example,

the current master does not have significantly higher CPU or resource usage than the other data nodes, and failure of the master should not have a significantly different impact on the cluster than the failure of any other data node.

#### **24.10.18: MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?**

It is *very* unlikely that a cluster would perform reliably under such conditions, as MySQL Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet—preferably the latter. We neither test nor warrant its performance using anything slower than this.

Also, it is extremely important to keep in mind that communications between the nodes in a MySQL Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.) For more information, see [Section 17.5.9, “MySQL Cluster Security Issues”](#).

#### **24.10.19: How do I find out what an error or warning message means when using MySQL Cluster?**

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition.
- From a system shell prompt, use `perror --ndb error_code`.

#### **24.10.20: Which versions of the MySQL software support Cluster? Do I have to compile from source?**

Beginning with MySQL 5.1.24, MySQL Cluster is no longer supported in standard MySQL Server 5.1 releases. Instead, MySQL Cluster is now released as a separate product. Currently, two MySQL Cluster release series are available for production use:

- **MySQL Cluster NDB 6.3.** This series is now Generally Available (GA) for use in production. The latest MySQL Cluster NDB 6.3 sources and binaries can be obtained from <http://dev.mysql.com/downloads/cluster/>.
- **MySQL Cluster NDB 7.0.** This series is now Generally Available (GA) for use in production. The latest MySQL Cluster NDB 7.0 sources can be obtained from <http://dev.mysql.com/downloads/cluster/>.

You should use MySQL NDB Cluster NDB 6.3 or 7.0 for any new deployments; if you are already using MySQL 5.1 with clustering support, you should upgrade to one of these MySQL Cluster release series as soon as possible. For an overview of improvements made in MySQL Cluster NDB 6.3 and 7.0, see [Section 17.1.4.3, “MySQL Cluster Development in MySQL Cluster NDB 6.3”](#), and [Section 17.1.4.2, “MySQL Cluster Development in MySQL Cluster NDB 7.0”](#), respectively.

You can determine whether your MySQL Server has `NDBCLUSTER` support using either of the statements `SHOW VARIABLES LIKE 'have_%'` or `SHOW ENGINES`.

#### **24.10.21: How do cluster nodes communicate with one another?**

Cluster nodes can communicate through any of three different transport mechanisms: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Section 17.3.5, “Using High-Speed Interconnects with MySQL Cluster”](#), for more about using SCI as a transport mechanism for MySQL Cluster.

#### **24.10.22: How do I start and stop MySQL Cluster?**

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node, using the `ndb_mgmd` command.

You must include the `-f` or `--config-file` option to tell the management node where its configuration file can be found.

2. Start each data node with the `ndbd` command.

Each data node must be started with the `-c` or `--connect-string` option so that the data node knows how to connect to the management server.

3. Start each MySQL Server (SQL node) using your preferred startup script, such as `mysqld_safe`.

Each MySQL Server must be started with the `--ndbcluster` and `--ndb-connectstring` options. These options cause mysqld to enable `NDBCLUSTER` storage engine support and how to connect to the management server.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine—a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the `NDB` management client `ndb_mgm` on the machine housing the management node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the management client. Alternatively, you may enter the following command in a system shell:

```
shell> ndb_mgm -e "SHUTDOWN"
```

(The quotation marks in this example are optional, since there are no spaces in the command string following the `-e` option; in addition, the `SHUTDOWN` command, like other management client commands, is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see [Section 17.5.2, “Commands in the MySQL Cluster Management Client”](#), and [Section 17.2.4, “Safe Shutdown and Restart of MySQL Cluster”](#).

#### 24.10.23: What happens to MySQL Cluster data when the cluster is shut down?

The data that was held in memory by the cluster's data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

#### 24.10.24: Is it a good idea to have more than one management node for a MySQL Cluster?

It can be helpful as a fail-safe. Only one management node controls the cluster at any given time, but it is possible to configure one management node as primary, and one or more additional management nodes to take over in the event that the primary management node fails.

See [Section 17.3.2, “MySQL Cluster Configuration Files”](#), for information on how to configure MySQL Cluster management nodes.

#### 24.10.25: What do the different computers do in a MySQL Cluster?

A MySQL Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node.** This node provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control MySQL Cluster is `ndb_mgm`. See [Section 17.4.4, “ndb\\_mgmd — The MySQL Cluster Management Server Daemon”](#), and [Section 17.4.5, “ndb\\_mgm — The MySQL Cluster Management Client”](#), for information about these programs.
- **Data node.** This type of node stores and replicates data. Data node functionality is handled by instances of the `NDB` data node process `ndbd`. For more information, see [Section 17.4.2, “ndbd — The MySQL Cluster Data Node Daemon”](#).
- **SQL node.** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the `NDBCLUSTER` storage engine and started with the `--ndb-cluster` option to enable the engine and the `--ndb-connectstring` option to enable it to connect to a MySQL Cluster management server. For more about these options, see [Section 17.3.4.2, “mysqld Command Options for MySQL Cluster”](#).

#### Note

An *API node* is any application that makes direct use of Cluster data nodes for data storage and retrieval. An *SQL node* can thus be considered a type of API node that uses a MySQL Server to provide an SQL interface to the Cluster. You can write such applications (that do not depend on a MySQL Server) using the NDB API, which supplies a direct, object-oriented transaction and scanning interface to MySQL Cluster data; see [The NDB API](#), for more information.

#### 24.10.26: Can I add data nodes to a MySQL Cluster without restarting it?

Beginning with MySQL Cluster NDB 6.4, it is possible to add new data nodes to a running MySQL Cluster without taking it off-line. For more information, see [Section 17.5.11, “Adding MySQL Cluster Data Nodes Online”](#).

For other types of MySQL Cluster nodes, a rolling restart is all that is required (see [Section 17.2.5.1, “Performing a Rolling Restart of a MySQL Cluster”](#)).

In MySQL Cluster NDB 6.3 and earlier, it was not possible to add new data nodes without shutting down and restarting the MySQL Cluster.

#### 24.10.27: What is an “angel process”?

This process monitors and, if necessary, attempts to restart the data node process. If you check the list of active processes on your system after starting `ndbd`, you can see that there are actually 2 processes running by that name, as shown here (we omit the output from `ndb_mgmd` and `ndbd` for brevity):

```
shell> ./ndb_mgmd
shell> ps aux | grep ndb
me 23002 0.0 0.0 122948 3104 ? Ssl 14:14 0:00 ./ndb_mgmd
me 23025 0.0 0.0 5284 820 pts/2 S+ 14:14 0:00 grep ndb

shell> ./ndbd -c 127.0.0.1 --initial
shell> ps aux | grep ndb
me 23002 0.0 0.0 123080 3356 ? Ssl 14:14 0:00 ./ndb_mgmd
me 23096 0.0 0.0 35876 2036 ? Ss 14:14 0:00 ./ndbd -c 127.0.0.1 --initial
me 23097 1.0 2.4 524116 91096 ? S1 14:14 0:00 ./ndbd -c 127.0.0.1 --initial
me 23168 0.0 0.0 5284 812 pts/2 R+ 14:15 0:00 grep ndb
```

The `ndbd` process showing 0 memory and CPU usage is the angel process. It actually does use a very small amount of each, of course. It simply checks to see if the main `ndbd` process (the primary data node process that actually handles the data) is running. If permitted to do so (for example, if the `StopOnError` configuration parameter is set to false—see [Section 17.3.3.1, “MySQL Cluster Data Node Configuration Parameters”](#)), the angel process tries to restart the primary data node process.

#### 24.10.28: Are there any limitations that I should be aware of when using MySQL Cluster?

Limitations on `NDB` tables in MySQL 5.1 (including MySQL Cluster NDB 6.x) include the following:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDBCCLUSTER` fails with an error.
- The only types of user-defined partitioning supported for `NDBCCLUSTER` tables are `KEY` and `LINEAR KEY`. (Beginning with MySQL 5.1.12, attempting to create an `NDB` table using any other partitioning type fails with an error.)
- `FULLTEXT` indexes are not supported.
- Index prefixes are not supported. Only complete columns may be indexed.
- Spatial indexes are not supported (although spatial columns can be used). See [Section 11.17, “Spatial Extensions”](#).
- Prior to MySQL Cluster NDB 6.3.19, the `NDBCCLUSTER` storage engine did not support partial transactions or partial rollbacks of transactions. Beginning with MySQL Cluster NDB 6.3.19, this limitation has been removed, and the behavior of `NDBCCLUSTER` is now in line with that of other transactional storage engines (such as `InnoDB`) that can roll back individual statements.
- Prior to MySQL Cluster NDB 7.0.15 and MySQL Cluster NDB 7.1.4, the maximum number of attributes allowed per table was 128; beginning with MySQL Cluster NDB 7.0.15 and MySQL Cluster NDB 7.1.4, this limit is increased to 512. Attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- The maximum size for a table row is 8 kilobytes, not counting `BLOB` values. There is no set limit for the number of rows per table. Table size limits depend on a number of factors, in particular on the amount of RAM available to each data node.
- The `NDBCCLUSTER` engine does not support foreign key constraints. As with `MyISAM` tables, if these are specified in a `CREATE TABLE` or `ALTER TABLE` statement, they are ignored.

For a complete listing of limitations in MySQL Cluster, see [Section 17.1.5, “Known Limitations of MySQL Cluster”](#). For information about limitations in MySQL Cluster 5.0 that are lifted in MySQL 5.1, MySQL Cluster NDB 6.x, or MySQL Cluster NDB 7.0, see [Section 17.1.5.11, “Previous MySQL Cluster Issues Resolved in MySQL 5.1, MySQL Cluster NDB 6.x, and MySQL Cluster NDB 7.x”](#).

#### 24.10.29: Is it possible to use `FULLTEXT` indexes with MySQL Cluster?

`FULLTEXT` indexing is not supported by any storage engine other than `MyISAM`. We are working to add this capability to MySQL Cluster tables in a future release.

#### **24.10.30: Can I run multiple nodes on a single computer?**

It is possible but not always advisable. One of the chief reasons to run a cluster is to provide redundancy. To obtain the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. For this reason, if you do run multiple data nodes on a single machine, it is *extremely* important that they be set up in such a way that the failure of this machine does not cause the loss of all the data nodes in a given node group.

Given that MySQL Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 300 MHz Pentium or equivalent CPU and sufficient RAM for the operating system, plus a small amount of overhead for the `ndb_mgmd` and `ndb_mgm` processes.

It is acceptable to run multiple cluster data nodes on a single host that has multiple CPUs, cores, or both. Beginning with MySQL Cluster NDB 6.4, there is also a special multi-threaded version of the data node binary intended for use on such systems. For more information, see [Section 17.4.3, “`ndbmttd` — The MySQL Cluster Data Node Daemon \(Multi-Threaded\)”](#).

It is also possible in some cases to run data nodes and SQL nodes concurrently on the same machine; how well such an arrangement performs is dependent on a number of factors such as number of cores and CPUs as well as the amount of disk and memory available to the data node and SQL node processes, and you must take these factors into account when planning such a configuration.

#### **24.10.31: What are the hardware requirements for running MySQL Cluster?**

MySQL Cluster should run on any platform for which `NDB`-enabled binaries are available. For data nodes and API nodes, faster CPUs and more memory are likely to improve performance, and 64-bit CPUs are likely to be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). For a computer which is used only for running the MySQL Cluster management server, the requirements are minimal; a common desktop PC (or the equivalent) is generally sufficient for this task. Nodes can communicate through the standard TCP/IP network and hardware. They can also use the high-speed SCI protocol; however, special networking hardware and software are required to use SCI (see [Section 17.3.5, “Using High-Speed Interconnects with MySQL Cluster”](#)).

#### **24.10.32: I am trying to populate a MySQL Cluster database. The loading process terminates prematurely and I get an error message like this one: `ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL` Why is this happening?**

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the `NDB` storage engine and automatically created in the event that the table definition does not include the definition of a primary key*.

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. For example, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote at most 1GB to MySQL Cluster data and indexes.

#### **24.10.33: In the event of a catastrophic failure—say, for instance, the whole city loses power and my UPS fails—would I lose all my data?**

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

#### **24.10.34: What storage engines are supported by MySQL Cluster?**

Clustering with MySQL is supported only by the `NDB` storage engine. That is, in order for a table to be shared between nodes in a MySQL Cluster, the table must be created using `ENGINE=NDB` (or the equivalent option `ENGINE=NDBCLUSTER`).

It is possible to create tables using other storage engines (such as `MyISAM` or `InnoDB`) on a MySQL server being used with a MySQL Cluster, but these non-`NDB` tables do *not* participate in clustering; each such table is strictly local to the individual MySQL server instance on which it is created.

#### **24.10.35: How do I import an existing MySQL database into a MySQL Cluster?**

You can import databases into MySQL Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ, the only other special requirement is that any tables to be included in the cluster must use the `NDB` storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`.

It is also possible to convert existing tables that use other storage engines to `NDBCLUSTER` using one or more `ALTER TABLE` statement. However, the definition of the table must be compatible with the `NDBCLUSTER` storage engine prior to making the con-

version. In MySQL 5.1, an additional workaround is also required; see [Section 17.1.5, “Known Limitations of MySQL Cluster”](#), for details.

#### **24.10.36: Does MySQL Cluster support IPv6?**

Beginning with MySQL Cluster NDB 6.4, IPv6 is supported for connections between SQL nodes (MySQL servers). However, connections between all other types of nodes must use IPv4.

In practical terms, this means that you can use IPv6 for replication between MySQL Clusters, but connections between nodes in the same MySQL Cluster must use IPv4. For more information, see [Section 17.6.3, “Known Issues in MySQL Cluster Replication”](#).

#### **24.10.37: Do I have to learn a new programming or query language to use MySQL Cluster?**

*No.* Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL statements are required for the following operations:

- Creating, altering, and dropping tables
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up a MySQL Cluster—see [Section 17.3.2, “MySQL Cluster Configuration Files”](#), for information about these.

A few simple commands are used in the MySQL Cluster management client (`ndb_mgm`) for tasks such as starting and stopping cluster nodes. See [Section 17.5.2, “Commands in the MySQL Cluster Management Client”](#).

#### **24.10.38: Can I mix different kinds of hardware and operating systems in one MySQL Cluster?**

Yes, as long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian). We are working to overcome this limitation in a future MySQL Cluster release.

It is also possible to use software from different MySQL Cluster releases on different nodes. However, we support this only as part of a rolling upgrade procedure (see [Section 17.2.5.1, “Performing a Rolling Restart of a MySQL Cluster”](#)).

#### **24.10.39: How many computers do I need to run a MySQL Cluster, and why?**

A minimum of three computers is required to run a viable cluster. However, the minimum *recommended* number of computers in a MySQL Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

## **A.11. MySQL 5.1 FAQ: MySQL Chinese, Japanese, and Korean Character Sets**

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

### **Questions**

- [24.11.1: Why do I get `DATA TRUNCATED` error messages?](#)
- [24.11.2: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?](#)
- [24.11.3: What should I do if I want to convert SJIS `81CA` to `cp932`?](#)
- [24.11.4: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?](#)
- [24.11.5: Why do Japanese character set conversions fail?](#)
- [24.11.6: How do I know whether character `X` is available in all character sets?](#)
- [24.11.7: What problems should I be aware of when working with the Big5 Chinese character set?](#)

- [24.11.8](#): How does MySQL represent the Yen (¥) sign?
- [24.11.9](#): Why don't CJK strings sort correctly in Unicode? (I)
- [24.11.10](#): Shouldn't it be "CJKV"?
- [24.11.11](#): What CJK character sets are available in MySQL?
- [24.11.12](#): Do MySQL plan to make a separate character set where 5C is the Yen sign, as at least one other major DBMS does?
- [24.11.13](#): Why are my supplementary characters rejected by MySQL?
- [24.11.14](#): Why don't CJK strings sort correctly in Unicode? (II)
- [24.11.15](#): Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?
- [24.11.16](#): Where can I get help with CJK and related issues in MySQL?
- [24.11.17](#): Does MySQL allow CJK characters to be used in database and table names?
- [24.11.18](#): Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?
- [24.11.19](#): I've upgraded to MySQL 5.1. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?
- [24.11.20](#): Of what issues should I be aware when working with Korean character sets in MySQL?

## Questions and Answers

### 24.11.1: Why do I get `DATA TRUNCATED` error messages?

For illustration, we'll create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
 -> (ucs2 CHAR(3) CHARACTER SET ucs2,
 -> gb2312 CHAR(3) CHARACTER SET gb2312);
Query OK, 0 rows affected (0.05 sec)
```

We'll try to place the rare character `𣁃` in both columns.

```
mysql> INSERT INTO ch VALUES ('A𣁃B', 'A𣁃B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Ah, there is a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message
+-----+-----+-----+
| Warning | 1265 | Data truncated for column 'gb2312' at row 1 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2 | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| A𣁃B | 00416C4C0042 | A?B | 413F42 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

There are several things that need explanation here.

1. The fact that it is a "warning" rather than an "error" is characteristic of MySQL. We like to try to do what we can, to get the best fit, rather than give up.
2. The `𣁃` character isn't in the `gb2312` character set. We described that problem earlier.
3. Admittedly the message is misleading. We didn't "truncate" in this case, we replaced with a question mark. We've had a complaint about this message (See [Bug#9337](#)). But until we come up with something better, just accept that error/warning code 2165 can mean a variety of things.
4. With `SQL_MODE=TRADITIONAL`, there would be an error message, but instead of error 2165 you would see: `ERROR 1406 (22001): Data too long for column 'gb2312' at row 1`.

#### 24.11.2: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client (Windows: `mysql.exe`), and try the same query there. If `mysql` responds correctly, then the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, then you are most likely connecting with MyODBC. In this case, you should check [Section 21.1.4, “Connector/ODBC Configuration”](#). If, for instance, you use `big5`, you would enter `SET NAMES 'big5'`. (Note that no `;` is required in this case). If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username; " \
 & "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, then you must specify the character set in the connection string. See [Section 21.2.5.1, “Connecting to MySQL Using Connector/NET”](#), for more information.

If you are using PHP, try this:

```
<?php
$link = mysql_connect($host, $usr, $pwd);
mysql_select_db($db);

if(mysql_error()) { print "Database ERROR: " . mysql_error(); }
mysql_query("SET NAMES 'utf8'", $link);
?>
```

In this case, we used `SET NAMES` to change `character_set_client` and `character_set_connection` and `character_set_results`.

We encourage the use of the newer `mysqli` extension, rather than `mysql`. Using `mysqli`, the previous example could be rewritten as shown here:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if(mysqli_connect_errno())
{
 printf("Connect failed: %s\n", mysqli_connect_error());
 exit();
}

$link->query("SET NAMES 'utf8'");
?>
```

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as `UTF-8`, you should include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` of the HTML page.

If you are using Connector/J, see [Section 21.3.4.4, “Using Character Sets and Unicode”](#).

#### 24.11.3: What should I do if I want to convert SJIS 81CA to cp932?

Our answer is: “?” . There are serious complaints about this: many people would prefer a “loose” conversion, so that `81CA (NOT SIGN)` in `sjis` becomes `81CA (FULLWIDTH NOT SIGN)` in `cp932`. We are considering a change to this behavior.

#### 24.11.4: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that doesn't match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- Be certain of what MySQL version you are using.

Use the statement `SELECT VERSION()` to determine this.

- Make sure that the database is actually using the desired character set.

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or—better—yet by using this statement:

```
SELECT character_set_name, collation_name
 FROM information_schema.columns
 WHERE table_schema = your_database_name
 AND table_name = your_table_name
 AND column_name = your_column_name;
```

- Determine the hexadecimal value of the character or characters that are not being displayed correctly.

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name)
 FROM table_name;
```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- Make sure that a round trip possible—that is, when you select `literal` (or `_introducer_hexadecimal-value`), you obtain `literal` as a result.

For example, the Japanese *Katakana* character *Pe* (ؘ) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ؘ' AS `ؘ`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also `ؘ`, then the round trip has failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ؘ');`. Then we can determine whether the client encoding is correct.

- Make sure that the problem is not with the browser or other application, rather than with MySQL.

Use the `mysql` client program (on Windows: `mysql.exe`) to accomplish this task. If `mysql` displays correctly but your application doesn't, then your problem is probably due to system settings.

To find out what your settings are, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

Variable_name	Value
character_set_client	utf8
character_set_connection	utf8
character_set_database	latin1
character_set_filesystem	binary
character_set_results	utf8
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysql/charsets/

8 rows in set (0.03 sec)

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set and a default for MySQL).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what your underlying computer is, then try changing to a common character set for the country that you're in (`euckr` = Korea; `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpm` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. There is a simple statement which changes all three at once: `SET NAMES`. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI*

*front end or browser not display CJK characters correctly...?* for more information.

#### 24.11.5: Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpm` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpm` columns represent the destinations—that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpm` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpm
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark ("?")—this is what is always used when the conversion cannot be performed.)

#### 24.11.6: How do I know whether character `x` is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese *Kana* characters appear in all CJK character sets. This stored procedure accepts a `UCS-2` Unicode character, converts it to all other character sets, and displays the results in hexadecimal.

```
DELIMITER //
CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN
CREATE TABLE tj
(ucs2 CHAR(1) character set ucs2,
 utf8 CHAR(1) character set utf8,
 big5 CHAR(1) character set big5,
 cp932 CHAR(1) character set cp932,
 eucjpm CHAR(1) character set eucjpm,
```

```

euckr CHAR(1) character set euckr,
gb2312 CHAR(1) character set gb2312,
gbk CHAR(1) character set gbk,
sjis CHAR(1) character set sjis,
ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
 big5=ucs2,
 cp932=ucs2,
 eucjpm=ucs2,
 euckr=ucs2,
 gb2312=ucs2,
 gbk=ucs2,
 sjis=ucs2,
 ujis=ucs2;

/* If there is a conversion problem, UPDATE will produce a warning. */

SELECT hex(ucs2) AS ucs2,
 hex(utf8) AS utf8,
 hex(big5) AS big5,
 hex(cp932) AS cp932,
 hex(eucjpm) AS eucjpm,
 hex(euckr) AS euckr,
 hex(gb2312) AS gb2312,
 hex(gbk) AS gbk,
 hex(sjis) AS sjis,
 hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//
```

The input can be any single `ucs2` character, or it can be the code point value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the *Katakana* character *Pe* appears in all CJK character sets, and that its code point value is `0x30da`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```
mysql> CALL p_convert(0x30da)//
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ucs2 | utf8 | big5 | cp932 | eucjpm | euckr | gb2312 | gbk | sjis | ujis |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 30DA | E3839A | C772 | 8379 | A5DA | ABDA | A5DA | A5DA | 8379 | A5DA |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.04 sec)
```

Since none of the column values is `3F`—that is, the question mark character (?)—we know that every conversion worked.

#### 24.11.7: What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). MySQL's `big5` is in reality Microsoft code page 950, which is very similar to the original `big5` character set. We changed to this character set starting with MySQL version 4.1.16 / 5.0.16 (as a result of [Bug#12476](#)). For example, the following statements work in current versions of MySQL, but not in old versions:

```
mysql> CREATE TABLE big5 (BIG5 CHAR(1) CHARACTER SET BIG5);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO big5 VALUES (0xf9dc);
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM big5;
+-----+
| big5 |
+-----+
| 媚 |
+-----+
1 row in set (0.02 sec)
```

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for [Bug#13577](#) to be of interest.

#### 24.11.8: How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (\—also known as a backslash), and others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is always the *reverse solidus* (\).

#### 24.11.9: Why don't CJK strings sort correctly in Unicode? (I)

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is

not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not read correctly the standard table of weights for the Unicode Collation Algorithm. MySQL uses the table found at <http://www.unicode.org/Public/UCA/4.0.0/allkeys-4.0.0.txt>. This is not the first table you will find by navigating from the [unicode.org](http://www.unicode.org) home page, because MySQL uses the older 4.0.0 “allkeys” table, rather than the more recent 4.1.0 table. This is because we are very wary about changing ordering which affects indexes, lest we bring about situations such as that reported in [Bug#16526](#), illustrated as follows:

```
mysql> CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('が'), ('か');
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = 'か';
+-----+
| s1 |
+-----+
| が |
| か |
+-----+
2 rows in set (0.00 sec)
```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```
mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+-----+
| s1 | HEX(CONVERT(s1 USING ucs2)) |
+-----+
| が | 304C
| か | 304B
+-----+
2 rows in set (0.03 sec)
```

Now we search for `304B` and `304C` in the `4.0.0 allkeys` table, and find these lines:

```
304B ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QOCM
```

The official Unicode names (following the “#” mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (`KA` or `GA`, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting `が` and `か` correctly according to the Unicode specification. If we wanted to distinguish them, we'd have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_bin` or `utf8_general_ci`), or to compare the `HEX()` values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct “according to Unicode” isn't enough, of course: the person who submitted the bug was equally correct. We plan to add another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like `KA/GA` are distinguishable for ordering purposes.

#### 24.11.10: Shouldn't it be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL has no plan to support the old Vietnamese script using Han characters. MySQL does of course support the modern Vietnamese script with Western characters.

[Bug#4745](#) is a request for a specialized Vietnamese collation, which we might add in the future if there is sufficient demand for it.

#### 24.11.11: What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `eucjpm` character set was not supported prior to MySQL 5.0.3 (see [Changes in MySQL 5.0.3](#)). However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
-> FROM INFORMATION_SCHEMA.CHARACTER_SETS
-> WHERE DESCRIPTION LIKE '%Chinese%'
-> OR DESCRIPTION LIKE '%Japanese%'
-> OR DESCRIPTION LIKE '%Korean%'
-> ORDER BY CHARACTER_SET_NAME;
+-----+
| CHARACTER_SET_NAME | DESCRIPTION |
+-----+
| big5 | Big5 Traditional Chinese
| cp932 | SJIS for Windows Japanese
| eucjpm | UJIS for Windows Japanese
| euckr | EUC-KR Korean
| gb2312 | GB2312 Simplified Chinese
| gbk | GBK Simplified Chinese
| sjis | Shift-JIS Japanese
| ujis | EUC-JP Japanese
+-----+
8 rows in set (0.01 sec)
```

(See [Section 20.9, “The INFORMATION\\_SCHEMA CHARACTER\\_SETS Table”](#), for more information.)

MySQL supports the two common variants of the *GB* (*Guojia BiaoZhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312` and `gbk`. Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312`—but eventually they try to insert a rarer Chinese character and it doesn't work. (See [Bug#16072](#) for an example).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs.

- For a complete listing of the `gb2312` characters, ordered according to the `gb2312_chinese_ci` collation: [gb2312](#)
- MySQL's `gbk` is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0-A6F5`, and `A8BB-A8C0`. For a listing of the differences, see <http://recode.progiciels-bpi.ca/showfile.html?name=dist/libiconv/gbk.h>.
- For a listing of `gbk`/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.
- For MySQL's listing of `gbk` characters, see [gbk](#).

#### 24.11.12: Do MySQL plan to make a separate character set where `5C` is the Yen sign, as at least one other major DBMS does?

This is one possible solution to the Yen sign issue; however, this will not happen in MySQL 5.1 or 6.0.

#### 24.11.13: Why are my supplementary characters rejected by MySQL?

Before MySQL 6.0.4, MySQL does not support supplementary characters—that is, characters which need more than 3 bytes—for [UTF-8](#). We support only what Unicode calls the *Basic Multilingual Plane / Plane 0*. Only a few very rare Han characters are supplementary; support for them is uncommon. This has led to reports such as that found in [Bug#12600](#), which we rejected as “not a bug”. With `utf8`, we must truncate an input string when we encounter bytes that we don't understand. Otherwise, we wouldn't know how long the bad multi-byte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks; however, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

As of MySQL 6.0.4, Unicode support is extended to include supplementary characters by means of additional Unicode character sets: `utf16`, `utf32`, and 4-byte `utf8`. These character sets support supplementary Unicode characters outside the Basic Multilingual Plane (BMP).

#### 24.11.14: Why don't CJK strings sort correctly in Unicode? (II)

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see [Section A.11, “MySQL 5.1 FAQ: MySQL Chinese, Japanese, and Korean Character Sets”](#)), but MySQL still seems to sort your table incorrectly, then you should first verify the table character set:

```
mysql> SHOW CREATE TABLE t\G
***** 1. row *****
Table: t
Create Table: CREATE TABLE `t` (
 `s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

Since the character set appears to be correct, let's see what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
 -> FROM INFORMATION_SCHEMA.COLUMNS
 -> WHERE COLUMN_NAME = 's1'
 -> AND TABLE_NAME = 't';
+-----+-----+-----+
| COLUMN_NAME | CHARACTER_SET_NAME | COLLATION_NAME |
+-----+-----+-----+
| s1 | ucs2 | ucs2_general_ci |
+-----+-----+-----+
1 row in set (0.01 sec)
```

(See [Section 20.3, “The INFORMATION\\_SCHEMA COLUMNS Table”](#), for more information.)

You can see that the collation is `ucs2_general_ci` instead of `ucs2_unicode_ci`. The reason why this is so can be found using `SHOW CHARSET`, as shown here:

```
mysql> SHOW CHARSET LIKE 'ucs2%';
```

Charset	Description	Default collation	Maxlen
ucs2	UCS-2 Unicode	ucs2_general_ci	2

1 row in set (0.00 sec)

For `ucs2` and `utf8`, the default collation is “general”. To specify a Unicode collation, use `COLLATE ucs2_unicode_ci`.

#### 24.11.15: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

There is a very simple problem with `LIKE` searches on `BINARY` and `BLOB` columns: we need to know the end of a character. With multi-byte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `𠂇` requires three bytes, as shown here:

OCTET_LENGTH(_utf8 'A')	OCTET_LENGTH(_utf8 '𠂇')
1	3

1 row in set (0.00 sec)

If we don't know where the first character ends, then we don't know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a regular CJK character set in the first place, or to convert to a CJK character set before comparing.

This is one reason why MySQL cannot allow encodings of nonexistent characters. If it is not strict about rejecting bad input, then it has no way of knowing where characters end.

For `FULLTEXT` searches, we need to know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary—the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

#### 24.11.16: Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <http://dev.mysql.com/user-groups/>.
- You can contact a sales engineer at the MySQL KK Japan office using any of the following:

Tel: +81(0)3-5326-3133  
Fax: +81(0)3-5326-3001  
Email: [dsaito@mysql.com](mailto:dsaito@mysql.com)

- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets, Collation, Unicode Forum](#). We are also in the process of adding foreign-language forums at <http://forums.mysql.com/>.

#### 24.11.17: Does MySQL allow CJK characters to be used in database and table names?

This issue is fixed in MySQL 5.1, by automatically rewriting the names of the corresponding directories and files.

For example, if you create a database named `褚` on a server whose operating system does not support CJK in directory names, MySQL creates a directory named `@0w@00a5@00ae`, which is just a fancy way of encoding `E6A5AE`—that is, the Unicode hexadeciml representation for the `褚` character. However, if you run a `SHOW DATABASES` statement, you can see that the database is listed as `褚`.

#### 24.11.18: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

A Simplified Chinese version of the Manual, current for MySQL 5.1.12, can be found at <http://dev.mysql.com/doc/>. The Japanese translation of the MySQL 4.1 manual can be downloaded from <http://dev.mysql.com/doc/>.

#### 24.11.19: I've upgraded to MySQL 5.1. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 9.1.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses

the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some of our Asian customers have said that they prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use—however, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The current settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

Now stop the client, and then stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the current settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | latin1 |
| character_set_connection | latin1 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | latin1 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` is used.

#### 24.11.20: Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted.

We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is WON SIGN(`₩`). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
 -> CONVERT('₩' USING euckr) AS euckr,
 -> HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ? | 3F |
+-----+-----+
1 row in set (0.00 sec)
```

MySQL's graphic Korean chart is here: [euckr](#).

## A.12. MySQL 5.1 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Section 21.9.10, “Common Questions and Problems When Using the C API”](#)
- [Section 21.10.6, “Common Problems with MySQL and PHP”](#)
- [Section 21.1.7, “Connector/ODBC Notes and Tips”](#)
- [Section 21.2.5, “Connector/.NET Programming”](#)
- [Section 21.3.5, “Connector/J Notes and Tips”](#)
- [Section 21.4.6, “Connector/MXJ Notes and Tips”](#)

## A.13. MySQL 5.1 FAQ: Replication

For answers to common queries and question regarding Replication within MySQL, see [Section 16.4.4, “Replication FAQ”](#).

## A.14. MySQL 5.1 FAQ: MySQL, DRBD, and Heartbeat

### A.14.1. Distributed Replicated Block Device (DRBD)

In the following section, we provide answers to questions that are most frequently asked about Distributed Replicated Block Device (DRBD).

#### Questions

- [24.14.1.1: How is DRBD licensed?](#)
- [24.14.1.2: Where can I download DRBD?](#)
- [24.14.1.3: If I find a bug in DRBD, to whom do I submit the issue?](#)
- [24.14.1.4: What are “Block Devices”?](#)
- [24.14.1.5: What is DRBD?](#)
- [24.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?](#)

#### Questions and Answers

##### 24.14.1.1: How is DRBD licensed?

DRBD is licensed under the GPL.

##### 24.14.1.2: Where can I download DRBD?

Please see <http://www.drbd.org/download/packages/>.

##### 24.14.1.3: If I find a bug in DRBD, to whom do I submit the issue?

Bug reports should be submitted to the DRBD mailing list. Please see <http://lists.linbit.com/>.

##### 24.14.1.4: What are “Block Devices”?

A *block device* is the type of device used to represent storage in the Linux Kernel. All physical disk devices present a block device interface. Additionally, virtual disk systems like LVM or DRBD present a block device interface. In this way, the file system or other software that might want to access a disk device can be used with any number of real or virtual devices without having to know anything about their underlying implementation details.

##### 24.14.1.5: What is DRBD?

DRBD is an acronym for Distributed Replicated Block Device. DRBD is an open source Linux kernel block device which lever-

ages synchronous replication to achieve a consistent view of data between two systems, typically an Active and Passive system. DRBD currently supports all the major flavors of Linux and comes bundled in several major Linux distributions. The DRBD project is maintained by [LINBIT](#).

#### **24.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?**

Please visit <http://mysql.com/drbd/>.

## **A.14.2. Linux Heartbeat**

In the following section, we provide answers to questions that are most frequently asked about Linux Heartbeat.

### **Questions**

- [24.14.2.1:](#) Where can I download Linux Heartbeat?
- [24.14.2.2:](#) How is Linux Heartbeat licensed?
- [24.14.2.3:](#) If I find a bug with Linux Heartbeat, to whom do I submit the issue?

### **Questions and Answers**

#### **24.14.2.1: Where can I download Linux Heartbeat?**

Please see <http://linux-ha.org/download/index.html>.

#### **24.14.2.2: How is Linux Heartbeat licensed?**

Linux Heartbeat is licensed under the GPL.

#### **24.14.2.3: If I find a bug with Linux Heartbeat, to whom do I submit the issue?**

Bug reports should be submitted to <http://www.linux-ha.org/ClusterResourceManager/BugReports>.

## **A.14.3. DRBD Architecture**

In the following section, we provide answers to questions that are most frequently asked about DRBD Architecture.

### **Questions**

- [24.14.3.1:](#) How long does a failover take?
- [24.14.3.2:](#) How long does it take to resynchronize data after a failure?
- [24.14.3.3:](#) Are there any situations where you shouldn't use DRBD?
- [24.14.3.4:](#) Where can I find more information on sample architectures?
- [24.14.3.5:](#) Is an Active/Active option available for MySQL with DRBD?
- [24.14.3.6:](#) Are there any limitations to DRBD?
- [24.14.3.7:](#) What MySQL storage engines are supported with DRBD?

### **Questions and Answers**

#### **24.14.3.1: How long does a failover take?**

Failover time is dependent on many things, some of which are configurable. After activating the passive host, MySQL will have to start and run a normal recovery process. If the InnoDB log files have been configured to a large size and there was heavy write traffic, this may take a reasonably long period of time. However, under normal circumstances, failover tends to take less than a minute.

#### **24.14.3.2: How long does it take to resynchronize data after a failure?**

Resynchronization time depends on how long the two machines are out of communication and how much data was written during that period of time. Resynchronization time is a function of data to be synced, network speed and disk speed. DRBD maintains a

bitmap of changed blocks on the primary machine, so only those blocks that have changed will need to be transferred.

#### **24.14.3.3: Are there any situations where you shouldn't use DRBD?**

See [When Not To Use DRBD](#).

#### **24.14.3.4: Where can I find more information on sample architectures?**

For an example of a Heartbeat R1-compatible resource configuration involving a MySQL database backed by DRBD, see [DRBD User's Guide](#).

For an example of the same DRBD-backed configuration for a MySQL database in a Heartbeat CRM cluster, see [DRBD User's Guide](#).

#### **24.14.3.5: Is an Active/Active option available for MySQL with DRBD?**

Currently, MySQL does not support Active/Active configurations using DRBD “out of the box”.

#### **24.14.3.6: Are there any limitations to DRBD?**

See [DRBD limitations \(or are they?\)](#).

#### **24.14.3.7: What MySQL storage engines are supported with DRBD?**

All of the MySQL transactional storage engines are supported by DRBD, including InnoDB and Falcon. For archived or read-only data, MyISAM or Archive can also be used.

## **A.14.4. DRBD and MySQL Replication**

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication Scale-out.

### **Questions**

- [24.14.4.1: What is the difference between MySQL Replication and DRBD?](#)
- [24.14.4.2: How can I combine MySQL Replication scale-out with DRBD?](#)
- [24.14.4.3: What is the difference between MySQL Cluster and DRBD?](#)

### **Questions and Answers**

#### **24.14.4.1: What is the difference between MySQL Replication and DRBD?**

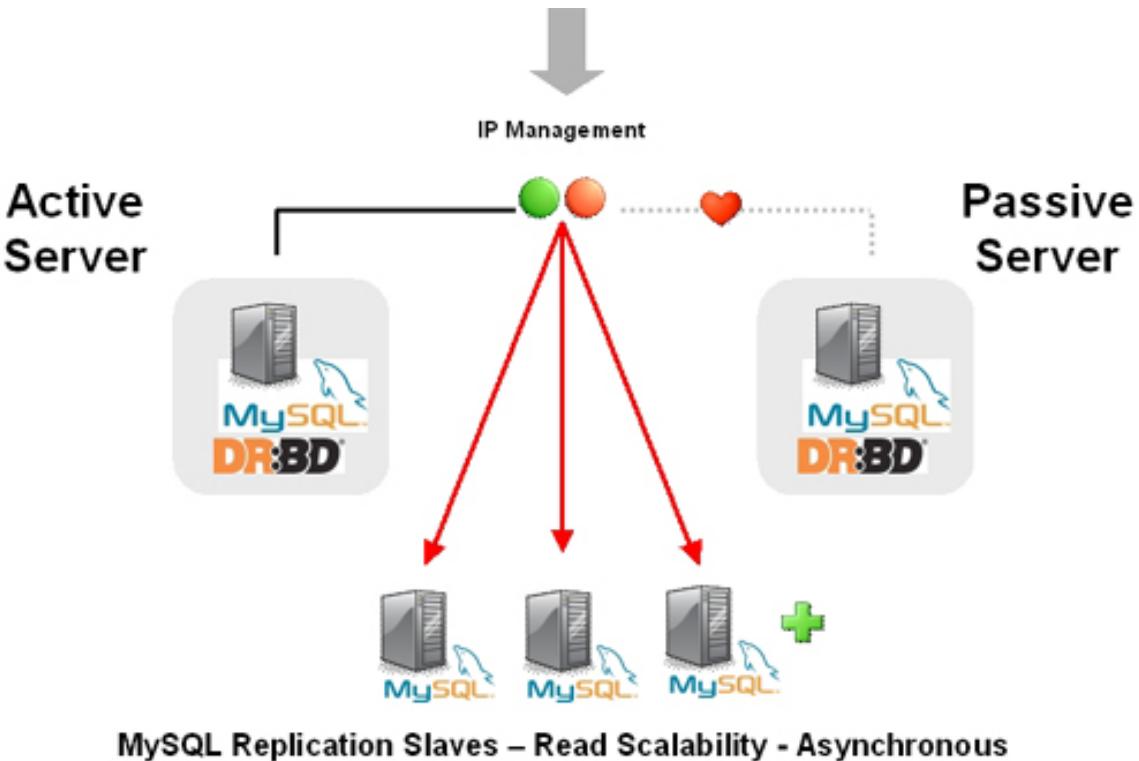

MySQL Replication replicates data asynchronously while DRBD replicates data synchronously. Also, MySQL Replication replicates MySQL statements, while DRBD replicates the underlying block device that stores the MySQL data files. For a comparison of various high availability features between these two options, please refer to the high availability comparison grid, [Chapter 14, High Availability and Scalability](#).

#### **24.14.4.2: How can I combine MySQL Replication scale-out with DRBD?**

MySQL Replication is typically deployed in a Master to many Slaves configuration. In this configuration, having many Slaves provides read scalability. DRBD is used to provide high-availability for the Master MySQL Server in an Active/Passive configuration. This provides for automatic failover, safeguards against data loss, and automatically synchronizes the failed MySQL Master after a failover.

The most likely scenario in which MySQL Replication scale-out can be leveraged with DRBD is in the form of attaching replicated MySQL “read-slaves” off of the Active-Master MySQL Server. Since DRBD replicates an entire block device, master information such as the binary logs are also replicated. In this way, all of the slaves can attach to the Virtual IP Address managed by Linux Heartbeat. In the event of a failure, the asynchronous nature of MySQL Replication allows the slaves to continue with the new Active machine as their master with no intervention needed.

**Figure A.1. Active-Master MySQL Server**

#### 24.14.4.3: What is the difference between MySQL Cluster and DRBD?

Both MySQL Cluster and DRBD replicate data synchronously. MySQL Cluster leverages a shared-nothing storage architecture in which the cluster can be architected beyond an Active/Passive configuration. DRBD operates at a much lower level within the “stack”, at the disk I/O level. For a comparison of various high availability features between these two options, please refer to [Chapter 14, High Availability and Scalability](#).

## A.14.5. DRBD and File Systems

In the following section, we provide answers to questions that are most frequently asked about DRBD and file systems.

### Questions

- [24.14.5.1: Can XFS be used with DRBD?](#)

### Questions and Answers

#### 24.14.5.1: Can XFS be used with DRBD?

Yes. XFS uses dynamic block size, thus DRBD 0.7 or later is needed.

## A.14.6. DRBD and LVM

In the following section, we provide answers to questions that are most frequently asked about DRBD and LVM.

### Questions

- [24.14.6.1: Can I use DRBD on top of LVM?](#)
- [24.14.6.2: Can I use LVM on top of DRBD?](#)
- [24.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?](#)

### Questions and Answers

#### 24.14.6.1: Can I use DRBD on top of LVM?

Yes, DRBD supports on-line resizing. If you enlarge your logical volume that acts as a backing device for DRBD, you can enlarge DRBD itself too, and of course your file system if it supports resizing.

#### **24.14.6.2: Can I use LVM on top of DRBD?**

Yes, you can use DRBD as a Physical Volume (PV) for LVM. Depending on the default LVM configuration shipped with your distribution, you may need to add the `/dev/drbd*` device files to the `filter` option in your `lvm.conf` so LVM scans your DRBDs for PV signatures.

#### **24.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?**

This requires careful tuning of your LVM configuration to avoid duplicate PV scans, but yes, it is possible.

## **A.14.7. DRBD and Virtualization**

In the following section, we provide answers to questions that are most frequently asked about DRBD and virtualization.

### **Questions**

- [24.14.7.1:](#) Can I use DRBD with Xen or KVM?
- [24.14.7.2:](#) Can I use DRBD with OpenVZ?

### **Questions and Answers**

#### **24.14.7.1: Can I use DRBD with Xen or KVM?**

Yes. If you are looking for professional consultancy or expert commercial support for Xen- or KVM-based virtualization clusters with DRBD, contact LINBIT (<http://www.linbit.com>).

#### **24.14.7.2: Can I use DRBD with OpenVZ?**

See [http://wiki.openvz.org/HA\\_cluster\\_with\\_DRBD\\_and\\_Heartbeat](http://wiki.openvz.org/HA_cluster_with_DRBD_and_Heartbeat).

## **A.14.8. DRBD and Security**

In the following section, we provide answers to questions that are most frequently asked about DRBD and security.

### **Questions**

- [24.14.8.1:](#) Does DRBD do mutual node authentication?
- [24.14.8.2:](#) Can I encrypt/compress the exchanged data?

### **Questions and Answers**

#### **24.14.8.1: Does DRBD do mutual node authentication?**

Yes, starting with DRBD 8 shared-secret mutual node authentication is supported.

#### **24.14.8.2: Can I encrypt/compress the exchanged data?**

Yes. But there is no option within DRBD to allow for this. You'll need to leverage a VPN and the network layer should do the rest.

## **A.14.9. DRBD and System Requirements**

In the following section, we provide answers to questions that are most frequently asked about DRBD and System Requirements.

### **Questions**

- [24.14.9.1:](#) What other packages besides DRBD are required?
- [24.14.9.2:](#) How many machines are required to set up DRBD?
- [24.14.9.3:](#) Does DRBD only run on Linux?

## Questions and Answers

### 24.14.9.1: What other packages besides DRBD are required?

When using pre-built binary packages, none except a matching kernel, plus packages for [glibc](#) and your favorite shell. When compiling DRBD from source additional prerequisite packages may be required. They include but are not limited to:

- glib-devel
- openssl
- devel
- libgcrypt-devel
- glib2-devel
- pkgconfig
- ncurses-devel
- rpm-build
- rpm-devel
- redhat-rpm-config
- gcc
- gcc-c++
- bison
- flex
- gnutls-devel
- lm\_sensors-devel
- net-snmp-devel
- python-devel
- bzip2-devel
- libselinux-devel
- perl-DBI
- libnet

Pre-built x86 and x86\_64 packages for specific kernel versions are available with a support subscription from LINBIT. Please note that if the kernel is upgraded, DRBD must be as well.

### 24.14.9.2: How many machines are required to set up DRBD?

Two machines are required to achieve the minimum degree of high availability. Although at any one given point in time one will be primary and one will be secondary, it is better to consider the machines as part of a mirrored pair without a “natural” primary machine.

### 24.14.9.3: Does DRBD only run on Linux?

DRBD is a Linux Kernel Module, and can work with many popular Linux distributions. DRBD is currently not available for non-Linux operating systems.

## A.14.10. DRBD and Support and Consulting

In the following section, we provide answers to questions that are most frequently asked about DRBD and resources.

### Questions

---

- [24.14.10.1](#): Where can I get more information about MySQL for DRBD?
- [24.14.10.2](#): Does MySQL offer professional consulting to help with designing a DRBD system?
- [24.14.10.3](#): Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?
- [24.14.10.4](#): Are pre-built binaries or RPMs available?
- [24.14.10.5](#): Is there a dedicated discussion forum for MySQL High-Availability?
- [24.14.10.6](#): Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

### Questions and Answers

#### **24.14.10.1: Where can I get more information about MySQL for DRBD?**

For more information about MySQL for DRBD, including a technical white paper please see: <http://www.mysql.com/products/enterprise/drbd.html>.

#### **24.14.10.2: Does MySQL offer professional consulting to help with designing a DRBD system?**

Yes. MySQL offers consulting for the design, installation, configuration, and monitoring of high availability DRBD. For more information concerning a High Availability Jumpstart, please see: <http://www.mysql.com/consulting/packaged/scaleout.html>.

#### **24.14.10.3: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?**

For MySQL-specific DRBD documentation, see [Section 14.1, “Using MySQL with DRBD”](#).

For general DRBD documentation, see [DRBD User’s Guide](#).

#### **24.14.10.4: Are pre-built binaries or RPMs available?**

Yes. “DRBD for MySQL” is an add-on subscription to MySQL Enterprise, which provides pre-built binaries for DRBD. For more information, see: <http://mysql.com/products/enterprise/features.html>.

#### **24.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?**

Yes, <http://forums.mysql.com/list.php?144>.

#### **24.14.10.6: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?**

Yes. Support for DRBD is available with an add-on subscription to MySQL Enterprise called “DRBD for MySQL”. For more information about support options for DRBD see: <http://mysql.com/products/enterprise/features.html>.

For the list of supported Linux distributions, please see: <http://www.mysql.com/support/supportedplatforms/enterprise.html>.

#### **Note**

DRBD is only available on Linux. DRBD is not available on Windows, MacOS, Solaris, HPUX, AIX, FreeBSD, or other non-Linux platforms.

---

# Appendix B. Errors, Error Codes, and Common Problems

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided; The first list displays server error messages. The second list displays client program messages.

## B.1. Sources of Error Information

There are several sources of error information in MySQL:

- Each SQL statement executed results in an error code, an SQLSTATE value, and an error message, as described in [Section B.2, “Types of Error Values”](#). These errors are returned from the server side; see [Section B.3, “Server Error Codes and Messages”](#).
- Errors can occur on the client side, usually involving problems communicating with the server; see [Section B.4, “Client Error Codes and Messages”](#).
- SQL statement warning and error information is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` and `error_count` system variables provide counts of the number of warnings and errors.
- `SHOW SLAVE STATUS` statement output includes information about replication errors occurring on the slave side.
- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an InnoDB table fails.
- The `perror` program provides information from the command line about error numbers. See [Section 4.8.1, “perror — Explain Error Codes”](#).

Descriptions of server and client errors are provided later in this Appendix. For information about errors related to InnoDB, see [Section 13.6.12, “InnoDB Error Handling”](#).

## B.2. Types of Error Values

When an error occurs in MySQL, the server returns two types of error values:

- A MySQL-specific error code. This value is numeric. It is not portable to other database systems.
- An SQLSTATE value. The value is a five-character string (for example, '`42S02`'). The values are specified by ANSI SQL and ODBC and are more standardized.

A message string that provides a textual description of the error is also available.

When an error occurs, you can access the MySQL error code, the SQLSTATE value, and the message string using C API functions:

- MySQL error code: Call `mysql_errno()`
- SQLSTATE value: Call `mysql_sqlstate()`
- Error message: Call `mysql_error()`

For prepared statements, the corresponding error functions are `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()`. All error functions are described in [Section 21.9, “MySQL C API”](#).

The first two characters of an SQLSTATE value indicate the error class:

- '`00`' indicates success.
- '`01`' indicates a warning.
- '`02`' indicates “not found.” These values are relevant only within the context of cursors and are used to control what happens when a cursor reaches the end of a data set.

- Other values indicate an exception.

## B.3. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error code ([1146](#)). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value (['42S02'](#)). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value ['HY000'](#) (general error) is used for unmapped errors.
- A message string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at <http://dev.mysql.com/doc/>.

- Error message information is listed in the `share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg.txt` are used to generate the definitions in the `include/mysqld_error.h` and `include/mysqld_erule.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: [1000](#) SQLSTATE: [HY000 \(ER\\_HASHCHK\)](#)  
Message: hashchk
- Error: [1001](#) SQLSTATE: [HY000 \(ER\\_NISAMCHK\)](#)  
Message: isamchk
- Error: [1002](#) SQLSTATE: [HY000 \(ER\\_NO\)](#)

## B.4. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the [include/errmsg.h](#) MySQL source file.
- The Message values correspond to the error messages that are listed in the [libmysql/errmsg.c](#) file. %d and %s represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: [2000 \(CR\\_UNKNOWN\\_ERROR\)](#)

Message: Unknown MySQL error

- Error: [2001 \(CR\\_SOCKET\\_CREATE\\_ERROR\)](#)

Message: Can't create UNIX socket (%d)

- Error: [2002 \(CR\\_CONNECTION\\_ERROR\)](#)

Message: Can't connect to local MySQL server through socket '%s' (%d)

- Error: [2003 \(CR\\_CONN\\_HOST\\_ERROR\)](#)

Message: Can't connect to MySQL server on '%s' (%d)

- Error: [2004 \(CR\\_IPSOCK\\_ERROR\)](#)

- Message: Can't create TCP/IP socket (%d)
- Error: [2005 \(CR\\_UNKNOWN\\_HOST\)](#)  
Message: Unknown MySQL server host '%s' (%d)
- Error: [2006 \(CR\\_SERVER\\_GONE\\_ERROR\)](#)  
Message: MySQL server has gone away
- Error: [2007 \(CR\\_VERSION\\_ERROR\)](#)  
Message: Protocol mismatch; server version = %d, client version = %d
- Error: [2008 \(CR\\_OUT\\_OF\\_MEMORY\)](#)  
Message: MySQL client ran out of memory
- Error: [2009 \(CR\\_WRONG\\_HOST\\_INFO\)](#)  
Message: Wrong host info
- Error: [2010 \(CR\\_LOCALHOST\\_CONNECTION\)](#)  
Message: Localhost via UNIX socket
- Error: [2011 \(CR\\_TCP\\_CONNECTION\)](#)  
Message: %s via TCP/IP
- Error: [2012 \(CR\\_SERVER\\_HANDSHAKE\\_ERR\)](#)  
Message: Error in server handshake
- Error: [2013 \(CR\\_SERVER\\_LOST\)](#)  
Message: Lost connection to MySQL server during query
- Error: [2014 \(CR\\_COMMANDS\\_OUT\\_OF\\_SYNC\)](#)  
Message: Commands out of sync; you can't run this command now
- Error: [2015 \(CR\\_NAMEDPIPE\\_CONNECTION\)](#)  
Message: Named pipe: %s
- Error: [2016 \(CR\\_NAMEDPIPEWAIT\\_ERROR\)](#)  
Message: Can't wait for named pipe to host: %s pipe: %s (%lu)
- Error: [2017 \(CR\\_NAMEDPIPEOPEN\\_ERROR\)](#)  
Message: Can't open named pipe to host: %s pipe: %s (%lu)
- Error: [2018 \(CR\\_NAMEDPIPESETSTATE\\_ERROR\)](#)  
Message: Can't set state of named pipe to host: %s pipe: %s (%lu)
- Error: [2019 \(CR\\_CANT\\_READ\\_CHARSET\)](#)  
Message: Can't initialize character set %s (path: %s)
- Error: [2020 \(CR\\_NET\\_PACKET\\_TOO\\_LARGE\)](#)  
Message: Got packet bigger than 'max\_allowed\_packet' bytes
- Error: [2021 \(CR\\_EMBEDDED\\_CONNECTION\)](#)  
Message: Embedded server
- Error: [2022 \(CR\\_PROBE\\_SLAVE\\_STATUS\)](#)

Message: Error on SHOW SLAVE STATUS:

- Error: [2023 \(CR\\_PROBE\\_SLAVE\\_HOSTS\)](#)

Message: Error on SHOW SLAVE HOSTS:

- Error: [2024 \(CR\\_PROBE\\_SLAVE\\_CONNECT\)](#)

Message: Error connecting to slave:

- Error: [2025 \(CR\\_PROBE\\_MASTER\\_CONNECT\)](#)

Message: Error connecting to master:

- Error: [2026 \(CR\\_SSL\\_CONNECTION\\_ERROR\)](#)

Message: SSL connection error

- Error: [2027 \(CR\\_MALFORMED\\_PACKET\)](#)

Message: Malformed packet

- Error: [2028 \(CR\\_WRONG\\_LICENSE\)](#)

Message: This client library is licensed only for use with MySQL servers having '%s' license

- Error: [2029 \(CR\\_NULL\\_POINTER\)](#)

Message: Invalid use of null pointer

- Error: [2030 \(CR\\_NO\\_PREPARE\\_STMT\)](#)

Message: Statement not prepared

- Error: [2031 \(CR\\_PARAMS\\_NOT\\_BOUND\)](#)

Message: No data supplied for parameters in prepared statement

- Error: [2032 \(CR\\_DATA\\_TRUNCATED\)](#)

Message: Data truncated

- Error: [2033 \(CR\\_NO\\_PARAMETERS\\_EXISTS\)](#)

Message: No parameters exist in the statement

- Error: [2034 \(CR\\_INVALID\\_PARAMETER\\_NO\)](#)

Message: Invalid parameter number

- Error: [2035 \(CR\\_INVALID\\_BUFFER\\_USE\)](#)

Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: [2036 \(CR\\_UNSUPPORTED\\_PARAM\\_TYPE\)](#)

Message: Using unsupported buffer type: %d (parameter: %d)

- Error: [2037 \(CR\\_SHARED\\_MEMORY\\_CONNECTION\)](#)

Message: Shared memory: %s

- Error: [2038 \(CR\\_SHARED\\_MEMORY\\_CONNECT\\_REQUEST\\_ERROR\)](#)

Message: Can't open shared memory; client could not create request event (%lu)

- Error: [2039 \(CR\\_SHARED\\_MEMORY\\_CONNECT\\_ANSWER\\_ERROR\)](#)

Message: Can't open shared memory; no answer event received from server (%lu)

- Error: [2040 \(CR\\_SHARED\\_MEMORY\\_CONNECT\\_FILE\\_MAP\\_ERROR\)](#)

- Message: Can't open shared memory; server could not allocate file mapping (%lu)
- Error: [2041 \(CR\\_SHARED\\_MEMORY\\_CONNECT\\_MAP\\_ERROR\)](#)  
Message: Can't open shared memory; server could not get pointer to file mapping (%lu)
- Error: [2042 \(CR\\_SHARED\\_MEMORY\\_FILE\\_MAP\\_ERROR\)](#)  
Message: Can't open shared memory; client could not allocate file mapping (%lu)
- Error: [2043 \(CR\\_SHARED\\_MEMORY\\_MAP\\_ERROR\)](#)  
Message: Can't open shared memory; client could not get pointer to file mapping (%lu)
- Error: [2044 \(CR\\_SHARED\\_MEMORY\\_EVENT\\_ERROR\)](#)  
Message: Can't open shared memory; client could not create %s event (%lu)
- Error: [2045 \(CR\\_SHARED\\_MEMORY\\_CONNECT\\_ABANDONED\\_ERROR\)](#)  
Message: Can't open shared memory; no answer from server (%lu)
- Error: [2046 \(CR\\_SHARED\\_MEMORY\\_CONNECT\\_SET\\_ERROR\)](#)  
Message: Can't open shared memory; cannot send request event to server (%lu)
- Error: [2047 \(CR\\_CONN\\_UNKNOW\\_PROTOCOL\)](#)  
Message: Wrong or unknown protocol
- Error: [2048 \(CR\\_INVALID\\_CONN\\_HANDLE\)](#)  
Message: Invalid connection handle
- Error: [2049 \(CR\\_SECURE\\_AUTH\)](#)  
Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure\_auth' enabled)
- Error: [2050 \(CR\\_FETCH\\_CANCELED\)](#)  
Message: Row retrieval was canceled by mysql\_stmt\_close() call
- Error: [2051 \(CR\\_NO\\_DATA\)](#)  
Message: Attempt to read column without prior row fetch
- Error: [2052 \(CR\\_NO\\_STMT\\_METADATA\)](#)  
Message: Prepared statement contains no metadata
- Error: [2053 \(CR\\_NO\\_RESULT\\_SET\)](#)  
Message: Attempt to read a row while there is no result set associated with the statement
- Error: [2054 \(CR\\_NOT\\_IMPLEMENTED\)](#)  
Message: This feature is not implemented yet
- Error: [2055 \(CR\\_SERVER\\_LOST\\_EXTENDED\)](#)  
Message: Lost connection to MySQL server at '%s', system error: %d
- Error: [2056 \(CR\\_STMT\\_CLOSED\)](#)  
Message: Statement closed indirectly because of a preceding %s() call
- Error: [2057 \(CR\\_NEW\\_STMT\\_METADATA\)](#)  
Message: The number of columns in the result set differs from the number of bound buffers. You must reset the statement, re-bind the result set columns, and execute the statement again

## B.5. Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

### B.5.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer doesn't move.
  - The machine doesn't answer to a remote machine's pings.
  - Other programs that are not related to MySQL don't behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.2, “MySQL Server Logs”](#).
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system doesn't work.” This doesn't provide us with any information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.7, “How to Report Bugs or Problems”](#).

## B.5.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

### B.5.2.1. Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See [Section 5.4, “The MySQL Access Privilege System”](#), and [Section 5.4.7, “Causes of Access-Denied Errors”](#).

### B.5.2.2. Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `-enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.13.1.3, “Starting and Troubleshooting the MySQL Server”](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP number of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your

clients get that error, you can find a workaround here: [Section B.5.2.2.1, “Connection to MySQL Server Failing on Windows”](#).

- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn't have native threads, `mysqld` uses the MIT-pthreads package. See [Section 2.1, “General Installation Guidance”](#). However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the host name explicitly when connecting to the server. Try using this command to check the connection to the server:

```
shell> mysqladmin -h `hostname` version
```

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.5.4.5, “How to Protect or Change the MySQL Unix Socket File”](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.5.4.5, “How to Protect or Change the MySQL Unix Socket File”](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See [Section B.5.4.2, “What to Do If MySQL Keeps Crashing”](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

### B.5.2.2.1. Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista and Server 2008: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

**IMPORTANT:** The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor (`Regedt32.exe`).

2. Locate the following key in the registry:

HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

Value Name: MaxUserPort  
Data Type: REG\_DWORD  
Value: 65534

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

Value Name: TcpTimedWaitDelay  
Data Type: REG\_DWORD  
Value: 30

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

### B.5.2.3. Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than

`max_allowed_packet`, which can cause this error with some clients. Sometime you may see “packet too large” as part of the error message, and that confirms that you need to increase `max_allowed_packet`.

#### B.5.2.4. Client does not support authentication protocol

MySQL 5.1 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` function:

```
mysql> SET PASSWORD FOR
-> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
```

Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

```
mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
-> WHERE Host = 'some_host' AND User = 'some_user';
mysql> FLUSH PRIVILEGES;
```

Substitute the password you want to use for “`newpwd`” in the preceding examples. MySQL cannot tell you what the original password was, so you’ll need to pick a new one.

- Tell the server to use the older password hashing algorithm:
  1. Start `mysqld` with the `--old-passwords` option.
  2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
-> WHERE LENGTH>Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

#### Note

In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for “MySQL, Improved”; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see <http://php.net/mysqli>.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our [MySQL with PHP forum](#).

For additional background on password hashing and authentication, see [Section 5.3.2.3, “Password Hashing in MySQL”](#).

#### B.5.2.5. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

### B.5.2.6. Host '`host_name`' is blocked

If you get the following error, it means that `mysqld` has received many connect requests from the host '`host_name`' that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests permitted is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See [Section 5.1.4, “Server System Variables”](#).

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

### B.5.2.7. Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections permitted is controlled by the `max_connections` system variable. Beginning with MySQL 5.1.15, its default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

`mysqld` actually permits `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 12.4.5.31, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform, the amount of RAM available, how much RAM is used for each connection, the workload from each connection, and the desired response time. Linux or Solaris should be able to support at 500 to 1000 simultaneous connections routinely and as many as 10,000 connections if you have many gigabytes of RAM available and the workload from each is low or the response time target un-demanding. Windows is limited to  $(\text{open tables} \times 2 + \text{open connections}) < 2048$  due to the Posix compatibility layer used on that platform.

Increasing `open-files-limit` may be necessary. Also see [Section 2.6, “Installing MySQL on Linux”](#), for how to raise the operating system limit on how many handles can be used by MySQL.

### B.5.2.8. Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

### B.5.2.9. MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connec-

tion. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
CR_SERVER_GONE_ERROR	The client couldn't send a question to the server.
CR_SERVER_LOST	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.1.4, “Server System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

Prior to MySQL 5.1.8, even if the `reconnect` flag in the `MYSQL` structure is equal to 1, MySQL does not automatically reconnect and re-issue the query as it doesn't know if the server did get the original query or not.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.5.2.10, “Packet too large”](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.5.4.2, “What to Do If MySQL Keeps Crashing”](#).

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See [Section 5.2.2, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.5.4.2, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [MySQL Internals: Porting](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See [Section 5.2.3, “The General Query Log”](#).)

See also [Section B.5.2.11, “Communication Errors and Aborted Connections”](#), and [Section 1.7, “How to Report Bugs or Problems”](#).

## B.5.2.10. Packet too large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.1 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a `Packet too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

## B.5.2.11. Communication Errors and Aborted Connections

---

The server error log can be a useful source of information about connection problems. See [Section 5.2.2, “The Error Log”](#). If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23 Aborted connection 854 to db: 'users' user: 'josh'
```

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `ABORTED CONNECTION` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.1.4, “Server System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connect attempts can occur for the following reasons:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See [Section 5.1.4, “Server System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server! Messages for these types of problems are logged to the general query log if it is enabled.

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.5.2.10, “Packet too large”](#).

See also [Section B.5.2.9, “MySQL server has gone away”](#).

### B.5.2.12. The table is full

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 file system) 4TB
Solaris 9/10	16TB
MacOS X w/ HFS+	2TB

NetWare w/NSS file system	8TB
---------------------------	-----

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get [MyISAM](#) tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 file system. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at [http://www.suse.de/~aj/linux\\_lfs.html](http://www.suse.de/~aj/linux_lfs.html).

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The [InnoDB](#) storage engine maintains [InnoDB](#) tables within a tablespace that can be created from several files. This enables a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which permits extremely large tables. The maximum tablespace size is 64TB.

If you are using [InnoDB](#) tables and run out of room in the [InnoDB](#) tablespace. In this case, the solution is to extend the [InnoDB](#) tablespace. See [Section 13.6.5, “Adding, Removing, or Resizing InnoDB Data and Log Files”](#).

- You are using [MyISAM](#) tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a [MyISAM](#) table and the space required for the table exceeds what is permitted by the internal pointer size. [MyISAM](#) permits data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum permissible size of 65,536TB (256<sup>7</sup> – 1 bytes).

If you need a [MyISAM](#) table that is larger than the default limit and your operating system supports large files, the [CREATE TABLE](#) statement supports [AVG\\_ROW\\_LENGTH](#) and [MAX\\_ROWS](#) options. See [Section 12.1.17, “CREATE TABLE Syntax”](#). The server uses these options to determine how large a table to permit.

If the pointer size is too small for an existing table, you can change the options with [ALTER TABLE](#) to increase a table's maximum permissible size. See [Section 12.1.7, “ALTER TABLE Syntax”](#).

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify [AVG\\_ROW\\_LENGTH](#) only for tables with [BLOB](#) or [TEXT](#) columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for [MyISAM](#) tables, set the [myisam\\_data\\_pointer\\_size](#), which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the [MAX\\_ROWS](#) option. The value of [myisam\\_data\\_pointer\\_size](#) can be from 2 to 7. A value of 4 permits tables up to 4GB; a value of 6 permits tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use [myisamchk -dv /path/to/table-index-file](#). See [Section 12.4.5, “SHOW Syntax”](#), or [Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”](#).

Other ways to work around file-size limits for [MyISAM](#) tables are as follows:

- If your large table is read only, you can use [myisampack](#) to compress it. [myisampack](#) usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. [myisampack](#) also can merge multiple tables into a single table. See [Section 4.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#).
- MySQL includes a [MERGE](#) library that enables you to handle a collection of [MyISAM](#) tables that have identical structure as a single [MERGE](#) table. See [Section 13.8, “The MERGE Storage Engine”](#).
- You are using the [NDB](#) storage engine, in which case you need to increase the values for the [DataMemory](#) and [IndexMemory](#) configuration parameters in your [config.ini](#) file. See [Section 17.3.3.1, “MySQL Cluster Data Node Configuration Parameters”](#).
- You are using the [MEMORY \(HEAP\)](#) storage engine; in this case you need to increase the value of the [max\\_heap\\_table\\_size](#) system variable. See [Section 5.1.4, “Server System Variables”](#).

### B.5.2.13. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.2.3.3, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

### B.5.2.14. Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

### B.5.2.15. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
 -> WHERE User='some_user' AND Host='some_host';
```

### B.5.2.16. Table '`tbl_name`' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
```

```
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 12.4.5, “SHOW Syntax”](#).

### B.5.2.17. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `configure` with the `--with-charset=charset_name` or `--with-extra-charsets=charset_name` option. See [Section 2.3.3, “Typical configure Options”](#).

All standard MySQL binaries are compiled with `--with-extra-charsets=complex`, which enables support for all multi-byte character sets. See [Section 2.3.3, “Typical configure Options”](#).

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.3.3, “Typical configure Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

### B.5.2.18. 'FILE' NOT FOUND and Similar Errors

If you get `ERROR '...' not found (errno: 23)`, `Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
OS error code 23: File table overflow
shell> perror 24
OS error code 24: Too many open files
shell> perror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 5.1.4, “Server System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.2.3.3, “Using Option Files”](#). If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the “#” character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operat-

ing system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

### Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

## B.5.2.19. Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair MyISAM tables if they are marked as ‘not closed properly’ or ‘crashed’. If this happens, MySQL writes an entry in the `hostname.err` file ‘Warning: Checking table ...’ which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

See also [Section 5.1.2, “Server Command Options”](#), and [Section 22.5.1.7, “Making a Test Case If You Experience Table Corruption”](#).

## B.5.3. Installation-Related Issues

### B.5.3.1. Problems Linking to the MySQL Client Library

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the path name of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don’t exist on your system:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See [Section 2.3, “Installing MySQL Using a Source Distribution”](#).

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can’t be found, it means that your system can’t find the shared `libmysqlclient.so` library. The fix for this is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.
- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.
- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

Another way to solve this problem is by linking your program statically with the `-static` option, or by removing the dynamic MySQL libraries before linking your code. Before trying the second method, you should be sure that no other programs are using the dynamic libraries.

### B.5.3.2. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero.

See [Section 2.14, “Environment Variables”](#).

## B.5.4. Administration-Related Issues

### B.5.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning passwords, see [Section 2.13.2, “Securing the Initial MySQL Accounts”](#).

If you know the `root` password, but want to change it, see [Section 12.4.1.6, “SET PASSWORD Syntax”](#).

If you set a `root` password previously, but have forgotten it, you can set a new password. The following sections provide instructions for Windows and Unix systems, as well as generic instructions that apply to any system.

#### B.5.4.1.1. Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for all MySQL `root` accounts:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the START menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list and stop it.  
If your server is not running as a service, you may need to use the Task Manager to force it to stop.
3. Create a text file containing the following statements. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
FLUSH PRIVILEGES;
```

Write the `UPDATE` and `FLUSH` statements each on a single line. The `UPDATE` statement resets the password for all `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

4. Save the file. For this example, the file will be named `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt: From the START menu, select Run, then enter `cmd` as the command to be run.
6. Start the MySQL server with the special `--init-file` option (notice that the backslash in the option value is doubled):

```
C:\> C:\mysql\bin\mysqld --init-file=C:\\mysql-init.txt
```

If you installed MySQL to a location other than `C:\mysql`, adjust the command accordingly.

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

You can also add the `--console` option to the command if you want server output to appear in the console window rather than in a log file.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option:

```
C:> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld.exe"
--defaults-file="C:\\Program Files\\MySQL\\MySQL Server 5.1\\my.ini"
--init-file=C:\\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the `START` menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list, right-click it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

#### B.5.4.1.2. Resetting the Root Password: Unix Systems

On Unix, use the following procedure to reset the password for all MySQL `root` accounts. The instructions assume that you will start the server so that it runs using the Unix login account that you normally use for running the server. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the `mysqld` server runs as (for example, `mysql`).
2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the path name of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the following statements. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
FLUSH PRIVILEGES;
```

Write the `UPDATE` and `FLUSH` statements each on a single line. The `UPDATE` statement resets the password for all `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

4. Save the file. For this example, the file will be named `/home/me/mysql-init`. The file contains the password, so it should not be saved where it can be read by other users.
5. Start the MySQL server with the special `--init-file` option:

```
shell> mysqld_safe --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

### B.5.4.1.3. Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions for Windows and Unix systems. Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges.
2. Connect to the `mysqld` server with this command:

```
shell> mysql
```

3. Issue the following statements in the `mysql` client. Replace the password with the password that you want to use.

```
mysql> UPDATE mysql.user SET Password=PASSWORD('MyNewPass')
 -> WHERE User='root';
mysql> FLUSH PRIVILEGES;
```

The `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` option).

### B.5.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.2.2, “The Error Log”](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `re-solve_stack_dump` program. See [MySQL Internals: Porting](#). Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `-delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, MySQL Server Administration](#).
- Start `mysqld` with the general query log enabled (see [Section 5.2.3, “The General Query Log”](#)). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.2.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See [Section 1.7, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [MySQL Internals: Porting](#).
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See [Section 22.1.2, “MySQL Test Suite”](#). They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` or `--with-debug=full` option to `configure` and then recompile. See [MySQL Internals: Porting](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:
  1. Start `mysqld` from `gdb` (or another debugger). See [MySQL Internals: Porting](#).
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where *N* is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.7, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to your memory and disk subsystems when troubleshooting hardware.

### B.5.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to [MyISAM](#) tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use [REPAIR TABLE](#) or [OPTIMIZE TABLE](#) or when the indexes are created in a batch after [LOAD DATA INFILE](#) or after an [ALTER TABLE](#) statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for [ALTER TABLE](#), the old table is left unchanged.

### B.5.4.4. Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, Netware and OS2, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a file system where you have enough space.

In MySQL 5.1, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (>:) on Unix and semicolon characters (;`) on Windows, NetWare, and OS/2.`

#### Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or [LOAD DATA INFILE](#) operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the file system in which the temporary file directory is located.

When sorting ([ORDER BY](#) or [GROUP BY](#)), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
```

```
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

### B.5.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket
[client]
socket=/path/to/socket
```

See [Section 4.2.3.3, “Using Option Files”](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `-with-unix-socket-path` option when you run `configure`. See [Section 2.3.3, “Typical configure Options”](#).

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

### B.5.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See [Section 2.14, “Environment Variables”](#).

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

## B.5.5. Query-Related Issues

### B.5.5.1. Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character's "sort value." Characters with the same sort value are treated as the same character. For example, if "e" and "é" have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with `col_name LIKE 'a%`', you get all column values that start with `A` or `a`. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_ci` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_ci LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_ci
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See [Section 12.1.17, "CREATE TABLE Syntax"](#).

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
 -> @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----+
| @s1 = @s2 |
+-----+
| 0 |
+-----+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-----+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-----+
| 1 |
+-----+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
| 0 |
+-----+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-----+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-----+
| 1 |
+-----+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
| COLLATION(VERSION()) |
+-----+
| utf8_general_ci |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
+-----+-----+
| COLLATION(ENCRYPT('x')) | COLLATION(SHA1('x')) |
+-----+-----+
| binary | binary |
+-----+-----+
```

## B.5.5.2. Problems Using DATE Columns

The format of a `DATE` value is '`YYYY-MM-DD`'. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to permit a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, '`2004-08-15`' and '`2004#08#15`' are equivalent.) MySQL can also convert a string containing no separators (such as '`20040815`'), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special date '`0000-00-00`' can be stored and retrieved as '`0000-00-00`'. When using a '`0000-00-00`' date through MyODBC, it is automatically converted to `NULL` in MyODBC 2.50.12 and above, because ODBC can't handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');

mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in '`YYYY-MM-DD`' format and performs a string comparison. It does not convert '`20030505`' to the date '`2003-05-05`' and perform a date comparison.

If you are using the `ALLOW_INVALID_DATES` SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12.

This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

If you are not using the `NO_ZERO_IN_DATE` SQL mode, the day or month part can be zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date.

If you are not using the `NO_ZERO_DATE` SQL mode, MySQL also permits you to store '`0000-00-00`' as a “dummy date.” This is in some cases more convenient than using `NULL` values.

If the date cannot be converted to any reasonable value, a `0` is stored in the `DATE` column, which is retrieved as '`0000-00-00`'. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

If you want MySQL to check all dates and accept only legal dates (unless overridden by `IGNORE`), you should set `sql_mode` to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

### B.5.5.3. Problems with `NULL` Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `''`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with `NULL` Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `''`. If you want a `NULL` value in a column, you should use `\N` in the data file. The literal word “`NULL`” may also be used under some circumstances. See [Section 12.2.6, “`LOAD DATA INFILE` Syntax”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

### B.5.5.4. Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in `GROUP BY`, `ORDER BY`, or `HAVING` clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
 GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
 GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a `WHERE` clause. This restriction is imposed because when the `WHERE` clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
 WHERE cnt > 0 GROUP BY id;
```

The `WHERE` clause determines which rows should be included in the `GROUP BY` clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the `GROUP BY`.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias ``a``:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
 GROUP BY `a`;
```

But this statement groups by the literal string `'a'` and will not work as expected:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
 GROUP BY 'a';
```

### B.5.5.5. Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 12.4.5.38, “SHOW TABLE STATUS Syntax”](#), and [Section 12.4.5.12, “SHOW CREATE TABLE Syntax”](#).

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See [Section 12.4.5.17, “SHOW ENGINES Syntax”](#), and [Section 12.4.5.41, “SHOW VARIABLES Syntax”](#).

### B.5.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

### B.5.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 12.8.2, “EX-](#)

[PLAIN Syntax](#).

2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.5.5.8, “Problems with Floating-Point Values”](#).
6. If you still can't figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.7, “How to Report Bugs or Problems”](#).

## B.5.5.8. Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The `FLOAT` and `DOUBLE` data types are subject to these issues. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.4	21.4
2	76.8	76.8
3	7.4	7.4
4	15.4	15.4
5	7.2	7.2
6	-51.4	0

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
```

```
+-----+-----+
| i | a | b |
+-----+-----+
| 6 | -51.4| 0 |
+-----+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+-----+-----+
| i | a | b |
+-----+-----+
| 1 | 21.4 | 21.4 |
| 2 | 76.8 | 76.8 |
| 3 | 7.4 | 7.4 |
| 4 | 15.4 | 15.4 |
| 5 | 7.2 | 7.2 |
+-----+
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52','-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. Other others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with `mysqldump` on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

## B.5.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make "educated" guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `PLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 12.8.2, “`EXPLAIN` Syntax”](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 12.4.2.1, “`ANALYZE TABLE` Syntax”](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 12.2.8.2, “Index Hint Syntax”](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 12.2.8, “`SELECT` Syntax”](#).
- You can tune global or thread-specific system variables. For example, Start `mysqld` with the `-max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.1.4, “Server System Variables”](#).

## B.5.7. Table Definition-Related Issues

### B.5.7.1. Problems with `ALTER TABLE`

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the

cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

### B.5.7.2. TEMPORARY Table Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.  
Temporary tables are not supported for MySQL Cluster.
- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

This error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function.

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See [Section 16.4.1, “Replication Features and Issues”](#), for more information.

## B.5.8. Known Issues in MySQL

This section is a list of the known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.1, “General Installation Guidance”](#), and [MySQL Internals: Porting](#).

### B.5.8.1. Open Issues in MySQL

The following problems are known and fixing them is a high priority:

## C API

- [Bug#45017](#): Failure to connect if hostname maps to multiple addresses
  - **Already fixed in:** 5.1
- [Bug#40552](#): Race condition around default\_directories in load\_defaults()
  - **Target fix:** 5.1
- [Bug#43560](#): client crashes in mysql\_stmt\_execute/mysql\_stmt\_close after connection loss
  - **Target fix:** 5.1
- [Bug#42675](#): Dangling pointer leads to a client crash (mysys/my\_error.c patch enclosed)
  - **Target fix:** 5.1
- [Bug#47485](#): mysql\_store result returns a result set for a prepared statement
  - **Target fix:** 5.1
- [Bug#48284](#): C99 aliasing violation, results in failures in the client library
  - **Target fix:** 5.1
- [Bug#53899](#): Wrong mysql\_stmt\_errno() after connection loss with automatic reconnect
  - **Target fix:** 5.1
- [Bug#47320](#): OpenSSL client does not check YaSSL server certificate
  - **Target fix:** 4.1

## Client

- [Bug#33048](#): Not able to recover binary/blob data correctly using mysqlbinlog
  - **Target fix:** 5.1
- [Bug#46310](#): mysql not handling <BACKSPACE> properly with multi-byte chars
  - **Already fixed in:** 5.1
- [Bug#34861](#): mysqldump with --tab gives weird output for triggers.
  - **Target fix:** 5.1
- [Bug#54896](#): --one-database option fails to filter row-based binlog replay correctly
  - **Target fix:** 5.1
- [Bug#54899](#): --one-database option cannot handle `DROP/CREATE DATABASE` commands
  - **Target fix:** 5.1
- [Bug#36391](#): mysqlbinlog creates invalid charset statements
  - **Target fix:** 5.1
- [Bug#35934](#): mysql\_upgrade calls mysqlcheck with insufficient parameters
  - **Target fix:** 5.1
- [Bug#39852](#): bug in mysql\_setpermission
  - **Target fix:** 5.1
- [Bug#40395](#): mysqladmin -i delay extended-status does not iterate with -r

- **Already fixed in:** 5.1
- [Bug#54004](#): mysql\_secure\_installation identifies "local host" incorrectly
  - **Target fix:** 5.1
- [Bug#44278](#): mysqlhotcopy unable to backup schema with a hyphen in its name
  - mysqlhotcopy fails for database names that contain non-alphanumeric characters.
- Target fix:** 5.1
- [Bug#53088](#): mysqldump with -T & --default-character-set set truncates text/blob to 766 chars
  - **Target fix:** 5.1
- [Bug#47655](#): Memory free error when connecting to 4.1 server from 5.1+ client
  - **Target fix:** 5.1
- [Bug#45740](#): mysqldump doesn't dump general\_log and slow\_query causes restore problem
  - **Target fix:** 5.1
- [Bug#52792](#): mysqldump in XML mode does not dump routines!!
  - **Target fix:** 5.1
- [Bug#34129](#): mysqldumpslow does not aggregate times
  - **Target fix:** 5.1
- [Bug#30946](#): mysqldump silently ignores --default-character-set when used with --tab
  - Dumps for tables containing columns with different character sets would not be reloadable. To deal with this, a CHARACTER SET clause is being added to SELECT ... INTO OUTFILE (which mysqldump uses) so that all columns will be converted to a single character set on output. The same character set can be specified for LOAD DATA to enable the dump file to be reloaded.

**Already fixed in:** 5.1

## Server

- [Bug#50227](#): Pre-auth buffer-overflow in mySQL through yaSSL
  - **Target fix:** 5.1.43
- [Bug#48665](#): sql-bench's insert test fails due to wrong result
  - **Target fix:** 5.1.42
- [Bug#44166](#): Possible Security Vulnerability in MySQL Server 5.1.30
  - **Target fix:** 5.1.35
- [Bug#42640](#): mysqld crashes when unsafe statements are executed (`STRICT_TRANS_TABLES` mode)
  - **Target fix:** 5.1.35
- [Bug#42610](#): Dynamic plugin broken in 5.1.31
  - **Target fix:** 5.1.33
- [Bug#56096](#): `STOP SLAVE` hangs if executed in parallel with user sleep
  - **Target fix:** 5.5
- [Bug#56382](#): valgrind leak warning from main.loaddata

- **Target fix:** 5.1
- [Bug#55721](#): AIX 5.1.50 build failing, cannot locate bzero
  - **Target fix:** 5.1
- [Bug#42563](#): Message tells me to repair table though Storage Engine doesn't allow me to.
  - **Target fix:** 5.1
- [Bug#46425](#): crash in Diagnostics\_area::set\_ok\_status , empty statement, `DELETE IGNORE`
  - **Target fix:** 5.1
- [Bug#50619](#): assert in handler::update\_auto\_increment
  - **Target fix:** 5.1
- [Bug#46614](#): Assertion in show\_create\_trigger() on `SHOW CREATE TRIGGER + MERGE` table
  - **Target fix:** 5.1
- [Bug#55846](#): Link tests fail on Windows - my\_compiler.h missing
  - **Target fix:** 5.1
- [Bug#46760](#): Fast `ALTER TABLE` no longer works for InnoDB
  - **Target fix:** 5.1
- [Bug#44495](#): Prepared Statement: `CALL p(<x>)` - `thd->protocol == &thd->protocol\_text' failed
  - **Already fixed in:** 5.1
- [Bug#50774](#): failed to get the correct resultset when timestamp values are appended with .0
  - **Target fix:** 5.1
- [Bug#46941](#): crash with lower\_case\_table\_names=2 and foreign key data dictionary confusion
  - **Target fix:** 5.1
- [Bug#43435](#): LOCK\_open does not use `MY_MUTEX_INIT_FAST`
  - **Already fixed in:** 5.1
- [Bug#45638](#): Create temporary table with engine innodb fails
  - **Target fix:** 5.1
- [Bug#39494](#): please support >4GB key\_buffer\_size on windows
  - **Target fix:** 5.1
- [Bug#35068](#): Assertion fails when reading from i\_s.tables and there is incorrect merge table
  - **Target fix:** 5.1
- [Bug#47788](#): Crash in `TABLE_LIST::hide_view_error` on `UPDATE IGNORE + VIEW + SP + ALTER`
  - **Target fix:** 5.1
- [Bug#46944](#): Internal prepared `XA` transaction XIDs are not removed if server\_id changes
  - **Target fix:** 5.1
- [Bug#56342](#): ssl\_8k\_key test fails with openssl
  - **Target fix:** 5.1
- [Bug#52512](#): Assertion `! is\_set()' in Diagnostics\_area::set\_ok\_status on `LOAD DATA`

- **Target fix:** 5.1
- [Bug#51591](#): deadlock in the plugins+status+variables
  - **Target fix:** 5.1
- [Bug#22891](#): session level max\_allowed\_packet can be set but is ignored
  - **Target fix:** 5.1
- [Bug#41057](#): mysql\_update fails **FATAL ERROR**: Failed to create temporary file for defaults
  - **Target fix:** 5.1
- [Bug#43827](#): Server closes connections and restarts
  - **Target fix:** 5.1
- [Bug#40757](#): server crash after failed plugin/engine initialization
  - **Target fix:** 5.1
- [Bug#54007](#): assert in ha\_myisam::index\_next , **HANDLER**
  - **Target fix:** 5.1
- [Bug#54190](#): Comparison to row subquery produces incorrect result
  - **Target fix:** 5.1
- [Bug#45613](#): handle failures from my\_hash\_insert
  - **Target fix:** 5.1
- [Bug#47919](#): assert in open\_table during **ALTER** temporary table
  - **Target fix:** 5.1
- [Bug#41030](#): Wrong meta data (incorrect fieldlen)
  - **Target fix:** 5.1
- [Bug#46043](#): mysqld --skip-innodb does not skip InnoDB
  - After changes made for [Bug#19027](#), --skip-innodb does not work.  
**Target fix:** 5.1
- [Bug#40536](#): **SELECT** is blocked by **INSERT DELAYED** waiting on upgrading lock, even with low\_pri
  - **Target fix:** 5.1
- [Bug#42503](#): "Lost connection" errors when using compression protocol
  - **Target fix:** 5.1
- [Bug#47412](#): Valgrind warnings / user can read uninitialized memory using **SP** variables
  - **Target fix:** 5.1
- [Bug#40230](#): 23 seconds difference while the time\_zone is **SYSTEM**
  - **Target fix:** 5.1
- [Bug#45058](#): init\_availableCharsets uses double checked locking
  - **Target fix:** 5.1
- [Bug#43354](#): Use key hint can crash server in explain extended query
  - **Target fix:** 5.1

- [Bug#46815](#): `CONCAT_WS` returning wrong data
  - **Target fix:** 5.1
- [Bug#40949](#): Debug version of MySQL server crashes when run `OPTIMIZE` on compressed table.
  - **Target fix:** 5.1
- [Bug#11604](#): Performance degradation caused by `do_div_mod()` call
  - **Target fix:** 5.1
- [Bug#44521](#): Prepared Statement: `CALL` p() - crashes: `! thd->main\_da.is\_sent' failed et.al.
  - **Already fixed in:** 5.1

  - **Target fix:** 5.1.30
- [Bug#55227](#): Fix compiler warnings in innodb with gcc 4.6
  - **Target fix:** 5.1
- [Bug#21704](#): Renaming column does not update FK definition

- Renaming a column that appears in a foreign key definition does not update the foreign key definition with the new column name; this occurs with both referenced and referencing tables. This could interfere with reloading from a dump, due to creating constraints against non-existent columns. Workaround: Drop and re-create manually any foreign key definitions affected by the renaming of a column.

  - **Target fix:** 5.1

### B.5.8.2. Additional Known Issues

The following problems are known:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` statement before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` statement wait until the table is not being used in any transaction.
- When inserting a big integer value (between  $2^{63}$  and  $2^{64}-1$ ) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

**If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.**

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog | mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an `ORDER BY` clause when needed.

The following issues are known and will be fixed in due time:

- Log file names are based on the server host name (if you don't specify a file name with the startup option). You have to use options such as `--log-bin=old_host_name-bin` if you change your host name to something else. Another option is to rename the old files to reflect your host name change (if these are binary logs, you need to edit the binary log index file and fix the binary log file names there as well). See [Section 5.1.2, “Server Command Options”](#).
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` statement. See [Section 4.6.7, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` doesn't work with `TEMPORARY` tables or tables used in a `MERGE` table.
- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations. This is scheduled to be fixed in version 5.1 when we implement new table definition format files.
- When using `SET CHARACTER SET`, you can't use translated characters in database, table, and column names.
- You can't use “`_`” or “`%`” with `ESCAPE` in `LIKE ... ESCAPE`.
- `BLOB` and `TEXT` values can't reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT`. Only the first `max_sort_length` bytes are used when comparing `BLOB` values in these cases. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use the general query log extensively, you should edit `mysqld_safe` to log to `host_name.err` instead of `host_name.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, not 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

---

# Appendix C. MySQL Change History

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 5.1, which is currently MySQL 5.1.52. We offer a version of the Manual for each series of MySQL releases (5.0, 5.1, and so forth). For information about changes in another release series of the MySQL database software, see the corresponding version of this Manual.

We update this section as we add new features in the 5.1 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last Bazaar ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

## C.1. Changes in Release 5.1.x (Production)

An overview of features added in MySQL 5.1 can be found here: [Section 1.5, “What Is New in MySQL 5.1”](#). For a full list of changes, please refer to the changelog sections for individual 5.1 releases.

For discussion of upgrade issues that you may encounter for upgrades from MySQL 5.0 to MySQL 5.1, see [Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”](#).

For changes relating to MySQL Cluster NDB 6.x, see [Section 17.7, “Changes in MySQL Cluster NDB 6.X and 7.X”](#).

### C.1.1. Changes in MySQL 5.1.50 (03 August 2010)

InnoDB Notes:

- [InnoDB Plugin](#) has been upgraded to version 1.0.11. This version is considered of General Availability (GA) quality.

In this release, the [InnoDB Plugin](#) is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86\_64, ia64), generic Linux RPM packages, and any builds produced with the [icc](#) compiler. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Bugs fixed:

- **Important Change: Replication:** The [LOAD DATA INFILE](#) statement is now considered unsafe for statement-based replication. When using statement-based logging mode, the statement now produces a warning; when using mixed-format logging, the statement is made using the row-based format. ([Bug#34283](#))
- **Partitioning:** [UPDATE](#) and [INSERT](#) statements affecting partitioned tables performed poorly when using row-based replication. ([Bug#52517](#))
- **Partitioning:** [INSERT ON DUPLICATE KEY UPDATE](#) statements performed poorly on tables having many partitions. This was because the handler function for reading a row from a specific index was not optimized in the partitioning handler. ([Bug#52455](#))
- The server could crash on shutdown, if started with `--innodb-use-system-malloc=0`. ([Bug#55581](#))
- [GROUP BY](#) operations used [max\\_sort\\_length](#) inconsistently. ([Bug#55188](#))
- Building MySQL on Solaris 8 x86 failed when using Sun Studio due to [gcc](#) inline assembler code. ([Bug#55061](#))
- In debug builds, an assertion could be raised when the server tried to send an OK packet to the client after having failed to detect errors during processing of the [WHERE](#) condition of an [UPDATE](#) statement. ([Bug#54734](#))
- The database server could crash when renaming a table that had active transactions. (This issue only affected the database server when built for debugging.) ([Bug#54453](#))
- The server could crash during the recovery phase of startup, if it previously crashed while inserting [BLOB](#) or other large

columns that use off-page storage into an `InnoDB` table created with `ROW_FORMAT=REDUNDANT` or `ROW_FORMAT=COMPACT`. ([Bug#54408](#))

- For an `InnoDB` table created with `ROW_FORMAT=COMPRESSED` or `ROW_FORMAT=DYNAMIC`, a query using the `READ UNCOMMITTED` isolation level could cause the server to stop with an assertion error, if `BLOB` or other large columns that use off-page storage were being inserted at the same time. ([Bug#54358](#))
- A client could supply data in chunks to a prepared statement parameter other than of type `TEXT` or `BLOB` using the `mysql_stmt_send_long_data()` C API function (or `COM_STMT_SEND_LONG_DATA` command). This led to a crash because other data types are not valid for long data. ([Bug#54041](#))
- `mysql_secure_installation` did not properly identify local accounts and could incorrectly remove nonlocal `root` accounts. ([Bug#54004](#))
- Transactions could be incorrectly committed during recovery, rather than rolled back, if the server crashed and was restarted after performing `ALTER TABLE...ADD PRIMARY KEY` on an `InnoDB` table, or some other operation that involves copying the entire table. ([Bug#53756](#))
- Portability problems in `SHOW STATUS` could lead to incorrect results on some platforms. ([Bug#53493](#))
- Builds of MySQL generated a large number of warnings. ([Bug#53445](#))
- With `lower_case_table_names` set to a nonzero value, searches for table or database names in `INFORMATION_SCHEMA` tables could produce incorrect results. ([Bug#53095](#))
- The ABI check for MySQL failed to compile with `gcc` 4.5. ([Bug#52514](#))
- `mysql_secure_installation` sometimes failed to locate the `mysql` client. ([Bug#52274](#))
- Reading a `ucs2` data file with `LOAD DATA INFILE` was subject to three problems. 1) Incorrect parsing of the file as `ucs2` data, resulting in incorrect length of the parsed string. This is fixed by truncating the invalid trailing bytes (incomplete multibyte characters) when reading from the file. 2) Reads from a proper `ucs2` file did not recognize newline characters. This is fixed by first checking whether a byte is a newline (or any other special character) before reading it as a part of a multibyte character. 3) When using user variables to hold column data, the character set of the user variable was set incorrectly to the database charset. This is fixed by setting it to the character set specified in the `LOAD DATA INFILE` statement, if any. ([Bug#51876](#))
- Searches in `INFORMATION_SCHEMA` tables for rows matching a nonexistent database produced an error instead of an empty query result. ([Bug#49542](#))
- On FreeBSD, memory mapping for `MERGE` tables could fail if underlying tables were empty. ([Bug#47139](#))
- The `my_like_range_xxx()` functions returned badly formed maximum strings for Asian character sets, which caused problems for storage engines. ([Bug#45012](#))
- A debugging assertion could be raised after a write failure to a closed socket. ([Bug#42496](#))
- An assertion failure occurred within yaSSL for very long keys. ([Bug#29784](#))

See also [Bug#53463](#).

## C.1.2. Changes in MySQL 5.1.49 (09 July 2010)

InnoDB Notes:

- `InnoDB Plugin` has been upgraded to version 1.0.10. This version is considered of General Availability (GA) quality.

In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86\_64, ia64), generic Linux RPM packages, and any builds produced with the `icc` compiler. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Bugs fixed:

- **Security Fix:** After changing the values of the `innodb_file_format` or `innodb_file_per_table` configuration parameters, DDL statements could cause a server crash. ([Bug#55039](#))
- **Security Fix:** Joins involving a table with a unique `SET` column could cause a server crash. ([Bug#54575](#))

- **Security Fix:** Incorrect handling of `NULL` arguments could lead to a crash for `IN()` or `CASE` operations when `NULL` arguments were either passed explicitly as arguments (for `IN()`) or implicitly generated by the `WITH ROLLUP` modifier (for `IN()` and `CASE`). ([Bug#54477](#))
- **Security Fix:** A malformed argument to the `BINLOG` statement could result in Valgrind warnings or a server crash. ([Bug#54393](#))
- **Security Fix:** Use of `TEMPORARY InnoDB` tables with nullable columns could cause a server crash. ([Bug#54044](#))
- **Security Fix:** The server could crash if there were alternate reads from two indexes on a table using the `HANDLER` interface. ([Bug#54007](#))
- **Security Fix:** Using `EXPLAIN` with queries of the form `SELECT ... UNION ... ORDER BY (SELECT ... WHERE ...)` could cause a server crash. ([Bug#52711](#))
- **Security Fix:** `LOAD DATA INFILE` did not check for SQL errors and sent an OK packet even when errors were already reported. Also, an assert related to client-server protocol checking in debug servers sometimes was raised when it should not have been. ([Bug#52512](#))
- **Replication:** When using unique keys on `NULL` columns in row-based replication, the slave sometimes chose the wrong row when performing an update. This happened because a table having a unique key on such a column could have multiple rows containing `NULL` for the column used by the unique key, and the slave merely picked the first row containing `NULL` in that column. ([Bug#53893](#))
- **Replication:** `FLUSH LOGS` could in some circumstances crash the server. This occurred because the I/O thread could concurrently access the relay log I/O cache while another thread was performing the `FLUSH LOGS`, which closes and reopens the relay log and, while doing so, initializes (or re-initializes) its I/O cache. This could cause problems if some other thread (in this case, the I/O thread) is accessing it at the same time.

Now the thread performing the `FLUSH LOGS` takes a lock on the relay log before actually flushing it. ([Bug#53657](#))

See also [Bug#50364](#).

- **Replication:** Two related issues involving temporary tables and transactions were introduced by a fix made in MySQL 5.1.37:
  1. When a temporary table was created or dropped within a transaction, any failed statement that followed the `CREATE TEMPORARY TABLE` or `DROP TEMPORARY TABLE` statement triggered a rollback, which caused the slave diverge from the master.
  2. When a `CREATE TEMPORARY TABLE ... SELECT * FROM ...` statement was executed within a transaction in which only tables using transactional storage engines were used and the transaction was rolled back at the end, the changes—including the creation of the temporary table—were not written to the binary log.

The current fix restores the correct behavior in both of these cases. ([Bug#53560](#))

This regression was introduced by [Bug#43929](#).

- **Replication:** When `CURRENT_USER()` or `CURRENT_USER` was used to supply the name and host of the affected user or of the definer in any of the statements `DROP USER`, `RENAME USER`, `GRANT`, `REVOKE`, and `ALTER EVENT`, the reference to `CURRENT_USER()` or `CURRENT_USER` was not expanded when written to the binary log. This resulted in `CUR-RENT_USER()` or `CURRENT_USER` being expanded to the user and host of the slave SQL thread on the slave, thus breaking replication. Now `CURRENT_USER()` and `CURRENT_USER` are expanded prior to being written to the binary log in such cases, so that the correct user and host are referenced on both the master and the slave. ([Bug#48321](#))
- An `ALTER TABLE` statement could convert an `InnoDB` compressed table (with `row_format=compressed`) back to an uncompressed table (with `row_format=compact`). ([Bug#54679](#))
- A signal-handler redefinition for `SIGUSR1` was removed. The redefinition could cause the server to encounter a kernel deadlock on Solaris when there are many active threads. Other POSIX platforms might also be affected. ([Bug#54667](#))
- `InnoDB` could issue an incorrect message on startup, if tables were created under the setting `innodb_file_per_table=ON` and the server was restarted under the setting `innodb_file_per_table=OFF`. The message was of the form `InnoDB: Warning: allocated tablespace n, old maximum was 0.` ([Bug#54658](#))
- The `make_binary_distribution` target to `make` could fail on some platforms because the lines generated were too long for the shell. ([Bug#54590](#))
- The server failed to disregard sort order for some zero-length tuples, leading to an assertion failure. ([Bug#54459](#))
- The default value of `myisam_max_extra_sort_file_size` could be higher than the maximum accepted value, leading to warnings upon the server start. ([Bug#54457](#))

- Inconsistent checking of the relationship between `SHOW` statements and `INFORMATION_SCHEMA` queries caused such queries to fail sometimes. ([Bug#54422](#))
- If a session tried to drop a database containing a table opened with `HANDLER` in another session, any `DATABASE` statement (`CREATE`, `DROP`, `ALTER`) executed by that session produced a deadlock. ([Bug#54360](#))
- Fast index creation in the `InnoDB` Plugin could fail, leaving the new secondary index corrupted. ([Bug#54330](#))
- Builds of the embedded `mysqld` would fail due to a missing element of the `struct NET`. ([Bug#53908](#), [Bug#53912](#))
- The definition of the `MY_INIT` macro in `my_sys.h` included an extraneous semicolon, which could cause compilation failure. ([Bug#53906](#))
- A client with automatic reconnection enabled saw the error message `Lost connection to MySQL server during query` if the connection was lost between the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions. However, `mysql_stmt_errno()` returned 0, not the corresponding error number 2013. ([Bug#53899](#))
- Queries that used `MIN()` or `MAX()` on indexed columns could be optimized incorrectly. ([Bug#53859](#))
- Some combinations of `SELECT` and `SELECT FOR UPDATE` statements could fail with errors about locks, or incorrectly release a row lock during a `semi-consistent read` operation. ([Bug#53674](#))
- The `Lock_time` value in the slow query log was negative for stored routines. ([Bug#53191](#))
- The results of some `ORDER BY ... DESC` queries were sorted incorrectly. ([Bug#51431](#))
- `Index Merge` between three indexes could return incorrect results. ([Bug#50389](#))
- Performing large numbers of `RENAME TABLE` statements caused excessive memory use. ([Bug#47991](#))
- The server could crash with an out of memory error when trying to parse a query that was too long to fit in memory. Now the parser rejects such queries with an `ER_OUT_OF_RESOURCES` error. ([Bug#42064](#))
- Sort-`index_merge` for join tables other than the first table used excessive memory. ([Bug#41660](#))
- The mechanism that checks if there is enough space for redo logs was improved, reducing the chance of encountering this message: `ERROR: the age of the last checkpoint is x, which exceeds the log group capacity y.` ([Bug#39168](#))
- Valgrind warnings in the `InnoDB compare_record()` function were corrected. ([Bug#38999](#))
- `mysqld` could fail during execution when using SSL. ([Bug#34236](#))
- The behavior of the RPM upgrade installation has changed. During an upgrade installation using the RPM packages, if the MySQL server is running when the upgrade occurs, the server is stopped, the upgrade occurs, and server is restarted. If the server is not already running when the RPM upgrade occurs, the server is not started at the end of the upgrade. The boot scripts for MySQL are installed in the appropriate directories in `/etc`, so the MySQL server will be restarted automatically at the next machine reboot. ([Bug#27072](#))

### C.1.3. Changes in MySQL 5.1.48 (02 June 2010)

InnoDB Notes:

- `InnoDB Plugin` has been upgraded to version 1.0.9. This version is considered of General Availability (GA) quality.

In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86\_64, ia64), generic Linux RPM packages, and any builds produced with the `icc` compiler. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality added or changed:

- The `Rows_examined` value in slow query log rows now is nonzero for `UPDATE` and `DELETE` statements that modify rows. ([Bug#49756](#))

Bugs fixed:

- **Important Change: Replication:** `MyISAM` transactions replicated to a transactional slave left the slave in an unstable condition. This was due to the fact that, when replicating from a nontransactional storage engine to a transactional engine with `autocommit` turned off, no `BEGIN` and `COMMIT` statements were written to the binary log; thus, on the slave, a never-ending transaction was started.

The fix for this issue includes enforcing `autocommit` mode on the slave by replicating all `autocommit=1` statements from the master. ([Bug#29288](#))

- **Partitioning:** `ALTER TABLE` statements that cause table partitions to be renamed or dropped (such as `ALTER TABLE ... ADD PARTITION`, `ALTER TABLE ... DROP PARTITION`, and `ALTER TABLE ... REORGANIZE PARTITION`) — when run concurrently with queries against the `INFORMATION_SCHEMA.PARTITIONS` table — could fail, cause the affected partitioned tables to become unusable, or both. This was due to the fact that the `INFORMATION_SCHEMA` database ignored the name lock imposed by the `ALTER TABLE` statement on the partitions affected. In particular, this led to problems with `InnoDB` tables, because `InnoDB` would accept the rename operation, but put it in a background queue, so that subsequent rename operations failed when `InnoDB` was unable to find the correct partition. Now, `INFORMATION_SCHEMA` honors name locks imposed by ongoing `ALTER TABLE` statements that cause partitions to be renamed or dropped. ([Bug#50561](#))

See also [Bug#47343](#), [Bug#45808](#).

- **Partitioning:** It was possible to execute a `CREATE TEMPORARY TABLE tmp LIKE pt` statement, where `pt` is a partitioned table, even though partitioned temporary tables are not permitted, which caused the server to crash. Now a check is performed to prevent such statements from being executed. ([Bug#49477](#))
- **Partitioning:** When attempting to perform DDL on a partitioned table and the table's `.par` file could not be found, the server returned the inaccurate error message `OUT OF MEMORY; RESTART SERVER AND TRY AGAIN (NEEDED 2 BYTES)`. Now in such cases, the server returns the error `FAILED TO INITIALIZE PARTITIONS FROM .PAR FILE.` ([Bug#49161](#))
- **Replication:** In some cases, attempting to update a column with a value of an incompatible type resulted in a mismatch between master and slave because the column value was set to its implicit default value on the master (as expected), but the same column on the slave was set to `NULL`. ([Bug#52868](#))
- **Replication:** When using a non-transactional table on the master with autocommit disabled, no `COMMIT` was recorded in the binary log following a statement affecting this table. If the slave's copy of the table used a transactional storage engine, the result on the slave was as though a transaction had been started, but never completed. ([Bug#49522](#))

See also [Bug#29288](#).

- **Replication:** Reading from a table that used a self-logging storage engine and updating a table that used a transactional engine (such as `InnoDB`) generated changes that were written to the binary log using statement format which could make slaves diverge. However, when using mixed logging format, such changes should be written to the binary log using row format. (This issue did not occur when reading from tables using a self-logging engine and updating `MyISAM` tables, as this was already handled by checking for combinations of non-transactional and transactional engines.) Now such statements are classified as unsafe, and in mixed mode, cause a switch to row-based logging. ([Bug#49019](#))
- The server could crash with a message `InnoDB: Assertion failure in thread nnnn`, typically during shutdown on a Windows system. ([Bug#53947](#))
- Valgrind warnings resulting from passing incomplete `DATETIME` values to the `TIMESTAMP()` function were corrected. ([Bug#53942](#))
- `UPDATE` on an `InnoDB` table modifying the same index that was used to satisfy the `WHERE` condition could trigger a debug assertion under some circumstances. ([Bug#53830](#))
- MySQL incorrectly processed `ALTER DATABASE `#mysql50#<special>` UPGRADE DATA DIRECTORY NAME` where `<special>` was `., . . .`, or a sequence starting with `./` or `../`. It used the server data directory (that contains other regular databases) as the database directory. ([Bug#53804](#), [CVE-2010-2008](#))
- `InnoDB` mistakenly considered the sequence `/* /` to be an open/close comment sequence. ([Bug#53644](#))
- `InnoDB` crashed when replacing duplicates in a table after a fast `ALTER TABLE` added a unique index. ([Bug#53592](#))
- For `InnoDB` tables, the error handler for a fast `CREATE INDEX` did not reset the error state of the transaction before attempting to undo a failed operation, resulting in a crash. ([Bug#53591](#))
- For single-table `DELETE` statements that used quick select and index scan simultaneously caused a server crash or assertion failure. ([Bug#53450](#))
- Incorrect results could be returned for `LEFT JOIN` of `InnoDB` tables with an impossible `WHERE` condition. ([Bug#53334](#))
- Adding a unique key on multiple columns, where one of the columns is null, could mistakenly report duplicate key errors. ([Bug#53290](#))

- Fixed a checksum error reported for compressed tables when the `--innodb_checksums` option is enabled. Although the message stated that the table was corrupted, the table is actually fine after the fix. ([Bug#53248](#))
- Corrected the handling of the setting `innodb_change_buffering=default`. (The appropriate default value is different between MySQL 5.1 and 5.5.) ([Bug#53165](#))
- Setting the `innodb_change_buffering` system variable to `DEFAULT` produced an incorrect result. ([Bug#53165](#))
- `mysqldump` and `SELECT ... INTO OUTFILE` truncated long `BLOB` and `TEXT` values to 766 bytes. ([Bug#53088](#))
- In the debug version of the server, the `FreeState()` function could in some circumstances be called twice, leading to an assertion failure. ([Bug#52884](#))
- Aggregate functions could incorrectly return `NULL` in outer join queries. ([Bug#52051](#))
- For outer joins, the optimizer could fail to properly calculate table dependencies. ([Bug#52005](#))
- The Loose Index Scan optimization method assumed that it could depend on the partitioning engine to maintain interval endpoint information, as if it were a storage engine. ([Bug#50939](#))
- Calculation of intervals for Event Scheduler events was not portable. ([Bug#50087](#))
- Selecting from `INFORMATION_SCHEMA.ROUTINES` or `INFORMATION_SCHEMA.PARAMETERS` resulted in a memory leak. ([Bug#48729](#))
- Multi-statement execution could fail with an error about foreign key constraints. This problem could affect calls to `mysql_query()` and `mysql_real_query()`, and `CALL` statements that invoke stored procedures. ([Bug#48024](#))
- When the transaction isolation level was `REPEATABLE READ` and binary logging used statement or mixed format, `SELECT` statements with subqueries referencing `InnoDB` tables unnecessarily acquired shared locks on rows in these tables. ([Bug#46947](#))
- Using an initial command with `mysql_options(..., MYSQL_INIT_COMMAND, ...)` that generated multiple result sets (such as a stored procedure or a multi-statement command) left the connection unusable. ([Bug#42373](#))
- If a crash occurs while creating an index using the InnoDB “Fast Index Creation” mechanism, the partially created index is dropped during the crash recovery processing when the database is restarted.

## C.1.4. Changes in MySQL 5.1.47 (06 May 2010)

InnoDB Notes:

- `InnoDB Plugin` has been upgraded to version 1.0.8. This version is considered of General Availability (GA) quality.

In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86\_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality added or changed:

- `InnoDB` stores redo log records in a hash table during recovery. On 64-bit systems, this hash table was 1/8 of the buffer pool size. To reduce memory usage, the dimension of the hash table was reduced to 1/64 of the buffer pool size (or 1/128 on 32-bit systems). ([Bug#53122](#))

Bugs fixed:

- **Security Fix:** The server failed to check the table name argument of a `COM_FIELD_LIST` command packet for validity and compliance to acceptable table name standards. This could be exploited to bypass almost all forms of checks for privileges and table-level grants by providing a specially crafted table name argument to `COM_FIELD_LIST`.

In MySQL 5.0 and above, this permitted an authenticated user with `SELECT` privileges on one table to obtain the field definitions of any table in all other databases and potentially of other MySQL instances accessible from the server's file system.

Additionally, for MySQL version 5.1 and above, an authenticated user with `DELETE` or `SELECT` privileges on one table could delete or read content from any other table in all databases on this server, and potentially of other MySQL instances accessible

from the server's file system. ([Bug#53371](#), [CVE-2010-1848](#))

- **Security Fix:** The server was susceptible to a buffer-overflow attack due to a failure to perform bounds checking on the table name argument of a `COM_FIELD_LIST` command packet. By sending long data for the table name, a buffer is overflowed, which could be exploited by an authenticated user to inject malicious code. ([Bug#53237](#), [CVE-2010-1850](#))
- **Security Fix:** The server could be tricked into reading packets indefinitely if it received a packet larger than the maximum size of one packet. ([Bug#50974](#), [CVE-2010-1849](#))
- **Important Change: Replication:** When invoked, `CHANGE MASTER TO` and `SET GLOBAL sql_slave_skip_counter` now cause information to be written to the error log about the slave's state prior to execution of the statement. For `CHANGE MASTER TO`, this information includes the previous values for `MASTER_HOST`, `MASTER_PORT`, `MASTER_LOG_FILE`, and `MASTER_LOG_POS`. For `SET GLOBAL sql_slave_skip_counter`, this information includes the previous values of `sql_slave_skip_counter`, the group relay log name, and the group relay log position. ([Bug#43406](#), [Bug#43407](#))
- **Replication:** The failure of a `REVOKE` statement was logged with the wrong error code, causing replication slaves to stop even when the failure was expected on the master. ([Bug#51987](#))
- Certain path names passed to `LOAD_FILE()` could cause a server crash. ([Bug#53417](#))
- When reporting a foreign key constraint violation during `INSERT`, `InnoDB` could display uninitialized data for the `DB_TRX_ID` and `DB_ROLL_PTR` system columns. ([Bug#53202](#))
- The values of `innodb_buffer_pool_pages_total` and `innodb_buffer_pool_pages_misc` in the `information_schema.global_status` table could be computed incorrectly. ([Bug#52983](#))
- `InnoDB` page splitting could enter an infinite loop for compressed tables. ([Bug#52964](#))
- An overly strict assertion could fail during the purge of delete-marked records in `DYNAMIC` or `COMPRESSED InnoDB` tables that contain column prefix indexes. ([Bug#52746](#))
- `InnoDB` attempted to choose off-page storage without ensuring that there was an “off-page storage” flag in the record header. To correct this, in `DYNAMIC` and `COMPRESSED` formats, `InnoDB` stores locally any non-`BLOB` columns having a maximum length not exceeding 256 bytes. This is because there is no room for the “external storage” flag when the maximum length is 255 bytes or less. This restriction trivially holds in `REDUNDANT` and `COMPACT` formats, because there `InnoDB` always stores locally columns having a length up to `local_len = 788` bytes. ([Bug#52745](#))
- Semi-consistent read was implemented for `InnoDB` to address [Bug#3300](#). Semi-consistent reads do not block when a non-matching record is already locked by some other transaction. If the record is not locked, a lock is acquired, but is released if the record does not match the `WHERE` condition. However, semi-consistent read was attempted even for `UPDATE` statements having a `WHERE` condition of the form `pk_col1=constant1, ..., pk_colN=constantN`. Some code that was designed with the assumption that semi-consistent read would be only attempted on table scans, failed. ([Bug#52663](#))
- Setting `@@GLOBAL.debug` to an empty string failed to clear the current debug settings. ([Bug#52629](#))
- A memory leak occurred due to missing deallocation of the `comparators` array (a member of the `Arg_comparator` class). ([Bug#52124](#))
- For debug builds, creating a view containing a subquery that might require collation adjustment caused an assertion to be raised. For example, this could occur if some items had different collations but the result collation could be adjusted to the one of them. ([Bug#52120](#))
- Connections waiting for an `InnoDB` row lock ignored `KILL` until the row lock wait ended. Now, `KILL` during lock wait results in “query interrupted” instead of “lock wait timeout exceeded”. The corresponding transaction is rolled back. ([Bug#51920](#))
- Locking involving the `LOCK_plugin`, `LOCK_global_system_variables`, and `LOCK_status` mutexes could deadlock. ([Bug#51591](#))
- `InnoDB` fast index creation could incorrectly use a table copy in some cases. ([Bug#50946](#))
- A syntactically invalid trigger could cause the server to crash when trying to list triggers. ([Bug#50755](#))
- `InnoDB Plugin` checks to see whether a row could possibly exceed the maximum size if all columns are fully used. This produced `Row size too large` errors for some tables that could be created with the built-in `InnoDB`. Now the check is only done when `innodb_strict_mode` is enabled or if the table is dynamic or compressed. ([Bug#50495](#))
- Setting `--secure-file-priv` to the empty string left the value unaffected. ([Bug#50373](#))
- In MySQL 5.1, `READ COMMITTED` was changed to use less locking due to the availability of row based binary logging (see the Note under `READ COMMITTED` at [Section 12.3.6, “SET TRANSACTION Syntax”](#)). However, `READ UNCOMMITTED` did

not have the same change, so it was using more locks than the higher isolation level, which is unexpected. This was changed so that `READ UNCOMMITTED` now also uses the lesser amount of locking and has the same restrictions for binary logging. ([Bug#48607](#))

- `EXPLAIN` could cause a server crash for some queries with subqueries. ([Bug#48419](#))
- On Windows, the server failed to find a description for Event ID 100. ([Bug#48042](#))
- For updates to `InnoDB` tables, `TIMESTAMP` columns could be updated even when no values actually changed. ([Bug#47453](#))
- `mysqld_safe` did not always pass `--open-files-limit` through to `mysqld`. `mysqld_safe` did not treat dashes and underscores as equivalent in option names. ([Bug#47095](#))
- If the server is started with `--skip-grant-tables`, plugin loading and unloading should be prohibited, but the server failed to reject `INSTALL PLUGIN` and `UNINSTALL PLUGIN` statements. ([Bug#46261](#))
- A mismatch between index information maintained within the `.frm` files and the corresponding information in the InnoDB system tablespace could produce this error: `[ERROR] Index index of table has n columns unique inside InnoDB, but MySQL is asking statistics for m columns. Have you mixed up .frm files from different installations?` ([Bug#44571](#))
- `InnoDB` could fail to create a unique index on `NULL` columns. ([Bug#41904](#))
- Storage engine plugins on Windows could've been built with a definition of `time_t` which was different from the server expectations. The difference could cause affected plugins to crash. In addition, the use of the `time_t` type in the storage engine API layer has been enforced. ([Bug#39802](#), [Bug#40092](#))
- When using `UNINSTALL PLUGIN` to remove a loaded plugin, open tables and connections caused `mysqld` to hang until the open connections had been closed. ([Bug#39053](#))
- 1) In rare cases, if a thread was interrupted during a `FLUSH PRIVILEGES` operation, a debug assertion occurred later due to improper diagnostics area setup. 2) A `KILL` operation could cause a console error message referring to a diagnostic area state without first ensuring that the state existed. ([Bug#33982](#))

## C.1.5. Release Notes for MySQL Enterprise 5.1.46sp1 [QSP] (23 June 2010)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

### Important

If you will be using the plugin version of `InnoDB`, we recommend that you use MySQL 5.1.48 or later instead of 5.1.46sp1. This is because 5.1.46sp1 contains the first production-ready version and the later version has fixes for some of the bugs found during more widespread production use.

Bugs fixed:

- **Security Fix:** The server failed to check the table name argument of a `COM_FIELD_LIST` command packet for validity and compliance to acceptable table name standards. This could be exploited to bypass almost all forms of checks for privileges and table-level grants by providing a specially crafted table name argument to `COM_FIELD_LIST`.

In MySQL 5.0 and above, this permitted an authenticated user with `SELECT` privileges on one table to obtain the field definitions of any table in all other databases and potentially of other MySQL instances accessible from the server's file system.

Additionally, for MySQL version 5.1 and above, an authenticated user with `DELETE` or `SELECT` privileges on one table could delete or read content from any other table in all databases on this server, and potentially of other MySQL instances accessible from the server's file system. ([Bug#53371](#), [CVE-2010-1848](#))

- **Security Fix:** The server was susceptible to a buffer-overflow attack due to a failure to perform bounds checking on the table name argument of a `COM_FIELD_LIST` command packet. By sending long data for the table name, a buffer is overflowed, which could be exploited by an authenticated user to inject malicious code. ([Bug#53237](#), [CVE-2010-1850](#))
- **Security Fix:** The server could be tricked into reading packets indefinitely if it received a packet larger than the maximum size of one packet. ([Bug#50974](#), [CVE-2010-1849](#))
- MySQL incorrectly processed `ALTER DATABASE `#mysql50#<special>` UPGRADE DATA DIRECTORY NAME` where `<special>` was `.., ..,` or a sequence starting with `./` or `../`. It used the server data directory (that contains other regular databases) as the database directory. ([Bug#53804](#), [CVE-2010-2008](#))

- [InnoDB](#) page splitting could enter an infinite loop for compressed tables. ([Bug#52964](#))
- [InnoDB](#) attempted to choose off-page storage without ensuring that there was an “off-page storage” flag in the record header. To correct this, in [DYNAMIC](#) and [COMPRESSED](#) formats, [InnoDB](#) stores locally any non-[BLOB](#) columns having a maximum length not exceeding 256 bytes. This is because there is no room for the “external storage” flag when the maximum length is 255 bytes or less. This restriction trivially holds in [REDUNDANT](#) and [COMPACT](#) formats, because there [InnoDB](#) always stores locally columns having a length up to `local_len` = 788 bytes. ([Bug#52745](#))
- A syntactically invalid trigger could cause the server to crash when trying to list triggers. ([Bug#50755](#))
- Selecting from [INFORMATION\\_SCHEMA.ROUTINES](#) or [INFORMATION\\_SCHEMA.PARAMETERS](#) resulted in a memory leak. ([Bug#48729](#))
- [EXPLAIN](#) could cause a server crash for some queries with subqueries. ([Bug#48419](#))

## C.1.6. Changes in MySQL 5.1.46 (06 April 2010)

### Important

If you will be using the plugin version of [InnoDB](#), we recommend that you use MySQL 5.1.48 or later instead of 5.1.46sp1. This is because 5.1.46 contains the first production-ready version and the later version has fixes for some of the bugs found during more widespread production use.

InnoDB Notes:

- [InnoDB Plugin](#) has been upgraded to version 1.0.7. This version is considered of General Availability (GA) quality. [InnoDB Plugin Change History](#), may contain information in addition to those changes reported here.

In this release, the [InnoDB Plugin](#) is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86\_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality added or changed:

- There is a new system variable, `skip_name_resolve`, that is set from the value of the `--skip-name-resolve` server option. This provides a way to determine at runtime whether the server uses name resolution for client connections. ([Bug#37168](#))

Bugs fixed:

- **Performance:** The redo scan during [InnoDB](#) recovery used excessive CPU. The efficiency of this scan was improved for [InnoDB Plugin](#), significantly speeding up crash recovery. ([Bug#49535](#), [Bug#29847](#))
- **Performance:** Deadlock detection could be a bottleneck in InnoDB processing, if many transactions attempted to update the same row simultaneously. The algorithm has been improved to enhance performance and scalability. ([Bug#49047](#))
- **Performance:** While looking for the shortest index for a covering index scan, the optimizer did not consider the full row length for a clustered primary key, as in [InnoDB](#). Secondary covering indexes will now be preferred, making full table scans less likely. ([Bug#39653](#))

See also [Bug#55656](#).

- **Performance:** [InnoDB Plugin](#) page-freeing operations were made faster for compressed blocks, speeding up [ALTER TABLE](#), [DROP TABLE](#), and other operations on compressed tables that free compressed blocks. One symptom of the older behavior could be 100% CPU use during these operations. ([Bug#35077](#))
- **Security Fix:** Privilege checking for [UNINSTALL PLUGIN](#) was incorrect. ([Bug#51770](#), [CVE-2010-1621](#))
- **Important Change:** When using fast [ALTER TABLE](#), different internal ordering of indexes in the MySQL optimizer and the [InnoDB](#) storage engine could cause error messages about possibly mixed up `.frm` files and incorrect index use. ([Bug#47622](#))
- **Partitioning:** Partition pruning on [RANGE](#) partitioned tables did not always work correctly; the last partition was not excluded if the range was beyond it (when not using [MAXVALUE](#)). Now the last partition is not included if the partitioning function value is not within the range. ([Bug#51830](#))

- **Partitioning:** The `insert_id` server system variable was not reset following an insert that failed on a partitioned `MyISAM` table having an `AUTO_INCREMENT` column. ([Bug#50392](#))
- **Partitioning:** Foreign keys are not supported on partitioned tables. However, it was possible using an `ALTER TABLE` statement to set a foreign key on a partitioned table; it was also possible to partition a table with a single foreign key. ([Bug#50104](#))
- **Partitioning:** `GROUP BY` queries performed poorly for some partitioned tables. This was due to the block size not being set for partitioned tables, thus the keys per block was not correct, which could cause such queries to be optimized incorrectly. ([Bug#48229](#))

See also [Bug#37252](#).

- **Partitioning:** `REPAIR TABLE` failed for partitioned `ARCHIVE` tables. ([Bug#46565](#))
- **Replication:** `TRUNCATE TABLE` performed on a temporary table using the `InnoDB` storage engine was logged even when using row-based mode. ([Bug#51251](#))
- **Replication:** When using temporary tables the binary log needs to insert a pseudo-thread ID for threads that are using temporary tables, each time a switch happens between two threads, both of which are using temporary tables. However, if a thread issued a failing statement before exit, its ID was not recorded in the binary log, and this in turn caused the ID for the next thread that tried to do something with a temporary table not to be logged as well. Subsequent replays of the binary log failed with the error `TABLE ... DOESN'T EXIST.` ([Bug#51226](#))
- **Replication:** If the master was using `sql_mode='TRADITIONAL'`, duplicate key errors were not sent to the slave, which received `0` rather than the expected error code. This caused replication to fail even when such an error was expected. ([Bug#51055](#))
- **Replication:** When run with the `--database` option, `mysqlbinlog` printed `ROLLBACK` statements but did not print any corresponding `SAVEPOINT` statements. ([Bug#50407](#))
- **Replication:** When a `CREATE EVENT` statement was followed by an additional statement and the statements were executed together as a single statement, the `CREATE EVENT` statement was padded with “garbage” characters when written to the binary log, which led to a syntax error when trying to read back from the log. ([Bug#50095](#))
- **Replication:** Column length information generated by `InnoDB` did not match that generated by `MyISAM`, which caused invalid metadata to be written to the binary log when trying to replicate `BIT` columns. ([Bug#49618](#))
- **Replication:** The value of `Slave_IO_running` in the output of `SHOW SLAVE STATUS` did not distinguish between all 3 possible states of the slave I/O thread (not running; running but not connected; connected). Now the value `Connecting` (rather than `No`) is shown when the slave I/O thread is running but the slave is not connected to a replication master.

The server system variable `Slave_running` also reflects this change, and is now consistent with what is shown for `Slave_IO_running`. ([Bug#30703](#), [Bug#41613](#), [Bug#51089](#))

- `EXPLAIN EXTENDED` crashed trying to resolve references to freed temporary table columns for `GROUP_CONCAT( ) ORDER BY` arguments. ([Bug#52397](#))
- For `InnoDB Plugin`, bit fields were causing problems with concurrency on SMP systems because of word-packing issues. ([Bug#52360](#))
- The optimizer could attempt to evaluate the `WHERE` clause before any rows had been read, resulting in a server crash. ([Bug#52177](#))
- Fixed a performance issue on Windows systems that affected the InnoDB Plugin, by turning off atomic instructions. ([Bug#52102](#))
- For LDML-defined collations, some data structures were not initialized properly to enable `UPPER( )` and `LOWER( )` to work correctly. ([Bug#51976](#))
- On Windows, `LOAD_FILE( )` could cause a crash for some pathnames. ([Bug#51893](#))
- Invalid memory reads occurred for `HANDLER ... READ NEXT` after a failed `HANDLER ... READ FIRST`. ([Bug#51877](#))
- After `TRUNCATE TABLE` of a `MyISAM` table, subsequent queries could crash the server if `myisam_use_mmap` was enabled. ([Bug#51868](#))
- If `myisam_sort_buffer_size` was set to a small value, table repair for `MyISAM` tables with `FULLTEXT` indexes could crash the server. ([Bug#51866](#))
- In `LOAD DATA INFILE`, using a `SET` clause to set a column equal to itself caused a server crash. ([Bug#51850](#))

- A problem with equality propagation optimization for prepared statements and stored procedures caused a server crash upon re-execution of the prepared statement or stored procedure. ([Bug#51650](#))

See also [Bug#8115](#), [Bug#8849](#).

- The optimizer performed an incorrect join type when `COALESCE()` appeared within an `IN()` operation. ([Bug#51598](#))
- The server crashed when the optimizer attempted to determine constant tables but a table storage engine did not support exact record count. ([Bug#51494](#))
- A unique index on a column prefix could not be upgraded to a primary index even if there was no primary index already defined. ([Bug#51378](#))
- The server could crash populating the `INFORMATION_SCHEMA.PROCESSLIST` table due to lack of mutex protection. ([Bug#51377](#))
- Use of `HANDLER` statements with tables that had spatial indexes caused a server crash. ([Bug#51357](#))
- With an XA transaction active, `SET autocommit = 1` could cause side effects such as memory corruption or a server crash. ([Bug#51342](#))
- Following a bulk insert into a `MyISAM` table, if `MyISAM` failed to build indexes using repair by sort, data file corruption could occur. ([Bug#51307](#))
- `CHECKSUM TABLE` could compute the checksum for `BIT` columns incorrectly. ([Bug#51304](#))
- A `HAVING` clause on a joined table in some cases failed to eliminate rows which should have been excluded from the result set. ([Bug#51242](#))
- The type inference used for view columns caused some columns in views to be handled as the wrong type, as compared to the same columns in base tables. `DATE` columns in base tables were treated as `TIME` columns in views, and base table `TIME` columns as view `DATETIME` columns. ([Bug#50918](#))
- The AIX implementation of `readdir_r()` caused `InnoDB` errors. ([Bug#50691](#))
- The `YEAR` values `2000` and `0000` could be treated as equal. ([Bug#49910](#))
- Performing a single in-place `ALTER TABLE` containing `ADD INDEX` and `DROP INDEX` options that used the same index name could result in a corrupt table definition file. Now such `ALTER TABLE` statements are no longer performed in place. ([Bug#49838](#))
- `mysql_upgrade` did not detect when `CSV` log tables incorrectly contained columns that could be `NULL`. Now these columns are altered to be `NOT NULL`. ([Bug#49823](#))
- `InnoDB` would return an error when inserting a negative value into an auto-increment column. ([Bug#49497](#))
- `InnoDB` did not reset table `AUTO_INCREMENT` values to the last used values after a server restart. ([Bug#49032](#))
- If a stored function contained a `RETURN` statement with an `ENUM` value in the `ucs2` character set, `SHOW CREATE FUNCTION` and `SELECT DTD_IDENTIFIER FROM INFORMATION_SCHEMA.ROUTINES` returned incorrect values. ([Bug#48766](#))
- A trigger could change the behavior of assigning `NULL` to a `NOT NULL` column. ([Bug#48525](#))
- The server crashed when it could not determine the best execution plan for queries involving outer joins with nondeterministic `ON` clauses such as the ones containing the `RAND()` function, a user-defined function, or a `NOT DETERMINISTIC` stored function. ([Bug#48483](#))
- The MERGE engine failed to open a child table from a different database if the child table or database name contained characters that were the subject of table name to filename encoding.

Further, the MERGE engine did not properly open a child table from the same database if the child table name contained characters such as `'`, `#`. ([Bug#48265](#))

- A query that read from a derived table (of the form `SELECT ... FROM (SELECT ...)`) produced incorrect results when the following conditions were present:
  - The table subquery contained a derived query (`(SELECT ... ) AS column`).
  - The derived query could potentially produce zero rows or a single `NULL` (that is, no rows matched, or the query used an aggregate function such as `SUM()` running over zero rows).

- The table subquery joined at least two tables.
- The join condition involved an index.  
([Bug#47904](#))
- The optimization to read `MIN()` or `MAX()` values from an index did not properly handle comparisons with `NULL` values. This could produce incorrect results for `MIN()` or `MAX()` when the `WHERE` clause tested a `NOT NULL` column for `NULL`.  
([Bug#47762](#))
- Killing a query during the optimization phase of a subquery could cause a server crash. ([Bug#47761](#))
- The query shown by `EXPLAIN EXTENDED` plus `SHOW WARNINGS` could produce results different from the original query.  
([Bug#47669](#))
- Renaming a column of an `InnoDB` table caused the server to go out of sync with the `InnoDB` data dictionary. ([Bug#47621](#))
- `MyISAM` could write uninitialized data to new index pages. Now zeros are written to unused bytes in the pages. ([Bug#47598](#))
- Setting `myisam_repair_threads` larger than 1 could result in the cardinality for all indexes of a `MyISAM` table being set to 1 after parallel index repair. ([Bug#47444](#))
- In debug builds, if the listed columns in the view definition of the table used in an `INSERT ... SELECT` statement mismatched, an assertion was raised in the query cache invalidation code following the failing statement. ([Bug#46615](#))
- For a query that selected from a view and used an alias for the view, the metadata used the alias name rather than the view name in the `MYSQL_FIELD.table` member. ([Bug#41788](#))
- `mysql_upgrade` did not create temporary files properly. ([Bug#41057](#))
- It was possible for `DROP TABLE` of one `MyISAM` table to remove the data and index files of a different `MyISAM` table.  
([Bug#40980](#))
- If the arguments to a `CONCAT()` call included a local routine variable, selecting the return value into a user variable could produce an incorrect result. ([Bug#40625](#))
- `SHOW CREATE VIEW` returned invalid SQL if the definition contained a `SELECT 'string'` statement where the `string` was longer than the maximum length of a column name, due to the fact that this text was also used as an alias (in the `AS` clause).

Because not all names retrieved from arbitrary `SELECT` statements can be used as view column names due to length and format restrictions, the server now checks the conformity of automatically generated column names and rewrites according to a pre-defined format any names that are not acceptable as view column names before storing the final view definition on disk.

In such cases, the name is now rewritten as `Name_exp_pos`, where `pos` is the position of the column. To avoid this conversion scheme, define explicit, valid names for view columns using the `column_list` clause of the `CREATE VIEW` statement.

As part of this fix, aliases are now generated only for top-level statements. ([Bug#40277](#))

- `mysqlbinlog` had a memory leak in its option-processing code. ([Bug#38468](#))
- The test for `readline` during configuration failed when trying to build MySQL in a directory other than the source tree root.  
([Bug#35250](#))
- A query on a `FEDERATED` table in which the data was ordered by a `TEXT` column returned incorrect results. For example, a query such as the following would result in incorrect results if column `column1` was a `TEXT` column:

```
SELECT * FROM table1 ORDER BY column1;
```

([Bug#32426](#))

## C.1.7. Changes in MySQL 5.1.45 (01 March 2010)

InnoDB Notes:

- This release includes `InnoDB Plugin` 1.0.6. This version is considered of Release Candidate (RC) quality.

In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86,

x86\_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality added or changed:

- `mysqltest` has a new `--max-connections` option to set a higher number of maximum permitted server connections than the default 128. This option can also be passed using `mysql-test-run.pl`. ([Bug#51135](#))
- `mysql-test-run.pl` has a new `--portbase` option and a corresponding `MTR_PORT_BASE` environment variable for setting the port range, as an alternative to the existing `--build-thread` option. ([Bug#50182](#))
- `mysql-test-run.pl` has a new `--gprof` option that runs the server through the `gprof` profiler, much the same way the currently supported `--gcov` option runs it through `gcov`. ([Bug#49345](#))
- `mysqltest` has a new `lowercase_result` command that converts the output of the next statement to lowercase. This is useful for test cases where the lettercase may vary between platforms. ([Bug#48863](#))
- `mysqltest` has a new `remove_files_wildcard` command that removes files matching a pattern from a directory. ([Bug#39774](#))

Bugs fixed:

- **Partitioning:** Attempting to drop a partitioned table from one connection while waiting for the completion of an `ALTER TABLE` that had been issued from a different connection, and that changed the storage engine used by the table, could cause the server to crash. ([Bug#42438](#))
- **Replication:** Adding an index to a table on the master caused the slave to stop logging slow queries to the slow query log. ([Bug#50620](#))
- **Replication:** Queries which were written to the slow query log on the master were not written to the slow query log on the slave. ([Bug#23300](#))

See also [Bug#48632](#).

- `mysqld_multi` failed due to a syntax error in the script. ([Bug#51468](#))
- Referring to a subquery result in a `HAVING` clause could produce incorrect results. ([Bug#50995](#))
- Use of `filesort` plus the join cache normally is preferred to a full index scan. But it was used even if the index is clustered, in which case, the clustered index scan can be faster. ([Bug#50843](#))
- For debug builds, `SHOW BINARY LOGS` caused an assertion to be raised if binary logging was not enabled. ([Bug#50780](#))
- The server did not recognize that the stored procedure cache became invalid if a view was created or modified within a procedure, resulting in a crash. ([Bug#50624](#))
- Incorrect handling of `BIT` columns in temporary tables could lead to spurious duplicate-key errors. ([Bug#50591](#))
- The second or subsequent invocation of a stored procedure containing `DROP TRIGGER` could cause a server crash. ([Bug#50423](#))
- Full-text queries that used the truncation operator (\*) could enter an infinite loop. ([Bug#50351](#))
- For debug builds, an assertion was incorrectly raised in the optimizer when matching `ORDER BY` expressions. ([Bug#50335](#))
- Queries optimized with `GROUP_MIN_MAX` did not clean up KEYREAD optimizations properly, causing subsequent queries to return incomplete rows. ([Bug#49902](#))
- For dynamic format `MyISAM` tables containing `LONGTEXT` columns, a bulk `INSERT ... ON DUPLICATE KEY UPDATE` or bulk `REPLACE` could cause corruption. ([Bug#49628](#))
- For debug builds, with `sql_safe_updates` enabled, a multiple-table `UPDATE` with the `IGNORE` modifier could raise an assertion. ([Bug#49534](#))
- `EXPLAIN EXTENDED` crashed trying to print column names for a subquery in the `FROM` clause when the table had gone out of scope. ([Bug#49487](#))
- For `InnoDB` tables, the test for using an index for `ORDER BY` sorting did not distinguish between primary keys and secondary

indexes and expected primary key values to be concatenated to index values the way they are to secondary key values. ([Bug#49324](#))

- `mysqltest` no longer lets you execute an SQL statement on a connection after doing a `send` command, unless you do a `reap` first. This was previously accepted but could produce unpredictable results. ([Bug#49269](#))
- For debug builds on Windows, warnings about incorrect use of debugging directives were written to the error log. The directives were rewritten to eliminate these messages. ([Bug#49025](#))
- `SHOW INNODB STATUS` could display incorrect information about deadlocks, when the deadlock detection routine stops early (to avoid excessive CPU usage). ([Bug#49001](#))
- An ARZ file missing from the database directory caused the server to crash. ([Bug#48757](#))
- Running `SHOW CREATE TABLE` on a view `v1` that contained a function which accessed another view `v2` could trigger a infinite loop if the view (`v2`) referenced within the function caused a warning to be raised while being opened. ([Bug#48449](#))
- Invalid memory reads could occur following a query that referenced a `MyISAM` table multiple times with a write lock. ([Bug#48438](#))
- For debug builds, creating a view containing a row constructor caused an assertion to be raised. ([Bug#48294](#))
- Slow `CALL` statements were not always logged to the slow query log because execution time for multiple-statement stored procedures was assessed incorrectly. ([Bug#47905](#))
- For debug builds, killing a `SELECT` retrieving from a view that was processing a function caused an assertion to be raised. ([Bug#47736](#))
- Failure to open a view with a nonexistent `DEFINER` was improperly handled and the server would crash later attempting to lock the view. ([Bug#47734](#))
- If `EXPLAIN` encountered an error in the query, a memory leak occurred. ([Bug#45989](#))
- Grouping by a subquery in a query with a `DISTINCT` aggregate function led to incorrect and unordered grouping values. ([Bug#45640](#))
- Propagation of a large unsigned numeric constant in `WHERE` expressions could lead to incorrect results. This also affected `EXPLAIN EXTENDED`, which printed incorrect numeric constants in such transformed `WHERE` expressions. ([Bug#45360](#))
- Valgrind warnings about uninitialized variables in optimizer code were corrected. ([Bug#45195](#))
- `flush_cache_records()` did not correctly check for errors that should cause statement execution to stop, leading to a server crash. ([Bug#39022](#))
- `InnoDB` logged an error repeatedly trying to load a page into the buffer pool, filling the error log and using excessive disk space. Now the number of attempts is limited to 100, after which the operation aborts with a message. ([Bug#38901](#))
- When building MySQL when using a different target directory (for example using the `VPATH` environment variable), the build of the embedded `readline` component would fail. ([Bug#35250](#))
- `INSERT INTO ... VALUES(DEFAULT)` failed to insert the correct value for `ENUM` columns. For `MyISAM` tables, an empty value was inserted. For `CSV` tables, the table became corrupt. ([Bug#33717](#))

## C.1.8. Changes in MySQL 5.1.44 (04 February 2010)

InnoDB Notes:

- This release includes `InnoDB Plugin` 1.0.6. This version is considered of Release Candidate (RC) quality.

In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86\_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality added or changed:

- **Replication:** Introduced the `binlog_direct_non_transactional_updates` system variable. Enabling this variable causes updates using the statement-based logging format to tables using nontransactional engines to be written directly to the

binary log, rather than to the transaction cache.

Before enabling this variable, be certain that you have no dependencies between transactional and nontransactional tables. A statement that both selects from an `InnoDB` table and inserts into a `MyISAM` table is an example of such a dependency. For more information, see [Section 16.1.3.4, “Binary Log Options and Variables”](#). ([Bug#46364](#))

See also [Bug#28976](#), [Bug#40116](#).

Bugs fixed:

- **Performance:** The method for comparing `INFORMATION_SCHEMA` names and database names was nonoptimal and an improvement was made: When the database name length is already known, a length check is made first and content comparison skipped if the lengths are unequal. ([Bug#49501](#))
- **Performance:** The `MD5()` and `SHA1()` functions had excessive overhead for short strings. ([Bug#49491](#))
- **Partitioning:** When an `ALTER TABLE ... REORGANIZE PARTITION` statement on an `InnoDB` table failed due to `innodb_lock_wait_timeout` expiring while waiting for a lock, `InnoDB` did not clean up any temporary files or tables which it had created. Attempting to reissue the `ALTER TABLE` statement following the timeout could lead to storage engine errors, or possibly a crash of the server. ([Bug#47343](#))
- **Replication:** In some cases, inserting into a table with many columns could cause the binary log to become corrupted. ([Bug#50018](#))

See also [Bug#42749](#).

- **Replication:** When using row-based replication, setting a `BIT` or `CHAR` column of a `MyISAM` table to `NULL`, then trying to delete from the table, caused the slave to fail with the error `CAN'T FIND RECORD IN TABLE`. ([Bug#49481](#), [Bug#49482](#))
- **Replication:** When logging in row-based mode, DDL statements are actually logged as statements; however, statements that affected temporary tables and followed DDL statements failed to reset the binary log format to `ROW`, with the result that these statements were logged using the statement-based format. Now the state of `binlog_format` is restored after a DDL statement has been written to the binary log. ([Bug#49132](#))
- **Replication:** When using row-based logging, the statement `CREATE TABLE t IF NOT EXIST ... SELECT` was logged as `CREATE TEMPORARY TABLE t IF NOT EXIST ... SELECT` when `t` already existed as a temporary table. This was caused by the fact that the temporary table was opened and the results of the `SELECT` were inserted into it when a temporary table existed and had the same name.

Now, when this statement is executed, `t` is created as a base table, the results of the `SELECT` are inserted into it—even if there already exists a temporary table having the same name—and the statement is logged correctly. ([Bug#47418](#))

See also [Bug#47442](#).

- **Replication:** Due to a change in the size of event representations in the binary log, when replicating from a MySQL 4.1 master to a slave running MySQL 5.0.60 or later, the `START SLAVE UNTIL` statement did not function correctly, stopping at the wrong position in the log. Now the slave detects that the master is using the older version of the binary log format, and corrects for the difference in event size, so that the slave stops in the correct position. ([Bug#47142](#))
- The SSL certificates in the test suite were about to expire. They have been updated with expiration dates in the year 2015. ([Bug#50642](#))
- The `printstack` function does not exist on Solaris 8 or earlier, which would lead to a compilation failure. ([Bug#50409](#))
- A user could see tables in `INFORMATION_SCHEMA.TABLES` without appropriate privileges for them. ([Bug#50276](#))
- Debug output for join structures was garbled. ([Bug#50271](#))
- The `filesort` sorting method applied to a `CHAR(0)` column could lead to a server crash. ([Bug#49897](#))
- The `sql_buffer_result` had an effect on non-`SELECT` statements, contrary to the documentation. ([Bug#49552](#))
- In some cases a subquery need not be evaluated because it returns only aggregate values that can be calculated from table metadata. This sometimes was not handled by the enclosing subquery, resulting in a server crash. ([Bug#49512](#))
- Mixing full-text searches and row expressions caused a crash. ([Bug#49445](#))
- Creating or dropping a table with 1023 transactions active caused an assertion failure. ([Bug#49238](#))

- `mysql-test-run.pl` now recognizes the `MTR_TESTCASE_TIMEOUT`, `MTR_SUITE_TIMEOUT`, `MTR_SHUTDOWN_TIMEOUT`, and `MTR_START_TIMEOUT` environment variables. If they are set, their values are used to set the `-- testcase-timeout`, `-- suite-timeout`, `-- shutdown-timeout`, and `-- start-timeout` options, respectively. ([Bug#49210](#))
- If `innodb_force_recovery` was set to 4 or higher, the server could crash when opening an `InnoDB` table containing an auto-increment column. MySQL versions 5.1.31 and later were affected. ([Bug#46193](#))
- The optimizer could continue to execute a query after a storage engine reported an error, leading to a server crash. ([Bug#46175](#))

## C.1.9. Release Notes for MySQL Enterprise 5.1.43sp1 [QSP] (25 March 2010)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

Bugs fixed:

- **Partitioning:** When an `ALTER TABLE ... REORGANIZE PARTITION` statement on an `InnoDB` table failed due to `innodb_lock_wait_timeout` expiring while waiting for a lock, `InnoDB` did not clean up any temporary files or tables which it had created. Attempting to reissue the `ALTER TABLE` statement following the timeout could lead to storage engine errors, or possibly a crash of the server. ([Bug#47343](#))
- Referring to a subquery result in a `HAVING` clause could produce incorrect results. ([Bug#50995](#))
- The `filesort` sorting method applied to a `CHAR(0)` column could lead to a server crash. ([Bug#49897](#))
- `sql_buffer_result` had an effect on non-`SELECT` statements, contrary to the documentation. ([Bug#49552](#))
- In some cases a subquery need not be evaluated because it returns only aggregate values that can be calculated from table metadata. This sometimes was not handled by the enclosing subquery, resulting in a server crash. ([Bug#49512](#))
- If `innodb_force_recovery` was set to 4 or higher, the server could crash when opening an `InnoDB` table containing an auto-increment column. MySQL versions 5.1.31 and later were affected. ([Bug#46193](#))
- `flush_cache_records()` did not correctly check for errors that should cause statement execution to stop, leading to a server crash. ([Bug#39022](#))

## C.1.10. Changes in MySQL 5.1.43 (15 January 2010)

InnoDB Notes:

- This release includes `InnoDB Plugin` 1.0.6. This version is considered of Release Candidate (RC) quality.

In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86\_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on S/390, PowerPC, and generic ia64.

Functionality added or changed:

- **Partitioning:** The `UNIX_TIMESTAMP()` function is now supported in partitioning expressions using `TIMESTAMP` columns. For example, it now possible to create a partitioned table such as this one:

```
CREATE TABLE t (c TIMESTAMP)
PARTITION BY RANGE (UNIX_TIMESTAMP(c)) (
 PARTITION p0 VALUES LESS THAN (631148400),
 PARTITION p1 VALUES LESS THAN (946681200),
 PARTITION p2 VALUES LESS THAN (MAXVALUE)
);
```

All other expressions involving `TIMESTAMP` values are now rejected with an error when attempting to create a new partitioned table or to alter an existing partitioned table.

When accessing an existing partitioned table having a timezone-dependent partitioning function (where the table was using a previous version of MySQL), a warning rather than an error is issued. In such cases, you should fix the table. One way of doing this is to alter the table's partitioning expression so that it uses `UNIX_TIMESTAMP()`. ([Bug#42849](#))

Bugs fixed:

- **Performance: Partitioning:** When used on partitioned tables, the `records_in_range` handler call checked more partitions than necessary. The fix for this issue reduces the number of unpruned partitions checked for statistics in partition range checking, which has resulted in some partition operations being performed up to 2-10 times faster than before this change was made, when testing with tables having 1024 partitions. ([Bug#48846](#))

See also [Bug#37252](#), [Bug#47261](#).

- **Security Fix:** For servers built with yaSSL, a preauthorization buffer overflow could cause memory corruption or a server crash. We thank Evgeny Legerov from Intevydis for providing us with a proof-of-concept script that permitted us to reproduce this bug. ([Bug#50227](#), [CVE-2009-4484](#))
- **Important Change: Replication:** The `RAND()` function is now marked as unsafe for statement-based replication. Using this function now generates a warning when `binlog_format=STATEMENT` and causes the format to switch to row-based logging when `binlog_format=MIXED`.

This change is being introduced because, when `RAND()` was logged in statement mode, the seed was also written to the binary log, so the replication slave generated the same sequence of random numbers as was generated on the master. While this could make replication work in some cases, the order of affected rows was still not guaranteed when this function was used in statements that could update multiple rows, such as `UPDATE` or `INSERT ... SELECT`; if the master and the slave retrieved rows in different order, they began to diverge. ([Bug#49222](#))

- **Partitioning:** A query that searched on a `ucs2` column failed if the table was partitioned. ([Bug#48737](#))
- **Replication:** A `LOAD DATA INFILE` statement that loaded data into a table having a column name that had to be escaped (such as ``key` INT`) caused replication to fail when logging in mixed or statement mode. In such cases, the master wrote the `LOAD DATA` event into the binary log without escaping the column names. ([Bug#49479](#))

See also [Bug#47927](#).

- **Replication:** Spatial data types caused row-based replication to crash. ([Bug#48776](#))
- **Replication:** A flaw in the implementation of the purging of binary logs could result in orphaned files being left behind in the following circumstances:
  - If the server failed or was killed while purging binary logs.  
If the server failed or was killed after creating of a new binary log when the new log file was opened for the first time.

In addition, if the slave was not connected during the purge operation, it was possible for a log file that was in use to be removed; this could lead data loss and possible inconsistencies between the master and slave. ([Bug#45292](#))

- **Replication:** When using the `STATEMENT` or `MIXED` logging format, the statements `LOAD DATA CONCURRENT LOCAL INFILE` and `LOAD DATA CONCURRENT INFILE` were logged as `LOAD DATA LOCAL INFILE` and `LOAD DATA LOCAL INFILE`, respectively (in other words, the `CONCURRENT` keyword was omitted). As a result, when using replication with either of these logging modes, queries on the slaves were blocked by the replication SQL thread while trying to execute the affected statements. ([Bug#34628](#))
- **Replication:** Manually removing entries from the binary log index file on a replication master could cause the server to repeatedly send the same binary log file to slaves. ([Bug#28421](#))
- **Cluster Replication:** When `expire_logs_days` was set, the thread performing the purge of the log files could deadlock, causing all binary log operations to stop. ([Bug#49536](#))
- Within a stored routine, selecting the result of `CONCAT_WS()` with a routine parameter argument into a user variable could return incorrect results. ([Bug#50096](#))
- The `IBMDB2I` storage engine was missing from the i5os 64-bit distribution of MySQL 5.1.42. It is now included again. ([Bug#50059](#))
- `EXPLAIN EXTENDED UNION ... ORDER BY` caused a crash when the `ORDER BY` referred to a nonconstant or full-text function or a subquery. ([Bug#49734](#))
- The `push_warning_printf()` function was being called with an invalid error level `MYSQL_ERROR::WARN_LEVEL_ERROR`, causing an assertion failure. To fix the problem, `MYSQL_ERROR::WARN_LEVEL_ERROR` has been replaced by `MYSQL_ERROR::WARN_LEVEL_WARN`. ([Bug#49638](#))
- Some prepared statements could raise an assertion when re-executed. ([Bug#49570](#))

- A Valgrind error in `make_cond_for_table_from_pred()` was corrected. Thanks to Sergey Petrunya for the patch to fix this bug. ([Bug#49506](#))
- When compiling on Windows, an error in the CMake definitions for `InnoDB` would cause the engine to be built incorrectly. ([Bug#49502](#))
- Valgrind warnings for `CHECKSUM TABLE` were corrected. ([Bug#49465](#))
- Specifying an index algorithm (such as `BTREE`) for `SPATIAL` or `FULLTEXT` indexes caused a server crash. These index types do not support algorithm specification, and it is not longer permitted to do so. ([Bug#49250](#))
- The optimizer sometimes incorrectly handled conditions of the form `WHERE col_name='const1' AND col_name='const2'`. ([Bug#49199](#))
- Execution of `DECODE()` and `ENCODE()` could be inefficient because multiple executions within a single statement reinitialized the random generator multiple times even with constant parameters. ([Bug#49141](#))
- MySQL 5.1 does not support 2-byte collation numbers, but did not check the number and crashed for out-of-range values. ([Bug#49134](#))
- With binary logging enabled, `REVOKE ... ON {PROCEDURE|FUNCTION} FROM ...` could cause a crash. ([Bug#49119](#))
- The `LIKE` operator did not work correctly when using an index for a `ucs2` column. ([Bug#49028](#))
- `check_key_in_view()` was missing a `DBUG_RETURN` in one code branch, causing a crash in debug builds. ([Bug#48995](#))
- Several `strmake()` calls had an incorrect length argument (too large by one). ([Bug#48983](#))
- On Fedora 12, `strmov()` did not guarantee correct operation for overlapping source and destination buffer. Calls were fixed to use an overlap-safe version instead. ([Bug#48866](#))
- Incomplete reset of internal `TABLE` structures could cause a crash with `eq_ref` table access in subqueries. ([Bug#48709](#))
- Re-execution of a prepared statement could cause a server crash. ([Bug#48508](#))
- The error message for `ER_UPDATE_INFO` was subject to buffer overflow or truncation. ([Bug#48500](#))
- `SHOW BINLOG EVENTS` could fail with a error: `Wrong offset or I/O error.` ([Bug#48357](#))
- Valgrind warnings related to binary logging of `LOAD DATA INFILE` statements were corrected. ([Bug#48340](#))
- An aliasing violation in the C API could lead to a crash. ([Bug#48284](#))
- With one thread waiting for a lock on a table, if another thread dropped the table and created a new table with the same name and structure, the first thread would not notice that the table had been re-created and would try to used cached metadata that belonged to the old table but had been freed. ([Bug#48157](#))
- The `InnoDB Monitor` could fail to print diagnostic information after a long lock wait. ([Bug#47814](#))
- Queries containing `GROUP BY ... WITH ROLLUP` that did not use indexes could return incorrect results. ([Bug#47650](#))
- If an invocation of a stored procedure failed in the table-open stage, subsequent invocations that did not fail in that stage could cause a crash. ([Bug#47649](#))
- On Solaris, no stack trace was printed to the error log after a crash. ([Bug#47391](#))
- A crash occurred when a user variable that was assigned to a subquery result was used as a result field in a `SELECT` statement with aggregate functions. ([Bug#47371](#))
- The first execution of `STOP SLAVE UNTIL` stopped too early. ([Bug#47210](#))
- When the `mysql` client was invoked with the `--vertical` option, it ignored the `--skip-column-names` option. ([Bug#47147](#))
- It was possible for `init_available_charsets()` not to initialize correctly. ([Bug#45058](#))
- For a `VARCHAR(N)` column, `ORDER BY BINARY(col_name)` sorted using only the first `N` bytes of the column, even though column values could be longer than `N` bytes if they contained multibyte characters. ([Bug#44131](#))
- Comparison with `NULL` values sometimes did not produce a correct result. ([Bug#42760](#))

- Crash recovery did not work for `InnoDB` temporary tables. ([Bug#41609](#))
- The `mysql_upgrade` command would create three additional fields to the `mysql.proc` table (`character_set_client`, `collation_connection`, and `db_collation`), but did not populate the fields with correct values. This would lead to error messages reported during stored procedure execution. ([Bug#41569](#))
- When compressed `MyISAM` files were opened, they were always memory mapped, sometimes causing memory-swapping problems. To deal with this, a new system variable, `myisam_mmap_size`, was added to limit the amount of memory used for memory mapping of `MyISAM` files. ([Bug#37408](#))
- A race condition on the privilege hash tables permitted one thread to try to delete elements that had already been deleted by another thread. A consequence was that `SET PASSWORD` or `FLUSH PRIVILEGES` could cause a crash. ([Bug#35589](#), [Bug#35591](#))
- `ALTER TABLE` with both `DROP COLUMN` and `ADD COLUMN` clauses could crash or lock up the server. ([Bug#31145](#))

## C.1.11. Changes in MySQL 5.1.42 (15 December 2009)

InnoDB Notes:

- `InnoDB Plugin` has been upgraded to version 1.0.6. This version is considered of Release Candidate (RC) quality. [InnoDB Plugin Change History](#), may contain information in addition to those changes reported here.

In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86\_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on S/390, PowerPC, and generic ia64.

Release availability:

- MySQL Server 5.1 is available on the following new platforms starting with the 5.1.42 release:
  - Mac OS X 10.6 x86/x64
  - HP-UX 11.31 IA64
  - SLES 11 x86/x64

Bugs fixed:

- **Performance:** When the query cache is fragmented, the size of the free block lists in the memory bins grows, which causes query cache invalidation to become slow. There is now a 50ms timeout for a `SELECT` statement waiting for the query cache lock. If the timeout expires, the statement executes without using the query cache. ([Bug#39253](#))

See also [Bug#21074](#).

- **Important Change: Replication:** The following functions have been marked unsafe for statement-based replication:
  - `GET_LOCK()`
  - `IS_FREE_LOCK()`
  - `IS_USED_LOCK()`
  - `MASTER_POS_WAIT()`
  - `RELEASE_LOCK()`
  - `SLEEP()`
  - `SYSDATE()`
  - `VERSION()`

None of the functions just listed are guaranteed to replicate correctly when using the statement-based format, because they can produce different results on the master and the slave. The use of any of these functions while `binlog_format` is set to

`STATEMENT` is logged with the warning, `STATEMENT IS NOT SAFE TO LOG IN STATEMENT FORMAT`. When `bin-log_format` is set to `MIXED`, the binary logging format is automatically switched to the row-based format whenever one of these functions is used. ([Bug#47995](#))

- **Partitioning:** In some cases, it was not possible to add a new column to a table that had subpartitions. ([Bug#48276](#))
- **Partitioning:** `SELECT COUNT(*)` from a partitioned table failed when using the `ONLY_FULL_GROUP_BY` SQL mode. ([Bug#46923](#))

This regression was introduced by [Bug#45807](#).
- **Partitioning:** `SUBPARTITION BY KEY` failed with `DEFAULT CHARSET=utf8`. ([Bug#45904](#))
- **Replication:** When using row-based logging, `TRUNCATE TABLE` was written to the binary log even if the affected table was temporary, causing replication to fail. ([Bug#48350](#))
- **Replication:** Replicating `TEXT` or `VARCHAR` columns declared as `NULL` on the master but `NOT NULL` on the slave caused the slave to crash. ([Bug#43789](#))

See also [Bug#38850](#), [Bug#43783](#), [Bug#43785](#), [Bug#47741](#), [Bug#48091](#).

- **Replication:** When using row-based format, replication failed with the error `COULD NOT EXECUTE WRITE_ROWS EVENT ON TABLE ...; FIELD '...' DOESN'T HAVE A DEFAULT VALUE` when an `INSERT` was made on the master without specifying a value for a column having no default, even if strict server SQL mode was not in use and the statement would otherwise have succeeded on the master. Now the SQL mode is checked, and the statement is replicated unless strict mode is in effect. For more information, see [Section 5.1.7, “Server SQL Modes”](#). ([Bug#38173](#))

See also [Bug#38262](#), [Bug#43992](#).

- The result of comparison between nullable `BIGINT` and `INT` columns was inconsistent. ([Bug#49517](#))
- Incorrect cache initialization prevented storage of converted constant values and could produce incorrect comparison results. ([Bug#49489](#))
- Comparisons involving `YEAR` values could produce incorrect results. ([Bug#49480](#))

See also [Bug#43668](#).

- If a query involving a table was terminated with `KILL`, a subsequent `SHOW CREATE TABLE` for that table caused a server crash. ([Bug#48985](#))
- Privileges for stored routines were ignored for mixed-case routine names. ([Bug#48872](#))

See also [Bug#41049](#).
- Building MySQL on Fedora Core 12 64-bit failed, due to errors in `comp_err`. ([Bug#48864](#))
- Concurrent `ALTER TABLE` operations on an `InnoDB` table could raise an assertion. ([Bug#48782](#))
- Certain `INTERVAL` expressions could cause a crash on 64-bit systems. ([Bug#48739](#))
- During query execution, ranges could be merged incorrectly for `OR` operations and return an incorrect result. ([Bug#48665](#))
- The `InnoDB` Table Monitor reported the `FLOAT` and `DOUBLE` data types incorrectly. ([Bug#48526](#))
- With row-based binary logging, the server crashed for statements of the form `CREATE TABLE IF NOT EXISTS existing_view LIKE temporary_table`. This occurred because the server handled the existing view as a table when logging the statement. ([Bug#48506](#))
- `DISTINCT` was ignored for queries with `GROUP BY WITH ROLLUP` and only `const` tables. ([Bug#48475](#))
- Loose index scan was inappropriately chosen for some `WHERE` conditions. ([Bug#48472](#))
- The server could crash and corrupt the tablespace if the `InnoDB` tablespace was configured with too small a value, or if many `CREATE TEMPORARY TABLE` statements were executed and the temporary file directory filled up with `innodb_file_per_table` enabled. ([Bug#48469](#))
- Parts of the range optimizer could be initialized incorrectly, resulting in Valgrind errors. ([Bug#48459](#))
- A bad typecast could cause query execution to allocate large amounts of memory. ([Bug#48458](#))
- `GRANT` and `REVOKE` crashed if a user name was specified as `CURRENT_USER()`. ([Bug#48319](#))

- On Windows, `InnoDB` could not be built as a statically linked library. ([Bug#48317](#))
- `mysql_secure_installation` did not work on Solaris. ([Bug#48086](#))
- When running `mysql_secure_installation`, the command would fail if the root password contained multiple spaces, \, # or quote characters. ([Bug#48031](#))
- `MATCH IN BOOLEAN MODE` searches could return too many results inside a subquery. ([Bug#47930](#))
- Using `REPLACE` to update a previously inserted negative value in an `AUTO_INCREMENT` column in an `InnoDB` table caused the table auto-increment value to be updated to 2147483647. ([Bug#47720](#))
- If a session held a global read lock acquired with `FLUSH TABLES WITH READ LOCK`, a lock for one table acquired with `LOCK TABLES`, and issued an `INSERT DELAYED` statement for another table, deadlock could occur. ([Bug#47682](#))
- The `mysql client status` command displayed an incorrect value for the server character set. ([Bug#47671](#))
- Connecting to a 4.1.x server from a 5.1.x or higher `mysql` client resulted in a memory-free error when disconnecting. ([Bug#47655](#))
- Assignment of a system variable sharing the same base name as a declared stored program variable in the same context could lead to a crash. ([Bug#47627](#))
- `mysqladmin debug` could crash on 64-bit systems. ([Bug#47382](#))
- The `innodb_file_format_check` system variable could not be set at runtime to `DEFAULT` or to the value of a user-defined variable. ([Bug#47167](#))
- After a binary upgrade to MySQL 5.1 from a MySQL 5.0 installation that contains `ARCHIVE` tables, accessing those tables caused the server to crash, even if you had run `mysql_upgrade` or `CHECK TABLE ... FOR UPGRADE`.

To work around this problem, use `mysqldump` to dump all `ARCHIVE` tables before upgrading, and reload them into MySQL 5.1 after upgrading. The same problem occurs for binary downgrades from MySQL 5.1 to 5.0. ([Bug#47012](#))

- The Mac OS X `MySQL Preference Pane` component was not built for 64-bit, which would trigger the System Preferences application to restart into 32-bit mode. ([Bug#46935](#))
- The `IGNORE` clause on a `DELETE` statement masked an SQL statement error that occurred during trigger processing. ([Bug#46425](#))
- On 64-bit systems, `--skip-innodb` did not skip `InnoDB` startup. ([Bug#46043](#))
- Valgrind errors for `InnoDB Plugin` were corrected. ([Bug#45992](#), [Bug#46656](#))
- The return value was not checked for some `my_hash_insert()` calls. ([Bug#45613](#))
- Truncation of `DECIMAL` values could lead to assertion failures; for example, when deducing the type of a table column from a literal `DECIMAL` value. ([Bug#45261](#))

See also [Bug#48370](#).

- For `YEAR(2)` values, `MIN()`, `MAX()`, and comparisons could yield incorrect results. ([Bug#43668](#))
- The server could crash when attempting to access a non-conformant `mysql.proc` system table. For example, the server could crash when invoking stored procedure-related statements after an upgrade from MySQL 5.0 to 5.1 without running `mysql_upgrade`. ([Bug#41726](#))
- Multiple-statement execution could fail. ([Bug#40877](#))
- Use of `InnoDB` monitoring (`SHOW ENGINE INNODB STATUS` or one of the `InnoDB` Monitor tables) could cause a server crash due to invalid access to a shared variable in a concurrent environment. This is a further fix for a regression introduced in MySQL 5.1.38 to the original fix in MySQL 5.1.31. ([Bug#38883](#))
- When running `mysql_secure_installation` on Windows, the command would fail to load a required module, `Term::ReadKey`, which was required for correct operation. ([Bug#35106](#))
- If the `--log-bin` server option was set to a directory name with a trailing component separator character, the basename of the binary log files was empty so that the created files were named `.000001` and `.index`. The same thing occurred with the `--log-bin-index`, `--relay-log`, and `--relay-log-index` options. Now the server reports an error and exits. ([Bug#34739](#))

- If a comparison involved a constant value that required type conversion, the converted value might not be cached, resulting in repeated conversion and poorer performance. ([Bug#34384](#))
- Using the `SHOW ENGINE INNODB STATUS` statement when using partitions in `InnoDB` tables caused `Invalid (old?) table or database name` errors to be logged. ([Bug#32430](#))
- On some Windows systems, `InnoDB` could report `Operating system error number 995 in a file operation` due to transient driver or hardware problems. `InnoDB` now retries the operation and adds `Retry attempt is made` to the error message. ([Bug#3139](#))

## C.1.12. Changes in MySQL 5.1.41 (05 November 2009)

InnoDB Notes:

- `InnoDB Plugin` has been upgraded to version 1.0.5. This version is considered of Release Candidate (RC) quality. [InnoDB Plugin Change History](#), may contain information in addition to those changes reported here.

Functionality added or changed:

- The `InnoDB` buffer pool is divided into two sublists: A new sublist containing blocks that are heavily used by queries, and an old sublist containing less-used blocks and from which candidates for eviction are taken. In the default operation of the buffer pool, a block when read in is loaded at the midpoint and then moved immediately to the head of the new sublist as soon as an access occurs. In the case of a table scan (such as performed for a `mysqldump` operation), each block read by the scan ends up moving to the head of the new sublist because multiple rows are accessed from each block. This occurs even for a one-time scan, where the blocks are not otherwise used by other queries. Blocks may also be loaded by the read-ahead background thread and then moved to the head of the new sublist by a single access. These effects can be disadvantageous because they push blocks that are in heavy use by other queries out of the new sublist to the old sublist where they become subject to eviction.

`InnoDB` now provides two system variables that enable LRU algorithm tuning:

- `innodb_old_blocks_pct`

Specifies the approximate percentage of the buffer pool used for the old block sublist. The range of values is 5 to 95. The default value is 37 (that is, 3/8 of the pool).

- `innodb_old_blocks_time`

Specifies how long in milliseconds (ms) a block inserted into the old sublist must stay there after its first access before it can be moved to the new sublist. The default value is 0: A block inserted into the old sublist moves immediately to the new sublist the first time it is accessed, no matter how soon after insertion the access occurs. If the value is greater than 0, blocks remain in the old sublist until an access occurs at least that many ms after the first access. For example, a value of 1000 causes blocks to stay in the old sublist for 1 second after the first access before they become eligible to move to the new sublist. See [Section 7.6.2, “The InnoDB Buffer Pool”](#)

For additional information, see [Section 7.6.2, “The InnoDB Buffer Pool”](#). ([Bug#45015](#))

- For `InnoDB Plugin`, two status variables have been added to `SHOW STATUS` output. `Innodb_buffer_pool_read_ahead` and `Innodb_buffer_pool_read_ahead_evicted` indicate the number of pages read in by the `InnoDB` read-ahead background thread, and the number of such pages evicted without ever being accessed, respectively. Also, the status variables `Innodb_buffer_pool_read_ahead_rnd` and `Innodb_buffer_pool_read_ahead_seq` status variables have been removed.

The built-in version of `InnoDB` is not affected by these changes. ([Bug#42885](#))

- The server now supports a Debug Sync facility for thread synchronization during testing and debugging. To compile in this facility, configure MySQL with the `--enable-debug-sync` option. The `debug_sync` system variable provides the user interface Debug Sync. `mysqld` and `mysql-test-run.pl` support a `--debug-sync-timeout` option to enable the facility and set the default synchronization point timeout.

Bugs fixed:

- **Important Change: Security Fix:** Additional corrections were made for the symlink-related privilege problem originally addressed in MySQL 5.1.24. The original fix did not correctly handle the data directory path name if it contained symlinks directories in its path, and the check was made only at table-creation time, not at table-opening time later. ([Bug#32167](#), [CVE-2008-2079](#))

See also [Bug#39277](#).

- **Security Fix:** MySQL clients linked against OpenSSL can be tricked not to check server certificates. ([Bug#47320](#), [CVE-2009-4028](#))
- **Partitioning:** An `ALTER TABLE ... ADD PARTITION` statement that caused `open_files_limit` to be exceeded led to a crash of the MySQL server. ([Bug#46922](#))

See also [Bug#47343](#).

- **Partitioning:** The cardinality of indexes on partitioned tables was calculated using the first partition in the table, which could result in suboptimal query execution plans being chosen. Now the partition having the most records is used instead, which should result in better use of indexes and thus improved performance of queries against partitioned tables in many if not most cases. ([Bug#44059](#))
- **Replication:** This issue occurred in MySQL 5.1.40 only. ([Bug#48297](#))
- **Replication:** When a session was closed on the master, temporary tables belonging to that session were logged with the wrong database names when either of the following conditions was true:
  1. The length of the name of the database to which the temporary table belonged was greater than the length of the current database name.
  2. The current database was not set.

([Bug#48216](#))

See also [Bug#46861](#), [Bug#48297](#).

- **Replication:** When using row-based replication, changes to nontransactional tables that occurred early in a transaction were not immediately flushed upon committing a statement. This behavior could break consistency since changes made to nontransactional tables become immediately visible to other connections. ([Bug#47678](#))

See also [Bug#47287](#), [Bug#46864](#), [Bug#43929](#), [Bug#46129](#).

- **Replication:** When `mysqlbinlog --verbose` was used to read a binary log that had been recorded using the row-based format, the output for events that updated some but not all columns of tables was not correct. ([Bug#47323](#))
- **Replication:** When using the row-based format to replicate a transaction involving both transactional and nontransactional engines, which contained a DML statement affecting multiple rows, the statement failed; if this transaction was followed by a `COMMIT`, the master and the slave could diverge, because the statement was correctly rolled back on the master, but was applied on the slave. ([Bug#47287](#))

See also [Bug#46864](#).

- **Replication:** A problem with the `BINLOG` statement in the output of `mysqlbinlog` could break replication; statements could be logged with the server ID stored within events by the `BINLOG` statement rather than the ID of the running server. With this fix, the server ID of the server executing the statements can no longer be overridden by the server ID stored in the binary log's `format_description` statement. ([Bug#46640](#))

This regression was introduced by [Bug#32407](#).

- **Replication:** When using statement-based replication and the transaction isolation level was set to `READ COMMITTED` or a less strict level, `InnoDB` returned an error even if the statement in question was filtered out according to the `--binlog-do-db` or `--binlog-ignore-db` rules in effect at the time. ([Bug#42829](#))
- **Replication:** `FLUSH LOGS` did not close and reopen the binary log index file. ([Bug#34582](#))

See also [Bug#48738](#).

- `SUM( )` artificially increased the precision of a `DECIMAL` argument, which was truncated when a temporary table was created to hold the results. ([Bug#48370](#))

See also [Bug#45261](#).

- If an outer query was invalid, a subquery might not even be set up. `EXPLAIN EXTENDED` did not expect this and caused a crash by trying to dereference improperly set up information. ([Bug#48295](#))
- A query containing a view using temporary tables and multiple tables in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash.

As a result of this bug fix, `PROCEDURE ANALYSE( )` is legal only in a top-level `SELECT`. ([Bug#48293](#))

See also [Bug#46184](#).

- Error handling was missing for `SELECT` statements containing subqueries in the `WHERE` clause and that assigned a `SELECT` result to a user variable. The server could crash as a result. ([Bug#48291](#))
- An assertion could fail if the optimizer used a `SPATIAL` index. ([Bug#48258](#), [Bug#47019](#))
- Memory-allocation failures were handled incorrectly in the `InnoDB os_mem_alloc_large()` function. ([Bug#48237](#))
- `WHERE` clauses with `outer_value_list NOT IN subquery` were handled incorrectly if the outer value list contained multiple items at least one of which could be `NULL`. ([Bug#48177](#))
- A combination of `GROUP BY WITH ROLLUP, DISTINCT` and the `const` join type in a query caused a server crash when the optimizer chose to employ a temporary table to resolve `DISTINCT`. ([Bug#48131](#))
- In some cases, using a null microsecond part in a `WHERE` condition (for example, `WHERE date_time_field <= 'YYYY-MM-DD HH:MM:SS.0000'`) could lead to incorrect results due to improper `DATETIME` comparison. ([Bug#47963](#))
- A build configured using the `--without-server` option did not compile the yaSSL code, so if `--with-ssl` was also used, the build failed. ([Bug#47957](#))
- When a query used a `DATE` or `DATETIME` value formatted using any separator characters other than hyphen (' - ') and a `>=` condition matching only the greatest value in an indexed column, the result was empty if an index range scan was employed. ([Bug#47925](#))
- `mysys/mf_keycache.c` requires threading, but no test was made for thread support. ([Bug#47923](#))
- For debug builds, an assertion could fail during the next statement executed for a temporary table after a multiple-table `UPDATE` involving that table and modified an `AUTO_INCREMENT` column with a user-supplied value. ([Bug#47919](#))
- The `mysys/mf_strip.c` file, which defines the `strip_sp()` function, has been removed from the MySQL source. The function was no longer used within the main build, and the supplied function was causing symbol errors on Windows builds. ([Bug#47857](#))
- The Windows build for MySQL would compile the `split.c` and `debug.c` files unnecessarily, causing additional symbols to be included in `mysqld`. ([Bug#47850](#))
- When building storage engines on Windows it was not possible to specify additional libraries within the CMake file required for the build. An `_${engine}_LIBS` macro has been included in the files to support these additional storage-engine specific libraries. ([Bug#47797](#))
- When building a pluggable storage engine on Windows, the engine name could be based on the directory name where the engine was located, rather than the configured storage engine name. ([Bug#47795](#))
- During cleanup of a stored procedure's internal structures, the flag to ignore the errors for `INSERT IGNORE` or `UPDATE IGNORE` was not cleaned up, which could result in a server crash. ([Bug#47788](#))
- If the first argument to `GeomFromWKB()` function was a geometry value, the function just returned its value. However, it failed to preserve the argument's `null_value` flag, which caused an unexpected `NULL` value to be returned to the caller, resulting in a server crash. ([Bug#47780](#))
- `InnoDB` could crash when updating spatial values. ([Bug#47777](#))
- On Windows, when an idle named pipe connection was forcibly closed with a `KILL` statement or because the server was being shut down, the thread that was closing the connection would hang infinitely. ([Bug#47571](#), [Bug#31621](#))
- A function call could end without throwing an error or setting the return value. For example, this could happen when an error occurred while calculating the return value. This is fixed by setting the value to `NULL` when an error occurs during evaluation of an expression. ([Bug#47412](#))
- A simple `SELECT` with implicit grouping could return many rows rather than a single row if the query was ordered by the aggregated column in the select list. ([Bug#47280](#))
- An assertion could be raised for `CREATE TABLE` if there was a pending `INSERT DELAYED` or `REPLACE DELAYED` for the same table. ([Bug#47274](#))
- `InnoDB` raised errors in some cases in a manner not compatible with `SIGNAL` and `RESIGNAL`. ([Bug#47233](#))

- If an `InnoDB` table was created with the `AUTO_INCREMENT` table option to specify an initial auto-increment value, and an index was added in a separate operation later, the auto-increment value was lost (subsequent inserts began at 1 rather than the specified value). ([Bug#47125](#))
- Incorrect handling of predicates involving `NULL` by the range optimizer could lead to an infinite loop during query execution. ([Bug#47123](#))
- Repair by sort or parallel repair of `MyISAM` tables could fail to fail over to repair with key cache. ([Bug#47073](#))
- `InnoDB Plugin` did not compile on some Solaris systems. ([Bug#47058](#))
- On Windows, when a failed I/O operation occurred with return code of `ERROR_WORKING_SET_QUOTA`, `InnoDB` intentionally crashed the server. Now `InnoDB` sleeps for 100ms and retries the failed operation. ([Bug#47055](#))
- `InnoDB` now ignores negative values supplied by a user for an `AUTO_INCREMENT` column when calculating the next value to store in the data dictionary. Setting `AUTO_INCREMENT` columns to negative values is undefined behavior and this change should bring the behavior of `InnoDB` closer to what users expect. ([Bug#46965](#))
- When MySQL crashed (or a snapshot was taken that simulates a crash), it was possible that internal XA transactions (used to synchronize the binary log and `InnoDB`) could be left in a `PREPARED` state, whereas they should be rolled back. This occurred when the `server_id` value changed before the restart, because that value was used to construct XID values.

Now the restriction is relaxed that the `server_id` value be consistent for XID values to be considered valid. The rollback phase should then be able to clean up all pending XA transactions. ([Bug#46944](#))

- `InnoDB Plugin` did not compile using `gcc` 4.1 on PPC systems. ([Bug#46718](#))
- If `InnoDB Plugin` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. ([Bug#46672](#))

See also [Bug#18828](#).

- A Valgrind error during index creation by `InnoDB Plugin` was corrected. ([Bug#46657](#))
- Concurrent `INSERT INTO ... SELECT` statements for an `InnoDB` table could cause an `AUTO_INCREMENT` assertion failure. ([Bug#46650](#))
- If a transaction was rolled back inside `InnoDB` due to a deadlock or lock wait timeout, and a statement in the transaction had an `IGNORE` clause, the server could crash at the end of the statement or on shutdown. ([Bug#46539](#))
- Trailing spaces were not ignored for user-defined collations that mapped spaces to a character other than 0x20. ([Bug#46448](#))

See also [Bug#29468](#).

- The GPL and commercial license headers had different sizes, so that error log, backtrace, core dump, and cluster trace file line numbers could be off by one if they were not checked against the version of the source used for the build. (For example, checking a GPL build backtrace against commercial sources.) ([Bug#46216](#))
- `InnoDB` did not disallow creation of an index with the name `GEN_CLUST_INDEX`, which is used internally. ([Bug#46000](#))
- During the build of the Red Hat IA64 MySQL server RPM, the system library link order was incorrect. This made the resulting Red Hat IA64 RPM depend on "libc.so.6.1(GLIBC\_PRIVATE)(64bit)", thus preventing installation of the package. ([Bug#45706](#))
- The `caseinfo` member of the `CHARSET_INFO` structure was not initialized for user-defined Unicode collations, leading to a server crash. ([Bug#45645](#))
- With `InnoDB Plugin`, renaming a table column and then creating an index on the renamed column caused a server crash to the `.frm` file and the `InnoDB` data directory going out of sync. Now `InnoDB Plugin` 1.0.5 returns an error instead: `ERROR 1034 (HY000): Incorrect key file for table 'tbl_name'; try to repair it`. To work around the problem, create another table with the same structure and copy the original table to it. ([Bug#44571](#))
- An `InnoDB` error message incorrectly referred to the nonexistent `innodb_max_files_open` variable rather than to `innodb_open_files`. ([Bug#44338](#))
- For `ALTER TABLE`, renaming a `DATETIME` or `TIMESTAMP` column unnecessarily caused a table copy operation. ([Bug#43508](#))
- The weekday names for the Romanian `lc_time_names` locale '`ro_RO`' were incorrect. Thanks to Andrei Boros for the patch to fix this bug. ([Bug#43207](#))

- `XA START` could cause an assertion failure or server crash when it is called after a unilateral rollback issued by the Resource Manager (both in a regular transaction and after an XA transaction). ([Bug#43171](#))
- The `FORCE INDEX FOR ORDER BY` index hint was ignored when join buffering was used. ([Bug#43029](#))
- Incorrect handling of range predicates combined with `OR` operators could yield incorrect results. ([Bug#42846](#))
- Failure to treat `BIT` values as unsigned could lead to unpredictable results. ([Bug#42803](#))
- For the embedded server on Windows, `InnoDB` crashed when `innodb_file_per_table` was enabled and a table name was in full path format. ([Bug#42383](#))
- Some queries with nested outer joins could lead to crashes or incorrect results because an internal data structure was handled improperly. ([Bug#42116](#))
- In a replication scenario with `innodb_locks_unsafe_for_binlog` enabled on the slave, where rows were changed only on the slave (not through replication), in some rare cases, many messages of the following form were written to the slave error log: `InnoDB: Error: unlock row could not find a 4 mode lock on the record.` ([Bug#41756](#))
- After renaming a user, granting that user privileges could result in the user having additional privileges other than those granted. ([Bug#41597](#))
- With a nonstandard `InnoDB` page size, some error messages became inaccurate.

#### Note

Changing the page size is not a supported operation and there is no guarantee that `InnoDB` will function normally with a page size other than 16KB. Problems compiling or running `InnoDB` may occur. In particular, `ROW_FORMAT=COMPRESSED` in the `InnoDB Plugin` assumes that the page size is at most 16KB and uses 14-bit pointers.

A version of `InnoDB` built for one page size cannot use data files or log files from a version built for a different page size.

([Bug#41490](#))

- In some cases, the server did not recognize lettercase differences between `GRANT` attributes such as table name or user name. For example, a user was able to perform operations on a table with privileges of another user with the same user name but in a different lettercase.

In consequence of this bug fix, the collation for the `Routine_name` column of the `mysql.proc` table is changed from `utf8_bin` to `utf8_general_ci`. ([Bug#41049](#))

See also [Bug#48872](#).

- Simultaneous `ANALYZE TABLE` operations for an `InnoDB` tables could be subject to a race condition. ([Bug#38996](#))
- Previously, `InnoDB` performed `REPLACE INTO T SELECT ... FROM S WHERE ...` by setting shared next-key locks on rows from `S`. Now `InnoDB` selects rows from `S` with shared locks or as a consistent read, as for `INSERT ... SELECT`. This reduces lock contention between sessions. ([Bug#37232](#))
- When an `InnoDB` tablespace filled up, an error was logged to the client, but not to the error log. Also, the error message was misleading and did not indicate the real source of the problem. ([Bug#31183](#))
- In `mysql`, using Control-C to kill the current query resulted in a `ERROR 1053 (08S01): Server shutdown in progress" message` if the query was waiting for a lock. ([Bug#28141](#))
- When a trigger inserts into a table containing an auto-increment column, an error `Error: Duplicate entry` could occur with the `InnoDB` Plugin if another insert was happening simultaneously. ([Bug#26316](#))

## C.1.13. Release Notes for MySQL Enterprise 5.1.40sp1 [QSP] (25 November 2009)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

Bugs fixed:

- **Replication:** When using statement-based or mixed-format replication, the database name was not written to the binary log

when executing a `LOAD DATA` statement. This caused problems when the table being loaded belonged to a database other than the current database; data could be loaded into the wrong table (if a table having the same name existed in the current database) or replication could fail (if no table having that name existed in the current database). Now a table referenced in a `LOAD DATA` statement is always logged using its fully qualified name when the database to which it belongs is not the current database. ([Bug#48297](#))

- **Replication:** When a session was closed on the master, temporary tables belonging to that session were logged with the wrong database names when either of the following conditions was true:

1. The length of the name of the database to which the temporary table belonged was greater than the length of the current database name.
2. The current database was not set.

([Bug#48216](#))

See also [Bug#46861](#), [Bug#48297](#).

- `SUM( )` artificially increased the precision of a `DECIMAL` argument, which was truncated when a temporary table was created to hold the results. ([Bug#48370](#))

See also [Bug#45261](#).

- If an outer query was invalid, a subquery might not even be set up. `EXPLAIN EXTENDED` did not expect this and caused a crash by trying to dereference improperly set up information. ([Bug#48295](#))
- A query containing a view using temporary tables and multiple tables in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash.

As a result of this bug fix, `PROCEDURE ANALYSE()` is legal only in a top-level `SELECT`. ([Bug#48293](#))

See also [Bug#46184](#).

- Error handling was missing for `SELECT` statements containing subqueries in the `WHERE` clause and that assigned a `SELECT` result to a user variable. The server could crash as a result. ([Bug#48291](#))
- An assertion could fail if the optimizer used a `SPATIAL` index. ([Bug#48258](#), [Bug#47019](#))
- A combination of `GROUP BY WITH ROLLUP, DISTINCT` and the `const` join type in a query caused a server crash when the optimizer chose to employ a temporary table to resolve `DISTINCT`. ([Bug#48131](#))
- In some cases, using a null microsecond part in a `WHERE` condition (for example, `WHERE date_time_field <= 'YYYY-MM-DD HH:MM:SS.0000'`) could lead to incorrect results due to improper `DATETIME` comparison. ([Bug#47963](#))
- When a query used a `DATE` or `DATETIME` value formatted using any separator characters other than hyphen (' - ') and a `>=` condition matching only the greatest value in an indexed column, the result was empty if an index range scan was employed. ([Bug#47925](#))
- During cleanup of a stored procedure's internal structures, the flag to ignore the errors for `INSERT IGNORE` or `UPDATE IGNORE` was not cleaned up, which could result in a server crash. ([Bug#47788](#))
- If the first argument to `GeomFromWKB()` function was a geometry value, the function just returned its value. However, it failed to preserve the argument's `null_value` flag, which caused an unexpected `NULL` value to be returned to the caller, resulting in a server crash. ([Bug#47780](#))
- `InnoDB` could crash when updating spatial values. ([Bug#47777](#))
- Incorrect handling of predicates involving `NULL` by the range optimizer could lead to an infinite loop during query execution. ([Bug#47123](#))
- `InnoDB` now ignores negative values supplied by a user for an `AUTO_INCREMENT` column when calculating the next value to store in the data dictionary. Setting `AUTO_INCREMENT` columns to negative values is undefined behavior and this change should bring the behavior of `InnoDB` closer to what users expect. ([Bug#46965](#))
- In a replication scenario with `innodb_locks_unsafe_for_binlog` enabled on the slave, where rows were changed only on the slave (not through replication), in some rare cases, many messages of the following form were written to the slave error log: `InnoDB: Error: unlock row could not find a 4 mode lock on the record.` ([Bug#41756](#))

## C.1.14. Changes in MySQL 5.1.40 (06 October 2009)

---

**InnoDB Notes:**

- In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86\_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on S/390, PowerPC, and generic ia64.

**Bugs fixed:**

- **Incompatible Change:** In binary installations of MySQL, the supplied `binary-configure` script would start and configure MySQL, even when command help was requested with the `--help` command-line option. The `--help`, if provided, will no longer start and install the server. ([Bug#30954](#))
- **Partitioning:** When reorganizing partitions, not all affected subpartitions were removed prior to renaming. One way in which the issue was visible was that attempting to reorganize two partitions into a single partition having the same name as one of the original partitions could lead to a crash of the server. ([Bug#47029](#))

See also [Bug#45961](#), [Bug#43729](#).

- **Partitioning:** An online or fast `ALTER TABLE` of a partitioned table could leave behind temporary files in the database directory.

This issue was observed in MySQL 5.1.31 and later only. ([Bug#46483](#))

- **Partitioning:** When performing an `INSERT ... SELECT` into a partitioned table, `read_buffer_size` bytes of memory were allocated for every partition in the target table, resulting in consumption of large amounts of memory when the table had many partitions (more than 100).

This fix changes the method used to estimate the buffer size required for each partition and limits the total buffer size to a maximum of approximately 10 times `read_buffer_size`. ([Bug#45840](#))

- **Partitioning:** Inserting negative values into an `AUTO_INCREMENT` column of a partitioned table could lead to apparently unrelated errors or a crash of the server. ([Bug#45823](#))
- **Partitioning:** Unnecessary calls were made in the server code for performing bulk inserts on partitions for which no inserts needed to be made. ([Bug#35845](#))

See also [Bug#35843](#).

- **Replication:** Performing `ALTER TABLE ... DISABLE KEYS` on a slave table caused row-based replication to fail. ([Bug#47312](#))
- **Replication:** `BEGIN` statements were not included in the output of `mysqlbinlog`. ([Bug#46998](#))
- **Replication:** When using row-based replication, `DROP TEMPORARY TABLE IF EXISTS` was written to the binary log if the table named in the statement did not exist, even though a `DROP TEMPORARY TABLE` statement should never be logged in row-based logging mode, whether the table exists or not. ([Bug#46572](#))
- **Replication:** When using row-based replication, importing a dump made with `mysqldump` and replicating a row with an `AUTO_INCREMENT` column set to 0, with `NO_AUTO_VALUE_ON_ZERO` active on the master, the row was inserted successfully on the master; however any setting for `NO_AUTO_VALUE_ON_ZERO` was ignored on the slave. When the `AUTO_INCREMENT` column was incremented, this caused replication to fail on the slave due to a duplicate key error. In some cases it could also cause the slave to crash. ([Bug#45999](#))
- **Replication:** Concurrent transactions that inserted rows into a table with an `AUTO_INCREMENT` column could break statement-based or mixed-format replication error 1062 `DUPLICATE ENTRY '...' FOR KEY 'PRIMARY'` on the slave. This was especially likely to happen when one of the transactions activated a trigger that inserted rows into the table with the `AUTO_INCREMENT` column, although other conditions could also cause the issue to manifest. ([Bug#45677](#))
- **Replication:** By default, all statements executed by the `mysql_upgrade` program on the master are written to the binary log, then replicated to the slave. In some cases, this can result in problems; for example, it attempted to alter log tables on replicated databases (this failed due to logging being enabled).

As part of this fix, a `mysql_upgrade` option, `--write-binlog`, is added. Its inverse, `--skip-write-binlog`, can be used to disable binary logging while the upgrade is in progress. ([Bug#43579](#))

- **Replication:** On the master, if a binary log event is larger than `max_allowed_packet`, the error message `ER_MASTER_FATAL_ERROR_READING_BINLOG` is sent to a slave when it requests a dump from the master, thus leading the I/O thread to stop. On a slave, the I/O thread stops when receiving a packet larger than `max_allowed_packet`.

In both cases, however, there was no `Last_IO_Error` reported, which made it difficult to determine why the slave had stopped in such cases. Now, `Last_IO_Error` is reported when `max_allowed_packet` is exceeded, and provides the reason for which the slave I/O thread stopped. ([Bug#42914](#))

See also [Bug#14068](#), [Bug#47200](#), [Bug#47303](#).

- **API:** The fix for [Bug#24507](#) could lead in some cases to client application failures due to a race condition. Now the server waits for the “dummy” thread to return before exiting, thus making sure that only one thread can initialize the POSIX threads library. ([Bug#42850](#))
- The `pthread_cond_wait()` implementations for Windows could deadlock in some rare circumstances. ([Bug#47768](#))
- On Mac OS X or Windows, sending a `SIGHUP` signal to the server or an asynchronous flush (triggered by `flush_time`) caused the server to crash. ([Bug#47525](#))
- Debug builds could not be compiled with the Sun Studio compiler. ([Bug#47474](#))
- A multiple-table `UPDATE` involving a natural join and a mergeable view raised an assertion. ([Bug#47150](#))
- Solaris binary packages now are compiled with `-g0` rather than `-g`. ([Bug#47137](#))
- `EXPLAIN` caused a server crash for certain valid queries. ([Bug#47106](#))
- The `configure` option `--without-server` did not work. ([Bug#46980](#))
- The `ARCHIVE` storage engine lost records during a bulk insert. ([Bug#46961](#))
- Failed multiple-table `DELETE` statements could raise an assertion. ([Bug#46958](#))
- When creating a new instance on Windows using `mysqld-nt` and the `--install` parameter, the value of the service would be set incorrectly, resulting in a failure to start the configured service. ([Bug#46917](#))
- `CONCAT_WS()` could return incorrect results due to an argument buffer also being used as a result buffer. ([Bug#46815](#))
- The server crashed when re-using outer column references in correlated subqueries when the enclosing query used a temp table. ([Bug#46791](#))
- For `InnoDB` tables, an unnecessary table rebuild for `ALTER TABLE` could sometimes occur for metadata-only changes. ([Bug#46760](#))
- Assertion failure could result from repeated execution of a stored procedure containing an incorrect query with a subselect. ([Bug#46629](#))
- The server ignored the setting of `sync_frm` for `CREATE TABLE ... LIKE`. ([Bug#46591](#))
- An attempt to create a table with the same name as an existing view could cause a server crash. ([Bug#46384](#))
- A parser problem prevented properly stripping backquotes from an argument to a user-defined function (UDF). If the UDF was in an `ORDER BY` clause, its name would not be properly resolved against an alias with the same name in the select list. ([Bug#46259](#))
- Dropping an `InnoDB` table that used an unknown collation (created on a different server, for example) caused a server crash. ([Bug#46256](#))
- Certain `SELECT` statements containing `DISTINCT`, `GROUP BY`, and `HAVING` clauses could hang in an infinite loop. ([Bug#46159](#))
- `InnoDB` did not disallow creation of an index with the name `GEN_CLUST_INDEX`, which is used internally. ([Bug#46000](#))
- `CREATE TEMPORARY TABLE` failed for `InnoDB` tables on systems with case-insensitive file systems when `lower_case_table_names = 2` and the pathname of the temporary file directory contained uppercase characters. ([Bug#45638](#))
- Appending values to an `ENUM` or `SET` definition is a metadata change for which `ALTER TABLE` need not rebuild the table, but it was being rebuilt anyway. ([Bug#45567](#))
- The `socket` system variable was unavailable on Windows. ([Bug#45498](#))
- When re-installing MySQL on Windows on a server that has a data directory from a previous MySQL installation, the installer would fail to identify the existence of the installation and the password configured for the `root` user. ([Bug#45200](#))

- Client flags were incorrectly initialized for the embedded server, causing several tests in the `jp` test suite to fail. ([Bug#45159](#))
- `InnoDB` did not always disallow creating tables containing columns with names that match the names of internal columns, such as `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR`, and `DB_MIX_ID`. ([Bug#44369](#))
- `SELECT ... WHERE ... IN (NULL, ...)` was executed using a full table scan, even if the same query without the `NULL` used an efficient range scan. ([Bug#44139](#))

See also [Bug#18360](#).

- `InnoDB` use of `SELECT MAX(autoinc_column)` could cause a crash when MySQL data dictionaries went out of sync. ([Bug#44030](#))
- `LOAD DATA INFILE` statements were written to the binary log in such a way that parsing problems could occur when re-executing the statement from the log. ([Bug#43746](#))
- Selecting from the process list in the embedded server caused a crash. ([Bug#43733](#))

See also [Bug#47304](#).

- Attempts to enable `large_pages` with a shared memory segment larger than 4GB caused a server crash. ([Bug#43606](#))
- A test for stack growth failed on some platforms, leading to server crashes. ([Bug#42213](#))
- The server used the wrong lock type (always `TL_READ` instead of `TL_READ_NO_INSERT` when appropriate) for tables used in subqueries of `UPDATE` statements. This led in some cases to replication failure because statements were written in the wrong order to the binary log. ([Bug#42108](#))
- The `mysql-stress-test.pl` test script was missing from the `noinstall` packages on Windows. ([Bug#41546](#))
- Privileges for `SHOW CREATE VIEW` were not being checked correctly. ([Bug#35996](#))
- Different invocations of `CHECKSUM TABLE` could return different results for a table containing columns with spatial data types. ([Bug#35570](#))
- Concurrent execution of `FLUSH TABLES` along with `SHOW FUNCTION STATUS` or `SHOW PROCEDURE STATUS` could cause a server crash. ([Bug#34895](#))
- `myisamchk` performed parameter value casting at startup that generated unnecessary warning messages. ([Bug#33785](#))
- When using the `ARCHIVE` storage engine, `SHOW TABLE STATUS` displayed incorrect information for `Max_data_length`, `Data_length` and `Avg_row_length`. ([Bug#29203](#))
- When building MySQL on Windows from source, the `WITH_BERKELEY_STORAGE_ENGINE` option would fail to configure `BDB` support correctly. ([Bug#27693](#))

## C.1.15. Changes in MySQL 5.1.39 (04 September 2009)

Bugs fixed:

- **Performance:** For `MyISAM` tables with `bulk_insert_buffer_size` values larger than 256KB, the performance of bulk insert operations such as multiple-row `INSERT` and `INSERT ... SELECT` operations has been improved greatly when up to a hundred rows are inserted at the same time. ([Bug#44723](#))
- **Partitioning:** An `INSERT ... SELECT` statement on an empty partition of a partitioned table failed with `ERROR 1030 (HY000): GOT ERROR 124 FROM STORAGE ENGINE`. This issue also caused queries run against a partitioned table while a `LOAD DATA CONCURRENT INFILE` statement was in progress to fail with the same error. ([Bug#46639](#))

See also [Bug#35845](#), [Bug#44657](#), [Bug#45840](#).

- **Partitioning:** A partitioned table having a `TIMESTAMP` column with a default value of `CURRENT_TIMESTAMP` and this column was not defined using an `ON UPDATE` option, an `ALTER TABLE ... REORGANIZE PARTITION` statement on the table caused the `TIMESTAMP` column value to be set to `CURRENT_TIMESTAMP` regardless. ([Bug#46478](#))
- **Partitioning:** Partition pruning did not always work correctly when the table's partitioning key used the `TO_DAYS()` function. ([Bug#46362](#))
- **Partitioning:** Attempting to access a partitioned table when partitioning support was disabled in a MySQL server binary that had been compiled with partitioning support caused the server to crash. ([Bug#39893](#))

- **Partitioning:** The use of `TO_DAYS()` in the partitioning expression led to selection failures when the column having the date value contained invalid dates. This occurred because the function returns `NULL` in such cases, and the partition containing `NULL` values was pruned away. For example, this problem occurred if '`2001-02-00`' was inserted into a `DATE` column of such a table, and a subsequent query on this table used `WHERE date_col < '2001-02-00'`—while '`2001-01-01`' is less than '`2001-02-00`', `TO_DAYS('2001-02-00')` evaluates as `NULL`, and so the row containing '`2001-01-01`' was not returned. Now, for tables using `RANGE` or `LIST` partitioning and having `TO_DAYS()` in the partitioning expression, the `NULL` partition is also scanned instead of being ignored.

The fix for this issue also corrects misbehavior such that a query of the form `SELECT * FROM table WHERE date_col < date_val` on a table partitioned by `RANGE` or `LIST` was handled as though the server SQL mode included `ALLOW_INVALID_DATES` even if this was not actually part of the server SQL mode at the time the query was issued. ([Bug#20577](#))

See also [Bug#18198](#), [Bug#32021](#), [Bug#46362](#).

- **Replication:** Performing a multi-row update of the `AUTO_INCREMENT` column of a transactional table could result in an inconsistency between master and slave when there was a trigger on the transactional table that updated a nontransactional table. When such an update failed on the master, no rows were updated on the master, but some rows could (erroneously) be updated on the slave. ([Bug#46864](#))
- **Replication:** When using the `--replicate-rewrite-db` option and the database referenced by this option on the master was the current database when the connection to the slave was closed, any temporary tables existing in this database were not properly dropped. ([Bug#46861](#))
- **Replication:** When a statement that changed both transactional and nontransactional tables failed, the transactional changes were automatically rolled back on the master but the slave ignored the error and did not roll them back, thus leading to inconsistencies between master and slave.

This issue is fixed by automatically rolling back a statement that fails on the slave; however, the transaction is not rolled back unless a corresponding `ROLLBACK` statement is found in the relay log file. ([Bug#46130](#))

See also [Bug#33864](#).

- **Replication:** When `slave_transaction_retries` is set, a statement that replicates, but is then rolled back due to a deadlock on the slave, should be retried. However, in certain cases, replication was stopped with error 1213 (`DEADLOCK FOUND WHEN TRYING TO GET LOCK; TRY RESTARTING TRANSACTION`) instead, even when this variable was set. ([Bug#45694](#))
- **Replication:** The binary logging behavior (and thus, the replication behavior) of `CREATE DATABASE IF NOT EXISTS`, `CREATE TABLE IF NOT EXISTS`, and `CREATE EVENT IF NOT EXISTS` was not consistent among these statements, nor with that of `DROP DATABASE IF EXISTS`, `DROP TABLE IF EXISTS`, and `DROP EVENT IF EXISTS`: A `DROP ... IF EXISTS` statement is always logged even if the database object named in the statement does not exist. However, of the `CREATE ... IF NOT EXISTS` statements, only the `CREATE EVENT IF NOT EXISTS` statement was logged when the database object named in the statement already existed.

Now, every `CREATE ... IF NOT EXISTS` statement is written to the binary log (and thus replicated), whether the database object named in the statement exists or not. For more information, see [Section 16.4.1.3, “Replication of CREATE ... IF NOT EXISTS Statements”](#).

**Exception.** Replication and logging of `CREATE TABLE IF NOT EXISTS ... SELECT` continues to be handled according to existing rules. See [Section 16.4.1.4, “Replication of CREATE TABLE ... SELECT Statements”](#), for more information.

([Bug#45574](#))

- **Replication:** When using statement-based replication, database-level character sets were not always honored by the replication SQL thread. This could cause data inserted on the master using `LOAD DATA` to be replicated using the wrong character set.

## Note

This was not an issue when using row-based replication.

([Bug#45516](#))

- **Replication:** In some cases, a `STOP SLAVE` statement could cause the replication slave to crash. This issue was specific to MySQL on Windows or Macintosh platforms. ([Bug#45238](#), [Bug#45242](#), [Bug#45243](#), [Bug#46013](#), [Bug#46014](#), [Bug#46030](#))

See also [Bug#40796](#).

- **Replication:** Creating a scheduled event whose `DEFINER` clause was either set to `CURRENT_USER` or not set explicitly caused the master and the slave to become inconsistent. This issue stems from the fact that, in both cases, the `DEFINER` is set to the `CURRENT_USER` of the current thread. (On the master, the `CURRENT_USER` is the `mysqld` user; on the slave, the

`CURRENT_USER` is empty.)

This behavior has been modified as follows:

- If `CURRENT_USER` is used as the `DEFINER`, it is replaced with the *value* of `CURRENT_USER` before the `CREATE EVENT` statement is written to the binary log.
- If the definer is not set explicitly, a `DEFINER` clause using the value of `CURRENT_USER` is added to the `CREATE EVENT` statement before it is written to the binary log.

([Bug#44331](#))

See also [Bug#42217](#).

- **Replication:** When using the statement-based logging format, the only possible safe combination of transactional and nontransactional statements within the same transaction is to perform any updates on nontransactional tables (such as `MyISAM` tables) first, before updating any transactional tables (such as those using the `InnoDB` storage engine). This is due to the fact that, although a modification made to a nontransactional table is immediately visible to other connections, the update is not immediately written to the binary log, which can lead to inconsistencies between master and slave. (Other combinations may hide a causal dependency, thus making it impossible to write statements updating nontransactional tables to the binary log in the correct order.)

However, in some cases, this situation was not handled properly, and the determination whether a given statement was safe or not under these conditions was not always correct. In particular, a multi-table update that affected both transactional and nontransactional tables or a statement modifying data in a nontransactional table having a trigger that operated on a transactional table (or the reverse) was not determined to be unsafe when it should have been.

With this fix, the following determinations regarding replication safety are made when combining updates to transactional and nontransactional tables within the same transaction in statement-based logging mode:

1. Any statement modifying data in a nontransactional table within a given transaction is considered safe if it is issued prior to any data modification statement accessing a transactional table within the same transaction.
2. A statement that updates transactional tables only is always considered safe.
3. A statement affecting both transactional and nontransactional tables within a transaction is always considered unsafe. It is not necessary that both tables be modified for this to be true; for example, a statement such as `INSERT INTO innodb_table SELECT * FROM myisam_table` is also considered unsafe.

## Note

The current fix is valid only when using statement-based logging mode; we plan to address similar issues occurring when using the `MIXED` or `ROW` format in a future MySQL release.

([Bug#28976](#))

- Stack overflow checking did not account for the size of the structure stored in the heap. ([Bug#46807](#))
- The server could crash for queries with the following elements: 1. An “impossible where” in the outermost `SELECT`; 2. An aggregate in the outermost `SELECT`; 3. A correlated subquery with a `WHERE` clause that includes an outer field reference as a top-level `WHERE` sargable predicate; ([Bug#46749](#))
- `CREATE TABLE ... SELECT` could cause assertion failure if a table already existed with the same name and contained an `AUTO_INCREMENT` column. ([Bug#46616](#))
- `SHOW CREATE TRIGGER` for a `MERGE` table trigger caused an assertion failure. ([Bug#46614](#))
- In queries for which the loose index scan access method was chosen, using a condition of the form `col_name` rather than the equivalent `col_name <> 0` caused an assertion failure. ([Bug#46607](#))
- `TRUNCATE TABLE` for a table that was opened with `HANDLER` did not close the handler and left it in an inconsistent state that could lead to a server crash. Now `TRUNCATE TABLE` for a table closes all open handlers for the table. ([Bug#46456](#))
- A query containing a subquery in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash. ([Bug#46184](#))

See also [Bug#48293](#).

- Killing a query that was performing a sort could result in a memory leak. ([Bug#45962](#))
- Truncation of `DECIMAL` values could lead to assertion failures; for example, when deducing the type of a table column from a literal `DECIMAL` value. ([Bug#45261](#))

See also [Bug#48370](#).

- A buffer overflow could occur during handling of `IS NULL` ranges. ([Bug#37044](#))
- `mysqladmin --wait ping` crashed on Windows systems. ([Bug#35132](#))
- Installation of MySQL on Windows would fail to set the correct location for the character set files, which could lead to `mysqld` and `mysql` failing to initialize properly. ([Bug#17270](#))

## C.1.16. Changes in MySQL 5.1.38 (01 September 2009)

InnoDB Notes:

- As of MySQL 5.1.38, the `InnoDB Plugin` is included in MySQL 5.1 releases, in addition to the built-in version of `InnoDB` that has been included in previous releases. The version of the `InnoDB Plugin` in this release is 1.0.4 and is considered of Beta quality.

The `InnoDB Plugin` offers new features, improved performance and scalability, enhanced reliability and new capabilities for flexibility and ease of use. Among the features of the `InnoDB Plugin` are “Fast index creation,” table and index compression, file format management, new `INFORMATION_SCHEMA` tables, capacity tuning, multiple background I/O threads, and group commit.

For information about these features, see [InnoDB Plugin 1.0 for MySQL 5.1 User’s Guide](#). For general information about using `InnoDB` in MySQL, see [Section 13.6, “The InnoDB Storage Engine”](#).

The `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86\_64, ia64), and generic Linux RPM packages.

For instructions on replacing the built-in version of `InnoDB` with `InnoDB Plugin`, see [Section 13.6.2.1, “Using InnoDB Plugin Instead of the Built-In InnoDB”](#).

Functionality added or changed:

- **Replication:** With statement-based logging (SBL), repeatedly calling statements that are unsafe for SBL caused a warning message to be written to the error log for each statement, and there was no way to disable this behavior. Now the server logs messages about statements that are unsafe for statement-based logging only if the `log_warnings` variable is greater than 0. ([Bug#46265](#))
- The undocumented `TRANSACTIONAL` and `PAGE_CHECKSUM` keywords were removed from the grammar. ([Bug#45829](#))
- Previously, `mysqldump` would not dump the `INFORMATION_SCHEMA` database and ignored it if it was named on the command line. Now, `mysqldump` will dump `INFORMATION_SCHEMA` if it is named on the command line. Currently, this requires that the `--skip-lock-tables` (or `--skip-opt`) option be given. ([Bug#33762](#))
- Previously, `SELECT ... INTO OUTFILE` dumped column values without character set conversion, which could produce data files that cannot be imported without error if different columns used different character sets. A consequence of this is that `mysqldump` ignored the `--default-character-set` option if the `--tab` option was given (which causes `SELECT ... INTO OUTFILE` to be used to dump data.)

`INTO OUTFILE` now can be followed by a `CHARACTER SET` clause indicating the character set to which dumped values should be converted. Also, `mysqldump` adds a `CHARACTER SET` clause to the `SELECT ... INTO OUTFILE` statement used to dump data, so that `--default-character-set` is no longer ignored if `--tab` is given.

Other changes are that `SELECT ... INTO OUTFILE` enforces that `ENCLOSED BY` and `ESCAPED BY` arguments must be a single character, and `SELECT ... INTO OUTFILE` and `LOAD DATA INFILE` produce warnings if non-ASCII field or line separators are specified. ([Bug#30946](#))

- Pluggable storage engines now can be built for Windows.
- The MySQL `euckr` character set now can store extended codes [81..FE][41..5A,61..7A,81..FE], which makes `euckr` compatible with the Microsoft `cp949` character set.

Bugs fixed:

- **Performance:** The table cache lock (`LOCK_open`) is now an adaptive mutex, which should improve performance in workloads where this lock is heavily contended. ([Bug#43435](#))
- **Partitioning:** Attempting to create a table using an invalid or inconsistent subpartition definition caused the server to crash. An example of such a statement is shown here:

```
CREATE TABLE t2 (s1 INT, s2 INT)
PARTITION BY LIST (s1) SUBPARTITION BY HASH (s2) SUBPARTITIONS 1
(
 PARTITION p1 VALUES IN (1),
 PARTITION p2 VALUES IN (2) (SUBPARTITION p3)
);
```

([Bug#46354](#))

- **Partitioning:** When using a debug build of MySQL, if a query against a partitioned table having an index on one or more `DOUBLE` columns used that index, the server failed with an assertion. ([Bug#45816](#))
- **Partitioning:** A failed `RENAME TABLE` operation on a table with user-defined partitioning left the table in an unusable state, due to only some of the table files having been renamed. ([Bug#30102](#))
- **Replication:** When a statement that changes a nontransactional table failed, the transactional cache was flushed, causing a mismatch between the execution and logging histories. Now we avoid flushing the transactional cache unless a `COMMIT` or `ROLLBACK` is issued. ([Bug#46129](#))
- **Replication:** The internal function `get_master_version_and_clock()` (defined in `sql/slave.cc`) ignored errors and passed directly when queries failed, or when queries succeeded but the result retrieved was empty. Now this function tries to reconnect the master if a query fails due to transient network problems, and to fail otherwise. The I/O thread now prints a warning if the same system variables do not exist on master (in the event the master is a very old version of MySQL, compared to the slave.) ([Bug#45214](#))
- **Replication:** When using the `MIXED` logging format, after creating a temporary table and performing an update that switched the logging format to `ROW`, the format switch persisted following the update. This prevented any subsequent DDL statements on temporary tables from being written to the binary log until the temporary table was dropped. ([Bug#43046](#))

See also [Bug#40013](#).

This regression was introduced by [Bug#20499](#).

- **Replication:** If the `--log-bin-trust-function-creators` option is not enabled, `CREATE FUNCTION` requires one of the modifiers `DETERMINISTIC`, `NO SQL`, or `READS SQL DATA`. When using statement-based mode, the execution of a stored function should follow the same rules; however, only functions defined with `DETERMINISTIC` could actually be executed. In addition, the wrong error was generated (`ER_BINLOG_ROW_RBR_TO_SBR` instead of `ER_BINLOG_UNSAFE_ROUTINE`).

Now execution of stored functions is compatible with creation in this regard; when a stored function without one of the modifiers above is executed in `STATEMENT` mode, the correct error is raised, and functions defined using `NO SQL`, `READS SQL DATA`, or both (that is, without using `DETERMINISTIC`) can be executed. ([Bug#41166](#))

- The test suite was missing from RPM packages. ([Bug#46834](#))
- Incorrect index optimization could lead to incorrect results or server crashes. ([Bug#46454](#))
- The server printed warnings at startup about adjusting the value of the `max_join_size` system variable. (These were harmless, but might be seen by users as significant.) ([Bug#46385](#))
- `mysql` did not handle backspace properly for multi-byte characters. This has been fixed now if `mysql` is linked with the `readline` library. It is not fixed if `mysql` is linked with `libedit`, which does not contain the necessary support for multi-byte character sets. ([Bug#46310](#))
- After an error such as a table-full condition, `INSERT IGNORE` could cause an assertion failure for debug builds. ([Bug#46075](#))
- An optimization that moved an item from a subquery to an outer query could cause a server crash. ([Bug#46051](#))
- Several Valgrind warnings were corrected. ([Bug#46003](#), [Bug#46034](#), [Bug#46042](#))
- `CREATE TABLE ... SELECT` could cause a server crash if no default database was selected. ([Bug#45998](#))
- The MySQL Server crashed when performing a `REPLACE` into a `MERGE` table if there was a duplicate. ([Bug#45800](#))
- An infinite hang and 100% CPU usage occurred after handler tried to open a merge table.

If the command `mysqladmin shutdown` was executed during the hang, the debug server generated the following assert:

```
mysqld: table.cc:407: void free_table_share(TABLE_SHARE*): Assertion `share->ref_count == 0' failed.
090610 14:54:04 - mysqld got signal 6 ;
```

([Bug#45781](#))

- For problems reading SSL files during SSL initialization, the server wrote error messages to `stderr` rather than to the error log. ([Bug#45770](#))
- The vendor name change from MySQL AB to Sun Microsystems, Inc. in RPM packages was not handled gracefully when upgrading MySQL using an RPM package. ([Bug#45534](#))
- A Windows Installation using the GUI installer would fail with:

```
MySQL Server 5.1 Setup Wizard ended prematurely
The wizard was interrupted before MySQL Server 5.1. could be completely installed.
Your system has not been modified. To complete installation at another time, please run
setup again.
Click Finish to exit the wizard
```

This was due to an step in the MSI installer that could fail to execute correctly on some environments. ([Bug#45418](#))

- Invalid memory reads could occur using the compressed client/server protocol. ([Bug#45031](#))
  - The `mysql_real_connect()` C API function only attempted to connect to the first IP address returned for a hostname. This could be a problem if a hostname mapped to multiple IP address and the server was not bound to the first one returned. Now `mysql_real_connect()` attempts to connect to all IPv4 or IPv6 addresses that a domain name maps to. ([Bug#45017](#))
- See also [Bug#47757](#).
- Invalid input could cause invalid memory reads by the parser. ([Bug#45010](#))
  - Some files in an AIX `tar` file distribution unpacked with incorrect permissions. ([Bug#44647](#))
  - For debug builds, executing a stored procedure as a prepared statement could sometimes cause an assertion failure. ([Bug#44521](#))
  - Using `mysql_stmt_execute()` to call a stored procedure could cause a server crash. ([Bug#44495](#))
  - Creating a new instance after previously removing an instance would fail to complete the installation properly because the security settings could not be applied correctly. ([Bug#44428](#))
  - `mysqlslap` ignored the `--csv` option if it was given without an argument. ([Bug#44412](#))
  - Enabling the event scheduler from within the file specified by `--init-file` caused a server crash. ([Bug#43587](#))
  - The server did not always check the return value of calls to the `hash_init()` function. ([Bug#43572](#))
  - `mysqladmin --count=X --sleep=Y` incorrectly delayed `Y` seconds after the last iteration before exiting. ([Bug#42639](#))
  - A test for stack growth failed on some platforms, leading to server crashes. ([Bug#42213](#))
  - `mysqladmin` did not have enough space allocated for tracking all variables when using `--vertical` or `--relative` with `extended-status`. ([Bug#40395](#))
  - Partitioning a log table caused a server crash. ([Bug#40281](#))
  - When using quick access methods to search for rows in `UPDATE` and `DELETE` statements, there was no check whether a fatal error had already been sent to the client while evaluating the quick condition. Consequently, a false OK (following the error) was sent to the client, causing the error to be incorrectly transformed into a warning. ([Bug#40113](#))
  - `SHOW PROCESSLIST` could access freed memory of a stored procedure run in a concurrent session. ([Bug#38816](#))
  - During installation on Windows, the MySQL Instance Configuration Wizard window could be opened at a size too small to be usable. ([Bug#38723](#))
  - `make_binary_distribution` did not always generate correct distribution names. ([Bug#37808](#))

- The server crashed when executing a prepared statement containing a duplicated `MATCH()` function call in the select list and `ORDER BY` clause; for example, `SELECT MATCH(a) AGAINST('test') FROM t1 ORDER BY MATCH(a) AGAINST('test')`. ([Bug#37740](#))
- The output of `mysqldump --tab` for views included a `DROP TABLE` statement without the `IF EXISTS` qualifier. ([Bug#37377](#))
- `mysql_upgrade` silently ignored the `--basedir` and `--datadir` options, which it accepts for backward compatibility. Now it prints a warning. ([Bug#36558](#))
- `mysqlimport` was not always compiled correctly to enable thread support, which is required for the `--use-threads` option. ([Bug#32991](#))
- `mysqlcheck` failed to fix table names when the `--fix-table-names` and `--all-in-1` options were both specified. ([Bug#31821](#))
- If the MySQL server was killed without the PID file being removed, attempts to stop the server with `mysql.server stop` waited 900 seconds before giving up. ([Bug#31785](#))
- When performing an installation on Windows using the GUI installer, the installer would fail to wait long enough during installation for the MySQL service to be installed, which would cause the installation to fail and may cause security settings, such as the `root` password to not be applied correctly. ([Bug#30525](#))
- `mysql` included extra spaces at the end of some result set lines. ([Bug#29622](#))
- The `mysql` client inconsistently handled NUL bytes in column data in various output formats. ([Bug#28203](#))
- `mysqlimport` did not correctly quote and escape table identifiers and file names. ([Bug#28071](#))
- When installing the Windows service, using quotation marks around command-line configuration parameters could cause the quotation marks to be incorrectly placed around the entire command-line option, and not just the value. ([Bug#27535](#))
- If the `mysql` client was built with the `readline` library and the `.inputrc` file mapped `Space` to the `magic-space` function, it became impossible to enter spaces. ([Bug#27439](#))
- If `InnoDB` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. ([Bug#18828](#))

See also [Bug#46672](#).

## C.1.17. Release Notes for MySQL Enterprise 5.1.37sp1 [QSP] (10 October 2009)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

Bugs fixed:

- The test suite was missing from RPM packages. ([Bug#46834](#))
- The server could crash for queries with the following elements: 1. An “impossible where” in the outermost `SELECT`; 2. An aggregate in the outermost `SELECT`; 3. A correlated subquery with a `WHERE` clause that includes an outer field reference as a top-level `WHERE` sargable predicate; ([Bug#46749](#))
- `SHOW CREATE TRIGGER` for a `MERGE` table trigger caused an assertion failure. ([Bug#46614](#))
- Incorrect index optimization could lead to incorrect results or server crashes. ([Bug#46454](#))
- A query containing a subquery in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash. ([Bug#46184](#))

See also [Bug#48293](#).

- `CREATE TABLE ... SELECT` could cause a server crash if no default database was selected. ([Bug#45998](#))
- A Windows Installation using the GUI installer would fail with:

```
MySQL Server 5.1 Setup Wizard ended prematurely
The wizard was interrupted before MySQL Server 5.1. could be completely installed.
Your system has not been modified. To complete installation at another time, please run
```

```
setup again.
Click Finish to exit the wizard
```

This was due to a step in the MSI installer that could fail to execute correctly on some environments. ([Bug#45418](#))

- For debug builds, executing a stored procedure as a prepared statement could sometimes cause an assertion failure. ([Bug#44521](#))
- Using `mysql_stmt_execute()` to call a stored procedure could cause a server crash. ([Bug#44495](#))

## C.1.18. Changes in MySQL 5.1.37 (13 July 2009)

Functionality added or changed:

- **Important Change: Replication:** `RESET MASTER` and `RESET SLAVE` now reset the values shown for `Last_IO_Error`, `Last_IO_Errno`, `Last_SQL_Error`, and `Last_SQL_Errno` in the output of `SHOW SLAVE STATUS`. ([Bug#44270](#))

See also [Bug#34654](#).

Bugs fixed:

- **Performance:** With `InnoDB` tables, MySQL used a less-selective secondary index to avoid a filesort even if a prefix of the primary key was much more selective.

The fix for this problem might cause other queries to run more slowly. ([Bug#45828](#))

- **Partitioning: Security Fix:** Accessing a table having user-defined partitioning when the server SQL mode included `ONLY_FULL_GROUP_BY` caused the MySQL server to crash. For example, the following sequence of statements crashed the server:

```
DROP TABLE IF EXISTS t1;
SET SESSION SQL_MODE='ONLY_FULL_GROUP_BY';
CREATE TABLE t1 (id INT, KEY(id))
PARTITION BY HASH(id) PARTITIONS 2;
```

([Bug#45807](#))

- **Security Fix:** The `strxnmov()` library function could write a null byte after the end of the destination buffer. ([Bug#44834](#))
- **Important Change: Replication:** When using `STATEMENT` or `MIXED` binary logging format, a statement that changes both nontransactional and transactional tables must be written to the binary log whenever there are changes to nontransactional tables. This means that the statement goes into the binary log even when the changes to the transactional tables fail. In particular, in the event of a failure such statement is annotated with the error number and wrapped inside a pair of `BEGIN` and `ROLLBACK` statements.

On the slave, while applying the statement, it is expected that the same failure and the rollback prevent the transactional changes from persisting. However, statements that fail due to concurrency issues such as deadlocks and timeouts are logged in the same way, causing the slave to stop since the statements are applied sequentially by the SQL thread.

To address this issue, we ignore concurrency failures on the slave. Specifically, the following failures are now ignored: `ER_LOCK_WAIT_TIMEOUT`, `ER_LOCK_DEADLOCK`, and `ER_XA_RBDEADLOCK`. ([Bug#44581](#))

- **Partitioning:** Truncating a partitioned `MyISAM` table did not reset the `AUTO_INCREMENT` value. ([Bug#35111](#))
- **Replication:** The `SHOW SLAVE STATUS` connection thread competed with the slave SQL thread for use of the error message buffer. As a result, the connection thread sometimes received incomplete messages. This issue was uncovered with `valgrind` when message strings were passed without `NULL` terminators, causing the error `CONDITIONAL JUMP OR MOVE DEPENDS ON UNINITIALISED VALUE(s)`. ([Bug#45511](#))

See also [Bug#43076](#).

- **Replication:** For replication of a stored procedure that uses the `gbk` character set, the result on the master and slave differed. ([Bug#45485](#))

- **Replication:** The internal function `purge_relay_logs()` did not propagate an error occurring in another internal function `count_relay_log_space()`. ([Bug#44115](#))
- **Replication:** Large transactions and statements could corrupt the binary log if the size of the cache (as set by `max_binlog_cache_size`) was not large enough to store the changes.

Now, for transactions that do not fit into the cache, the statement is not logged, and the statement generates an error instead.

For nontransactional changes that do not fit into the cache, the statement is also not logged—an incident event is logged after committing or rolling back any pending transaction, and the statement then raises an error.

### Note

If a failure occurs before the incident event is written the binary log, the slave does not stop, and the master does not report any errors.

([Bug#43929](#))

See also [Bug#37148](#).

- **Replication:** The `--database` option for `mysqlbinlog` was ignored when using the row-based logging format. ([Bug#42941](#))
- **Replication:** Statements using `LIMIT` generated spurious `STATEMENT IS NOT SAFE TO LOG IN STATEMENT FORMAT` warnings in the error log, causing the log to grow rapidly in size. ([Bug#42851](#))

See also [Bug#46265](#), [Bug#42415](#).

This regression was introduced by [Bug#34768](#).

- **Replication:** Shutting down the slave while executing `FLUSH LOGS`, `CHANGE MASTER TO`, or `STOP SLAVE` could sometimes cause it to crash. ([Bug#38240](#))
- **Replication:** When reading a binary log that was in use by a master or that had not been properly closed (possibly due to a crash), the following message was printed: `WARNING: THIS BINLOG WAS NOT CLOSED PROPERLY. MOST PROBABLY MYSQLD CRASHED WRITING IT.` This message did not take into account the possibility that the file was merely in use by the master, which caused some users concern who were not aware that this could happen.

To make this clear, the original message has been replaced with `WARNING: THIS BINLOG IS EITHER IN USE OR WAS NOT CLOSED PROPERLY.` ([Bug#34687](#))

- The server crashed if evaluation of `GROUP_CONCAT( ... ORDER BY)` required allocation of a sort buffer but allocation failed. ([Bug#46080](#))
- When creating tables using the `IBMDB2I` storage engine with the `ibmdb2i_create_index_option` option set to 1, creating an `IBMDB2I` table with a primary key should produce an additional index that uses EBCDIC hexadecimal sorting, but this index was not created. ([Bug#45983](#))
- The server crashed for attempts to use `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` with a view defined using a join. ([Bug#45806](#))
- Some collations were causing `IBMDB2I` to report inaccurate key range estimations to the optimizer for `LIKE` clauses that select substrings. This can be seen by running `EXPLAIN`. This problem primarily affects multi-byte and unicode character sets. ([Bug#45803](#))
- Invalid memory reads and writes were generated when altering merge and base tables. This could lead to a crash or Valgrind errors:

```
==28038== Invalid write of size 1
at: memset (mc_replace_strmem.c:479)
by: myrg_attach_children (myrg_open.c:433)
by: ha_myisammrg::attach_children() (ha_myisammrg.cc:546)
by: ha_myisammrg::extra(ha_extra_function) (ha_myisammrg.cc:944)
by: attach_merge_children(TABLE_LIST*) (sql_base.cc:4147)
by: open_tables(THD*, TABLE_LIST**, unsigned*, unsigned) (sql_base.cc:4709)
by: open_and_lock_tables_derived(THD*, TABLE_LIST*, bool) (sql_base.cc:4977)
by: open_n_lock_single_table (mysql_priv.h:1550)
by: mysql_alter_table(sql_table.cc:6428)
by: mysql_execute_command(THD*) (sql_parse.cc:2860)
by: mysql_parse(THD*, char const*, unsigned, char const**) (sql_parse.cc:5933)
by: dispatch_command (sql_parse.cc:1213)
```

([Bug#45796](#))

- Inserting data into a table using the `macce` character set with the `IBMDB2I` storage engine would fail. ([Bug#45793](#))
- There was a race condition when changing `innodb_commit_concurrency` at runtime to the value `DEFAULT`. ([Bug#45749](#))

See also [Bug#42101](#).

- Performing an empty XA transaction caused the server to crash for the next XA transaction. ([Bug#45548](#))
- `SHOW CREATE TRIGGER` requires the `TRIGGER` privilege but was not checking privileges. ([Bug#45412](#))
- An assertion failure could occur if `InnoDB` tried to unlock a record when the clustered index record was unknown. ([Bug#45357](#))
- `--enable-plugin_name` options (for example, `--enable-innodb`) did not work correctly. ([Bug#45336](#))

See also [Bug#19027](#).

- If `autocommit` was enabled, `InnoDB` did not roll back `DELETE` or `UPDATE` statements if the statement was killed. ([Bug#45309](#))
- The optimizer mishandled “impossible range” conditions and returned empty results due to an uninitialized variable. ([Bug#45266](#))
- Use of `DECIMAL` constants with more than 65 digits in `CREATE TABLE ... SELECT` statements led to spurious errors or assertion failures. ([Bug#45262](#))
- The `mysql` client could misinterpret some character sequences as commands under some circumstances. ([Bug#45236](#))
- Use of `CONVERT( )` with an empty `SET` value could cause an assertion failure. ([Bug#45168](#))
- `InnoDB` recovery could hang due to redo logging of doublewrite buffer pages. ([Bug#45097](#))
- When reading binary data, the concatenation function for geometry data collections did not rigorously check for available data, leading to invalid reads and server crashes. ([Bug#44684](#))
- If an error occurred during the creation of a table (for example, the table already existed) having an `AUTO_INCREMENT` column and a `BEFORE` trigger that used the `INSERT ... SELECT` construct, an internal flag was not reset properly. This led to a crash the next time the table was opened again. ([Bug#44653](#))
- `configure.in` contained references to literal instances of `nm` and `libc`, rather than to variables parameterized for the proper values on the current platform. ([Bug#42721](#))
- `configure.in` did not properly check for the `pthread_setschedprio()` function. ([Bug#42599](#))
- `SHOW ERRORS` returned an empty result set after an attempt to drop a nonexistent table. ([Bug#42364](#))
- A workaround for a Sun Studio bug was instituted. ([Bug#41710](#))
- For queries with a sufficient number of subqueries in the `FROM` clause of this form:

```
SELECT * FROM (SELECT 1) AS t1,
 (SELECT 2) AS t2,
 (SELECT 3) AS t3, ...
```

The query failed with a `Too high level of nesting for select` error, as though the query had this form:

```
SELECT * FROM (SELECT 1 FROM (SELECT 2 FROM (SELECT 3 FROM ...
```

([Bug#41156](#))

- Some `UPDATE` statements that affected no rows returned a rows-affected count of one. ([Bug#40565](#))
- Valgrind warnings that occurred for `SHOW TABLE STATUS` with `InnoDB` tables were silenced. ([Bug#38479](#))
- In the `mysql` client, if the server connection was lost during repeated `status` commands, the client would fail to detect this and command output would be inconsistent. ([Bug#37274](#))
- A Valgrind error during subquery execution was corrected. ([Bug#36995](#))
- When invoked to start multiple server instances, `mysqld_multi` sometimes would fail to start them all due to not changing

location into the base directory for each instance. ([Bug#36654](#))

- Rows written to the slow query log could have an indeterminate `Rows_examined` value due to improper initialization. ([Bug#34002](#))
- Renaming a column that appeared in a foreign key definition did not update the foreign key definition with the new column name. ([Bug#21704](#))

## C.1.19. Changes in MySQL 5.1.36 (16 June 2009)

Functionality added or changed:

- **Important Change: Replication:** Previously, incident log events were represented as comments in the output from `mysql-binlog`, making them effectively silent when playing back the binlog.

(An incident log event represents an incident that could cause the contents of the database to change without that event being recorded in the binary log.)

This meant that, if the SQL were applied to a server, it could potentially lead to the master and the slave having different data. To make it possible to handle incident log events without breaking applications that expect the previous behavior, the nonsense statement `RELOAD DATABASE` is added to the SQL output for that incident log event, which causes an error.

To use this functionality currently requires hand editing of the dump file and handling of each case on an individual basis by a database administrator before applying the output to a server. ([Bug#44442](#))

- `mysql_upgrade` now displays a message indicating the connection parameters it uses when invoking `mysqlcheck`. ([Bug#44638](#))
- The time zone tables for Windows available at <http://dev.mysql.com/downloads/timezones.html> have been updated. ([Bug#39923](#))
- The `mysqltest` program now has a `move_file from_file to_file` command for renaming files. This should be used in test cases rather than invoking an external command that might be platform specific. ([Bug#39542](#))
- The maximum value for `max_binlog_cache_size` has been increased from  $2^{32} - 1$  to  $2^{64} - 1$  (even on 32-bit platforms), which enables transactions 4GB and larger to be performed when binary logging is enabled. ([Bug#10206](#))

Bugs fixed:

- **Performance:** The `InnoDB` adaptive hash latch is released (if held) for several potentially long-running operations. This improves throughput for other queries if the current query is removing a temporary table, changing a temporary table from memory to disk, using `CREATE TABLE ... SELECT`, or performing a `MyISAM` repair on a table used within a transaction. ([Bug#32149](#))
- **Security Fix:** The server crashed if an account with the `CREATE ROUTINE` privilege but not the `EXECUTE` privilege attempted to create a stored procedure. ([Bug#44798](#))
- **Security Fix:** The server crashed if an account without the proper privileges attempted to create a stored procedure. ([Bug#44658](#))
- **Security Fix:** Four potential format string vulnerabilities were fixed (discovered by the Veracode code analysis). ([Bug#44166](#))
- **Incompatible Change:** The server can load plugins under the control of startup options. For example, many storage engines can be built in pluggable form and loaded when the server starts. In the following descriptions, `plugin_name` stands for a plugin name such as `innodb`.

Previously, plugin options were handled like other boolean options (see [Section 4.2.3.2, “Program Option Modifiers”](#)). That is, any of these options enabled the plugin:

```
--plugin_name
--plugin_name=1
--enable-plugin_name
```

And these options disabled the plugin:

```
--plugin_name=0
--disable-plugin_name
--skip-plugin_name
```

However, use of a boolean option for plugin loading did not provide control over what to do if the plugin failed to start properly: Should the server exit, or start with the plugin disabled? The actual behavior has been that the server starts with the plugin disabled, which can be problematic. For example, if `InnoDB` fails to start, existing `InnoDB` tables become inaccessible, and attempts to create new `InnoDB` tables result in tables that use the default storage engine unless the `NO_ENGINE_SUBSTITUTION` SQL mode has been enabled to cause an error to occur instead.

Now, there is a change in the options used to control plugin loading, such that they have a tristate format:

- `--plugin_name=OFF`

Do not enable the plugin.

- `--plugin_name [=ON]`

Enable the plugin. If plugin initialization fails, start the server anyway, but with the plugin disabled. Specifying the option as `--plugin_name` without a value also enables the plugin.

- `--plugin_name=FORCE`

Enable the plugin. If plugin initialization fails, do not start the server. In other words, force the server to run with the plugin or not at all.

The values `OFF`, `ON`, and `FORCE` are not case sensitive.

Suppose that `CSV` and `InnoDB` have been built as pluggable storage engines and that you want the server to load them at startup, subject to these conditions: The server is permitted to run if `CSV` initialization fails, but must require that `InnoDB` initialization succeed. To accomplish that, use these lines in an option file:

```
[mysqld]
csv=ON
innodb=FORCE
```

This change is incompatible with the previous implementation if you used options of the form `--plugin_name=0` or `--plugin_name=1`, which should be changed to `--plugin_name=OFF` or `--plugin_name=ON`, respectively.

`--enable-plugin_name` is still supported and is the same as `--plugin_name=ON`. `--disable-plugin_name` and `--skip-plugin_name` are still supported and are the same as `--plugin_name=OFF`. ([Bug#19027](#))

See also [Bug#45336](#).

- **Important Change: Replication:** `BEGIN`, `COMMIT`, and `ROLLBACK` statements are no longer affected by `--replicate-do-db` or `--replicate-ignore-db` rules. ([Bug#43263](#))
- **Partitioning:** Queries using `DISTINCT` on multiple columns or `GROUP BY` on multiple columns did not return correct results with partitioned tables. ([Bug#44821](#))

See also [Bug#41136](#).

- **Replication:** When using row-based logging, the length of an event for which the field metadata exceeded 255 bytes in size was incorrectly calculated. This could lead to corruption of the binary log, or cause the server to hang. ([Bug#42749](#))

See also [Bug#44548](#), [Bug#44672](#), [Bug#44752](#).

- **Replication:** The warning `STATEMENT IS NOT SAFE TO LOG IN STATEMENT FORMAT`, issued in situations when it cannot be determined that a statement or other database event can be written reliably to the binary log using the statement-based format, has been changed to `STATEMENT MAY NOT BE SAFE TO LOG IN STATEMENT FORMAT`. ([Bug#42415](#))

- **Replication:** The `Query_log_event` used by replication to transfer a query to the slave has been refactored. `Query_log_event` also stores and sends the error code resulting from the execution since it, in some cases, is necessary to execute the statement on the slave as well, which should result in the same error code. The `Query_log_event` constructor previously worked out for itself the error code using a complex routine, the result of which was often set aside within the constructor itself. This was also involved with at least 2 known bugs relating to invalid errors, and taken as a clear sign that the constructor was not well-designed and needed to be re-written. ([Bug#41948](#))

See also [Bug#37145](#).

- **Replication:** When stopping and restarting the slave while it was replicating temporary tables, the slave server could crash or raise an assertion failure. This was due to the fact that, although temporary tables were saved between slave thread restarts, the reference to the thread being used (`table->in_use`) was not being properly updated when restarting, continuing to refer-

ence the old thread instead of the new one. This issue affected statement-based replication only. ([Bug#41725](#))

- A separator was added between the time tag and the thread ID in the general query log file. ([Bug#45387](#))
- The combination of `MIN()` or `MAX()` in the select list with `WHERE` and `GROUP BY` clauses could lead to incorrect results. ([Bug#45386](#))
- Linker failures with `libmysqld` on VC++ 2008 were fixed. ([Bug#45326](#))
- Compiler warnings on Mac OS X were fixed. ([Bug#45286](#))
- Running a `SELECT` query over an `IBMDB2I` table using the `cp1250` character set would produce an error

```
ibmdb2i error 2027: Error converting single-byte sort sequence to UCS-2
```

([Bug#45197](#))

- Use of `ROUND()` on a `LONGTEXT` or `LONGBLOB` column of a derived table could cause a server crash. ([Bug#45152](#))
- `DROP USER` could fail to drop all privileges for an account if the `PAD_CHAR_TO_FULL_LENGTH` SQL mode was enabled. ([Bug#45100](#))
- `GROUP BY` on a `constant` (single-row) `InnoDB` table joined to other tables caused a server crash. ([Bug#44886](#))
- `ALTER TABLE` on a view crashed the server. ([Bug#44860](#))
- When using partitioning with the `IBMDB2I` storage engine, the engine could report that a valid character set was not supported. ([Bug#44856](#))
- Running queries on tables with the `IBMDB2I` storage engine using the `utf8` character would fail when using the 64-bit version of MySQL. ([Bug#44811](#))
- Index Merge followed by a filesort could result in a server crash if `sort_buffer_size` was not large enough for all sort keys. ([Bug#44810](#))

See also [Bug#40974](#).

- `UNCOMPRESSED_LENGTH()` returned a garbage result when passed a string shorter than 5 bytes. Now `UNCOMPRESSED_LENGTH()` returns `NULL` and generates a warning. ([Bug#44796](#))
- Several Valgrind warnings were silenced. ([Bug#44774](#), [Bug#44792](#))
- Selecting `RAND(N)` function where `N` is a column of a `constant` table (table with a single row) failed with a `SIGFPE` signal. ([Bug#44768](#))
- The `PASSWORD()` and `OLD_PASSWORD()` functions could read memory outside of an internal buffer when used with `BLOB` arguments. ([Bug#44767](#))
- Conversion of a string to a different character set could use the same buffer for input and output, leading to incorrect results or warnings. ([Bug#44743](#), [Bug#44766](#))
- `mysqld_safe` could fail to find the `logger` program. ([Bug#44736](#))
- Code that optimized a read-only XA transaction failed to reset the XID once the transaction was no longer active. ([Bug#44672](#))
- A Valgrind warning related to transaction processing was silenced. ([Bug#44664](#))
- Some Perl scripts in AIX packages contained an incorrect path to the `perl` executable. ([Bug#44643](#))
- When creating tables using the `IBMDB2I` storage engine, the `RCDFMT` (record format) that would be applied to the corresponding files within the IBM i would be set according to the table name. During whole table operations, the name could get modified to a value inconsistent with the table name. In addition, the record format would be inconsistent compared to the file content. The `IBMDB2I` storage engine now adds an explicit `RCDFMT` clause to the `CREATE TABLE` statement passed down to the DB2 storage engine layer. ([Bug#44610](#))
- `innochecksum` could incorrectly determine the input file name from the arguments. ([Bug#44484](#))
- Incorrect time was reported at the end of `mysqldump` output. ([Bug#44424](#))
- Caching of `GROUP BY` expressions could lead to mismatches between compile-time and runtime calculations and cause a server crash. ([Bug#44399](#))

- Lettercase conversion in multibyte `cp932` or `sjis` character sequences could produce incorrect results. ([Bug#44352](#))
- `InnoDB` was missing `DB_ROLL_PTR` information in Table Monitor `COLUMNS` output. ([Bug#44320](#))
- Assertion failure could occur for duplicate-key errors in `INSERT INTO ... SELECT` statements. ([Bug#44306](#))
- Trying to use an unsupported character set on an `IBMDB2I` table would produce DB2 error 2501 or 2511. The error has been updated to produce Error 2504 (Character set is unsupported). ([Bug#44232](#))
- On 64-bit Windows systems, `myisamchk` did not handle `key_buffer_size` values larger than 4GB. ([Bug#43940](#))
- For user-defined `utf8` collations, attempts to store values too long for a column could cause a server crash. ([Bug#43827](#))
- Invalidation of query cache entries due to table modifications could cause threads to hang inside the query cache with state “freeing items”. ([Bug#43758](#))
- `EXPLAIN EXTENDED` could crash for `UNION` queries in which the last `SELECT` was not parenthesized and included an `ORDER BY` clause. ([Bug#43612](#))
- Multiple-table updates for `InnoDB` tables could produce unexpected results. ([Bug#43580](#))
- If the client lost the connection to the MySQL server after `mysql_stmt_prepare()`, the first call to `mysql_stmt_execute()` returned an error (as expected) but consecutive calls to `mysql_stmt_execute()` or `mysql_stmt_close()` crashed the client. ([Bug#43560](#))
- For `DELETE` statements with `ORDER BY var`, where `var` was a global system variable with a `NULL` value, the server could crash. ([Bug#42778](#))
- Builds linked against OpenSSL had a memory leak in association with use of X509 certificates. ([Bug#42158](#))
- There was a race condition when changing `innodb_commit_concurrency` at runtime from zero to nonzero or from nonzero to zero. Now this variable cannot be changed at runtime from zero to nonzero or vice versa. The value can still be changed from one nonzero value to another. ([Bug#42101](#))

See also [Bug#45749](#).

- `SELECT ... INTO @var` could produce values different from `SELECT ...` without the `INTO` clause. ([Bug#42009](#))
- `mysql_zap` did not work on Mac OS X. ([Bug#41883](#))
- A crash occurred due to a race condition between the merge table and `table_cache` evictions.

([Bug#41212](#))

- Shared-memory connections did not work in Vista if `mysqld` was started from the command line. ([Bug#41190](#))
- For views created with a column list clause, column aliases were not substituted when selecting through the view using a `HAVING` clause. ([Bug#40825](#))
- A multiple-table `DELETE` involving a table self-join could cause a server crash. ([Bug#39918](#))
- Creating an `InnoDB` table with a comment containing a ‘#’ character caused foreign key constraints to be omitted. ([Bug#39793](#))
- `ALTER TABLE` neglected to preserve `ROW_FORMAT` information from the original table, which could cause subsequent `ALTER TABLE` and `OPTIMIZE TABLE` statements to lose the row format for `InnoDB` tables. ([Bug#39200](#))

- The `mysql` option `--ignore-spaces` was nonfunctional. ([Bug#39101](#))
- If a query was such as to produce the error `1054 Unknown column '....' in 'field list'`, using `EXPLAIN EXTENDED` with the query could cause a server crash. ([Bug#37362](#))
- In the `mysql` client, using a default character set of `binary` caused internal commands such as `DELIMITER` to become case sensitive. ([Bug#37268](#))
- `mysqldump --tab` dumped triggers to `stdout` rather than to the `.sql` file for the corresponding table. ([Bug#34861](#))
- If the `MYSQL_HISTFILE` environment variable was set to `/dev/null`, the `mysql` client overwrote the `/dev/null` device file as a normal file. ([Bug#34224](#))
- `mysqld_safe` mishandled certain parameters if they contained spaces. ([Bug#33685](#))
- `mysqladmin kill` did not work for thread IDs larger than 32 bits. ([Bug#32457](#))
- Several client programs failed to interpret `--skip-password` as “send no password.” ([Bug#28479](#))
- Output from `mysql --html` did not encode the `<`, `>`, or `&` characters. ([Bug#27884](#))
- `mysql_convert_table_format` did not prevent conversion of tables to `MEMORY` or `BLACKHOLE` tables, which could result in data loss. ([Bug#27149](#))

## C.1.20. Changes in MySQL 5.1.35 (13 May 2009)

Windows Notes:

- This release of MySQL has two known outstanding issues for Windows:
  - The `.msi` installer does not detect an existing `root` password on the initial configuration attempt. To work around this, install and configure MySQL as normal, but skip any changes to security. (There is a checkbox that enables this on the security screen of the configuration wizard.) Then check your settings:
    - If the old `root` password and security settings are okay, you are done and can proceed to use MySQL.
    - Otherwise, reconfigure with the wizard and make any changes on the second configuration attempt. The wizard will properly prompt for the existing `root` password and permit changes to be made.

This issue has been filed as [Bug#45200](#) for correction in a future release.

- The Windows configuration wizard permits changes to `InnoDB` settings during a reconfiguration operation. For an upgrade, this may cause difficulties. To work around this, use one of the following alternatives:
  - Do not change `InnoDB` settings.
  - Copy files from the old `InnoDB` location to the new one.

This issue has been filed as [Bug#45201](#) for correction in a future release.

Bugs fixed:

- **Performance:** `InnoDB` uses random numbers to generate dives into indexes for calculating index cardinality. However, under certain conditions, the algorithm did not generate random numbers, so `ANALYZE TABLE` did not update cardinality estimates properly. A new algorithm has been introduced with better randomization properties, together with a system variable, `innodb_use_legacy_cardinality_algorithm`, that controls which algorithm to use. The default value of the variable is 1 (`ON`), to use the original algorithm for compatibility with existing applications. The variable can be set to 0 (`OFF`) to use the new algorithm with improved randomness. ([Bug#43660](#))
- **Performance:** If the character set for a column being compared was neither the default server character set nor `latin1`, `InnoDB` was slower than necessary due to excessive contention for a character set mutex.

As a workaround for earlier versions, set the default server character set to the character set other than `latin1` that is most often used in indexed columns. ([Bug#42649](#))

- **Important Change: Replication:** The transactional behavior of `STOP SLAVE` has changed. Formerly, it took effect immediately, even inside a transaction; now, it waits until the current replication event group (if any) has finished executing, or until

the user issues a `KILL QUERY` or `KILL CONNECTION` statement.

This was done to solve the problem encountered when replication was stopped while a nontransactional slave was replicating a transaction on the master. (It was impossible to roll back a mixed-engines transaction when one of the engines was nontransactional, which meant that the slave could not safely re-apply any transaction that had been interrupted by `STOP SLAVE`.) ([Bug#319](#), [Bug#38205](#))

See also [Bug#43217](#).

- **Partitioning:** When a value was equal to a `PARTITION ... VALUES LESS THAN (value)` value other than `MAX-VALUE`, the corresponding partition was not pruned. ([Bug#42944](#))
- **Replication:** Unrelated errors occurring during the execution of `RESET SLAVE` could cause the slave to crash. ([Bug#44179](#))
- **Replication:** The `--slave-skip-errors` option had no effect when using row-based logging format. ([Bug#39393](#))
- **Replication:** The following errors were not correctly reported:
  - Failures during slave thread initialization
  - Failures while initializing the relay log position (immediately following the starting of the slave thread)
  - Failures while processing queries passed through the `--init_slave` option.

Information about these types of failures can now be found in the output of `SHOW SLAVE STATUS`. ([Bug#38197](#))

- **Replication:** Killing the thread executing a DDL statement, after it had finished its execution but before it had written the binlog event, caused the error code in the binlog event to be set (incorrectly) to `ER_SERVER_SHUTDOWN` or `ER_QUERY_INTERRUPTED`, which caused replication to fail. ([Bug#37145](#))

See also [Bug#27571](#), [Bug#22725](#).

- **Replication:** Column aliases used inside subqueries were ignored in the binary log. ([Bug#35515](#))
- Valgrind warnings for the `DECODE()`, `ENCRYPT()`, and `FIND_IN_SET()` functions were corrected. ([Bug#44358](#), [Bug#44365](#), [Bug#44367](#))
- On Windows, entries for `build-vs9.bat` and `build-vs9_x64.bat` were missing in `win/Makefile.am`. ([Bug#44353](#))
- Incomplete cleanup of `JOIN_TAB::select` during the filesort of rows for a `GROUP BY` clause inside a subquery caused a server crash. ([Bug#44290](#))
- Not all lock types had proper descriptive strings, resulting in garbage output from `mysqladmin debug`. ([Bug#44164](#))
- Use of `HANDLER` statements with `INFORMATION_SCHEMA` tables caused a server crash. Now `HANDLER` is prohibited with such tables. ([Bug#44151](#))
- MySQL Server permitted the creation of a merge table based on views but crashed when attempts were made to read from that table. The following example demonstrates this:

```
#Create a test table
CREATE TABLE tmp (id int, c char(2));

#Create two VIEWS upon it
CREATE VIEW v1 AS SELECT * FROM tmp;
CREATE VIEW v2 AS SELECT * FROM tmp;

#Finally create a MERGE table upon the VIEWS
CREATE TABLE merge (id int, c char(2))
ENGINE=MERGE UNION(v1, v2);

#Reading from the merge table lead to a crash
SELECT * FROM merge;
```

The final line of the code generated the crash. ([Bug#44040](#))

- Some schema names longer than 8 characters were not supported by `IBMDB2I`. The engine has been updated to permit digits and underscore characters to be used in names longer than 8 characters. ([Bug#44025](#))
- In some circumstances, when a table is created with the `IBMDB2I` engine, the `CREATE TABLE` statement will return successfully but the table will not exist. ([Bug#44022](#))
- The `ucs2_swedish_ci` and `utf8_swedish_ci` collations did not work with indexes using the `IBMDB2I` storage engine.

Support is now provided for MySQL when running on IBM i 6.1 or higher. ([Bug#44020](#))

- Invoking `SHOW TABLE STATUS` from within a stored procedure could cause a `Packets out of order` error. ([Bug#43962](#))
- `myisamchk` could display a negative `Max keyfile length` value. ([Bug#43950](#))
- On 64-bit systems, a `key_buffer_size` value larger than 4GB could cause `MyISAM` index corruption. ([Bug#43932](#))
- `mysqld_multi` incorrectly passed `--no-defaults` to `mysqld_safe`. ([Bug#43876](#))
- `SHOW VARIABLES` did not properly display the value of `slave_skip_errors`. ([Bug#43835](#))
- On Windows, a server crash occurred for attempts to insert a floating-point value into a `CHAR` column with a maximum length less than the converted floating-point value length. ([Bug#43833](#))
- Incorrect initialization of `MyISAM` table indexes could cause incorrect query results. ([Bug#43737](#))
- `libmysqld` crashed when it was reinitialized. ([Bug#43706](#), [Bug#44091](#))
- `UNION` of floating-point numbers did unnecessary rounding. ([Bug#43432](#))
- `ALTER DATABASE ... UPGRADE DATA DIRECTORY NAME` failed when the database contained views. ([Bug#43385](#))
- Certain statements might open a table and then wait for an impending global read lock without noticing whether they hold a table being waiting for by the global read lock, causing a hang. Affected statements are `SELECT ... FOR UPDATE, LOCK TABLES ... WRITE, TRUNCATE TABLE`, and `LOAD DATA INFILE`. ([Bug#43230](#))
- Using an XML function such as `ExtractValue()` more than once in a single query could produce erroneous results. ([Bug#43183](#))

See also [Bug#43937](#).

- Full-text prefix searches could hang the connection and cause 100% CPU consumption. ([Bug#42907](#))
- Incorrect elevation of warning messages to error messages for unsafe statements caused a server crash. ([Bug#42640](#))
- `CHECK TABLE` suggested use of `REPAIR TABLE` for corrupt tables for storage engines not supported by `REPAIR TABLE`. Now `CHECK TABLE` suggests that the user dump and reload the table. ([Bug#42563](#))
- Compressing a table with the `myisampack` utility caused the server to produce Valgrind warnings when it opened the table. ([Bug#41541](#))
- For a `MyISAM` table with `DELAY_KEY_WRITE` enabled, the index file could be corrupted without the table being marked as crashed if the server was killed. ([Bug#41330](#))
- For some queries, an equality propagation problem could cause `a = b` and `b = a` to be handled differently. ([Bug#40925](#))
- Killing an `INSERT ... SELECT` statement for a `MyISAM` table could cause table corruption if the table had indexes. ([Bug#40827](#))
- A multiple-table `DELETE IGNORE` statement involving a foreign key constraint caused an assertion failure. ([Bug#40127](#))
- Multiple-table `UPDATE` statements did not properly activate triggers. ([Bug#39953](#))
- The `mysql_setpermission` operation for removing database privileges removed global privileges instead. ([Bug#39852](#))
- A stored routine contain a C-style comment could not be dumped and reloaded. ([Bug#39559](#))
- In an `UPDATE` or `DELETE` through a secondary index, `InnoDB` did not store the cursor position. This made `InnoDB` crash in semi-consistent read while attempting to unlock a nonmatching record. ([Bug#39320](#))
- The functions listed in [Section 11.17.4.2.3, “Creating Geometry Values Using MySQL-Specific Functions”](#), previously accepted WKB arguments and returned WKB values. They now accept WKB or geometry arguments and return geometry values. ([Bug#38990](#))

The functions listed in [Section 11.17.4.2.2, “Creating Geometry Values Using WKB Functions”](#), previously accepted WKB arguments and returned geometry values. They now accept WKB or geometry arguments and return geometry values. ([Bug#38990](#))

- On Windows, running the server with `myisam_use mmap` enabled caused `MyISAM` table corruption. ([Bug#38848](#))
- `CHECK TABLE` did not properly check whether `MyISAM` tables created by servers from MySQL 4.0 or older needed to be up-

graded. This could cause problems upgrading to MySQL 5.1 or higher. ([Bug#37631](#))

- An `UPDATE` statement that updated a column using the same `DES_ENCRYPT( )` value for each row actually updated different rows with different values. ([Bug#35087](#))
- For shared-memory connections, the read and write methods did not properly handle asynchronous close events, which could lead to the client locking up waiting for a server response. For example, a call to `mysql_real_query()` would block forever on the client side if the executed statement was aborted on the server side. Thanks to Armin Schöffmann for the bug report and patch. ([Bug#33899](#))
- `CHECKSUM TABLE` was not killable with `KILL QUERY`. ([Bug#33146](#))
- `myisamchk` and `myisampack` were not being linked with the library that enabled support for \* filename pattern expansion. ([Bug#29248](#))
- For `InnoDB` tables that have their own `.ibd` tablespace file, a superfluous `ibuf cursor restoration fails!` message could be written to the error log. This warning has been suppressed. ([Bug#27276](#))
- `COMMIT` did not delete savepoints if there were no changes in the transaction. ([Bug#26288](#))
- Several memory allocation functions were not being checked for out-of-memory return values. ([Bug#25058](#))

## C.1.21. Release Notes for MySQL Enterprise 5.1.34sp1 [QSP] (25 June 2009)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.1.34).

### Note

The fix for [Bug#40974](#) in MySQL 5.1.31 caused the regression problem reported in [Bug#44810](#). Users for whom stability is of utmost priority should note that 5.1.34sp1 is affected by this problem because [Bug#44810](#) is not fixed until MySQL 5.1.36.

If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Bugs fixed:

- Incomplete cleanup of `JOIN_TAB::select` during the filesort of rows for a `GROUP BY` clause inside a subquery caused a server crash. ([Bug#44290](#))
- Use of `HANDLER` statements with `INFORMATION_SCHEMA` tables caused a server crash. Now `HANDLER` is prohibited with such tables. ([Bug#44151](#))
- On 64-bit systems, a `key_buffer_size` value larger than 4GB could cause `MyISAM` index corruption. ([Bug#43932](#))
- On Windows, a server crash occurred for attempts to insert a floating-point value into a `CHAR` column with a maximum length less than the converted floating-point value length. ([Bug#43833](#))
- `libmysqld` crashed when it was reinitialized. ([Bug#43706](#), [Bug#44091](#))
- Certain statements might open a table and then wait for an impending global read lock without noticing whether they hold a table being waiting for by the global read lock, causing a hang. Affected statements are `SELECT ... FOR UPDATE, LOCK TABLES ... WRITE, TRUNCATE TABLE`, and `LOAD DATA INFILE`. ([Bug#43230](#))
- Using an XML function such as `ExtractValue( )` more than once in a single query could produce erroneous results. ([Bug#43183](#))

See also [Bug#43937](#).

- Incorrect elevation of warning messages to error messages for unsafe statements caused a server crash. ([Bug#42640](#))
- In an `UPDATE` or `DELETE` through a secondary index, `InnoDB` did not store the cursor position. This made `InnoDB` crash in semi-consistent read while attempting to unlock a nonmatching record. ([Bug#39320](#))
- The functions listed in [Section 11.17.4.2.3, “Creating Geometry Values Using MySQL-Specific Functions”](#), previously accepted WKB arguments and returned WKB values. They now accept WKB or geometry arguments and return geometry values.

The functions listed in [Section 11.17.4.2.2, “Creating Geometry Values Using WKB Functions”](#), previously accepted WKB arguments and returned geometry values. They now accept WKB or geometry arguments and return geometry values. ([Bug#38990](#))

## C.1.22. Changes in MySQL 5.1.34 (02 April 2009)

RPM Notes:

- Support Ending for AIX 5.2: Per the <http://www.mysql.com/about/legal/lifecycle/> regarding ending support for OS versions that have reached vendor end of life, we plan to discontinue building or supporting MySQL binaries for AIX 5.2 as of April 30, 2009. This release of MySQL 5.1 (5.1.34) is the last MySQL 5.1 release with support for AIX 5.2. For more information, see the March 24, 2009 note at [MySQL Product Support EOL Announcements](#).

Functionality added or changed:

- The `optimizer_switch` system variable is now available to control optimizations that can be switched on and off. See [Section 7.4.2, “Controlling Switchable Optimizations”](#).

Bugs fixed:

- Replication: Important Note:** Binary logging with `--binlog-format=ROW` failed when a change to be logged included more than 251 columns. This issue was not known to occur with mixed-format or statement-based logging. ([Bug#42977](#))

See also [Bug#42914](#).

- Replication:** Assigning an invalid directory for the `--slave-load-tmpdir` caused the replication slave to crash. ([Bug#42861](#))

- Replication:** The `mysql.procs_priv` system table was not replicated. ([Bug#42217](#))

- Replication:** An `INSERT DELAYED` into a `TIMESTAMP` column issued concurrently with an insert on the same column not using `DELAYED`, but applied after the other insert, was logged using the same timestamp as generated by the other (non-`DELAYED`) insert. ([Bug#41719](#))

- Replication:** The `MIXED` binary logging format did not switch to row-based mode for statements containing the `LOAD_FILE()` function. ([Bug#39701](#))

- Replication:** When the server SQL mode included `IGNORE_SPACE`, statement-based replication of `LOAD DATA INFILE ... INTO tbl_name` failed because the statement was read incorrectly from the binary log; a trailing space was omitted, causing the statement to fail with a syntax error when run on the slave. ([Bug#22504](#))

See also [Bug#43746](#).

- An attempt by a user who did not have the `SUPER` privilege to kill a system thread could cause a server crash. ([Bug#43748](#))
- On Windows, incorrectly specified link dependencies in `CMakeLists.txt` resulted in link errors for `mysql_embedded`, `mysqltest_embedded`, and `mysql_client_test_embedded`. ([Bug#43715](#))
- `mysql` crashed if a request for the current database name returned an empty result, such as after the client has executed a preceding `SET sql_select_limit=0` statement. ([Bug#43254](#))
- If the value of the `version_comment` system variable was too long, the `mysql` client displayed a truncated startup message. ([Bug#43153](#))
- Queries of the following form returned an empty result:

```
SELECT ... WHERE ... (col=col AND col=col) OR ... (false expression)
```

([Bug#42957](#))

- The `strings/CHARSET_INFO.txt` file was not included in source distributions. ([Bug#42937](#))
- A dangling pointer in `mysys/my_error.c` could lead to client crashes. ([Bug#42675](#))

- Passing an unknown time zone specification to `CONVERT_TZ()` resulted in a memory leak. ([Bug#42502](#))
- The MySQL Instance Configuration Wizard would fail to start correctly on Windows Vista. ([Bug#42386](#))
- With more than two arguments, `LEAST()`, `GREATEST()`, and `CASE` could unnecessarily return `Illegal mix of collations` errors. ([Bug#41627](#))
- The `mysql` client could misinterpret its input if a line was longer than an internal buffer. ([Bug#41486](#))
- In the `help` command output displayed by `mysql`, the description for the `\c (clear)` command was misleading. ([Bug#41268](#))
- The `load_defaults()`, `my_search_option_files()` and `my_print_default_files()` functions in the C client library were subject to a race condition in multi-threaded operation. ([Bug#40552](#))
- If `--basedir` was specified, `mysqld_safe` did not use it when attempting to locate `my_print_defaults`. ([Bug#39326](#))
- When running the MySQL Instance Configuration Wizard in command-line only mode, the service name would be ignored (effectively creating all instances with the default `MySQL` service name), irrespective of the name specified on the command line. However, the wizard would attempt to start the service with the specified name, and would fail. ([Bug#38379](#))
- When MySQL was configured with the `--with-max-indexes=128` option, `mysqld` crashed. ([Bug#36751](#))
- Setting the `join_buffer_size` variable to its minimum value produced spurious warnings. ([Bug#36446](#))
- The use of `NAME_CONST()` can result in a problem for `CREATE TABLE ... SELECT` statements when the source column expressions refer to local variables. Converting these references to `NAME_CONST()` expressions can result in column names that are different on the master and slave servers, or names that are too long to be legal column identifiers. A workaround is to supply aliases for columns that refer to local variables.

Now a warning is issued in such cases that indicate possible problems. ([Bug#35383](#))

- An attempt to check or repair an `ARCHIVE` table that had been subjected to a server crash returned a 144 internal error. The data appeared to be irrecoverable. ([Bug#32880](#))
- The `Time` column for `SHOW PROCESSLIST` output and the value of the `TIME` column of the `INFORMATION_SCHEMA.PROCESSLIST` table now can have negative values. Previously, the column was unsigned and negative values were displayed incorrectly as large positive values. Negative values can occur if a thread alters the time into the future with `SET TIMESTAMP = value` or the thread is executing on a slave and processing events from a master that has its clock set ahead of the slave. ([Bug#22047](#))
- Restoring a `mysqldump` dump file containing `FEDERATED` tables failed because the file contained the data for the table. Now only the table definition is dumped (because the data is located elsewhere). ([Bug#21360](#))

## C.1.23. Changes in MySQL 5.1.33 (13 March 2009)

RPM Notes:

- Support Ending for AIX 5.2: Per the <http://www.mysql.com/about/legal/lifecycle/> regarding ending support for OS versions that have reached vendor end of life, we plan to discontinue building or supporting MySQL binaries for AIX 5.2 as of April 30, 2009. The next release of MySQL 5.1 (5.1.34) will be the last MySQL 5.1 release with support for AIX 5.2. For more information, see the March 24, 2009 note at [MySQL Product Support EOL Announcements](#).

Functionality added or changed:

- **Performance:** The query cache now checks whether a `SELECT` statement begins with `SQL_NO_CACHE` to determine whether it can skip checking for the query result in the query cache. This is not supported when `SQL_NO_CACHE` occurs within a comment. ([Bug#37416](#))
- `mysql-test-run.pl` now supports an `--experimental=file_name` option. It enables you to specify a file that contains a list of test cases that should be displayed with the `[ exp-fail ]` code rather than `[ fail ]` if they fail. ([Bug#42888](#))
- The MD5 algorithm now uses the Xfree implementation. ([Bug#42434](#))

Bugs fixed:

- **Partitioning:** A duplicate key error raised when inserting into a partitioned table using a different error code from that returned by such an error raised when inserting into a table that was not partitioned. ([Bug#38719](#))

See also [Bug#28842](#).

- **Partitioning:** Several error messages relating to partitioned tables were incorrect or missing. ([Bug#36001](#))
- **Replication:** When `binlog_format` was set to `STATEMENT`, a statement unsafe for statement-based logging caused an error or warning to be issued even if `sql_log_bin` was set to 0. ([Bug#41980](#))
- **Replication:** When using `MIXED` replication format and temporary tables were created in statement-based mode, but a later operation in the same session caused a switch to row-based mode, the temporary tables were not dropped on the slave at the end of the session. ([Bug#40013](#))

See also [Bug#43046](#).

This regression was introduced by [Bug#20499](#).

- **Replication:** When using the `MIXED` replication format, `UPDATE` and `DELETE` statements that searched for rows where part of the key had nullable `BIT` columns failed. This occurred because operations that inserted the data were replicated as statements, but `UPDATE` and `DELETE` statements affecting the same data were replicated using row-based format.

This issue did not occur when using statement-based replication (only) or row-based replication (only). ([Bug#39753](#))

See also [Bug#39648](#).

- **Replication:** The server SQL mode in effect when a stored procedure was created was not retained in the binary log. This could cause a `CREATE PROCEDURE` statement that succeeded on the master to fail on the slave.

This issue was first noticed when a stored procedure was created when `ANSI_QUOTES` was in effect on the master, but could possibly cause failed `CREATE PROCEDURE` statements and other problems on the slave when using other server SQL modes as well. ([Bug#39526](#))

- **Replication:** If `--secure-file-priv` was set on the slave, it was unable to execute `LOAD DATA INFILE` statements sent from the master when using mixed-format or statement-based replication.

As a result of this fix, this security restriction is now ignored on the slave in such cases; instead the slave checks whether the files were created and should be read by the slave in its `--slave-load-tmpdir`. ([Bug#38174](#))

- **Replication:** Server IDs greater than  $2^{32} - 1$  were represented by negative numbers in the binary log. ([Bug#37313](#))
- **Replication:** When its disk becomes full, a replication slave may wait while writing the binary log, relay log or `MyISAM` tables, continuing after space has been made available. The error message provided in such cases was not clear about the frequency with which checking for free space is done (once every 60 seconds), and how long the server waits after space has been freed before continuing (also 60 seconds); this caused users to think that the server had hung.

These issues have been addressed by making the error message clearer, and dividing it into two separate messages:

1. The error message `DISK IS FULL WRITING 'FILENAME' (ERRCODE: ERROR_CODE). WAITING FOR SOMEONE TO FREE SPACE... (EXPECT UP TO 60 SECS DELAY FOR SERVER TO CONTINUE AFTER FREEING DISK SPACE)` is printed only once.
2. The warning `RETRY IN 60 SECS, MESSAGE REPRINTED IN 600 SECS` is printed once every 10 times that the check for free space is made; that is, the check is performed once each 60 seconds, but the reminder that space needs to be freed is printed only once every 10 minutes (600 seconds).

([Bug#22082](#))

- **Replication:** The statements `DROP PROCEDURE IF EXISTS` and `DROP FUNCTION IF EXISTS` were not written to the binary log if the procedure or function to be dropped did not exist. ([Bug#13684](#))

See also [Bug#25705](#).

- The IBM DB2i storage engine has been added to this release for the IBM i Series platform. For more information, see [Section 13.7, “The IBMDB2I Storage Engine”](#). ([Bug#44217](#))
- On 64-bit debug builds, code in `safemalloc` resulted in errors due to use of a 32-bit value for 64-bit allocations.

- )
- `make distcheck` failed to properly handle subdirectories of `storage/ndb`. ([Bug#43614](#))
  - Use of `USE INDEX` hints could cause `EXPLAIN EXTENDED` to crash. ([Bug#43354](#))
  - For `InnoDB` tables, overflow in an `AUTO_INCREMENT` column could cause a server crash. ([Bug#43203](#))
  - On 32-bit Windows, `mysqld` could not use large buffers due to a 2GB user mode address limit. ([Bug#43082](#))
  - `stderr` should be unbuffered, but when the server redirected `stderr` to a file, it became buffered. ([Bug#42790](#))
  - The `DATA_TYPE` column of the `INFORMATION_SCHEMA.COLUMNS` table displayed the `UNSIGNED` attribute for floating-point data types. (The column should contain only the data type name.) ([Bug#42758](#))
  - For `InnoDB` tables, spurious duplicate-key errors could occur when inserting into an `AUTO_INCREMENT` column. ([Bug#42714](#))
  - `mysqldump` included views that were excluded with the `--ignore-table` option. ([Bug#42635](#))
  - An earlier bug fix resulted in the problem that the `InnoDB` plugin could not be used with a server that was compiled with the built-in `InnoDB`. To handle this two changes were made:
    - The server now supports an `--ignore-built-in-innodb` option that causes the server to behave as if the built-in `InnoDB` is not present. This option causes other `InnoDB` options not to be recognized.
    - For the `INSTALL PLUGIN` statement, the server reads option (`my.cnf`) files just as during server startup. This enables the plugin to pick up any relevant options from those files. Consequently, a plugin no longer is started with each option set to its default value.

Because of this change, it is possible to add plugin options to an option file even before loading a plugin (if the `loose` prefix is used). It is also possible to uninstall a plugin, edit `my.cnf`, and install the plugin again. Restarting the plugin this way enables it to the new option values without a server restart.

### Note

`InnoDB` Plugin versions 1.0.4 and higher will take advantage of this bug fix. Although the `InnoDB` Plugin is source code compatible with multiple MySQL releases, a given binary `InnoDB` Plugin can be used only with a specific MySQL release. When `InnoDB` Plugin 1.0.4 is released, it is expected to be compiled for MySQL 5.1.34. For 5.1.33, you can use `InnoDB` Plugin 1.0.3, but you must build from source.

([Bug#42610](#))

This regression was introduced by [Bug#29263](#).

- With the `ONLY_FULL_GROUP_BY` SQL mode enabled, some legal queries failed. ([Bug#42567](#))
- Tables could enter open table cache for a thread without being properly cleaned up, leading to a server crash. ([Bug#42419](#))
- For `InnoDB` tables, inserting into floating-point `AUTO_INCREMENT` columns failed. ([Bug#42400](#))
- The `InnoDB btr_search_drop_page_hash_when_freed()` function had a race condition. ([Bug#42279](#))
- For `InnoDB` tables, there was a race condition for `ALTER TABLE`, `OPTIMIZE TABLE`, `CREATE INDEX`, and `DROP INDEX` operations when periodically checking whether table copying can be committed. ([Bug#42152](#))
- Parsing of the optional microsecond component of `DATETIME` values did not fail gracefully when that component width was larger than the permitted six places. ([Bug#42146](#))
- In `InnoDB` recovery after a server crash, table lookup could fail and corrupt the data dictionary cache. ([Bug#42075](#))
- `mysqldumpslow` parsed the `--debug` and `--verbose` options incorrectly. ([Bug#42027](#))
- Queries that used the loose index scan access method could return no rows. ([Bug#41610](#))
- In `InnoDB` recovery after a server crash, rollback of a transaction that updated a column from `NULL` to `NULL` could cause another crash. ([Bug#41571](#))
- The error message for a too-long column comment was `Unknown error` rather than a more appropriate message. ([Bug#41465](#))

- Use of `SELECT *`  permitted users with rights to only some columns of a view to access all columns. ([Bug#41354](#))
- If the tables underlying a `MERGE` table had a primary key but the `MERGE` table itself did not, inserting a duplicate row into the `MERGE` table caused a server crash. ([Bug#41305](#))
- The server did not robustly handle problems hang if a table opened with `HANDLER` needed to be re-opened because it had been altered to use a different storage engine that does not support `HANDLER`. The server also failed to set an error if the re-open attempt failed. These problems could cause the server to crash or hang. ([Bug#41110](#), [Bug#41112](#))
- `SELECT` statements executed concurrently with `INSERT` statements for a `MyISAM` table could cause incorrect results to be returned from the query cache. ([Bug#41098](#))
- For prepared statements, multibyte character sets were not taking into account when calculating `max_length` for string values and `mysql_stmt_fetch()` could return truncated strings. ([Bug#41078](#))
- Deprecation warnings that referred to MySQL 5.2 were changed to refer to MySQL 6.0. ([Bug#41077](#))
- For user-defined variables in a query result, incorrect length values were returned in the result metadata. ([Bug#41030](#))
- On Windows, starting the server with an invalid value for `innodb_flush_method` caused a crash. ([Bug#40757](#))
- MySQL 5.1 crashed with index merge algorithm and merge tables.

A query in the MyISAM merge table caused a crash if the index merge algorithm was being used. ([Bug#40675](#))
- With strict SQL mode enabled, setting a system variable to an out-of-bounds value caused an assertion failure. ([Bug#40657](#))
- Table temporary scans were slower than necessary due to use of mmap rather than caching, even with the `myisam_use_mmap` system variable disabled. ([Bug#40634](#))
- For a view that references a table in another database, `mysqldump` wrote the view name qualified with the current database name. This makes it impossible to reload the dump file into a different database. ([Bug#40345](#))
- On platforms where long and pointer variables have different sizes, `MyISAM` could copy key statistics incorrectly, resulting in a server crash or incorrect cardinality values. ([Bug#40321](#))
- `DELETE` tried to acquire write (not read) locks for tables accessed within a subquery of the `WHERE` clause. ([Bug#39843](#))
- `perror` did not produce correct output for error codes 153 to 163. ([Bug#39370](#))
- Several functions in `libmysqld` called `exit()` when an error occurred rather than returning an error to the caller. ([Bug#39289](#))
- The `innodb_log_arch_dir` system variable is no longer available but was present in some of the sample option files included with MySQL distributions (such as `my-huge.cnf`). The line was present as a comment but uncommenting it would cause server startup failure so the line has been removed. ([Bug#38249](#))
- Setting a savepoint with the same name as an existing savepoint incorrectly deleted any other savepoints that had been set in the meantime. For example, setting savepoints named `a, b, c, b` resulted in savepoints `a, b`, rather than the correct savepoints `a, c, b`. ([Bug#38187](#))
- `--help` output for `myisamchk` did not list the `--HELP` option. ([Bug#38103](#))
- Comparisons between row constructors, such as `(a, b) = (c, d)` resulted in unnecessary `Illegal mix of collations` errors for string columns. ([Bug#37601](#))
- If a user created a view that referenced tables for which the user had disjoint privileges, an assertion failure occurred. ([Bug#37191](#))
- An argument to the `MATCH( )` function that was an alias for an expression other than a column name caused a server crash. ([Bug#36737](#))
- The `event`, `general_log`, and `slow_log` tables in the `mysql` database store `server_id` values, but did not use an `UNSIGNED` column and thus were not able to store the full range of ID values. ([Bug#36540](#))
- On Windows, the `_PC` macro in `my_global.h` was causing problems for modern compilers. It has been removed because it is no longer used. ([Bug#34309](#))
- For `DROP FUNCTION` with names that were qualified with a database name, the database name was handled in case-sensitive fashion even with `lower_case_table_names` set to 1. ([Bug#33813](#))

- `mysqldump --compatible=mysql40` emitted statements referring to the `character_set_client` system variable, which is unknown before MySQL 4.1. Now the statements are enclosed in version-specific comments. ([Bug#33550](#))
- Detection by `configure` of several functions such as `setsockopt()`, `bind()`, `sched_yield()`, and `getty()` could fail. ([Bug#31506](#))
- Use of MBR spatial functions such as `MBRTouches()` with columns of `InnoDB` tables caused a server crash rather than an error. ([Bug#31435](#))
- The `mysql` client mishandled input parsing if a `delimiter` command was not first on the line. ([Bug#31060](#))
- `SHOW PRIVILEGES` listed the `CREATE ROUTINE` privilege as having a context of `Functions,Procedures`, but it is a database-level privilege. ([Bug#30305](#))
- `mysqld --help` did not work as `root`. ([Bug#30261](#))
- `CHECK TABLE`, `REPAIR TABLE`, `ANALYZE TABLE`, and `OPTIMIZE TABLE` erroneously reported a table to be corrupt if the table did not exist or the statement was terminated with `KILL`. ([Bug#29458](#))
- `SHOW TABLE STATUS` could fail to produce output for tables with non-ASCII characters in their name. ([Bug#25830](#))
- Allocation of stack space for error messages could be too small on HP-UX, leading to stack overflow crashes. ([Bug#21476](#))
- Floating-point numbers could be handled with different numbers of digits depending on whether the text or prepared-statement protocol was used. ([Bug#21205](#))
- Incorrect length metadata could be returned for `LONG TEXT` columns when a multibyte server character set was used. ([Bug#19829](#))
- `ROUND()` sometimes returned different results on different platforms. ([Bug#15936](#))

## C.1.24. Changes in MySQL 5.1.32 (14 February 2009)

Functionality added or changed:

- The `libedit` library was upgraded to version 2.11. ([Bug#42433](#))

Bugs fixed:

- **Security Fix:** Using an XPath expression employing a scalar expression as a `FilterExpr` with `ExtractValue()` or `UpdateTextXML()` caused the server to crash. Such expressions now cause an error instead. ([Bug#42495](#))
- **Incompatible Change:** The fix for [Bug#33699](#) introduced a change to the `UPDATE` statement such that assigning `NULL` to a `NOT NULL` column caused an error even when strict SQL mode was not enabled. The original behavior before was that such assignments caused an error only in strict SQL mode, and otherwise set the column to the implicit default value for the column data type and generated a warning. (For information about implicit default values, see [Section 10.1.4, “Data Type Default Values”](#).)

The change caused compatibility problems for applications that relied on the original behavior. It also caused replication problems between servers that had the original behavior and those that did not, for applications that assigned `NULL` to `NOT NULL` columns in `UPDATE` statements without strict SQL mode enabled. This change has been reverted so that `UPDATE` again had the original behavior. Problems can still occur if you replicate between servers that have the modified `UPDATE` behavior and those that do not. ([Bug#39265](#))

- **Important Change:** When using the MySQL Instance Configuration Wizard with a configuration where you already have an existing installation with a custom `datadir`, the wizard could reset the data to the default data directory. When performing an upgrade installation in this situation, you must re-specify your custom settings, including the `datadir`, to ensure that your configuration file is not reset to the default values. ([Bug#37534](#))
- **Important Change:** Uninstalling MySQL using the MySQL installer on Windows would delete the `my.ini` file. The file is no longer deleted. In addition, when a new installation is conducted, any existing configuration file will be renamed to `myDATE-TIME.ini.bak` during configuration. ([Bug#36493](#))
- **Important Change:** When installing MySQL on Windows, it was possible to install multiple editions (Complete, and Essential, for example) of the same version of MySQL, leading to two separate entries in the installed packages which were impossible to isolate. This could lead to problems with installation and uninstallation. The MySQL installer on Windows no longer permits multiple installations of the same version of MySQL on a single machine. ([Bug#4217](#))

- **Replication:** `START SLAVE UNTIL` did not work correctly with `--replicate-same-server-id` enabled; when started with this option, the slave did not perform events recorded in the relay log and that originated from a different master.

Log rotation events are automatically generated and written when rotating the binary log or relay log. Such events for relay logs are usually ignored by the slave SQL thread because they have the same server ID as that of the slave. However, when `--replicate-same-server-id` was enabled, the rotation event for the relay log was treated as if it originated on the master, because the log's name and position were incorrectly updated. This caused the `MASTER_POS_WAIT()` function always to return `NULL` and thus to fail. ([Bug#38734](#), [Bug#38934](#))

- **Replication:** `TRUNCATE TABLE` statements failed to replicate when statement-based binary logging mode was not available. The issue was observed when using `InnoDB` with the transaction isolation level set to `READ UNCOMMITTED` (thus forcing `InnoDB` not to permit statement-based logging). However, the same behavior could be reproduced using any transactional storage engine supporting only row-based logging, regardless of the isolation level. This was due to two separate problems:

1. An error was printed by `InnoDB` for `TRUNCATE TABLE` when using statement-based logging mode where the transaction isolation level was set to `READ COMMITTED` or `READ UNCOMMITTED`, because `InnoDB` permits statement-based replication for DML statements. However, `TRUNCATE TABLE` is not transactional; since it is the equivalent of `DROP TABLE` followed by `CREATE TABLE`, it is actually DDL, and should therefore be permitted to be replicated as a statement.
2. `TRUNCATE TABLE` was not logged in mixed mode because of the error just described; however, this error was not reported to the client.

As a result of this fix, `TRUNCATE TABLE` is now treated as DDL for purposes of binary logging and replication; that is, it is always logged as a statement and so no longer causes an error when replicated using a transactional storage engine such as `InnoDB`. ([Bug#36763](#))

See also [Bug#42643](#).

- **Replication:** `mysqlbinlog` replay of `CREATE TEMPORARY TABLE ... LIKE` statements and of `TRUNCATE TABLE` statements used on temporary tables failed with Error 1146 (`TABLE ... DOESN'T EXIST`). ([Bug#35583](#))
- **Replication:** In statement mode, `mysqlbinlog` failed to issue a `SET @@autocommit` statement when the autocommit mode was changed. ([Bug#34541](#))
- **Replication:** `LOAD DATA INFILE` statements did not replicate correctly from a master running MySQL 4.1 to a slave running MySQL 5.1 or later. ([Bug#31240](#))
- The use by `libedit` of the `__weak_reference()` macro caused compilation failure on FreeBSD. ([Bug#42817](#))
- A '`%`' character in SQL statements could cause the server to crash. ([Bug#42634](#))
- An optimization introduced for [Bug#37553](#) required an explicit cast to be added for some uses of `TIMEDIFF()` because automatic casting could produce incorrect results. (It was necessary to use `TIME(TIMEDIFF(...))`). ([Bug#42525](#))
- On the IBM i5 platform, the MySQL configuration process caused the system version of `pthread_setschedprio()` to be used. This function returns `SIGILL` on i5 because it is not supported, causing the server to crash. Now the `my_pthread_setprio()` function in the `mysys` library is used instead. ([Bug#42524](#))
- The SSL certificates included with MySQL distributions were regenerated because the previous ones had expired. ([Bug#42366](#))
- User variables within triggers could cause a crash if the `mysql_change_user()` C API function was invoked. ([Bug#42188](#))
- Dependent subqueries such as the following caused a memory leak proportional to the number of outer rows:

```
SELECT COUNT(*) FROM t1, t2 WHERE t2.b
 IN (SELECT DISTINCT t2.b FROM t2 WHERE t2.b = t1.a);
```

([Bug#42037](#))

- Some queries using `NAME_CONST(... COLLATE ...)` led to a server crash due to a failed type cast. ([Bug#42014](#))
- On Mac OS X, some of the universal client libraries were not actually universal and were missing code for one or more architectures. ([Bug#41940](#))
- String reallocation could cause memory overruns. ([Bug#41868](#))
- `mysql_install_db` did not pass some relevant options to `mysqld`. ([Bug#41828](#))
- Setting `innodb_locks_unsafe_for_binlog` should be equivalent to setting the transaction isolation level to `READ`

**COMMITTED**. However, if both of those things were done, nonmatching semi-consistently read rows were not unlocked when they should have been. ([Bug#41671](#))

- `REPAIR TABLE` crashed for compressed `MyISAM` tables. ([Bug#41574](#))
- For a `TIMESTAMP NOT NULL DEFAULT ...` column, storing `NULL` as the return value from some functions caused “cannot be NULL” error. `NULL` returns now correctly cause the column default value to be stored. ([Bug#41370](#))
- The server cannot execute `INSERT DELAYED` statements when statement-based binary logging is enabled, but the error message displayed only the table name, not the entire statement. ([Bug#41121](#))
- `FULLTEXT` indexes did not work for Unicode columns that used a custom UCA collation. ([Bug#41084](#))
- The Windows installer displayed incorrect product names in some images. ([Bug#40845](#))
- Changing `innodb_thread_concurrency` at runtime could cause errors. ([Bug#40760](#))
- `SELECT` statements could be blocked by `INSERT DELAYED` statements that were waiting for a lock, even with `low_priority_updates` enabled. ([Bug#40536](#))
- For `InnoDB` tables that used `ROW_FORMAT=REDUNDANT`, storage size of `NULL` columns could be determined incorrectly. ([Bug#40369](#))
- The query cache stored only partial query results if a statement failed while the results were being sent to the client. This could cause other clients to hang when trying to read the cached result. Now if a statement fails, the result is not cached. ([Bug#40264](#))
- When a `MEMORY` table became full, the error generated was returned to the client but was not written to the error log. ([Bug#39886](#))
- With row-based binary logging, replication of `InnoDB` tables containing `NULL`-valued `BIT` columns could fail. ([Bug#39648](#))
- The expression `ROW(...)` `IN` `(SELECT ... FROM DUAL)` always returned `TRUE`. ([Bug#39069](#))
- The greedy optimizer could cause a server crash due to improper handling of nested outer joins. ([Bug#38795](#))
- Use of `COUNT(DISTINCT)` prevented `NULL` testing in the `HAVING` clause. ([Bug#38637](#))
- The `innodb_stats_on_metadata` system variable was not displayed by `SHOW VARIABLES` and was not settable at runtime. ([Bug#38189](#))
- Enabling the `sync_frm` system variable had no effect on the handling of `.frm` files for views. ([Bug#38145](#))
- The embedded server truncated some error messages. ([Bug#37995](#))
- For comparison of `NULL` to a subquery result inside `IS NULL`, the comparison could evaluate to `NULL` rather than to `TRUE` or `FALSE`. This occurred for expressions such as:

```
SELECT ... WHERE NULL IN (SELECT ...) IS NULL
```

([Bug#37822](#))

- Setting `myisam_repair_threads` greater than 1 caused a server crash for table repair or alteration operations for `MyISAM` tables with multiple `FULLTEXT` indexes. ([Bug#37756](#))
- When using the MySQL MSI Installer on Windows and selecting BACK after choosing Repair, you would be returned to the Fresh Install section of the installer. You are now correctly returned to the Install, Repair, Modify screen. ([Bug#37294](#))
- The `mysql` client sometimes improperly interpreted string escape sequences in nonstring contexts. ([Bug#36391](#))
- The query cache stored packets containing the server status of the time when the cached statement was run. This might lead to an incorrect transaction status on the client side if a statement was cached during a transaction and later served outside a transaction context (or vice versa). ([Bug#36326](#))
- If the system time was adjusted backward during query execution, the apparent execution time could be negative. But in some cases these queries would be written to the slow query log, with the negative execution time written as a large unsigned number. Now statements with apparent negative execution time are not written to the slow query log. ([Bug#35396](#))
- `libmysqld` was not built with all character sets. ([Bug#32831](#))
- For `mysqld_multi`, using the `--mysqld=mysql_safe` option caused the `--defaults-file` and `--defaults-extra-file` options to behave the same way. ([Bug#32136](#))

- Attempts to open a valid MERGE table sometimes resulted in a [ER\\_WRONG\\_MRG\\_TABLE](#) error. This happened after failure to open an invalid MERGE table had also generated an [ER\\_WRONG\\_MRG\\_TABLE](#) error. ([Bug#32047](#))
- For Solaris package installation using `pkgadd`, the postinstall script failed, causing the system tables in the `mysql` database not to be created. ([Bug#31164](#))
- If the default database was dropped, the value of `character_set_database` was not reset to `character_set_server` as it should have been. ([Bug#27208](#))

## C.1.25. Release Notes for MySQL Enterprise 5.1.31sp1 [QSP] (19 March 2009)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.1.31).

If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- The `libedit` library was upgraded to version 2.11. ([Bug#42433](#))

Bugs fixed:

- **Security Fix:** Using an XPath expression employing a scalar expression as a `FilterExpr` with `ExtractValue()` or `UpdateXML()` caused the server to crash. Such expressions now cause an error instead. ([Bug#42495](#))
- On the IBM i5 platform, the MySQL configuration process caused the system version of `pthread_setschedprio()` to be used. This function returns `SIGILL` on i5 because it is not supported, causing the server to crash. Now the `my_pthread_setprio()` function in the `mysys` library is used instead. ([Bug#42524](#))
- The SSL certificates included with MySQL distributions were regenerated because the previous ones had expired. ([Bug#42366](#))
- User variables within triggers could cause a crash if the `mysql_change_user()` C API function was invoked. ([Bug#42188](#))
- Some queries using `NAME_CONST(... COLLATE ...)` led to a server crash due to a failed type cast. ([Bug#42014](#))

## C.1.26. Changes in MySQL 5.1.31 (19 January 2009)

Functionality added or changed:

- `MySQL-shared-compat-advanced-gpl-5.1.31-0.*.rpm` and `MySQL-shared-compat-advanced-5.1.31-0.*.rpm` packages are now available. These client library compatibility packages are like the `MySQL-shared-compat` package, but are for the “MySQL Enterprise Server — Advanced Edition” products. Install these packages rather than the normal `MySQL-shared-compat` package if you want to included shared client libraries for older MySQL versions. ([Bug#41838](#))
- A new status variable, `Queries`, indicates the number of statements executed by the server. This includes statements executed within stored programs, unlike the `Questions` variable which includes only statements sent to the server by clients. ([Bug#41131](#))
- Performance of `SELECT *` retrievals from `INFORMATION_SCHEMA.COLUMNS` was improved slightly. ([Bug#38918](#))
- Previously, index hints did not work for `FULLTEXT` searches. Now they work as follows:

For natural language mode searches, index hints are silently ignored. For example, `IGNORE INDEX(i)` is ignored with no warning and the index is still used.

For boolean mode searches, index hints with `FOR ORDER BY` or `FOR GROUP BY` are silently ignored. Index hints with `FOR JOIN` or no `FOR` modifier are honored. In contrast to how hints apply for non-`FULLTEXT` searches, the hint is used for all phases of query execution (finding rows and retrieval, grouping, and ordering). This is true even if the hint is given for a non-`FULLTEXT` index. ([Bug#38842](#))

Bugs fixed:

- **Performance:** For an `InnoDB` table, `DROP TABLE` or `ALTER TABLE ... DISCARD TABLESPACE` could take a long time or cause a server crash. ([Bug#39939](#))
- **Important Change: Replication:** If a trigger was defined on an `InnoDB` table and this trigger updated a nontransactional table, changes performed on the `InnoDB` table were replicated and were visible on the slave before they were committed on the master, and were not rolled back on the slave after a successful rollback of those changes on the master.

As a result of the fix for this issue, the semantics of mixing nontransactional and transactional tables in a transaction have changed. Previously, if the initial statements in a transaction contained nontransactional changes, those statements were written directly to the binary log. Now, any statement appearing after a `BEGIN` (or immediately following a `COMMIT` if `autocommit = 0`) is always considered part of the transaction and cached. This means that nontransactional changes do not propagate to the slave until the transaction is committed and thus written to the binary log.

See [Section 16.4.1.28, “Replication and Transactions”](#), for more information about this change in behavior. ([Bug#40116](#))

- **Important Change:** The MSI installer packages for Windows are now digitally signed with a certificate, enabling installation on Windows where only certified packages are permitted by group policy or configuration.

As part of this change, and to comply with the certified installer requirements, the `Setup.exe` versions of the MySQL installer have been discontinued. You must have Windows Installer support in your Windows installation to use the MSI install package. This is a standard component on Windows XP SP2 and higher. For earlier versions, you can download the Microsoft Installer support from Microsoft.com. ([Bug#36409](#))

- **Partitioning: Replication:** Changing the transaction isolation level while replicating partitioned `InnoDB` tables could cause statement-based logging to fail. ([Bug#39084](#))
- **Partitioning:** A comparison with an invalid `DATE` value in a query against a partitioned table could lead to a crash of the MySQL server.

### Note

Invalid `DATE` and `DATETIME` values referenced in the `WHERE` clause of a query on a partitioned table are treated as `NULL`. See [Section 18.4, “Partition Pruning”](#), for more information.

([Bug#40972](#))

- **Partitioning:** A query on a user-partitioned table caused MySQL to crash, where the query had the following characteristics:
  - The query's `WHERE` clause referenced an indexed column that was also in the partitioning key.
  - The query's `WHERE` clause included a value found in the partition.
  - The query's `WHERE` clause used the `<` or `<>` operators to compare with the indexed column's value with a constant.
  - The query used an `ORDER BY` clause, and the same indexed column was used in the `ORDER BY` clause.
  - The `ORDER BY` clause used an explicit or implicit `ASC` sort priority.

Two examples of such a query are given here, where `a` represents an indexed column used in the table's partitioning key:

1. 

```
SELECT * FROM table WHERE a < constant ORDER BY a;
```

2. 

```
SELECT * FROM table WHERE a <> constant ORDER BY a;
```

This bug was introduced in MySQL 5.1.29. ([Bug#40954](#))

This regression was introduced by [Bug#30573](#), [Bug#33257](#), [Bug#33555](#).

- **Partitioning:** With `READ COMMITTED` transaction isolation level, `InnoDB` uses a semi-consistent read that releases non-matching rows after MySQL has evaluated the `WHERE` clause. However, this was not happening if the table used partitions. ([Bug#40595](#))
- **Partitioning:** A query that timed out when run against a partitioned table failed silently, without providing any warnings or errors, rather than returning `LOCK WAIT TIMEOUT EXCEEDED`. ([Bug#40515](#))

- **Partitioning:** `ALTER TABLE ... REORGANIZE PARTITION` could crash the server when the number of partitions was not changed. ([Bug#40389](#))

See also [Bug#41945](#).
- **Partitioning:** For a partitioned table having an `AUTO_INCREMENT` column: If the first statement following a start of the server or a `FLUSH TABLES` statement was an `UPDATE` statement, the `AUTO_INCREMENT` column was not incremented correctly. ([Bug#40176](#))
- **Partitioning:** The server attempted to execute the statements `ALTER TABLE ... ANALYZE PARTITION`, `ALTER TABLE ... CHECK PARTITION`, `ALTER TABLE ... OPTIMIZE PARTITION`, and `ALTER TABLE ... REORGANIZE PARTITION` on tables that were not partitioned. ([Bug#39434](#))

See also [Bug#20129](#).
- **Partitioning:** The value of the `CREATE_COLUMNS` column in `INFORMATION_SCHEMA.TABLES` was not `partitioned` for partitioned tables. ([Bug#38909](#))
- **Partitioning:** When executing an `ORDER BY` query on a partitioned `InnoDB` table using an index that was not in the partition expression, the results were sorted on a per-partition basis rather than for the table as a whole. ([Bug#37721](#))
- **Partitioning:** Dropping or creating an index on a partitioned table managed by the `InnoDB` Plugin locked the table. ([Bug#37453](#))
- **Partitioning:** Partitioned table checking sometimes returned a warning with an error code of 0, making proper response to errors impossible. The fix also renders the error message subject to translation in non-English deployments. ([Bug#36768](#))
- **Partitioning:** `SHOW TABLE STATUS` could show a nonzero value for the `Mean record length` of a partitioned `InnoDB` table, even if the table contained no rows. ([Bug#36312](#))
- **Partitioning:** When `SHOW CREATE TABLE` was used on a partitioned table, all of the table's `PARTITION` and `SUBPARTITION` clauses were output on a single line, making it difficult to read or parse. ([Bug#14326](#))
- **Replication:** Per-table `AUTO_INCREMENT` option values were not replicated correctly for `InnoDB` tables. ([Bug#41986](#))
- **Replication:** Some `log_event` types did not skip the post-header when reading. ([Bug#41961](#))
- **Replication:** Attempting to read a binary log containing an `Incident_log_event` having an invalid incident number could cause the debug server to crash. ([Bug#40482](#))
- **Replication:** When using row-based replication, an update of a primary key that was rolled back on the master due to a duplicate key error was not rolled back on the slave. ([Bug#40221](#))
- **Replication:** When rotating relay log files, the slave deletes relay log files and then edits the relay log index file. Formerly, if the slave shut down unexpectedly between these two events, the relay log index file could then reference relay logs that no longer existed. Depending on the circumstances, this could when restarting the slave cause either a race condition or the failure of replication. ([Bug#38826](#), [Bug#39325](#))
- **Replication:** With row-based replication, `UPDATE` and `DELETE` statements using `LIMIT` and a table's primary key could produce different results on the master and slave. ([Bug#38230](#))
- `resolve_stack_dump` was unable to resolve the stack trace format produced by `mysqld` in MySQL 5.1 and up (see [Section 22.5.1.5, “Using a Stack Trace”](#)). ([Bug#41612](#))
- In example option files provided in MySQL distributions, the `thread_stack` value was increased from 64K to 128K. ([Bug#41577](#))
- The optimizer could ignore an error and rollback request during a filesort, causing an assertion failure. ([Bug#41543](#))
- `DATE_FORMAT( )` could cause a server crash for year-zero dates. ([Bug#41470](#))
- `SET PASSWORD` caused a server crash if the account name was given as `CURRENT_USER()`. ([Bug#41456](#))
- When a repair operation was carried out on a `CSV` table, the debug server crashed. ([Bug#41441](#))
- When substituting system constant functions with a constant result, the server was not expecting `NULL` function return values and could crash. ([Bug#41437](#))
- Queries such as `SELECT ... CASE AVG( . . . ) WHEN . . .` that used aggregate functions in a `CASE` expression crashed the server. ([Bug#41363](#))

- `INSERT INTO ... SELECT ... FROM` and `CREATE TABLE ... SELECT ... FROM` a TEMPORARY table could inadvertently change the locking type of the temporary table from a write lock to a read lock, causing statement failure. ([Bug#41348](#))
- The `INFORMATION_SCHEMA.SCHEMA_PRIVILEGES` table was limited to 7680 rows. ([Bug#41079](#))
- In debug builds, obsolete debug code could be used to crash the server. ([Bug#41041](#))
- Some queries that used a “range checked for each record” scan could return incorrect results. ([Bug#40974](#))

See also [Bug#44810](#).

- Certain `SELECT` queries could fail with a `Duplicate entry` error. ([Bug#40953](#))
- For debug servers, `OPTIMIZE TABLE` on a compressed table caused a server crash. ([Bug#40949](#))
- Accessing user variables within triggers could cause a server crash. ([Bug#40770](#))
- `IF(..., CAST(longtext_val AS UNSIGNED), signed_val)` as an argument to an aggregate function could cause an assertion failure. ([Bug#40761](#))
- For single-table `UPDATE` statements, an assertion failure resulted from a runtime error in a stored function (such as a recursive function call or an attempt to update the same table as in the `UPDATE` statement). ([Bug#40745](#))
- `TRUNCATE TABLE` for an `InnoDB` table did not flush cached queries for the table. ([Bug#40386](#))
- Prepared statements permitted invalid dates to be inserted when the `ALLOW_INVALID_DATES` SQL mode was not enabled. ([Bug#40365](#))
- `mc.exe` is no longer needed to compile MySQL on Windows. This makes it possible to build MySQL from source using Visual Studio Express 2008. ([Bug#40280](#))
- The `'::'` character was incorrectly not permitted in table names. ([Bug#40104](#))
- Support for the `revision` field in `.frm` files has been removed. This addresses the downgrading problem introduced by the fix for [Bug#17823](#). ([Bug#40021](#))
- Retrieval speed from the following `INFORMATION_SCHEMA` tables was improved by shortening the `VARIABLE_VALUE` column to 1024 characters: `GLOBAL_VARIABLES`, `SESSION_VARIABLES`, `GLOBAL_STATUS`, and `SESSION_STATUS`.

As a result of this change, any variable value longer than 1024 characters will be truncated with a warning. This affects only the `init_connect` system variable. ([Bug#39955](#))

- If the operating system is configured to return leap seconds from OS time calls or if the MySQL server uses a time zone definition that has leap seconds, functions such as `NOW()` could return a value having a time part that ends with `:59:60` or `:59:61`. If such values are inserted into a table, they would be dumped as is by `mysqldump` but considered invalid when re-loaded, leading to backup/restore problems.

Now leap second values are returned with a time part that ends with `:59:59`. This means that a function such as `NOW()` can return the same value for two or three consecutive seconds during the leap second. It remains true that literal temporal values having a time part that ends with `:59:60` or `:59:61` are considered invalid.

For additional details about leap-second handling, see [Section 9.6.2, “Time Zone Leap Second Support”](#). ([Bug#39920](#))

- The server could crash during a sort-order optimization of a dependent subquery. ([Bug#39844](#))
- For a server started with the `--temp-pool` option on Windows, temporary file creation could fail. This option now is ignored except on Linux systems, which was its original intended scope. ([Bug#39750](#))
- `ALTER TABLE` on a table with `FULLTEXT` index that used a pluggable `FULLTEXT` parser could cause debug servers to crash. ([Bug#39746](#))
- With the `ONLY_FULL_GROUP_BY` SQL mode enabled, the check for nonaggregated columns in queries with aggregate functions, but without a `GROUP BY` clause was treating all the parts of the query as if they were in the select list. This is fixed by ignoring the nonaggregated columns in the `WHERE` clause. ([Bug#39656](#))
- The server crashed if an integer field in a CSV file did not have delimiting quotation marks. ([Bug#39616](#))
- Creating a table with a comment of 62 characters or longer caused a server crash. ([Bug#39591](#))
- The `do_abi_check` program run during the build process depends on `mysql_version.h` but that file was not created

first, resulting in build failure. ([Bug#39571](#))

- `CHECK TABLE` failed for `MyISAM INFORMATION_SCHEMA` tables. ([Bug#39541](#))
- On 64-bit Windows systems, the server accepted `key_buffer_size` values larger than 4GB, but allocated less. (For example, specifying a value of 5GB resulted in 1GB being allocated.) ([Bug#39494](#))
- `InnoDB` could hang trying to open an adaptive hash index. ([Bug#39483](#))
- Following `ALTER TABLE ... DISCARD TABLESPACE` for an `InnoDB` table, an attempt to determine the free space for the table before the `ALTER TABLE` operation had completely finished could cause a server crash. ([Bug#39438](#))
- Use of the `PACK_KEYS` or `MAX_ROWS` table option in `ALTER TABLE` should have triggered table reconstruction but did not. ([Bug#39372](#))
- The server returned a column type of `VARBINARY` rather than `DATE` as the result from the `COALESCE()`, `IFNULL()`, `IF()`, `GREATEST()`, or `LEAST()` functions or `CASE` expression if the result was obtained using `filesort` in an anonymous temporary table during the query execution. ([Bug#39283](#))
- A server built using yaSSL for SSL support would crash if configured to use an RSA key and a client sent a cipher list containing a non-RSA key as acceptable. ([Bug#39178](#))
- When built with Valgrind, the server failed to access tables created with the `DATA DIRECTORY` or `INDEX DIRECTORY` table option. ([Bug#39102](#))
- With binary logging enabled `CREATE VIEW` was subject to possible buffer overwrite and a server crash. ([Bug#39040](#))
- The fast mutex implementation was subject to excessive lock contention. ([Bug#38941](#))
- Use of `InnoDB` monitoring (`SHOW ENGINE INNODB STATUS` or one of the `InnoDB` Monitor tables) could cause a server crash due to invalid access to a shared variable in a concurrent environment. ([Bug#38883](#))
- `InnoDB` could fail to generate `AUTO_INCREMENT` values after an `UPDATE` statement for the table. ([Bug#38839](#))
- If delayed insert failed to upgrade the lock, it did not free the temporary memory storage used to keep newly constructed `BLOB` values in memory, resulting in a memory leak. ([Bug#38693](#))
- On Windows, a five-second delay occurred at shutdown of applications that used the embedded server. ([Bug#38522](#))
- On Solaris, a scheduling policy applied to the main server process could be unintentionally overwritten in client-servicing threads. ([Bug#38477](#))
- Building MySQL on FreeBSD would result in a failure during the `gen_lex_hash` phase of the build. ([Bug#38364](#))
- On Windows, the embedded server would crash in `mysql_library_init()` if the language file was missing. ([Bug#38293](#))
- A mix of `TRUNCATE TABLE` with `LOCK TABLES` and `UNLOCK TABLES` for an `InnoDB` could cause a server crash. ([Bug#38231](#))
- The `ExtractValue()` function did not work correctly with XML documents containing a `DOCTYPE` declaration. ([Bug#38227](#))
- Queries with a `HAVING` clause could return a spurious row. ([Bug#38072](#))
- The Event Scheduler no longer logs “started in thread” or “executed” successfully messages to the error log. ([Bug#38066](#))
- Use of spatial data types in prepared statements could cause memory leaks or server crashes. ([Bug#37956](#), [Bug#37671](#))
- An error in a debugging check caused crashes in debug servers. ([Bug#37936](#))
- A `SELECT` with a `NULL NOT IN` condition containing a complex subquery from the same table as in the outer select caused an assertion failure. ([Bug#37894](#))
- The presence of a `/* ... */` comment preceding a query could cause `InnoDB` to use unnecessary gap locks. ([Bug#37885](#))
- Use of an uninitialized constant in `EXPLAIN` evaluation caused an assertion failure. ([Bug#37870](#))
- When using `ALTER TABLE` on an `InnoDB` table, the `AUTO_INCREMENT` value could be changed to an incorrect value. ([Bug#37788](#))
- Primary keys were treated as part of a covering index even if only a prefix of a key column was used. ([Bug#37742](#))

- Renaming an `ARCHIVE` table to the same name with different lettercase and then selecting from it could cause a server crash. ([Bug#37719](#))
  - The `MONTHNAME()` and `DAYNAME()` functions returned a binary string, so that using `LOWER()` or `UPPER()` had no effect. Now `MONTHNAME()` and `DAYNAME()` return a value in `character_set_connection` character set. ([Bug#37575](#))
  - `TIMEDIFF()` was erroneously treated as always returning a positive result. Also, `CAST()` of `TIME` values to `DECIMAL` dropped the sign of negative values. ([Bug#37553](#))
- See also [Bug#42525](#).
- `SHOW PROCESSLIST` displayed “copy to tmp table” when no such copy was occurring. ([Bug#37550](#))
  - `mysqlcheck` used `SHOW FULL TABLES` to get the list of tables in a database. For some problems, such as an empty `.frm` file for a table, this would fail and `mysqlcheck` then would neglect to check other tables in the database. ([Bug#37527](#))
  - Updating a view with a subquery in the `CHECK` option could cause an assertion failure. ([Bug#37460](#))
  - Statements that displayed the value of system variables (for example, `SHOW VARIABLES`) expect variable values to be encoded in `character_set_system`. However, variables set from the command line such as `basedir` or `datadir` were encoded using `character_set_filesystem` and not converted correctly. ([Bug#37339](#))
  - `CREATE INDEX` could crash with `InnoDB` plugin 1.0.1. ([Bug#37284](#))
  - Certain boolean-mode `FULLTEXT` searches that used the truncation operator did not return matching records and calculated relevance incorrectly. ([Bug#37245](#))
  - On a 32-bit server built without big tables support, the offset argument in a `LIMIT` clause might be truncated due to a 64-bit to 32-bit cast. ([Bug#37075](#))
  - For an `InnoDB` table with a `FOREIGN KEY` constraint, `TRUNCATE TABLE` may be performed using row by row deletion. If an error occurred during this deletion, the table would be only partially emptied. Now if an error occurs, the truncation operation is rolled back and the table is left unchanged. ([Bug#37016](#))
  - The code for the `ut_usectime()` function in `InnoDB` did not handle errors from the `gettimeofday()` system call. Now it retries `gettimeofday()` several times and updates the value of the `Innodb_row_lock_time_max` status variable only if `ut_usectime()` was successful. ([Bug#36819](#))
  - Use of `CONVERT()` with `GROUP BY` to convert numeric values to `CHAR` could return truncated results. ([Bug#36772](#))
  - The `mysql` client, when built with Visual Studio 2005, did not display Japanese characters. ([Bug#36279](#))
  - `CREATE INDEX` for `InnoDB` tables could under very rare circumstances cause the server to crash.. ([Bug#36169](#))
  - A read past the end of the string could occur while parsing the value of the `--innodb-data-file-path` option. ([Bug#36149](#))
  - Setting the `slave_compressed_protocol` system variable to `DEFAULT` failed in the embedded server. ([Bug#35999](#))
  - For upgrades to MySQL 5.1 or higher, `mysql_upgrade` did not re-encode database or table names that contained nonalphanumeric characters. (They would still appear after the upgrade with the `#mysql150#` prefix described in [Section 8.2.3, “Mapping of Identifiers to File Names”](#).) To correct this problem, it was necessary to run `mysqlcheck -all-databases --check-upgrade --fix-db-names --fix-table-names` manually. `mysql_upgrade` now runs that command automatically after performing the initial upgrade. ([Bug#35934](#))
  - `SHOW CREATE TABLE` did not display a printable value for the default value of `BIT` columns. ([Bug#35796](#))
  - The columns that store character set and collation names in several `INFORMATION_SCHEMA` tables were lengthened because they were not long enough to store some possible values: `SCHEMATA`, `TABLES`, `COLUMNS`, `CHARACTER_SETS`, `COLLATIONS`, and `COLLATION_CHARACTER_SET_APPLICABILITY`. ([Bug#35789](#))
  - The `max_length` metadata value was calculated incorrectly for the `FORMAT()` function, which could cause incorrect result set metadata to be sent to clients. ([Bug#35558](#))
  - `InnoDB` was not updating the `Handler_delete` or `Handler_update` status variables. ([Bug#35537](#))
  - `InnoDB` could fail to generate `AUTO_INCREMENT` values if rows previously had been inserted containing literal values for the `AUTO_INCREMENT` column. ([Bug#35498](#), [Bug#36411](#), [Bug#39830](#))
  - The `CREATE_OPTIONS` column for `INFORMATION_SCHEMA.TABLES` did not display the `KEY_BLOCK_SIZE` option. ([Bug#35275](#))

- Selecting from an `INFORMATION_SCHEMA` table into an incorrectly defined `MERGE` table caused an assertion failure. ([Bug#35068](#))
- `perror` on Windows did not know about Win32 system error codes. ([Bug#34825](#))
- `EXPLAIN EXTENDED` evaluation of aggregate functions that required a temporary table caused a server crash. ([Bug#34773](#))
- `SHOW GLOBAL STATUS` shows values that aggregate the session status values for all threads. This did not work correctly for the embedded server. ([Bug#34517](#))
- `mysqldumpslow` did not aggregate times. ([Bug#34129](#))
- `mysql_config` did not output `-ldl` (or equivalent) when needed for `--libmysqld-libs`, so its output could be insufficient to build applications that use the embedded server. ([Bug#34025](#))
- The `mysql` client incorrectly parsed statements containing the word “delimiter” in mid-statement.

This fix is different from the one applied for this bug in MySQL 5.1.26. ([Bug#33812](#))

See also [Bug#38158](#).

- For a stored procedure containing a `SELECT * ... RIGHT JOIN` query, execution failed for the second call. ([Bug#33811](#))
- Previously, use of index hints with views (which do not have indexes) produced the error `ERROR 1221 (HY000): INCORRECT USAGE OF USE/IGNORE INDEX AND VIEW`. Now this produces `ERROR 1176 (HY000): KEY '...' DOESN'T EXIST IN TABLE '...'`, the same error as for base tables without an appropriate index. ([Bug#3461](#))
- Three conditions were discovered that could cause an upgrade from MySQL 5.0 to 5.1 to fail: 1) Triggers associated with a table that had a `#mysql150#` prefix in the name could cause assertion failure. 2) `ALTER DATABASE ... UPGRADE DATA DIRECTORY NAME` failed for databases that had a `#mysql150#` prefix if there were triggers in the database. 3) `mysqlcheck --fix-table-name` didn't use UTF8 as the default character set, resulting in parsing errors for tables with nonlatin symbols in their names and trigger definitions. ([Bug#33094](#), [Bug#41385](#))
- Execution of a prepared statement that referred to a system variable caused a server crash. ([Bug#32124](#))
- Some division operations produced a result with incorrect precision. ([Bug#31616](#))
- Queries executed using join buffering of `BIT` columns could produce incorrect results. ([Bug#31399](#))
- `ALTER TABLE CONVERT TO CHARACTER SET` did not convert `TINYTEXT` or `MEDIUMTEXT` columns to a longer text type if necessary when converting the column to a different character set. ([Bug#31291](#))
- Server variables could not be set to their current values on Linux platforms. ([Bug#31177](#))

See also [Bug#6958](#).

- For installation on Solaris using `pkgadd` packages, the `mysql_install_db` script was generated in the `scripts` directory, but the temporary files used during the process were left there and not deleted. ([Bug#31052](#))
- Static storage engines and plugins that were disabled and dynamic plugins that were installed but disabled were not listed in the `INFORMATION_SCHEMA` appropriate `PLUGINS` or `ENGINES` table. ([Bug#29263](#))
- Some `SHOW` statements and retrievals from the `INFORMATION_SCHEMA TRIGGERS` and `EVENTS` tables used a temporary table and incremented the `Created_tmp_disk_tables` status variable, due to the way that `TEXT` columns are handled. The `TRIGGERS.SQL_MODE`, `TRIGGERS.DEFINER`, and `EVENTS.SQL_MODE` columns now are `VARCHAR` to avoid this problem. ([Bug#29153](#))
- For several read only system variables that were viewable with `SHOW VARIABLES`, attempting to view them with `SELECT @@var_name` or set their values with `SET` resulted in an `unknown system variable` error. Now they can be viewed with `SELECT @@var_name` and attempting to set their values results in a message indicating that they are read only. ([Bug#28234](#))
- On Windows, Visual Studio does not take into account some x86 hardware limitations, which led to incorrect results converting large `DOUBLE` values to unsigned `BIGINT` values. ([Bug#27483](#))
- SSL support was not included in some “generic” RPM packages. ([Bug#26760](#))
- The `Questions` status variable is intended as a count of statements sent by clients to the server, but was also counting statements executed within stored routines. ([Bug#24289](#))
- Setting the session value of the `max_allowed_packet` or `net_buffer_length` system variable was permitted but had

no effect. The session value of these variables is now read only. ([Bug#22891](#))

See also [Bug#32223](#).

- A race condition between the `mysqld.exe` server and the Windows service manager could lead to inability to stop the server from the service manager. ([Bug#20430](#))
- On Windows, moving an `InnoDB .ibd` file and then symlinking to it in the database directory using a `.sym` file caused a server crash. ([Bug#11894](#))

## C.1.27. Changes in MySQL 5.1.30 (14 November 2008 General Availability)

Bugs fixed:

- **Partitioning:** A `SELECT` using a range `WHERE` condition with an `ORDER BY` on a partitioned table caused a server crash. ([Bug#40494](#))
- **Replication:** Executing `SHOW BINLOG EVENTS` increased the value of `max_allowed_packet` applying to the session that executed the statement. ([Bug#55322](#))
- **Replication:** Row-based replication failed with nonpartitioned `MyISAM` tables having no indexes. ([Bug#40004](#))
- With statement-based binary logging format and a transaction isolation level of `READ COMMITTED` or stricter, `InnoDB` printed an error because statement-based logging might lead to inconsistency between master and slave databases. However, this error was printed even when binary logging was not enabled (in which case, no such inconsistency can occur). ([Bug#40360](#))
- The `CHECK TABLE ... FOR UPGRADE` statement did not check for incompatible collation changes made in MySQL 5.1.24 ([Bug#27877](#)). This also affects `mysqlcheck` and `mysql_upgrade`, which cause that statement to be executed. See [Section 2.12.3, “Checking Whether Tables or Indexes Must Be Rebuilt”](#).

Prior to this fix, a binary upgrade (performed without dumping tables with `mysqldump` before the upgrade and reloading the dump file after the upgrade) would corrupt tables that have indexes that use the `utf8_general_ci` or `ucs2_general_ci` collation for columns that contain 'ß' LATIN SMALL LETTER SHARP S (German). After the fix, `CHECK TABLE ... FOR UPGRADE` properly detects the problem and warns about tables that need repair.

However, the fix is not backward compatible and can result in a downgrading problem under these circumstances:

1. Perform a binary upgrade to a version of MySQL that includes the fix.
2. Run `CHECK TABLE ... FOR UPGRADE` (or `mysqlcheck` or `mysql_upgrade`) to upgrade tables.
3. Perform a binary downgrade to a version of MySQL that does not include the fix.

The solution is to dump tables with `mysqldump` before the downgrade and reload the dump file after the downgrade. Alternatively, drop and recreate affected indexes. ([Bug#40053](#))

- Some recent releases for Solaris 10 were built on Solaris 10 U5, which included a new version of `libnsl.so` that does not work on U4 or earlier. To correct this, Solaris 10 builds now are created on machines that do not have that upgraded `libnsl.so`, so that they will work on Solaris 10 installations both with and without the upgraded `libnsl.so`. ([Bug#39074](#))
- With binary logging enabled, `CREATE TABLE ... SELECT` and `INSERT INTO ... SELECT` failed if the source table was a log table. ([Bug#34306](#))
- XA transaction rollbacks could result in corrupted transaction states and a server crash. ([Bug#28323](#))
- `ALTER TABLE` for an `ENUM` column could change column values. ([Bug#23113](#))

## C.1.28. Changes in MySQL 5.1.29 (11 October 2008)

Functionality added or changed:

- **Important Change:** The `--skip-thread-priority` option is now deprecated such that the server won't change the thread priorities by default. Giving threads different priorities might yield marginal improvements in some platforms (where it actually works), but it might instead cause significant degradation depending on the thread count and number of processors. Meddling with the thread priorities is a not a safe bet as it is very dependent on the behavior of the CPU scheduler and system where MySQL is being run. ([Bug#35164](#), [Bug#37536](#))

- **Important Change:** The `--log` option now is deprecated and will be removed (along with the `log` system variable) in the future. Instead, use the `--general_log` option to enable the general query log and the `--general_log_file=file_name` option to set the general query log file name. The values of these options are available in the `general_log` and `general_log_file` system variables, which can be changed at runtime.

Similar changes were made for the `--log-slow-queries` option and `log_slow_queries` system variable. You should use the `--slow_query_log` and `--slow_query_log_file=file_name` options instead (and the `slow_query_log` and `slow_query_log_file` system variables).

- The `BUILD/compile-solaris-*` scripts now compile MySQL with the `mtmalloc` library rather than `malloc`. ([Bug#38727](#))

Bugs fixed:

- **Incompatible Change: Replication:** The default binary logging mode has been changed from `MIXED` to `STATEMENT` for compatibility with MySQL 5.0. ([Bug#39812](#))
- **Incompatible Change:** `CHECK TABLE ... FOR UPGRADE` did not check for incompatible collation changes made in MySQL 5.1.21 ([Bug#29499](#)) and 5.1.23 ([Bug#27562](#), [Bug#29461](#)). This also affects `mysqlcheck` and `mysql_upgrade`, which cause that statement to be executed. See [Section 2.12.3, “Checking Whether Tables or Indexes Must Be Rebuilt”](#). ([Bug#39585](#))

See also [Bug#40984](#).
- **Incompatible Change:** In connection with view creation, the server created `arc` directories inside database directories and maintained useless copies of `.frm` files there. Creation and renaming procedures of those copies as well as creation of `arc` directories has been discontinued.

This change does cause a problem when downgrading to older server versions which manifests itself under these circumstances:

1. Create a view `v_orig` in MySQL 5.1.29 or higher.
2. Rename the view to `v_new` and then back to `v_orig`.
3. Downgrade to an older 5.1.x server and run `mysql_upgrade`.
4. Try to rename `v_orig` to `v_new` again. This operation fails.

As a workaround to avoid this problem, use either of these approaches:

- Dump your data using `mysqldump` before downgrading and reload the dump file after downgrading.
- Instead of renaming a view after the downgrade, drop it and recreate it.

The downgrade problem introduced by the fix for this bug has been addressed as [Bug#40021](#). ([Bug#17823](#))

- **Important Change: Replication:** The `SUPER` privilege is now required to change the session value of `binlog_format` as well as its global value. For more information about `binlog_format`, see [Section 16.1.2, “Replication Formats”](#). ([Bug#39106](#))
- **Partitioning: Replication:** Replication to partitioned `MyISAM` tables could be slow with row-based binary logging. ([Bug#35843](#))
- **Partitioning:** If an error occurred when evaluating a column of a partitioned table for the partitioning function, the row could be inserted anyway. ([Bug#38083](#))
- **Partitioning:** Using `INSERT ... SELECT` to insert records into a partitioned `MyISAM` table could fail if some partitions were empty and others are not. ([Bug#38005](#))
- **Partitioning:** Ordered range scans on partitioned tables were not always handled correctly. In some cases this caused some rows to be returned twice. The same issue also caused `GROUP BY` query results to be aggregated incorrectly. ([Bug#30573](#), [Bug#33257](#), [Bug#33555](#))
- **Replication:** Server code used in binary logging could in some cases be invoked even though binary logging was not actually enabled, leading to asserts and other server errors. ([Bug#38798](#))
- **Replication:** Replication of `BLACKHOLE` tables did not work with row-based binary logging. ([Bug#38360](#))
- **Replication:** In some cases, a replication master sent a special event to a reconnecting slave to keep the slave's temporary

tables, but they still had references to the “old” slave SQL thread and used them to access that thread’s data. ([Bug#38269](#))

- **Replication:** Replication filtering rules were inappropriately applied when executing `BINLOG` pseudo-queries. One way in which this problem showed itself was that, when replaying a binary log with `mysqlbinlog`, RBR events were sometimes not executed if the `--replicate-do-db` option was specified. Now replication rules are applied only to those events executed by the slave SQL thread. ([Bug#36099](#))
- **Replication:** For a `CREATE TABLE ... SELECT` statement that creates a table in a database other than the current one, the table could be created in the wrong database on replication slaves if row-based binary logging is used. ([Bug#34707](#))
- **Replication:** A statement did not always commit or roll back correctly when the server was shut down; the error could be triggered by having a failing `UPDATE` or `INSERT` statement on a transactional table, causing an implicit rollback. ([Bug#32709](#))

See also [Bug#38262](#).

- The Sun Studio compiler failed to build debug versions of the server due to use of features specific to `gcc`. ([Bug#39451](#))
- For a `TIMESTAMP` column in an `InnoDB` table, testing the column with multiple conditions in the `WHERE` clause caused a server crash. ([Bug#39353](#))
- References to local variables in stored procedures are replaced with `NAME_CONST(name, value)` when written to the binary log. However, an “illegal mix of collation” error might occur when executing the log contents if the value’s collation differed from that of the variable. Now information about the variable collation is written as well. ([Bug#39182](#))
- Queries of the form `SELECT ... REGEXP BINARY NULL` could lead to a hung or crashed server. ([Bug#39021](#))
- Statements of the form `INSERT ... SELECT .. ON DUPLICATE KEY UPDATE col_name = DEFAULT` could result in a server crash. ([Bug#39002](#))
- Column names constructed due to wild-card expansion done inside a stored procedure could point to freed memory if the expansion was performed after the first call to the stored procedure. ([Bug#38823](#))
- Repeated `CREATE TABLE ... SELECT` statements, where the created table contained an `AUTO_INCREMENT` column, could lead to an assertion failure. ([Bug#38821](#))
- For deadlock between two transactions that required a timeout to resolve, all server tables became inaccessible for the duration of the deadlock. ([Bug#38804](#))
- When inserting a string into a duplicate-key error message, the server could improperly interpret the string, resulting in a crash. ([Bug#38701](#))
- A race condition between threads sometimes caused unallocated memory to be addressed. ([Bug#38692](#))
- A server crash resulted from concurrent execution of a multiple-table `UPDATE` that used a `NATURAL` or `USING` join together with `FLUSH TABLES WITH READ LOCK` or `ALTER TABLE` for the table being updated. ([Bug#38691](#))
- On ActiveState Perl, `mysql-test-run.pl --start-and-exit` started but did not exit. ([Bug#38629](#))
- An uninitialized variable in the query profiling code was corrected (detected by Valgrind). ([Bug#38560](#))
- A server crash resulted from execution of an `UPDATE` that used a derived table together with `FLUSH TABLES`. ([Bug#38499](#))
- Stored procedures involving substrings could crash the server on certain platforms due to invalid memory reads. ([Bug#38469](#))
- The handlerton-to-plugin mapping implementation did not free handler plugin references when the plugin was uninstalled, resulting in a server crash after several install/uninstall cycles. Also, on Mac OS X, the server crashed when trying to access an `EXAMPLE` table after the `EXAMPLE` plugin was installed. ([Bug#37958](#))
- The server crashed if an argument to a stored procedure was a subquery that returned more than one row. ([Bug#37949](#))
- When analyzing the possible index use cases, the server was incorrectly reusing an internal structure, leading to a server crash. ([Bug#37943](#))
- Access checks were skipped for `SHOW PROCEDURE STATUS` and `SHOW FUNCTION STATUS`, which could lead to a server crash or insufficient access checks in subsequent statements. ([Bug#37908](#))
- The `<=` operator could return incorrect results when comparing `NULL` to `DATE`, `TIME`, or `DATETIME` values. ([Bug#37526](#))
- The combination of a subquery with a `GROUP BY`, an aggregate function calculated outside the subquery, and a `GROUP BY` on the outer `SELECT` could cause the server to crash. ([Bug#37348](#))

- The `NO_BACKSLASH_ESCAPES` SQL mode was ignored for `LOAD DATA INFILE` and `SELECT INTO ... OUTFILE`. The setting is taken into account now. ([Bug#37114](#))
- In some cases, references to views were confused with references to anonymous tables and privilege checking was not performed. ([Bug#36086](#))
- For crash reports on Windows, symbol names in stack traces were not correctly resolved. ([Bug#35987](#))
- `ALTER EVENT` changed the `PRESERVE` attribute of an event even when `PRESERVE` was not specified in the statement. ([Bug#35981](#))
- Host name values in SQL statements were not being checked for '@', which is illegal according to RFC952. ([Bug#35924](#))
- `mysql_install_db` failed on machines that had the host name set to `localhost`. ([Bug#35754](#))
- Dynamic plugins failed to load on i5/OS. ([Bug#35743](#))
- With the `PAD_CHAR_TO_FULL_LENGTH` SQL mode enabled, a `ucs2 CHAR` column returned additional garbage after trailing space characters. ([Bug#35720](#))
- A trigger for an `InnoDB` table activating multiple times could lead to `AUTO_INCREMENT` gaps. ([Bug#31612](#))
- `mysqldump` could fail to dump views containing a large number of columns. ([Bug#31434](#))
- The server could improperly type user-defined variables used in the select list of a query. ([Bug#26020](#))
- For access to the `INFORMATION_SCHEMA.VIEWS` table, the server did not check the `SHOW VIEW` and `SELECT` privileges, leading to inconsistency between output from that table and the `SHOW CREATE VIEW` statement. ([Bug#22763](#))
- `mysqld_safe` would sometimes fail to remove the pid file for the old `mysql` process after a crash. As a result, the server would fail to start due to a false `A mysqld process already exists...` error. ([Bug#11122](#))

## C.1.29. Changes in MySQL 5.1.28 (28 August 2008)

Functionality added or changed:

- **Important Change:** `mysqlbinlog` now supports `--verbose` and `--base64-output=DECODE-ROWS` options to display row events as commented SQL statements. (The default otherwise is to display row events encoded as base-64 strings using `BINLOG` statements.) See [Section 4.6.7.2, “mysqlbinlog Row Event Display”](#). ([Bug#31455](#))
- MySQL source distributions are now available in Zip format. ([Bug#27742](#))
- Added the `SHOW PROFILES` and `SHOW PROFILE` statements to display statement profile data, and the accompanying `INFORMATION_SCHEMA.PROFILING` table. Profiling is controlled using the `profiling` and `profiling_history_size` session variables. see [Section 12.4.5.33, “SHOW PROFILES Syntax”](#), and [Section 20.26, “The INFORMATION\\_SCHEMA PROFILING Table”](#). (Community contribution by Jeremy Cole)

The profiling feature is enabled using the `--enable-community-features` and `--enable-profiling` options to `configure`. These options are enabled by default; to disable them, use `--disable-community-features` and `--disable-profiling`. ([Bug#24795](#))

Bugs fixed:

- **Performance: Incompatible Change:** Some performance problems of `SHOW ENGINE INNODB STATUS` were reduced by removing `used cells` and `Total number of lock structs in row lock hash table` from the output. Now these values are present only if the `UNIV_DEBUG` symbol is defined at MySQL build time. ([Bug#36941](#), [Bug#36942](#))
- **Performance:** Over-aggressive lock acquisition by `InnoDB` when calculating free space for tablespaces could result in performance degradation when multiple threads were executing statements on multi-core machines. ([Bug#38185](#))
- **Important Change: Security Fix:** Additional corrections were made for the symlink-related privilege problem originally addressed in MySQL 5.1.24. The original fix did not correctly handle the data directory path name if it contained symlinks directories in its path, and the check was made only at table-creation time, not at table-opening time later.

### Note

Additional fixes were made in MySQL 5.1.41.

(Bug#32167, CVE-2008-2079)

See also Bug#39277.

- **Security Enhancement:** The server consumed excess memory while parsing statements with hundreds or thousands of nested boolean conditions (such as `OR (OR ... (OR ... ))`). This could lead to a server crash or incorrect statement execution, or cause other client statements to fail due to lack of memory. The latter result constitutes a denial of service. (Bug#38296)
- **Incompatible Change:** There were some problems using `DllMain()` hook functions on Windows that automatically do global and per-thread initialization for `libmysqld.dll`:
  - Per-thread initialization: MySQL internally counts the number of active threads, which causes a delay in `my_end()` if not all threads have exited. But there are threads that can be started either by Windows internally (often in TCP/IP scenarios) or by users. Those threads do not necessarily use `libmysql.dll` functionality but still contribute to the open-thread count. (One symptom is a five-second delay in times for PHP scripts to finish.)
  - Process-initialization: `my_init()` calls `WSAStartup` that itself loads DLLs and can lead to a deadlock in the Windows loader.

To correct these problems, DLL initialization code now is not invoked from `libmysql.dll` by default. To obtain the previous behavior (DLL initialization code will be called), set the `LIBMYSQL_DLLINIT` environment variable to any value. This variable exists only to prevent breakage of existing Windows-only applications that do not call `mysql_thread_init()` and work okay today. Use of `LIBMYSQL_DLLINIT` is discouraged and is removed in MySQL 6.0. (Bug#37226, Bug#33031)

- **Incompatible Change:** `SHOW STATUS` took a lot of CPU time for calculating the value of the `In-nodb_buffer_pool_pages_latched` status variable. Now this variable is calculated and included in the output of `SHOW STATUS` only if the `UNIV_DEBUG` symbol is defined at MySQL build time. (Bug#36600)
- **Incompatible Change:** An additional correction to the original MySQL 5.1.23 fix was made to normalize directory names before adding them to the list of directories. This prevents `/etc/` and `/etc` from being considered different, for example. (Bug#20748)

See also Bug#38180.

- **Partitioning:** When a partitioned table had a `TIMESTAMP` column defined with `CURRENT_TIMESTAMP` as the default but with no `ON UPDATE` clause, the column's value was incorrectly set to `CURRENT_TIMESTAMP` when updating across partitions. (Bug#38272)
- **Partitioning:** `myisamchk` failed with an assertion error when analyzing a partitioned `MyISAM` table. (Bug#37537)
- **Partitioning:** A `LIST` partitioned `MyISAM` table returned erroneous results when an index was present on a column in the `WHERE` clause and `NOT IN` was used on that column.

Searches using the index were also much slower than if the index were not present. (Bug#35931)

- **Partitioning:** `SELECT COUNT(*)` was not correct for some partitioned tables using a storage engine that did not support `HA_STATS_RECORDS_IS_EXACT`. Tables using the `ARCHIVE` storage engine were known to be affected.

This was because `ha_partition::records()` was not implemented, and so the default `handler::records()` was used in its place. However, this is not correct behavior if the storage engine does not support `HA_STATS_RECORDS_IS_EXACT`.

The solution was to implement `ha_partition::records()` as a wrapper around the underlying partition records.

As a result of this fix, the `rows` column in the output of `EXPLAIN PARTITIONS` now includes the total number of records in the partitioned table. (Bug#35745)

- **Partitioning:** `MyISAM` recovery enabled with the `--myisam-recover` option did not work for partitioned `MyISAM` tables. (Bug#35161)
- **Partitioning:** When one user was in the midst of a transaction on a partitioned table, a second user performing an `ALTER TABLE` on this table caused the server to hang. (Bug#34604)
- **Partitioning:** Attempting to execute an `INSERT DELAYED` statement on a partitioned table produced the error `TABLE STORAGE ENGINE FOR 'TABLE' DOESN'T HAVE THIS OPTION`, which did not reflect the source of the error accurately. The error message returned in such cases has been changed to `DELAYED OPTION NOT SUPPORTED FOR TABLE 'TABLE'`. (Bug#31210)
- **Replication:** Some kinds of internal errors, such as `OUT OF MEMORY` errors, could cause the server to crash when replicating statements with user variables.

certain internal errors. ([Bug#37150](#))

- **Replication:** Row-based replication did not correctly copy `TIMESTAMP` values from a big-endian storage engine to a little-endian storage engine. ([Bug#37076](#))
- **Replication:** `INSTALL PLUGIN` and `UNINSTALL PLUGIN` caused row-based replication to fail.

### Note

These statements are not replicated; however, when using row-based logging, the changes they introduce in the `mysql` system tables are written to the binary log.

([Bug#35807](#))

- Server-side cursors were not initialized properly, which could cause a server crash. ([Bug#38486](#))
- A server crash or Valgrind warnings could result when a stored procedure selected from a view that referenced a function. ([Bug#38291](#))
- A failure to clean up binary log events was corrected (detected by Valgrind). ([Bug#38290](#))
- Incorrect handling of aggregate functions when loose index scan was used caused a server crash. ([Bug#38195](#))
- Queries containing a subquery with `DISTINCT` and `ORDER BY` could cause a server crash. ([Bug#38191](#))
- The fix for [Bug#20748](#) caused a problem such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/.my.cnf`. ([Bug#38180](#))
- If the table definition cache contained tables with many `BLOB` columns, much memory could be allocated to caching `BLOB` values. Now a size limit on the cached `BLOB` values is enforced. ([Bug#38002](#))
- For `InnoDB` tables, `ORDER BY ... DESC` sometimes returned results in ascending order. ([Bug#37830](#))
- If a table has a `BIT NOT NULL` column `c1` with a length shorter than 8 bits and some additional `NOT NULL` columns `c2, ..., cn`, and a `SELECT` query has a `WHERE` clause of the form `(c1 = constant) AND c2 ...`, the query could return an unexpected result set. ([Bug#37799](#))
- The server returned unexpected results if a right side of the `NOT IN` clause consisted of the `NULL` value and some constants of the same type. For example, this query might return 3, 4, 5, and so forth if a table contained those values:

```
SELECT * FROM t WHERE NOT t.id IN (NULL, 1, 2);
```

([Bug#37761](#))

- Setting the session value of the `innodb_table_locks` system variable caused a server crash. ([Bug#37669](#))
- Nesting of `IF()` inside of `SUM()` could cause an extreme server slowdown. ([Bug#37662](#))
- Killing a query that used an `EXISTS` subquery as the argument to `SUM()` or `AVG()` caused a server crash. ([Bug#37627](#))
- When using indexed `ORDER BY` sorting, incorrect query results could be produced if the optimizer switched from a covering index to a noncovering index. ([Bug#37548](#))
- After `TRUNCATE TABLE` for an `InnoDB` table, inserting explicit values into an `AUTO_INCREMENT` column could fail to increment the counter and result in a duplicate-key error for subsequent insertion of `NULL`. ([Bug#37531](#))
- Within stored programs or prepared statements, `REGEXP` could return incorrect results due to improper initialization. ([Bug#37337](#))
- For a `MyISAM` table with `CHECKSUM = 1` and `ROW_FORMAT = DYNAMIC` table options, a data consistency check (maximum record length) could fail and cause the table to be marked as corrupted. ([Bug#37310](#))
- The `max_length` result set metadata value was calculated incorrectly under some circumstances. ([Bug#37301](#))
- If the length of a field was 3, internal `InnoDB` to integer type conversion didn't work on big-endian machines in the `row_search_autoinc_column()` function. ([Bug#36793](#))
- A query which had an `ORDER BY DESC` clause that is satisfied with a reverse range scan could cause a server crash for some specific CPU/compiler combinations. ([Bug#36639](#))

- The `CSV` storage engine returned success even when it failed to open a table's data file. ([Bug#36638](#))
- `SELECT DISTINCT` from a simple view on an `InnoDB` table, where all selected columns belong to the same unique index key, returned incorrect results. ([Bug#36632](#))
- Dumping information about locks in use by sending a `SIGHUP` signal to the server or by invoking the `mysqladmin debug` command could lead to a server crash in debug builds or to undefined behavior in production builds. ([Bug#36579](#))
- If initialization of an `INFORMATION_SCHEMA` plugin failed, `INSTALL PLUGIN` freed some internal plugin data twice. ([Bug#36399](#))
- For `InnoDB` tables, the `DATA_FREE` column of the `INFORMATION_SCHEMA.TABLES` displayed free space in kilobytes rather than bytes. Now it displays bytes. ([Bug#36278](#))
- When the fractional part in a multiplication of `DECIMAL` values overflowed, the server truncated the first operand rather than the longest. Now the server truncates so as to produce more precise multiplications. ([Bug#36270](#))
- The `mysql` client failed to recognize comment lines consisting of `--` followed by a newline. ([Bug#36244](#))
- The server could crash with an assertion failure (or cause the client to get a “Packets out of order” error) when the expected query result was that it should terminate with a “Subquery returns more than 1 row” error. ([Bug#36135](#))
- The `UUID()` function returned UUIDs with the wrong time; this was because the offset for the time part in UUIDs was miscalculated. ([Bug#35848](#))
- The `configure` script did not permit `utf8_hungarian_ci` to be specified as the default collation. ([Bug#35808](#))
- On 64-bit systems, assigning values of  $2^{63} - 1$  or larger to `key_buffer_size` caused memory overruns. ([Bug#35616](#))
- For `InnoDB` tables, `REPLACE` statements used “traditional” style locking, regardless of the setting of `innodb_autoinc_lock_mode`. Now `REPLACE` works the same way as “simple inserts” instead of using the old locking algorithm. (`REPLACE` statements are treated in the same way as `INSERT` statements.) ([Bug#35602](#))
- Freeing of an internal parser stack during parsing of complex stored programs caused a server crash. ([Bug#35577](#), [Bug#37269](#), [Bug#37228](#))
- `mysqlbinlog` left temporary files on the disk after shutdown, leading to the pollution of the temporary directory, which eventually caused `mysqlbinlog` to fail. This caused problems in testing and other situations where `mysqlbinlog` might be invoked many times in a relatively short period of time. ([Bug#35543](#))
- Index scans performed with the `sort_union()` access method returned wrong results, caused memory to be leaked, and caused temporary files to be deleted when the limit set by `sort_buffer_size` was reached. ([Bug#35477](#), [Bug#35478](#))
- Table checksum calculation could cause a server crash for `FEDERATED` tables with `BLOB` columns containing `NULL` values. ([Bug#34779](#))
- A significant slowdown occurred when many `SELECT` statements that return many rows from `InnoDB` tables were running concurrently. ([Bug#34409](#))
- `mysql_install_db` failed if the server was running with an SQL mode of `TRADITIONAL`. This program now resets the SQL mode internally to avoid this problem. ([Bug#34159](#))
- Changes to build files were made to enable the MySQL distribution to compile on Microsoft Visual C++ Express 2008. ([Bug#33907](#))
- Fast `ALTER TABLE` operations were not fast for columns that used multibyte character sets. ([Bug#33873](#))
- The internal functions `my_getsys time()`, `my_micro_time()`, and `my_micro_time_and_time()` did not work correctly on Windows. One symptom was that uniqueness of `UUID()` values could be compromised. ([Bug#33748](#))
- Cached queries that used 256 or more tables were not properly cached, so that later query invalidation due to a `TRUNCATE TABLE` for one of the tables caused the server to hang. ([Bug#33362](#))
- `mysql_upgrade` attempted to use the `/proc` file system even on systems that do not have it. ([Bug#31605](#))
- `mysql_install_db` failed if the default storage engine was `NDB`. Now it explicitly uses `MyISAM` as the storage engine when running `mysqld --bootstrap`. ([Bug#31315](#))
- Several MySQL programs could fail if the `HOME` environment variable had an empty value. ([Bug#30394](#))
- On NetWare, `mysql_install_db` could appear to execute normally even if it failed to create the initial databases.

**Bug#30129)**

- The Serbian translation for the `ER_INCORRECT_GLOBAL_LOCAL_VAR` error was corrected. ([Bug#29738](#))
- `TRUNCATE TABLE` for `InnoDB` tables returned a count showing too many rows affected. Now the statement returns 0 for `InnoDB` tables. ([Bug#29507](#))
- The `BUILD/check-cpu` build script failed if `gcc` had a different name (such as `gcc.real` on Debian). ([Bug#27526](#))
- In some cases, the parser interpreted the `;` character as the end of input and misinterpreted stored program definitions. ([Bug#26030](#))
- The `FLUSH PRIVILEGES` statement did not produce an error when it failed. ([Bug#21226](#))
- After executing a prepared statement that accesses a stored function, the next execution would fail to find the function if the stored function cache was flushed in the meantime. ([Bug#12093](#), [Bug#21294](#))

## C.1.30. Changes in MySQL 5.1.27 (Not released)

Functionality added or changed:

- `mysqltest` now installs signal handlers and generates a stack trace if it crashes. ([Bug#37003](#))
- `mysql-test-run.pl` now supports `--client-bindir` and `--client-libdir` options for specifying the directory where client binaries and libraries are located. ([Bug#34995](#))

Bugs fixed:

- **Partitioning: Incompatible Change:** On Mac OS X, with `lower_case_table_names = 2`, the server could not read partitioned tables whose names contained uppercase letters.  
Partitioned tables using mixed case names should be renamed or dropped before upgrading to this version of the server on Mac OS X. ([Bug#37402](#))
- **Important Change: Partitioning:** The statements `ANALYZE TABLE`, `CHECK TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` are now supported for partitioned tables.

Also as a result of this fix, the following statements which were disabled in MySQL 5.1.24 have been re-enabled:

- `ALTER TABLE ... ANALYZE PARTITION`
- `ALTER TABLE ... CHECK PARTITION`
- `ALTER TABLE ... OPTIMIZE PARTITION`
- `ALTER TABLE ... REPAIR PARTITION`

([Bug#20129](#))

See also [Bug#39434](#).

- **Replication:** Issuing a `DROP DATABASE` while any temporary tables were open caused the server to switch to statement-based mode. ([Bug#38773](#))
- **Replication:** The `--replicate-*-table` options were not evaluated correctly when replicating multi-table updates.

As a result of this fix, replication of multi-table updates no longer fails when an update references a missing table but does not update any of its columns. ([Bug#37051](#))

- The fix for [Bug#33812](#) had the side effect of causing the `mysql` client not to be able to read some dump files produced with `mysqldump`. To address this, that fix was reverted. ([Bug#38158](#))

## C.1.31. Changes in MySQL 5.1.26 (30 June 2008)

Functionality added or changed:

- **Important Change: Incompatible Change:** The `FEDERATED` storage engine is now disabled by default in binary distributions. The engine is still available and can be enabled by starting the server with the `--federated` option. ([Bug#37069](#))
- `mysqld test` was changed to be more robust in the case of a race condition that can occur for rapid disconnect/connect sequences with the server. The account used by `mysqld test` could reach its permitted simultaneous-sessions user limit if the connect attempt occurred before the server had fully processed the preceding disconnect. `mysqld test` now checks specifically for a user-limits error when it connects; if that error occurs, it delays briefly before retrying. ([Bug#23921](#))

Bugs fixed:

- **Replication:** Row-based replication broke for `utf8 CHAR` columns longer than 85 characters. ([Bug#37426](#))
- **Replication:** Performing an insert on a table having an `AUTO_INCREMENT` column and an `INSERT` trigger that was being replicated from a master running MySQL 5.0 or any version of MySQL 5.1 up to and including MySQL 5.1.11 to a slave running MySQL 5.1.12 or later caused the replication slave to crash. ([Bug#36443](#))

See also [Bug#33029](#).

- Some binary distributions had a duplicate “-64bit” suffix in the file name. ([Bug#37623](#))
- `NOT IN` subqueries that selected `MIN()` or `MAX()` values but produced an empty result could cause a server crash. ([Bug#37004](#))
- `ha_innodb.so` was incorrectly installed in the `lib/mysql` directory rather than in `lib/mysql/plugin`. ([Bug#36434](#))
- An empty bit-string literal (`b' '`) caused a server crash. Now the value is parsed as an empty bit value (which is treated as an empty string in string context or 0 in numeric context). ([Bug#35658](#))
- The code for detecting a byte order mark (BOM) caused `mysql` to crash for empty input. ([Bug#35480](#))
- The `mysql` client incorrectly parsed statements containing the word “delimiter” in mid-statement.

The fix for this bug had the side effect of causing the problem reported in [Bug#38158](#), so it was reverted in MySQL 5.1.27. ([Bug#33812](#))

## C.1.32. Changes in MySQL 5.1.25 (28 May 2008)

Functionality added or changed:

- **Incompatible Change:** A change has been made to the way that the server handles prepared statements. This affects prepared statements processed at the SQL level (using the `PREPARE` statement) and those processed using the binary client-server protocol (using the `mysql_stmt_prepare()` C API function).

Previously, changes to metadata of tables or views referred to in a prepared statement could cause a server crash when the statement was next executed, or perhaps an error at execute time with a crash occurring later. For example, this could happen after dropping a table and recreating it with a different definition.

Now metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. Metadata changes occur for DDL statements such as those that create, drop, alter, rename, or truncate tables, or that analyze, optimize, or repair tables. Repreparation also occurs after referenced tables or views are flushed from the table definition cache, either implicitly to make room for new entries in the cache, or explicitly due to `FLUSH TABLES`.

Repreparation is automatic, but to the extent that it occurs, performance of prepared statements is diminished.

Table content changes (for example, with `INSERT` or `UPDATE`) do not cause repreparation, nor do `SELECT` statements.

An incompatibility with previous versions of MySQL is that a prepared statement may now return a different set of columns or different column types from one execution to the next. For example, if the prepared statement is `SELECT * FROM t1`, altering `t1` to contain a different number of columns causes the next execution to return a number of columns different from the previous execution.

Older versions of the client library cannot handle this change in behavior. For applications that use prepared statements with the new server, an upgrade to the new client library is strongly recommended.

Along with this change to statement repreparation, the default value of the `table_definition_cache` system variable has been increased from 128 to 256. The purpose of this increase is to lessen the chance that prepared statements will need repre-

paration due to referred-to tables/views having been flushed from the cache to make room for new entries.

A status variable, `Com_stmt_reprepare`, has been introduced to track the number of repreparations. ([Bug#27420](#), [Bug#27430](#), [Bug#27690](#))

- **Important Change:** Some changes were made to `CHECK TABLE ... FOR UPGRADE` and `REPAIR TABLE` with respect to detection and handling of tables with incompatible `.frm` files (files created with a different version of the MySQL server). These changes also affect `mysqlcheck` because that program uses `CHECK TABLE` and `REPAIR TABLE`, and thus also `mysql_upgrade` because that program invokes `mysqlcheck`.
  - If your table was created by a different version of the MySQL server than the one you are currently running, `CHECK TABLE ... FOR UPGRADE` indicates that the table has an `.frm` file with an incompatible version. In this case, the result set returned by `CHECK TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Table upgrade required. Please do "REPAIR TABLE `tbl_name`" to fix it!`
  - `REPAIR TABLE` without `USE_FRM` upgrades the `.frm` file to the current version.
  - If you use `REPAIR TABLE ... USE_FRM` and your table was created by a different version of the MySQL server than the one you are currently running, `REPAIR TABLE` will not attempt to repair the table. In this case, the result set returned by `REPAIR TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Failed repairing incompatible .FRM file.`

Previously, use of `REPAIR TABLE ... USE_FRM` with a table created by a different version of the MySQL server risked the loss of all rows in the table.

([Bug#36055](#))

- `mysql_upgrade` now has a `--tmpdir` option to enable the location of temporary files to be specified. ([Bug#36469](#))
- `mysqldump` now adds the `LOCAL` qualifier to the `FLUSH TABLES` statement that is sent to the server when the `-master-data` option is enabled. This prevents the `FLUSH TABLES` statement from replicating to slaves, which is disadvantageous because it would cause slaves to block while the statement executes. ([Bug#35157](#))

See also [Bug#38303](#).

Bugs fixed:

- **Important Change:** The server no longer issues warnings for truncation of excess spaces for values inserted into `CHAR` columns. This reverts a change in the previous release that caused warnings to be issued. ([Bug#30059](#))
- **Replication:** `CREATE PROCEDURE` and `CREATE FUNCTION` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. ([Bug#36570](#))

See also [Bug#32575](#).

- **Replication:** When flushing tables, there was a slight chance that the flush occurred between the processing of one table map event and the next. Since the tables were opened one by one, subsequent locking of tables would cause the slave to crash. This problem was observed when replicating `NDBCLUSTER` or `InnoDB` tables, when executing multi-table updates, and when a trigger or a stored routine performed an (additional) insert on a table so that two tables were effectively being inserted into in the same statement. ([Bug#36197](#))

- **Replication:** `CREATE VIEW` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. Now, all comments are stripped from such statements before being written to the binary log. ([Bug#32575](#))

See also [Bug#36570](#).

- On Windows 64-bit systems, temporary variables of `long` types were used to store `ulong` values, causing key cache initialization to receive distorted parameters. The effect was that setting `key_buffer_size` to values of 2GB or more caused memory exhaustion due to allocation of too much memory. ([Bug#36705](#))
- Multiple-table `UPDATE` statements that used a temporary table could fail to update all qualifying rows or fail with a spurious duplicate-key error. ([Bug#36676](#))
- A `REGEXP` match could return incorrect rows when the previous row matched the expression and used `CONCAT()` with an empty string. ([Bug#36488](#))
- `mysqltest` ignored the value of `--tmpdir` in one place. ([Bug#36465](#))

- When updating an existing instance (for example, from MySQL 5.0 to 5.1, or 5.1 to 6.0), the Instance Configuration Wizard unnecessarily prompted for a `root` password when there was an existing `root` password. ([Bug#36305](#))
- Conversion of a `FLOAT ZEROFILL` value to string could cause a server crash if the value was `NULL`. ([Bug#36139](#))
- On Windows, the installer attempted to use JScript to determine whether the target data directory already existed. On Windows Vista x64, this resulted in an error because the installer was attempting to run the JScript in a 32-bit engine, which wasn't registered on Vista. The installer no longer uses JScript but instead relies on a native WiX command. ([Bug#36103](#))
- `mysqldtest` was performing escape processing for the `--replace_result` command, which it should not have been. ([Bug#36041](#))
- An error in calculation of the precision of zero-length items (such as `NULL`) caused a server crash for queries that employed temporary tables. ([Bug#36023](#))
- For `EXPLAIN EXTENDED`, execution of an uncorrelated `IN` subquery caused a crash if the subquery required a temporary table for its execution. ([Bug#36011](#))
- The `MERGE` storage engine did a table scan for `SELECT COUNT(*)` statements when it could calculate the number of records from the underlying tables. ([Bug#36006](#))
- The server crashed inside `NOT IN` subqueries with an impossible `WHERE` or `HAVING` clause, such as `NOT IN (SELECT ... FROM t1, t2, ... WHERE 0)`. ([Bug#36005](#))
- The Event Scheduler was not designed to work under the embedded server. It is now disabled for the embedded server, and the `event_scheduler` system variable is not displayed. ([Bug#35997](#))
- Grouping or ordering of long values in unindexed `BLOB` or `TEXT` columns with the `gbk` or `big5` character set crashed the server. ([Bug#35993](#))
- `SET GLOBAL debug= ''` resulted in a Valgrind warning in `DbugParse()`, which was reading beyond the end of the control string. ([Bug#35986](#))
- The “prefer full scan on clustered primary key over full scan of any secondary key” optimizer rule introduced by [Bug#26447](#) caused a performance regression for some queries, so it has been disabled. ([Bug#35850](#))
- The server ignored any covering index used for `ref` access of a table in a query with `ORDER BY` if this index was incompatible with the `ORDER BY` list and there was another covering index compatible with this list. As a result, suboptimal execution plans were chosen for some queries that used an `ORDER BY` clause. ([Bug#35844](#))
- `mysql_upgrade` did not properly update the `mysql.event` table. ([Bug#35824](#))
- An incorrect error and message was produced for attempts to create a `MyISAM` table with an index (`.MYI`) file name that was already in use by some other `MyISAM` table that was open at the same time. For example, this might happen if you use the same value of the `INDEX DIRECTORY` table option for tables belonging to different databases. ([Bug#35733](#))
- Enabling the `read_only` system variable while `autocommit` mode was enabled caused `SELECT` statements for transactional storage engines to fail. ([Bug#35732](#))
- The combination of `GROUP_CONCAT()`, `DISTINCT`, and `LEFT JOIN` could crash the server when the right table is empty. ([Bug#35298](#))
- Some binaries produced stack corruption messages due to being built with versions of `bison` older than 2.1. Builds are now created using `bison` 2.3. ([Bug#34926](#))
- The `log_output` system variable could be set to an illegal value. ([Bug#34820](#))
- On Windows 64-bit builds, an apparent compiler bug caused memory overruns for code in `innobase/mem/*`. Removed optimizations so as not to trigger this problem. ([Bug#34297](#))
- Several additional configuration scripts in the `BUILD` directory now are included in source distributions. These may be useful for users who wish to build MySQL from source. (See [Section 2.3.4, “Installing from the Development Source Tree”](#), for information about what they do.) ([Bug#34291](#))
- Executing a `FLUSH PRIVILEGES` statement after creating a temporary table in the `mysql` database with the same name as one of the MySQL system tables caused the server to crash.

### Note

While it is possible to shadow a system table in this way, the temporary table exists only for the current user and connection, and does not effect any user privileges.

(Bug#33275)

- UNION constructs cannot contain `SELECT ... INTO` except in the final `SELECT`. However, if a `UNION` was used in a subquery and an `INTO` clause appeared in the top-level query, the parser interpreted it as having appeared in the `UNION` and raised an error. (Bug#32858)
- Assignment of relative path names to `general_log_file` or `slow_query_log_file` did not always work. (Bug#32748)
- The `mysql.servers` table was not created during installation on Windows. (Bug#28680, Bug#32797)
- The `jp` test suite was not working. (Bug#28563)
- The internal `init_time()` library function was renamed to `my_init_time()` to avoid conflicts with external libraries. (Bug#26294)
- The parser used signed rather than unsigned values in some cases that caused legal lengths in column declarations to be rejected. (Bug#15776)

## C.1.33. Changes in MySQL 5.1.24 (08 April 2008)

Functionality added or changed:

- **Important Change: MySQL Cluster: Packaging:** Beginning with this release, standard MySQL 5.1 binaries are no longer built with support for the `NDBCLUSTER` storage engine, and the `NDBCLUSTER` code included in 5.1 mainline sources is no longer guaranteed to be maintained or supported. Those using MySQL Cluster in MySQL 5.1.23 and earlier MySQL 5.1 mainline releases should upgrade to MySQL Cluster NDB 6.2.15 or a later MySQL Cluster NDB 6.2 or 6.3 release. (Bug#36193)
- **Important Change:** The `FEDERATED` storage engine is not included in binary distributions of MySQL 5.1.24. (It will be included again in 5.1.25.)
- **Replication:** Introduced the `slave_exec_mode` system variable to control whether idempotent or strict mode is used for replication conflict resolution. Idempotent mode suppresses duplicate-key, no-key-found, and some other errors, and is needed for circular replication, multi-master replication, and some other complex replication setups when using MySQL Cluster, where idempotent mode is the default. However, strict mode is the default for storage engines other than `NDB`. (Bug#31609)
- **Replication:** When running the server with `--binlog-format=MIXED` or `--binlog-format=STATEMENT`, a query that referred to a system variable used the slave's value when replayed on the slave. This meant that, if the value of a system variable was inserted into a table, the slave differed from the master. Now, statements that refer to a system variable are marked as "unsafe", which means that:
  - When the server is using `--binlog-format=MIXED`, the row-based format is used automatically to replicate these statements.
  - When the server is using `--binlog-format=STATEMENT`, these statements produce a warning. (Bug#31168)

See also Bug#34732.

- The `PROCESS` privilege now is required to start or stop the `InnoDB` monitor tables (see Section 13.6.13.2, “`SHOW ENGINE INNODB STATUS` and the `InnoDB Monitors`”). Previously, no privilege was required. (Bug#34053)
- For binary `.tar.gz` packages, `mysqld` and other binaries now are compiled with debugging symbols included to enable easier use with a debugger. If you do not need debugging symbols and are short on disk space, you can use `strip` to remove the symbols from the binaries. (Bug#33252)
- Formerly, when the MySQL server crashed, the generated stack dump was numeric and required external tools to properly resolve the names of functions. This is not very helpful to users having a limited knowledge of debugging techniques. In addition, the generated stack trace contained only the names of functions and was formatted differently for each platform due to different stack layouts.

Now it is possible to take advantage of newer versions of the GNU C Library provide a set of functions to obtain and manipulate stack traces from within the program. On systems that use the ELF binary format, the stack trace contains important information such as the shared object where the call was generated, an offset into the function, and the actual return address. Having the function name also makes possible the name demangling of C++ functions.

The library generates meaningful stack traces on the following platforms: i386, x86\_64, PowerPC, IA64, Alpha, and S390. On other platforms, a numeric stack trace is still produced, and the use of the `resolve_stack_dump` utility is still required.

**Bug#31891)**

- `mysqltest` now has `mkdir` and `rmdir` commands for creating and removing directories. ([Bug#31004](#))
- The server uses less memory when loading privileges containing table grants. (Patch provided by Google.) ([Bug#25175](#))
- Added the `Uptime_since_flush_status` status variable, which indicates the number of seconds since the most recent `FLUSH STATUS` statement. (Community contribution by Jeremy Cole) ([Bug#24822](#))
- `SHOW OPEN TABLES` now supports `FROM` and `LIKE` clauses. ([Bug#12183](#))
- The new read-only global system variables `report_host`, `report_password`, `report_port`, and `report_user` system variables provide runtime access to the values of the corresponding `--report-host`, `--report-password`, `--report-port`, and `--report-user` options.
- Formerly it was possible to specify an `innodb_flush_method` value of `fdatasync` to obtain the default flush behavior of using `fdatasync()` for flushing. This is no longer possible because it can be confusing that a value of `fdatasync` causes use of `fsync()` rather than `fdatasync()`.
- The use of `InnoDB` hash indexes now can be controlled by setting the new `innodb_adaptive_hash_index` system variable at server startup. By default, this variable is enabled. See [Section 13.6.10.4, “Adaptive Hash Indexes”](#).

Bugs fixed:

- **Performance:** `InnoDB` adaptive hash latches could be held too long during filesort operations, resulting in a server crash. Now the hash latch is released when a query on `InnoDB` tables performs a filesort. This eliminates the crash and may provide significant performance improvements on systems on which many queries using filesorts with temporary tables are being performed. ([Bug#32149](#))
- **Performance:** `InnoDB` exhibited thread thrashing with more than 50 concurrent connections under an update-intensive workload. ([Bug#22868](#))
- **Important Change: Security Fix:** It was possible to circumvent privileges through the creation of `MyISAM` tables employing the `DATA DIRECTORY` and `INDEX DIRECTORY` options to overwrite existing table files in the MySQL data directory. Use of the MySQL data directory in `DATA DIRECTORY` and `INDEX DIRECTORY` is no longer permitted. This is now also true of these options when used with partitioned tables and individual partitions of such tables.

**Note**

Additional fixes were made in MySQL 5.1.28, 5.1.41.

([Bug#32167](#), [CVE-2008-2079](#))

See also [Bug#39277](#).

- **Security Fix:** A client that connects to a malicious server could be tricked by the server into sending files from the client host to the server. This occurs because the `libmysqlclient` client library would respond to a `FETCH LOCAL FILE` request from the server even if the request is sent for statements from the client other than `LOAD DATA LOCAL INFILE`. The client library has been modified to respond to a `FETCH LOCAL FILE` request from the server only if is sent in response to a `LOAD DATA LOCAL INFILE` statement from the client.

The client library now also checks whether `CLIENT_LOCAL_FILE` is set and refuses to send a local file if not.

**Note**

Binary distributions ship with the `local-infile` capability enabled. Applications that do not use this functionality should disable it to be safe.

([Bug#29605](#))

- **Important Change: Security Enhancement:** On Windows Vista and Windows Server 2008, a user without administrative privileges does not have write permissions to the `Program Files` directory where MySQL and the associated data files are normally installed. Using data files located in the standard `Program Files` installation directory could therefore cause MySQL to fail, or lead to potential security issues in an installed instance.

To address the problem, on Windows XP, Windows Vista and Windows Server 2008, the datafiles and data file configuration are now set to the Microsoft recommended `AppData` folder. The `AppData` folder is typically located within the user's home directory.

## Important

When upgrading an existing 5.1.23 or 6.0.4 installation of MySQL you must take a backup of your data and configuration file (`my.ini`) before installing the new version. To migrate your data, either extract the data and re-import (using `mysqldump`, then upgrade and re-import using `mysql`), or back up your data, upgrade to the new version, and copy your existing data files from your old `datadir` directory to the new directory located within `AppData`.

Failure to back up your data and follow these procedures may lead to data loss.

([Bug#34593](#))

- **Incompatible Change:** In MySQL 5.1.23, the `last_errno` and `last_error` members of the `NET` structure in `mysql_com.h` were renamed to `client_last_errno` and `client_last_error`. This was found to cause problems for connectors that use the internal `NET` structure for error handling. The change has been reverted. ([Bug#34655](#))

See also [Bug#12713](#).

- **Incompatible Change:** It was possible to use `FRAC_SECOND` as a synonym for `MICROSECOND` with `DATE_ADD()`, `DATE_SUB()`, and `INTERVAL`; now, using `FRAC_SECOND` with anything other than `TIMESTAMPADD()` or `TIMESTAMPDIFF()` produces a syntax error.

It is now possible (and preferable) to use `MICROSECOND` with `TIMESTAMPADD()` and `TIMESTAMPDIFF()`, and `FRAC_SECOND` is now deprecated. ([Bug#33834](#))

- **Incompatible Change:** The `UPDATE` statement permitted `NULL` to be assigned to `NOT NULL` columns (the implicit default value for the column data type was assigned). This was changed so that an error occurs.

This change was reverted, because the original report was determined not to be a bug: Assigning `NULL` to a `NOT NULL` column in an `UPDATE` statement should produce an error only in strict SQL mode and set the column to the implicit default with a warning otherwise, which was the original behavior. See [Section 10.1.4, “Data Type Default Values”](#), and [Bug#39265](#). ([Bug#33699](#))

- **Incompatible Change:** For packages that are built within their own prefix (for example, `/usr/local/mysql`) the plugin directory will be `lib/plugin`. For packages that are built to be installed into a system-wide prefix (such as RPM packages with a prefix of `/usr`), the plugin directory will be `lib/mysql/plugin` to ensure a clean `/usr/lib` hierarchy. In both cases, the `$pkglibdir` configuration setting is used at build time to set the plugin directory.

The current plugin directory location is available as the value of the `plugin_dir` system variable as before, but the `mysql_config` script now has a `--plugindir` option that can be used externally to the server by third-party plugin writers to obtain the default plugin directory path name and configure their installation directory appropriately. ([Bug#31736](#))

- **Incompatible Change:** The `utf8_general_ci` and `ucs2_general_ci` collations did not sort the letter "U+00DF SHARP S" equal to '`s`'.

As a result of this bug fix, indexes must be rebuilt for columns that use the `utf8_general_ci` or `ucs2_general_ci` collation for columns that contain SHARP S. See [Section 2.12.3, “Checking Whether Tables or Indexes Must Be Rebuilt”](#). ([Bug#27877](#))

See also [Bug#37046](#).

- **Important Change: Partitioning:** The following statements did not function correctly with corrupted or crashed tables and have been disabled:

- `ALTER TABLE ... ANALYZE PARTITION`
- `ALTER TABLE ... CHECK PARTITION`
- `ALTER TABLE ... OPTIMIZE PARTITION`
- `ALTER TABLE ... REPAIR PARTITION`

`ALTER TABLE ... REBUILD PARTITION` is unaffected by this change and continues to be available. This statement and `ALTER TABLE ... REORGANIZE PARTITION` may be used to analyze and optimize partitioned tables, since these operations cause the partition files to be rebuilt. ([Bug#20129](#))

See also [Bug#39434](#).

- **Important Change: Replication:** When the master crashed during an update on a transactional table while in `autocommit` mode, the slave failed. This fix causes every transaction (including `autocommit` transactions) to be recorded in the binlog as starting with a `BEGIN` and ending with a `COMMIT` or `ROLLBACK`. ([Bug#26395](#))

- **Important Change:** InnoDB free space information is now shown in the `Data_free` column of `SHOW TABLE STATUS` and in the `DATA_FREE` column of the `INFORMATION_SCHEMA.TABLES` table. ([Bug#32440](#))

See also [Bug#11379](#).

- **Important Change:** The server handled truncation of values having excess trailing spaces into `CHAR`, `VARCHAR`, and `TEXT` columns in different ways. This behavior has now been made consistent for columns of all three of these types, and now follows the existing behavior of `VARCHAR` columns in this regard; that is, a `Note` is always issued whenever such truncation occurs.

This change does not affect columns of these three types when using a binary encoding; `BLOB` columns are also unaffected by the change, since they always use a binary encoding. ([Bug#30059](#))

- **Important Change:** An `AFTER UPDATE` trigger was not invoked when the `UPDATE` did not make any changes to the table for which the trigger was defined. Now `AFTER UPDATE` triggers behave the same in this regard as do `BEFORE UPDATE` triggers, which are invoked whether the `UPDATE` makes any changes in the table or not. ([Bug#23771](#))
- **Replication: Important Note:** Network timeouts between the master and the slave could result in corruption of the relay log. This fix rectifies a long-standing replication issue when using unreliable networks, including replication over wide area networks such as the Internet. If you experience reliability issues and see many `YOU HAVE AN ERROR IN YOUR SQL SYNTAX` errors on replication slaves, we strongly recommend that you upgrade to a MySQL version which includes this fix. ([Bug#26489](#))
- **Partitioning:** In some cases, matching rows from a partitioned `MyISAM` using a `BIT` column as the primary key were not found by queries. ([Bug#34358](#))
- **Partitioning:** Enabling `innodb_file_per_table` produced problems with partitioning and tablespace operations on partitioned InnoDB tables, in some cases leading to corrupt partitions or causing the server to crash. ([Bug#33429](#))
- **Partitioning:** A table defined using `PARTITION BY KEY` and having a `BIT` column referenced in the partitioning key did not behave correctly; some rows could be inserted into the wrong partition, causing wrong results to be returned from queries. ([Bug#33379](#))
- **Partitioning:** For InnoDB tables, there was a race condition involving the data dictionary and repartitioning. ([Bug#33349](#))
- **Partitioning:** When `ALTER TABLE DROP PARTITION` was executed on a table on which there was a trigger, the statement failed with an error. This occurred even if the trigger did not reference any tables. ([Bug#32943](#))
- **Partitioning:** Currently, all partitions of a partitioned table must use the same storage engine. One may optionally specify the storage engine on a per-partition basis; however, where this is done, the storage engine must be the same as used by the table as a whole. `ALTER TABLE` did not enforce these rules correctly, the result being that inaccurate error messages were shown when trying to use the statement to change the storage engine used by an individual partition or partitions. ([Bug#31931](#))
- **Partitioning:** Using the `DATA DIRECTORY` and `INDEX DIRECTORY` options for partitions with `CREATE TABLE` or `ALTER TABLE` statements appeared to work on Windows, although they are not supported by MySQL on Windows systems, and subsequent attempts to use the tables referenced caused errors. Now these options are disabled on Windows, and attempting to use them generates a warning. ([Bug#30459](#))
- **Replication:** The failure of a `CREATE TABLE ... ENGINE=InnoDB ... SELECT` statement caused the slave to lose data. ([Bug#35762](#))
- **Replication:** When using row-based replication, a slave could crash at startup because it received a row-based replication event that InnoDB could not handle due to an incorrect test of the query string provided by MySQL, which was `NULL` for row-based replication events. ([Bug#35226](#))
- **Replication:** `insert_id` was not written to the binary log for inserts into `BLACKHOLE` tables. ([Bug#35178](#))
- **Replication:** When using statement-based replication and a `DELETE`, `UPDATE`, or `INSERT ... SELECT` statement using a `LIMIT` clause is encountered, a warning that the statement is not safe to replicate in statement mode is now issued; when using `MIXED` mode, the statement is now replicated using the row-based format. ([Bug#34768](#))
- **Replication:** `mysqlbinlog` did not output the values of `auto_increment_increment` and `auto_increment_offset` when both were equal to their default values (for both of these variables, the default is 1). This meant that a binary log recorded by a client using the defaults for both variables and then replayed on another client using its own values for either or both of these variables produced erroneous results. ([Bug#34732](#))

See also [Bug#31168](#).

- **Replication:** When the Windows version of `mysqlbinlog` read 4.1 binlogs containing `LOAD DATA INFILE` statements, it output backslashes as path separators, causing problems for client programs expecting forward slashes. In such cases, it now converts `\` to `/` in directory paths. ([Bug#34355](#))

- **Replication:** `SHOW SLAVE STATUS` failed when slave I/O was about to terminate. ([Bug#34305](#))
- **Replication:** The character sets and collations used for constant identifiers in stored procedures were not replicated correctly. ([Bug#34289](#))
- **Replication:** `mysqlbinlog` from a 5.1 or later MySQL distribution could not read binary logs generated by a 4.1 server when the logs contained `LOAD DATA INFILE` statements. ([Bug#34141](#))

This regression was introduced by [Bug#32407](#).

- **Replication:** A `CREATE USER`, `DROP USER`, or `RENAME USER` statement that fails on the master, or that is a duplicate of any of these statements, is no longer written to the binlog; previously, either of these occurrences could cause the slave to fail. ([Bug#33862](#))

See also [Bug#29749](#).

- **Replication:** `SHOW BINLOG EVENTS` could fail when the binlog contained one or more events whose size was close to the value of `max_allowed_packet`. ([Bug#33413](#))
- **Replication:** An extraneous `ROLLBACK` statement was written to the binary log by a connection that did not use any transactional tables. ([Bug#33329](#))
- **Replication:** `mysqlbinlog` failed to release all of its memory after terminating abnormally. ([Bug#33247](#))
- **Replication:** When a stored routine or trigger, running on a master that used MySQL 5.0 or MySQL 5.1.11 or earlier, performed an insert on an `AUTO_INCREMENT` column, the `insert_id` value was not replicated correctly to a slave running MySQL 5.1.12 or later (including any MySQL 6.0 release). ([Bug#33029](#))

See also [Bug#19630](#).

- **Replication:** The error message generated due to lack of a default value for an extra column was not sufficiently informative. ([Bug#32971](#))
- **Replication:** When a user variable was used inside an `INSERT` statement, the corresponding binlog event was not written to the binlog correctly. ([Bug#32580](#))
- **Replication:** When using row-based replication, deletes from a table with a foreign key constraint failed on the slave. ([Bug#32468](#))
- **Replication:** The `--base64-output` option for `mysqlbinlog` was not honored for all types of events. This interfered in some cases with performing point-in-time recovery. ([Bug#32407](#))

See also [Bug#46640](#), [Bug#34777](#).

- **Replication:** SQL statements containing comments using `--` syntax were not replayable by `mysqlbinlog`, even though such statements replicated correctly. ([Bug#32205](#))
- **Replication:** When using row-based replication from a master running MySQL 5.1.21 or earlier to a slave running 5.1.22 or later, updates of integer columns failed on the slave with `ERROR IN UNKNOWN EVENT: ROW APPLICATION FAILED`. ([Bug#31583](#))

This regression was introduced by [Bug#21842](#).

- **Replication:** Replicating write, update, or delete events from a master running MySQL 5.1.15 or earlier to a slave running 5.1.16 or later caused the slave to crash. ([Bug#31581](#))
- **Replication:** When using row-based replication, the slave stopped when attempting to delete nonexistent rows from a slave table without a primary key. In addition, no error was reported when this occurred. ([Bug#31552](#))
- **Replication:** Errors due to server ID conflicts were reported only in the slave's error log; now these errors are also shown in the `Server_IO_State` column in the output of `SHOW SLAVE STATUS`. ([Bug#31316](#))
- **Replication:** `STOP SLAVE` did not stop connection attempts properly. If the I/O slave thread was attempting to connect, `STOP SLAVE` waited for the attempt to finish, sometimes for a long period of time, rather than stopping the slave immediately. ([Bug#31024](#))

See also [Bug#30932](#).

- **Replication:** Issuing a `DROP VIEW` statement caused replication to fail if the view did not actually exist. ([Bug#30998](#))
- **Replication:** Replication of `LOAD DATA INFILE` could fail when `read_buffer_size` was larger than

[max\\_allowed\\_packet](#). ([Bug#30435](#))

- **Replication:** Replication crashed with the `NDB` storage engine when `mysqld` was started with `--character-set-server=ucs2`. ([Bug#29562](#))
- **Replication:** When using row-based logging, nontransactional updates were not written atomically to the binary log. If a non-transactional update was made concurrently with some other update, this could cause incorrect binary logging, and consequently the slave could diverge from the master. Now, nontransactional updates are always written atomically to the binary log. ([Bug#29020](#))
- **Replication:** Setting `server_id` did not update its value for the current session. ([Bug#28908](#))
- **Replication:** Some older servers wrote events to the binary log using different numbering from what is currently used, even though the file format number in the file is the same. Slaves running MySQL 5.1.18 and later could not read these binary logs properly. Binary logs from these older versions now are recognized and event numbers are mapped to the current numbering so that they can be interpreted properly. ([Bug#27779](#), [Bug#32434](#))

This regression was introduced by [Bug#22583](#).

- **Replication:** `MASTER_POS_WAIT()` did not return `NULL` when the server was not a slave. ([Bug#26622](#))
- **Replication:** The nonspecific error message `WRONG PARAMETERS TO FUNCTION REGISTER_SLAVE` resulted when `START SLAVE` failed to register on the master due to excess length of any of the slave server options `--report-host`, `--report-user`, or `--report-password`. An error message specific to each of these options is now returned in such cases. The new error messages are:
  - `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-HOST'`
  - `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-USER'`
  - `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-PASSWORD'`

See also [Bug#19328](#).

- **Replication:** `PURGE BINARY LOGS TO` and `PURGE BINARY LOGS BEFORE` did not handle missing binary log files correctly or in the same way. Now for both of these statements, if any files listed in the `.index` file are missing from the file system, the statement fails with an error. ([Bug#18199](#), [Bug#18453](#))
- **Replication:** `START SLAVE UNTIL MASTER_LOG_POS=position` issued on a slave that was using `-log-slave-updates` and that was involved in circular replication would cause the slave to run and stop one event later than that specified by the value of `position`. ([Bug#13861](#))
- Manually replacing a binary log file with a directory having the same name caused an error that was not handled correctly. ([Bug#35675](#))
- Using `LOAD DATA INFILE` with a view could crash the server. ([Bug#35469](#))
- Selecting from `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` could cause a server crash. ([Bug#35406](#))

See also [Bug#35108](#).

- For a `TEMPORARY` table, `DELETE` with no `WHERE` clause could fail when preceded by `DELETE` statements with a `WHERE` clause. ([Bug#35392](#))
- If the server crashed with an `InnoDB` error due to unavailability of undo slots, errors could persist during rollback when the server was restarted: There are two `UNDO` slot caches (for `INSERT` and `UPDATE`). If all slots end up in one of the slot caches, a request for a slot from the other slot cache would fail. This can happen if the request is for an `UPDATE` slot and all slots are in the `INSERT` slot cache, or vice versa. ([Bug#35352](#))
- In some cases, when too many clients tried to connect to the server, the proper `SQLSTATE` code was not returned. ([Bug#35289](#))
- Memory-allocation failures for attempts to set `key_buffer_size` to large values could result in a server crash. ([Bug#35272](#))
- For `InnoDB` tables, `ALTER TABLE DROP` failed if the name of the column to be dropped began with “foreign”. ([Bug#35220](#))
- Queries could return different results depending on whether `ORDER BY` columns were indexed. ([Bug#35206](#))
- When a view containing a reference to `DUAL` was created, the reference was removed when the definition was stored, causing some queries against the view to fail with invalid SQL syntax errors. ([Bug#35193](#))

- `SELECT ... FROM INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` caused the server to crash if the table referenced by a foreign key had been dropped. This issue was observed on Windows platforms only. ([Bug#35108](#))

See also [Bug#35406](#).

- Debugging symbols were missing for some executables in Windows binary distributions. ([Bug#35104](#))
- Nonconnection threads were being counted in the value of the `Max_used_connections` status variable. ([Bug#35074](#))
- A query that performed a `ref_or_null` join where the second table used a key having one or columns that could be `NULL` and had a column value that was `NULL` caused the server to crash. ([Bug#34945](#))

This regression was introduced by [Bug#12144](#).

- For some queries, the optimizer used an ordered index scan for `GROUP BY` or `DISTINCT` when it was supposed to use a loose index scan, leading to incorrect results. ([Bug#34928](#))
- Creating a foreign key on an `InnoDB` table that was created with an explicit `AUTO_INCREMENT` value caused that value to be reset to 1. ([Bug#34920](#))
- `mysqldump` failed to return an error code when using the `--master-data` option without binary logging being enabled on the server. ([Bug#34909](#))
- Under some circumstances, the value of `mysql_insert_id()` following a `SELECT ... INSERT` statement could return an incorrect value. This could happen when the last `SELECT ... INSERT` did not involve an `AUTO_INCREMENT` column, but the value of `mysql_insert_id()` was changed by some previous statements. ([Bug#34889](#))
- Table and database names were mixed up in some places of the subquery transformation procedure. This could affect debugging trace output and further extensions of that procedure. ([Bug#34830](#))
- If `fsync()` returned `ENOLCK`, `InnoDB` could treat this as fatal and cause abnormal server termination. `InnoDB` now retries the operation. ([Bug#34823](#))
- `CREATE SERVER` and `ALTER SERVER` could crash the server if out-of-memory conditions occurred. ([Bug#34790](#))
- `DROP SERVER` does not release memory cached for server structures created by `CREATE SERVER`, so repeated iterations of these statements resulted in a memory leak. `FLUSH PRIVILEGES` now releases the memory allocated for `CREATE SERVER`. ([Bug#34789](#))
- A malformed URL used for a `FEDERATED` table's `CONNECTION` option value in a `CREATE TABLE` statement was not handled correctly and could crash the server. ([Bug#34788](#))
- Queries such as `SELECT ROW(1, 2) IN (SELECT t1.a, 2) FROM t1 GROUP BY t1.a` (combining row constructors and subqueries in the `FROM` clause) could lead to assertion failure or unexpected error messages. ([Bug#34763](#))
- Using `NAME_CONST()` with a negative number and an aggregate function caused MySQL to crash. This could also have a negative impact on replication. ([Bug#34749](#))
- A memory-handling error associated with use of `GROUP_CONCAT()` in subqueries could result in a server crash. ([Bug#34747](#))
- For an indexed integer column `col_name` and a value `N` that is one greater than the maximum value permitted for the data type of `col_name`, conditions of the form `WHERE col_name < N` failed to return rows where the value of `col_name` is `N - 1`. ([Bug#34731](#))
- A server running with the `--debug` option could attempt to dereference a null pointer when opening tables, resulting in a crash. ([Bug#34726](#))
- Assigning an “incremental” value to the `debug` system variable did not add the new value to the current value. For example, if the current `debug` value was '`T`', the statement `SET debug = '+P'` resulted in a value of '`P`' rather than the correct value of '`P:T`'. ([Bug#34678](#))
- For debug builds, reading from `INFORMATION_SCHEMA.TABLES` or `INFORMATION_SCHEMA.COLUMNS` could cause assertion failures. This could happen under rare circumstances when `INFORMATION_SCHEMA` fails to get information about a table (for example, when a connection is killed). ([Bug#34656](#))
- Executing a `TRUNCATE TABLE` statement on a table having both a foreign key reference and a `DELETE` trigger crashed the server. ([Bug#34643](#))
- Some subqueries using an expression that included an aggregate function could fail or in some cases lead to a crash of the server. ([Bug#34620](#))

- Dangerous pointer arithmetic crashed the server on some systems. ([Bug#34598](#))
- Creating a view inside a stored procedure could lead to a crash of the MySQL Server. ([Bug#34587](#))
- A server crash could occur if `INFORMATION_SCHEMA` tables built in memory were swapped out to disk during query execution. ([Bug#34529](#))
- `CAST(AVG(arg) AS DECIMAL)` produced incorrect results for non-`DECIMAL` arguments. ([Bug#34512](#))
- The per-thread debugging settings stack was not being deallocated before thread termination, resulting in a stack memory leak. ([Bug#34424](#))
- Executing an `ALTER VIEW` statement on a table crashed the server. ([Bug#34337](#))
- `InnoDB` could crash if overflow occurred for an `AUTO_INCREMENT` column. ([Bug#34335](#))
- For `InnoDB`, exporting and importing a table could corrupt `TINYBLOB` columns, and a subsequent `ALTER TABLE` could corrupt `TINYTEXT` columns as well. ([Bug#34300](#))
- `DEFAULT 0` was not permitted for the `YEAR` data type. ([Bug#34274](#))
- Under some conditions, a `SET GLOBAL innodb_commit_concurrency` or `SET GLOBAL innodb_autoextend_increment` statement could fail. ([Bug#34223](#))
- `mysqldump` attempts to set the `character_set_results` system variable after connecting to the server. This failed for pre-4.1 servers that have no such variable, but `mysqldump` did not account for this and 1) failed to dump database contents; 2) failed to produce any error message alerting the user to the problem. ([Bug#34192](#))
- Use of stored functions in the `WHERE` clause for `SHOW OPEN TABLES` caused a server crash. ([Bug#34166](#))
- For a `FEDERATED` table with an index on a nullable column, accessing the table could crash a server, return an incorrect result set, or return `ERROR 1030 (HY000): Got error 1430 from storage engine.` ([Bug#33946](#))
- Passing anything other than an integer argument to a `LIMIT` clause in a prepared statement would fail. (This limitation was introduced to avoid replication problems; for example, replicating the statement with a string argument would cause a parse failure in the slave). Now, arguments to the `LIMIT` clause are converted to integer values, and these converted values are used when logging the statement. ([Bug#33851](#))
- An internal buffer in `mysql` was too short. Overextending it could cause stack problems or segmentation violations on some architectures. (This is not a problem that could be exploited to run arbitrary code.) ([Bug#33841](#))
- A query using `WHERE (column1='string1' AND column2=constant1) OR (column1='string2' AND column2=constant2)`, where `col1` used a binary collation and `string1` matched `string2` except for case, failed to match any records even when matches were found by a query using the equivalent clause `WHERE column2=constant1 OR column2=constant2.` ([Bug#33833](#))
- Large unsigned integers were improperly handled for prepared statements, resulting in truncation or conversion to negative numbers. ([Bug#33798](#))
- Reuse of prepared statements could cause a memory leak in the embedded server. ([Bug#33796](#))
- The server crashed when executing a query that had a subquery containing an equality `X=Y` where `Y` referred to a named select list expression from the parent select. The server crashed when trying to use the `X=Y` equality for `ref`-based access. ([Bug#33794](#))
- Some queries using a combination of `IN`, `CONCAT()`, and an implicit type conversion could return an incorrect result. ([Bug#33764](#))
- In some cases a query that produced a result set when using `ORDER BY ASC` did not return any results when this was changed to `ORDER BY DESC`. ([Bug#33758](#))
- Disabling concurrent inserts caused some cacheable queries not to be saved in the query cache. ([Bug#33756](#))
- `ORDER BY ... DESC` sorts could produce misordered results. ([Bug#33697](#))
- The server could crash when `REPEAT` or another control instruction was used in conjunction with labels and a `LEAVE` instruction. ([Bug#33618](#))
- The parser permitted control structures in compound statements to have mismatched beginning and ending labels. ([Bug#33618](#))
- `make_binary_distribution` passed the `--print-libgcc-file` option to the C compiler, but this does not work

with the [ICC](#) compiler. ([Bug#33536](#))

- Threads created by the event scheduler were incorrectly counted against the `max_connections` thread limit, which could lead to client lockout. ([Bug#33507](#))
- Dropping a function after dropping the function's creator could cause the server to crash. ([Bug#33464](#))
- Certain combinations of views, subselects with outer references and stored routines or triggers could cause the server to crash. ([Bug#33389](#))
- `SET GLOBAL myisam_max_sort_file_size=DEFAULT` set `myisam_max_sort_file_size` to an incorrect value. ([Bug#33382](#))

See also [Bug#31177](#).

- `ENUM-` or `SET`-valued plugin variables could not be set from the command line. ([Bug#33358](#))
- Loading plugins using command-line options to `mysqld` could cause an assertion failure. ([Bug#33345](#))
- `SLEEP(0)` failed to return on 64-bit Mac OS X due to a bug in `pthread_cond_timedwait()`. ([Bug#33304](#))
- Using **Control-R** in the `mysql` client caused it to crash. ([Bug#33288](#))
- For `MyISAM` tables, `CHECK TABLE` (non-`QUICK`) and any form of `REPAIR TABLE` incorrectly treated rows as corrupted under the combination of the following conditions:
  - The table had dynamic row format
  - The table had a `CHAR` (not `VARCHAR`) column longer than 127 bytes (for multi-byte character sets this could be less than 127 characters)
  - The table had rows with a significant length of more than 127 bytes significant length in that `CHAR` column (that is, a byte beyond byte position 127 must be a nonspace character)

This problem affected `CHECK TABLE`, `REPAIR TABLE`, `OPTIMIZE TABLE`, `ALTER TABLE`, `CHECK TABLE` reported and marked the table as crashed if any row was present that fulfilled the third condition. The other statements deleted these rows. ([Bug#33222](#))

- Granting the `UPDATE` privilege on one column of a view caused the server to crash. ([Bug#33201](#))
- For `DECIMAL` columns used with the `ROUND(X,D)` or `TRUNCATE(X,D)` function with a nonconstant value of `D`, adding an `ORDER BY` for the function result produced misordered output. ([Bug#33143](#))

See also [Bug#33402](#), [Bug#30617](#).

- The `CSV` engine did not honor update requests for `BLOB` columns when the new column value had the same length as the value to be updated. ([Bug#33067](#))
- After receiving a `SIGHUP` signal, the server could crash, and user-specified log options were ignored when reopening the logs. ([Bug#33065](#))
- When MySQL was built with OpenSSL, the SSL library was not properly initialized with information of which endpoint it was (server or client), causing connection failures. ([Bug#33050](#))
- Under some circumstances a combination of aggregate functions and `GROUP BY` in a `SELECT` query over a view could lead to incorrect calculation of the result type of the aggregate function. This in turn could lead to incorrect results, or to crashes on debug builds of the server. ([Bug#33049](#))
- For `DISTINCT` queries, MySQL 4.0 and 4.1 stopped reading joined tables as soon as the first matching row was found. However, this optimization was lost in MySQL 5.0, which instead read all matching rows. This fix for this regression may result in a major improvement in performance for `DISTINCT` queries in cases where many rows match. ([Bug#32942](#))
- Repeated creation and deletion of views within prepared statements could eventually crash the server. ([Bug#32890](#))

See also [Bug#34587](#).

- Incorrect assertions could cause a server crash for `DELETE` triggers for transactional tables. ([Bug#32790](#))
- In some cases where setting a system variable failed, no error was sent to the client, causing the client to hang. ([Bug#32757](#))
- Enabling the `PAD_CHAR_TO_FULL_LENGTH` SQL mode caused privilege-loading operations (such as `FLUSH PRIV-`

`LEGES`) to include trailing spaces from grant table values stored in `CHAR` columns. Authentication for incoming connections failed as a result. Now privilege loading does not include trailing spaces, regardless of SQL mode. ([Bug#32753](#))

- The `SHOW ENGINE INNODB STATUS` and `SHOW ENGINE INNODB MUTEX` statements incorrectly required the `SUPER` privilege rather than the `PROCESS` privilege. ([Bug#32710](#))
- Inserting strings with a common prefix into a table that used the `ucs2` character set corrupted the table. ([Bug#32705](#))
- Tables in the `mysql` database that stored the current `sql_mode` value as part of stored program definitions were not updated with newer mode values (`NO_ENGINE_SUBSTITUTION`, `PAD_CHAR_TO_FULL_LENGTH`). This causes various problems defining stored programs if those modes were included in the current `sql_mode` value. ([Bug#32633](#))
- A view created with a string literal for one of the columns picked up the connection character set, but not the collation. Comparison to that field therefore used the default collation for that character set, causing an error if the connection collation was not compatible with the default collation. The problem was caused by text literals in a view being dumped with a character set introducer even when this was not necessary, sometimes leading to a loss of collation information. Now the character set introducer is dumped only if it was included in the original query. ([Bug#32538](#))

See also [Bug#21505](#).

- Queries using `LIKE` on tables having indexed `CHAR` columns using either of the `euc_jpms` or `ujis` character sets did not return correct results. ([Bug#32510](#))
- Executing a prepared statement associated with a materialized cursor sent to the client a metadata packet with incorrect table and database names. The problem occurred because the server sent the name of the temporary table used by the cursor instead of the table name of the original table.

The same problem occurred when selecting from a view, in which case the name of the table name was sent, rather than the name of the view. ([Bug#32265](#))

- On Windows, `mysqltest_embedded.exe` did not properly execute the `send` command. ([Bug#32044](#))
- A variable named `read_only` could be declared even though that is a reserved word. ([Bug#31947](#))
- On Windows, the build process failed with four parallel build threads. ([Bug#31929](#))
- Queries testing numeric constants containing leading zeros against `ZEROFILL` columns were not evaluated correctly. ([Bug#31887](#))
- If an error occurred during file creation, the server sometimes did not remove the file, resulting in an unused file in the file system. ([Bug#31781](#))
- The `mysqld` crash handler failed on Windows. ([Bug#31745](#))
- When upgrading from MySQL 5.1.19 to any version between MySQL 5.1.20 to MySQL 5.1.23, the MySQL Instance Configuration Wizard would fail to account for the change in name for the `mysqld-nt.exe` to `mysqld.exe`, causing MySQL to fail to start properly after the upgrade. ([Bug#31674](#))
- The server returned the error message `OUT OF MEMORY; RESTART SERVER AND TRY AGAIN` when the actual problem was that the sort buffer was too small. Now an appropriate error message is returned in such cases. ([Bug#31590](#))
- A table having an index that included a `BLOB` or `TEXT` column, and that was originally created with a MySQL server using version 4.1 or earlier, could not be opened by a 5.1 or later server. ([Bug#31331](#))
- The `-`, `*`, and `/` operators and the functions `POW()` and `EXP()` could misbehave when used with floating-point numbers. Previously they might return `+INF`, `-INF`, or `NaN` in cases of numeric overflow (including that caused by division by zero) or when invalid arguments were used. Now `NULL` is returned in all such cases. ([Bug#31236](#))
- The `mysql_change_user()` C API function caused global `Com_xxx` status variable values to be incorrect. ([Bug#31222](#))
- When sorting privilege table rows, the server treated escaped wildcard characters (`\%` and `\_`) the same as unescaped wildcard characters (`%` and `_`), resulting in incorrect row ordering. ([Bug#31194](#))
- On Windows, `SHOW PROCESSLIST` could display process entries with a `State` value of `*** DEAD ***`. ([Bug#30960](#))
- `ROUND(X,D)` or `TRUNCATE(X,D)` for nonconstant values of `D` could crash the server if these functions were used in an `ORDER BY` that was resolved using `filesort`. ([Bug#30889](#))
- Resetting the query cache by issuing a `SET GLOBAL query_cache_size=0` statement caused the server to crash if it concurrently was saving a new result set to the query cache. ([Bug#30887](#))

- Manifest problems prevented `MySQLInstanceConfig.exe` from running on Windows Vista. ([Bug#30823](#))
- If an alias was used to refer to the value returned by a stored function within a subselect, the outer select recognized the alias but failed to retrieve the value assigned to it in the subselect. ([Bug#30787](#))
- Binary logging for a stored procedure differed depending on whether or not execution occurred in a prepared statement. ([Bug#30604](#))
- An orphaned PID file from a no-longer-running process could cause `mysql.server` to wait for that process to exit even though it does not exist. ([Bug#30378](#))
- The `Table_locks_waited` waited variable was not incremented in the cases that a lock had to be waited for but the waiting thread was killed or the request was aborted. ([Bug#30331](#))
- The `Com_create_function` status variable was not incremented properly. ([Bug#30252](#))
- View metadata returned from `INFORMATION_SCHEMA.VIEWS` was changed by the fix for [Bug#11986](#), causing the information returned in MySQL 5.1 to differ from that returned in 5.0. ([Bug#30217](#))
- `mysqld` displayed the `--enable-pstack` option in its help message even if MySQL was configured without `-with-pstack`. ([Bug#29836](#))
- The `mysql_config` command would output `CFLAGS` values that were incompatible with C++ for the HP-UX platform. ([Bug#29645](#))
- Views were treated as insertable even if some base table columns with no default value were omitted from the view definition. (This is contrary to the condition for insertability that a view must contain all columns in the base table that do not have a default value.) ([Bug#29477](#))
- `myisamchk` always reported the character set for a table as `latin1_swedish_ci (8)` regardless of the table's actual character set. ([Bug#29182](#))
- `InnoDB` could return an incorrect rows-updated value for `UPDATE` statements. ([Bug#29157](#))
- The MySQL preferences pane did not work to start or stop MySQL on Mac OS X 10.5 (Leopard). ([Bug#28854](#))
- For upgrading to a new major version using RPM packages (such as 4.1 to 5.0), if the installation procedure found an existing MySQL server running, it could fail to shut down the old server, but also erroneously removed the server's socket file. Now the procedure checks for an existing server package from a different vendor or major MySQL version. In such case, it refuses to install the server and recommends how to safely remove the old packages before installing the new ones. ([Bug#28555](#))
- `mysqlhotcopy` silently skipped databases with names consisting of two alphanumeric characters. ([Bug#28460](#))
- No information was written to the general query log for the `COM_STMT_CLOSE`, `COM_STMT_RESET`, and `COM_STMT_SEND_LONG_DATA` commands. (These occur when a client invokes the `mysql_stmt_close()`, `mysql_stmt_reset()` and `mysql_stmt_send_long_data()` C API functions.) ([Bug#28386](#))
- Previously, the parser accepted the ODBC `{ OJ ... LEFT OUTER JOIN ... }` syntax for writing left outer joins. The parser now permits `{ OJ ... }` to be used to write other types of joins, such as `INNER JOIN` or `RIGHT OUTER JOIN`. This helps with compatibility with some third-party applications, but is not official ODBC syntax. ([Bug#28317](#))
- The `FEDERATED` storage engine did not perform identifier quoting for column names that are reserved words when sending statements to the remote server. ([Bug#28269](#))
- The SQL parser did not accept an empty `UNION=()` clause. This meant that, when there were no underlying tables specified for a `MERGE` table, `SHOW CREATE TABLE` and `mysqldump` both output statements that could not be executed.

Now it is possible to execute a `CREATE TABLE` or `ALTER TABLE` statement with an empty `UNION=()` clause. However, `SHOW CREATE TABLE` and `mysqldump` do not output the `UNION=()` clause if there are no underlying tables specified for a `MERGE` table. This also means it is now possible to remove the underlying tables for a `MERGE` table using `ALTER TABLE ... UNION=()`. ([Bug#28248](#))

- It was possible to exhaust memory by repeatedly running `index_merge` queries and never performing any `FLUSH TABLES` statements. ([Bug#27732](#))
- When `utf8` was set as the connection character set, using `SPACE()` with a non-Unicode column produced an error. ([Bug#27580](#))

See also [Bug#23637](#).

- The parser rules for the `SHOW PROFILE` statement were revised to work with older versions of `bison`. ([Bug#27433](#))

- `resolveip` failed to produce correct results for host names that begin with a digit. ([Bug#27427](#))
- In `ORDER BY` clauses, mixing aggregate functions and nongrouping columns is not permitted if the `ONLY_FULL_GROUP_BY` SQL mode is enabled. However, in some cases, no error was thrown because of insufficient checking. ([Bug#27219](#))
- For the `--record-log-pos` option, `mysqlhotcopy` now determines the slave status information from the result of `SHOW SLAVE STATUS` by using the `Relay_Master_Log_File` and `Exec_Master_Log_Pos` values rather than the `Master_Log_File` and `Read_Master_Log_Pos` values. This provides a more accurate indication of slave execution relative to the master. ([Bug#27101](#))
- The MySQL Instance Configuration Wizard would not permit you to choose a service name, even though the criteria for the service name were valid. The code that checks the name has been updated to support the correct criteria of any string less than 256 character and not containing either a forward or backward slash character. ([Bug#27013](#))
- Memory corruption, a crash of the MySQL server, or both, could take place if a low-level I/O error occurred while an `ARCHIVE` table was being opened. ([Bug#26978](#))
- `DROP DATABASE` failed for attempts to drop databases with names that contained the legacy `#mysql150#` name prefix. ([Bug#26703](#))
- `config-win.h` unconditionally defined `bool` as `BOOL`, causing problems on systems where `bool` is 1 byte and `BOOL` is 4 bytes. ([Bug#26461](#))
- On Windows, for distributions built with debugging support, `mysql` could crash if the user typed Control-C. ([Bug#26243](#))
- The XPath `boolean()` function did not cast string and nodeset values correctly in some cases. It now returns `TRUE` for any nonempty string or nodeset and 0 for a `NULL` string, as specified in the XPath standard.. ([Bug#26051](#))
- When symbolic links were disabled, either with a server startup option or by enabling the `NO_DIR_IN_CREATE` SQL mode, `CREATE TABLE` silently ignored the `DATA DIRECTORY` and `INDEX DIRECTORY` table options. Now the server issues a warning if symbolic links are disabled when these table options are used. ([Bug#25677](#))
- Attempting to create an index with a prefix on a `DECIMAL` column appeared to succeed with an inaccurate warning message. Now, this action fails with the error `INCORRECT PREFIX KEY; THE USED KEY PART ISN'T A STRING, THE USED LENGTH IS LONGER THAN THE KEY PART, OR THE STORAGE ENGINE DOESN'T SUPPORT UNIQUE PREFIX KEYS.` ([Bug#25426](#))
- `mysqlcheck -A -r` did not correctly identify all tables that needed repairing. ([Bug#25347](#))
- On Windows, an error in `configure.js` caused installation of source distributions to fail. ([Bug#25340](#))
- The `Qcache_free_blocks` status variable did not display a value of 0 if the query cache was disabled. ([Bug#25132](#))
- The client library had no way to return an error if no connection had been established. This caused problems such as `mysql_library_init()` failing silently if no `errmsg.sys` file was available. ([Bug#25097](#))
- On Mac OS X, the StartupItem for MySQL did not work. ([Bug#25008](#))
- For Windows 64-bit builds, enabling shared-memory support caused client connections to fail. ([Bug#24992](#))
- `mysql` did not use its completion table. Also, the table contained few entries. ([Bug#24624](#))
- If a user installed MySQL Server and set a password for the `root` user, and then uninstalled and reinstalled MySQL Server to the same location, the user could not use the MySQL Instance Config wizard to configure the server because the uninstall operation left the previous data directory intact. The config wizard *assumed* that any new install (not an upgrade) would have the default data directory where the `root` user has no password. The installer now writes a registry key named `FoundExistingDataDir`. If the installer finds an existing data directory, the key will have a value of 1, otherwise it will have a value of 0. When `MySQLInstanceConfig.exe` is run, it will attempt to read the key. If it can read the key, and the value is 1 and there is no existing instance of the server (indicating a new installation), the Config Wizard will permit the user to input the old password so the server can be configured. ([Bug#24215](#))
- Logging of statements to log tables was incorrect for statements that contained `utf8`-incompatible binary strings. Incompatible sequences are hex-encoded now. ([Bug#23924](#))
- The MySQL header files contained some duplicate macro definitions that could cause compilation problems. ([Bug#23839](#))
- `SHOW COLUMNS` on a `TEMPORARY` table caused locking issues. ([Bug#23588](#))
- For distributions compiled with the bundled `libedit` library, there were difficulties using the `mysql` client to enter input for non-ASCII or multi-byte characters. ([Bug#23097](#))
- `perror` reported incomplete or inaccurate information. ([Bug#23028](#), [Bug#25177](#))

- After stopping and starting the event scheduler, disabled events could remain in the execution queue. ([Bug#22738](#))
- The server produced a confusing error message when attempting to open a table that required a storage engine that was not loaded. ([Bug#22708](#))
- For views or stored programs created with an invalid `DEFINER` value, the error message was confusing (did not tie the problem to the `DEFINER` clause) and has been improved. ([Bug#21854](#))
- Warnings for deprecated syntax constructs used in stored routines make sense to report only when the routine is being created, but they were also being reported when the routine was parsed for loading into the execution cache. Now they are reported only at routine creation time. ([Bug#21801](#))
- On Mac OS X, `mysqld` did not react to Ctrl-C when run under `gdb`, even when run with the `--gdb` option. ([Bug#21567](#))
- `CREATE ... SELECT` did not always set `DEFAULT` column values in the new table. ([Bug#21380](#))
- `mysql_config` output did not include `-lmygcc` on some platforms when it was needed. ([Bug#21158](#))
- `mysql-stress-test.pl` and `mysqld_multi.server.sh` were missing from some binary distributions. ([Bug#21023](#), [Bug#25486](#))
- The `BENCHMARK()` function, invoked with more than 2147483648 iterations (the size of a signed 32-bit integer), terminated prematurely. ([Bug#20752](#))
- `mysqldumpslow` returned a confusing error message when no configuration file was found. ([Bug#20455](#))
- `MySQLInstanceConfig.exe` could lose the `innodb_data_home_dir` setting when reconfiguring an instance. ([Bug#19797](#))
- `DROP DATABASE` did not drop orphaned `FOREIGN KEY` constraints. ([Bug#18942](#))
- `CREATE TABLE` permitted 0 as the default value for a `TIMESTAMP` column when the server was running in `NO_ZERO_DATE` mode. ([Bug#18834](#))
- A `SET` column whose definition specified 64 elements could not be updated using integer values. ([Bug#15409](#))
- If a `SELECT` calls a stored function in a transaction, and a statement within the function fails, that statement should roll back. Furthermore, if `ROLLBACK` is executed after that, the entire transaction should be rolled back. Before this fix, the failed statement did not roll back when it failed (even though it might ultimately get rolled back by a `ROLLBACK` later that rolls back the entire transaction). ([Bug#12713](#))

See also [Bug#34655](#).

- The parser incorrectly permitted `SQLSTATE '00000'` to be specified for a condition handler. (This is incorrect because the condition must be a failure condition and '`00000`' indicates success.) ([Bug#8759](#))
- `MySQLInstanceConfig.exe` did not save the `innodb_data_home_dir` value to the `my.ini` file under certain circumstances. ([Bug#6627](#))

## C.1.34. Changes in MySQL 5.1.23 (29 January 2008)

Functionality added or changed:

- **Important Change: Partitioning: Security Fix:** It was possible, by creating a partitioned table using the `DATA DIRECTORY` and `INDEX DIRECTORY` options to gain privileges on other tables having the same name as the partitioned table. As a result of this fix, any table-level `DATA DIRECTORY` or `INDEX DIRECTORY` options are now ignored for partitioned tables. ([Bug#32091](#), [CVE-2007-5970](#))  
See also [Bug#29325](#), [Bug#32111](#).
- **Incompatible Change:** In MySQL 5.1.6, when log tables were implemented, the default log destination for the general query and slow query log was `TABLE`. This default has been changed to `FILE`, which is compatible with MySQL 5.0, but incompatible with earlier releases of MySQL 5.1 from 5.1.6 to 5.1.20. If you are upgrading from MySQL 5.0 to 5.1.21 or higher, no logging option changes should be necessary. However, if you are upgrading from 5.1.6 through 5.1.20 to 5.1.21 or higher and were using `TABLE` logging, use the `--log-output=TABLE` option explicitly to preserve your server's table-logging behavior.

The MySQL 5.1.23 fix is in addition to a fix in 5.1.21 because it turned out that the default was set in two places, only one of which was fixed the first time. ([Bug#29993](#))

- **Incompatible Change**

The parser accepted statements that contained `/* ... */` that were not properly closed with `*/`, such as `SELECT 1 /* + 2.` Statements that contain unclosed `/*`-comments now are rejected with a syntax error.

This fix has the potential to cause incompatibilities. Because of [Bug#26302](#), which caused the trailing `*/` to be truncated from comments in views, stored routines, triggers, and events, it is possible that objects of those types may have been stored with definitions that now will be rejected as syntactically invalid. Such objects should be dropped and re-created so that their definitions do not contain truncated comments. ([Bug#28779](#))

- **MySQL Cluster:** The following improvements have been made in the `ndb_size.pl` utility:

- The script can now be used with multiple databases; lists of databases and tables can also be excluded from analysis.
- Schema name information has been added to index table calculations.
- The database name is now an optional parameter, the exclusion of which causes all databases to be examined.
- If selecting from `INFORMATION_SCHEMA` fails, the script now attempts to fall back to `SHOW TABLES`.
- A `--real_table_name` option has been added; this designates a table to handle unique index size calculations.
- The report title has been amended to cover cases where more than one database is being analyzed.

Support for a `--socket` option was also added.

For more information, see [Section 17.4.21, “`ndb\_size.pl` — NDBCLUSTER Size Requirement Estimator”](#). ([Bug#28683](#), [Bug#28253](#))

- **MySQL Cluster:** Mapping of `NDB` error codes to MySQL storage engine error codes has been improved. ([Bug#28423](#))
- **MySQL Cluster:** The output of the `ndb_mgm` client `SHOW` and `STATUS` commands now indicates when the cluster is in single user mode. ([Bug#27999](#))
- **MySQL Cluster:** The output from the cluster management client showing the progress of data node starts has been improved. ([Bug#23354](#))
- **Partitioning:** Error messages for partitioning syntax errors have been made more descriptive. ([Bug#29368](#))
- **Replication:** Replication of the following SQL functions now switches to row-based logging in `MIXED` mode, and generates a warning in `STATEMENT` mode:

- `USER()`
- `CURRENT_USER()` and its alias `CURRENT_USER`
- `FOUND_ROWS()`
- `ROW_COUNT()`

See [Section 5.2.4.3, “Mixed Binary Logging Format”](#), for more information. ([Bug#12092](#), [Bug#28086](#), [Bug#30244](#))

- `mysqldump` information at the top of the output now shows the same information as `mysqldump` invoked with the `-V` option, namely the `mysqldump` version number, the MySQL server version, and the distribution. ([Bug#32350](#))
- `mysqltest` now has a `change_user` command to change the user for the current connection. (It invokes the `mysql_change_user()` C API function.) ([Bug#31608](#))
- `mysql-test-run.pl` now permits a suite name prefix to be specified in command-line arguments that name test cases. The test name syntax now is `[suite_name.]test_name[.suffix]`. For example, `mysql-test-run.pl bin-log.mytest` runs the `mytest.test` test in the `binlog` test suite. ([Bug#31400](#))
- The `--event-scheduler` option without a value disabled the event scheduler. Now it enables the event scheduler. ([Bug#31332](#))
- `mysqldump` produces a `-- Dump completed on DATE` comment at the end of the dump if `--comments` is given. The date causes dump files for identical data take at different times to appear to be different. The new options `--dump-date` and `--skip-dump-date` control whether the date is added to the comment. `--skip-dump-date` suppresses date printing. The default is `--dump-date` (include the date in the comment). ([Bug#31077](#))
- Server parser performance was improved for expression parsing by lowering the number of state transitions and reductions

needed. ([Bug#30625](#))

- Server parser performance was improved for identifier lists, expression lists, and UDF expression lists. ([Bug#30333](#))
- Server parser performance was improved for boolean expressions. ([Bug#30237](#))
- The `LAST_EXECUTED` column of the `INFORMATION_SCHEMA.EVENTS` table now indicates when the event started executing rather than when it finished executing. As a result, the `ENDS` column is never less than `LAST_EXECUTED`. ([Bug#29830](#))
- The `mysql_odbc_escape_string()` C API function has been removed. It has multi-byte character escaping issues, doesn't honor the `NO_BACKSLASH_ESCAPES` SQL mode and is not needed anymore by Connector/ODBC as of 3.51.17. ([Bug#29592](#))

See also [Bug#41728](#).

- If a `MyISAM` table is created with no `DATA DIRECTORY` option, the `.MYD` file is created in the database directory. By default, if `MyISAM` finds an existing `.MYD` file in this case, it overwrites it. The same applies to `.MYI` files for tables created with no `INDEX DIRECTORY` option. To suppress this behavior, start the server with the new `--keep_files_on_create` option, in which case `MyISAM` will not overwrite existing files and returns an error instead. ([Bug#29325](#))
- The default value of the `connect_timeout` system variable was increased from 5 to 10 seconds. This might help in cases where clients frequently encounter errors of the form `Lost connection to MySQL server at 'XXX', system error: errno.` ([Bug#28359](#))
- MySQL now can be compiled with `gcc` 4.2.x. There was a problem involving a conflict with the `min()` and `max()` macros in `my_global.h`. ([Bug#28184](#))
- `mysql-test-run.pl` now supports a `--combination` option for specifying options to the `mysqld` server. This option is similar to `--mysqld` but should be given two or more times. `mysql-test-run.pl` executes multiple test runs, using the options for each instance of `--combination` in successive runs.

For test runs specific to a given test suite, an alternative to the use of `--combination` is to create a `combinations` file in the suite directory. The file should contain a section of options for each test run.

- The argument for the `mysql-test-run.pl --do-test` and `--skip-test` options is now interpreted as a Perl regular expression if there is a pattern metacharacter in the argument value. This enables more flexible specification of which tests to perform or skip.

Bugs fixed:

- **Performance:** If a `LIMIT` clause was present, the server could fail to consider indexes that could be used for `ORDER BY` or `GROUP BY`. ([Bug#28404](#))
- **Security Fix: Replication:** It was possible for any connected user to issue a `BINLOG` statement, which could be used to escalate privileges.

Use of the `BINLOG` statement now requires the `SUPER` privilege. ([Bug#31611](#), [CVE-2007-6313](#))

- **Security Fix:** Three vulnerabilities in yaSSL versions 1.7.5 and earlier were discovered that could lead to a server crash or execution of unauthorized code. The exploit requires a server with yaSSL enabled and TCP/IP connections enabled, but does not require valid MySQL account credentials. The exploit does not apply to OpenSSL.

## Warning

The proof-of-concept exploit is freely available on the Internet. Everyone with a vulnerable MySQL configuration is advised to upgrade *immediately*.

([Bug#33814](#), [CVE-2008-0226](#), [CVE-2008-0227](#))

- **Security Fix:** Using `RENAME TABLE` against a table with explicit `DATA DIRECTORY` and `INDEX DIRECTORY` options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points.

MySQL will now return an error when the file to which the symlink points already exists. ([Bug#32111](#), [CVE-2007-5969](#))

- **Security Fix:** `ALTER VIEW` retained the original `DEFINER` value, even when altered by another user, which could enable that user to gain the access rights of the view. Now `ALTER VIEW` is permitted only to the original definer or users with the `SUPER` privilege. ([Bug#29908](#))
- **Security Fix:** When using a `FEDERATED` table, the local server could be forced to crash if the remote server returned a result

with fewer columns than expected. ([Bug#29801](#))

- **Security Enhancement:** It was possible to force an error message of excessive length which could lead to a buffer overflow. This has been made no longer possible as a security precaution. ([Bug#32707](#))
- **Incompatible Change:** It is no longer possible to create `CSV` tables with `NULL` columns. However, for backward compatibility, you can continue to use such tables that were created in previous MySQL releases. ([Bug#32050](#))
- **Incompatible Change:** With `ONLY_FULL_GROUP_BY` SQL mode enabled, queries such as `SELECT a FROM t1 HAVING COUNT(*) > 2` were not being rejected as they should have been.

This fix results in the following behavior:

- There is a check against mixing group and nongroup columns *only* when `ONLY_FULL_GROUP_BY` is enabled.
- This check is done both for the select list and for the `HAVING` clause if there is one.

This behavior differs from previous versions as follows:

- Previously, the `HAVING` clause was not checked when `ONLY_FULL_GROUP_BY` was enabled; now it is checked.
- Previously, the select list was checked even when `ONLY_FULL_GROUP_BY` was not enabled; now it is checked only when `ONLY_FULL_GROUP_BY` is enabled.

([Bug#31794](#))

- **Incompatible Change:** Inserting a row with a `NULL` value for a `DATETIME` column results in a `CSV` file that the storage engine cannot read.

All `CSV` tables now need to be defined with each column marked as `NOT NULL`. An error is raised if you try to create a `CSV` table with columns that are not defined with `NOT NULL`. ([Bug#31473](#), [Bug#32817](#))

- **Incompatible Change:** `SET PASSWORD` statements now cause an implicit commit, and thus are prohibited within stored functions and triggers. ([Bug#30904](#))
- **Incompatible Change:** The `mysql_install_db` script could fail to locate some components (including `resolveip`) during execution if the `--basedir` option was specified on the command-line or within the `my.cnf` file. This was due to a conflict when comparing the compiled-in values and the supplied values.

The `--source-install` command-line option to the script has been removed and replaced with the `--srcdir` option. `mysql_install_db` now locates components either using the compiled-in options, the `--basedir` option or `--srcdir` option. ([Bug#30759](#))

- **Incompatible Change:** Multiple-table `DELETE` statements containing ambiguous aliases could have unintended side effects such as deleting rows from the wrong table. Examples:

```
DELETE FROM t1 AS a2 USING t1 AS a1 INNER JOIN t2 AS a2;
DELETE t1 AS a2 FROM t1 AS a1 INNER JOIN t2 AS a2;
```

To avoid ambiguity, declaration of aliases other than in the `table_references` part of the statement should be avoided:

```
DELETE FROM t1 USING t1 AS a1 INNER JOIN t2 AS a2;
DELETE t1 FROM t1 AS a1 INNER JOIN t2 AS a2;
```

For the `USING` variant of multiple-table `DELETE` syntax, alias declarations outside the `table_references` part of the statement now are disallowed. (In MySQL 5.5, alias declarations outside `table_references` are disallowed for all multiple-table `DELETE` statements.) Statements containing aliases that are no longer permitted must be rewritten. ([Bug#30234](#))

See also [Bug#27525](#).

- **Incompatible Change:** Within a stored routine, it is no longer permissible to declare a cursor for a `SHOW` or `DESCRIBE` statement. This happened to work in some instances, but is no longer supported. In many cases, a workaround for this change is to use the cursor with a `SELECT` query to read from an `INFORMATION_SCHEMA` table that produces the same information as the `SHOW` statement. ([Bug#29223](#))
- **Incompatible Change:** It was possible to create a view having a column whose name consisted of an empty string or space characters only.

One result of this bug fix is that aliases for columns in the view `SELECT` statement are checked to ensure that they are legal column names. In particular, the length must be within the maximum column length of 64 characters, not the maximum alias length of 256 characters. This can cause problems for replication or loading dump files. For additional information and work-

around, see [Section D.4, “Restrictions on Views”](#). ([Bug#27695](#))

See also [Bug#31202](#).

- **Incompatible Change:** Several type-preserving functions and operators returned an incorrect result type that does not match their argument types: `COALESCE()`, `IF()`, `IFNULL()`, `LEAST()`, `GREATEST()`, `CASE`. These now aggregate using the precise SQL types of their arguments rather than the internal type. In addition, the result type of the `STR_TO_DATE()` function is now `DATETIME` by default. ([Bug#27216](#))
- **Incompatible Change:** `GRANT` and `REVOKE` statements now cause an implicit commit, and thus are prohibited within stored functions and triggers. ([Bug#21975](#), [Bug#21422](#), [Bug#17244](#))
- **Incompatible Change:** It was possible for option files to be read twice at program startup, if some of the standard option file locations turned out to be the same directory. Now duplicates are removed from the list of files to be read.

Also, users could not override system-wide settings using `~/.my.cnf` because `SYSCONFDIR/my.cnf` was read last. The latter file now is read earlier so that `~/.my.cnf` can override system-wide settings.

The fix for this problem had a side effect such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/.my.cnf`. That problem was addressed as [Bug#38180](#). ([Bug#20748](#))

- **Incompatible Change:** A number of problems existed in the implementation of `MERGE` tables that could cause problems. The problems are summarized below:
  - [Bug#26379](#) - Combination of `FLUSH TABLE` and `REPAIR TABLE` corrupts a `MERGE` table. This was caused in a number of situations:
    1. A thread trying to lock a `MERGE` table performs busy waiting while `REPAIR TABLE` or a similar table administration task is ongoing on one or more of its `MyISAM` tables.
    2. A thread trying to lock a `MERGE` table performs busy waiting until all threads that did `REPAIR TABLE` or similar table administration tasks on one or more of its `MyISAM` tables in `LOCK TABLES` segments do `UNLOCK TABLES`. The difference against problem #1 is that the busy waiting takes place after the administration task. It is terminated by `UNLOCK TABLES` only.
    3. Two `FLUSH TABLES` within a `LOCK TABLES` segment can invalidate the lock. This does not require a `MERGE` table. The first `FLUSH TABLES` can be replaced by any statement that requires other threads to reopen the table. In 5.0 and 5.1 a single `FLUSH TABLES` can provoke the problem.
  - [Bug#26867](#) - Simultaneously executing `LOCK TABLES` and `REPAIR TABLE` on a `MERGE` table would result in memory/cpu hogging.

Trying DML on a `MERGE` table, which has a child locked and repaired by another thread, made an infinite loop in the server.

- [Bug#26377](#) - Deadlock with `MERGE` and `FLUSH TABLE`

Locking a `MERGE` table and its children in parent-child order and flushing the child deadlocked the server.

- [Bug#25038](#) - Waiting `TRUNCATE TABLE`

Truncating a `MERGE` child, while the `MERGE` table was in use, let the truncate fail instead of waiting for the table to become free.

- [Bug#25700](#) - `MERGE` base tables get corrupted by `OPTIMIZE TABLE`, `ANALYZE TABLE`, or `REPAIR TABLE`.

Repairing a child of an open `MERGE` table corrupted the child. It was necessary to `FLUSH` the child first.

- [Bug#30275](#) - `MERGE` tables: `FLUSH TABLES` or `UNLOCK TABLES` causes server to crash.

Flushing and optimizing locked `MERGE` children crashed the server.

- [Bug#19627](#) - temporary merge table locking

Use of a temporary `MERGE` table with nontemporary children could corrupt the children.

Temporary tables are never locked. Creation of tables with nontemporary children of a temporary `MERGE` table is now prohibited.

- [Bug#27660](#) - Falcon: `MERGE` table possible

It was possible to create a `MERGE` table with non-`MyISAM` children.

- [Bug#30273](#) - `MERGE` tables: Can't lock file (errno: 155)

This was a Windows-only bug. Table administration statements sometimes failed with "Can't lock file (errno: 155)".

The fix introduces the following changes in behavior:

- This patch changes the behavior of temporary `MERGE` tables. Temporary `MERGE` must have temporary children. The old behavior was wrong. A temporary table is not locked. Hence even nontemporary children were not locked. See [Bug#19627](#).
- You cannot change the union list of a nontemporary `MERGE` table when `LOCK TABLES` is in effect. The following does *not* work:

```
CREATE TABLE m1 ... ENGINE=MRG_MYISAM ...;
LOCK TABLES t1 WRITE, t2 WRITE, m1 WRITE;
ALTER TABLE m1 ... UNION=(t1,t2) ...;
```

However, you can do this with a temporary `MERGE` table.

- You cannot create a `MERGE` table with `CREATE ... SELECT`, neither as a temporary `MERGE` table, nor as a nontemporary `MERGE` table. For example, `CREATE TABLE m1 ... ENGINE=MRG_MYISAM ... SELECT ...` causes the error message: `TABLE IS NOT BASE TABLE`.

([Bug#19627](#), [Bug#25038](#), [Bug#25700](#), [Bug#26377](#), [Bug#26379](#), [Bug#26867](#), [Bug#27660](#), [Bug#30275](#), [Bug#30491](#))

- **Important Change: MySQL Cluster:** `AUTO_INCREMENT` columns had the following problems when used in `NDB` tables:
  - The `AUTO_INCREMENT` counter was not updated correctly when such a column was updated.
  - `AUTO_INCREMENT` values were not prefetched beyond statement boundaries.
  - `AUTO_INCREMENT` values were not handled correctly with `INSERT IGNORE` statements.
  - After being set, `ndb_autoincrement_prefetch_sz` showed a value of 1, regardless of the value it had actually been set to.

As part of this fix, the behavior of `ndb_autoincrement_prefetch_sz` has changed. Setting this to less than 32 no longer has any effect on prefetching within statements (where IDs are now always obtained in batches of 32 or more), but only between statements. The default value for this variable has also changed, and is now 1. ([Bug#25176](#), [Bug#31956](#), [Bug#32055](#))

- **Partitioning: Important Note:** An apostrophe or single quote character (') used in the `DATA DIRECTORY`, `INDEX DIRECTORY`, or `COMMENT` for a `PARTITION` clause caused the server to crash. When used as part of a `CREATE TABLE` statement, the crash was immediate. When used in an `ALTER TABLE` statement, the crash did not occur until trying to perform a `SELECT` or DML statement on the table. In either case, the server could not be completely restarted until the `.frm` file corresponding to the newly created or altered table was deleted.

### Note

Upgrading to the current (or later) release solves this problem only for tables that are newly created or altered. Tables created or altered in previous versions of the server to include ' characters in `PARTITION` options must still be removed by deleting the corresponding `.frm` files and re-creating them afterward.

([Bug#30695](#))

- **Important Note:** The `RENAME DATABASE` statement was removed and replaced with `ALTER DATABASE db_name UPGRADE DATA DIRECTORY NAME`. The `RENAME DATABASE` statement was intended for upgrading database directory names to the encoding format used in 5.1 for representing identifiers in the file system (see [Section 8.2.3, “Mapping of Identifiers to File Names”](#)). However, the statement was found to be dangerous because it could result in loss of database contents. See [Section 12.1.32, “RENAME DATABASE Syntax”](#), and [Section 12.1.1, “ALTER DATABASE Syntax”](#). ([Bug#17565](#), [Bug#21741](#), [Bug#28360](#))
- **Replication: MySQL Cluster:** Row-based replication from or to a big-endian machine where the table used the `NDB` storage engine failed, if the same table on the other machine was either non-`NDB` or the other machine was little-endian. ([Bug#29549](#), [Bug#30790](#))

See also [Bug#24231](#), [Bug#30024](#), [Bug#30133](#), [Bug#30134](#).

- **MySQL Cluster:** An improperly reset internal signal was observed as a hang when using events in the `NDB` API but could result in various errors. ([Bug#33206](#))

- **MySQL Cluster:** Incorrectly handled parameters could lead to a crash in the Transaction Coordinator during a node failure, causing other data nodes to fail. ([Bug#33168](#))
- **MySQL Cluster:** A memory leak occurred if a subscription start request was received by the subscription manager before the node making the request was fully connected to the cluster. ([Bug#32652](#))
- **MySQL Cluster:** A local checkpoint could sometimes be started before the previous LCP was restorable from a global checkpoint. ([Bug#32519](#))
- **MySQL Cluster:** High numbers of API nodes on a slow or congested network could cause connection negotiation to time out prematurely, leading to the following issues:
  - Excessive retries
  - Excessive CPU usage
  - Partially connected API nodes([Bug#32359](#))
- **MySQL Cluster:** When a `mysqld` acting as a cluster SQL node starts the `NDBCLUSTER` storage engine, there is a delay during which some necessary data structures cannot be initialized until after it has connected to the cluster, and all MySQL Cluster tables should be opened as read only. This worked correctly when the `NDB` binlog thread was running, but when it was not running, Cluster tables were not opened as read only even when the data structures had not yet been set up. ([Bug#32275](#), [Bug#33763](#))
- **MySQL Cluster:** The failure of a master node could lead to subsequent failures in local checkpointing. ([Bug#32160](#))
- **MySQL Cluster:** The management server was slow to respond when no data nodes were connected to the cluster. This was most noticeable when running `SHOW` in the management client. ([Bug#32023](#))
- **MySQL Cluster:** An error with an `if` statement in `sql/ha_ndbcluster.cc` could potentially lead to an infinite loop in case of failure when working with `AUTO_INCREMENT` columns in `NDB` tables. ([Bug#31810](#))
- **MySQL Cluster:** The `NDB` storage engine code was not safe for strict-alias optimization in `gcc` 4.2.1. ([Bug#31761](#))
- **MySQL Cluster:** It was possible in some cases for a node group to be “lost” due to missed local checkpoints following a system restart. ([Bug#31525](#))
- **MySQL Cluster:** A query against a table with `TEXT` or `BLOB` columns that would return more than a certain amount of data failed with `GOT_ERROR 4350 'TRANSACTION ALREADY ABORTED' FROM NDBCLUSTER.` ([Bug#31482](#))

This regression was introduced by [Bug#29102](#).

- **MySQL Cluster:** `NDB` tables having names containing nonalphanumeric characters (such as “\$”) were not discovered correctly. ([Bug#31470](#))
- **MySQL Cluster:** A node failure during a local checkpoint could lead to a subsequent failure of the cluster during a system restart. ([Bug#31257](#))
- **MySQL Cluster:** A cluster restart could sometimes fail due to an issue with table IDs. ([Bug#30975](#))
- **MySQL Cluster:** When handling `BLOB` columns, the addition of read locks to the lock queue was not handled correctly. ([Bug#30764](#))
- **MySQL Cluster:** Discovery of `NDB` tables did not work correctly with `INFORMATION_SCHEMA`. ([Bug#30667](#))
- **MySQL Cluster:** A file system close operation could fail during a node or system restart. ([Bug#30646](#))
- **MySQL Cluster:** Transaction timeouts were not handled well in some circumstances, leading to excessive number of transactions being aborted unnecessarily. ([Bug#30379](#))
- **MySQL Cluster:** The cluster management client could not connect, and would hang instead. This issue affected Mac OS X 64-bit only. ([Bug#30366](#))
- **MySQL Cluster:** Attempting to restore a backup made on a cluster host using one endian to a machine using the other endian could cause the cluster to fail. ([Bug#29674](#))
- **MySQL Cluster:** Log event requests to `ndb_mgmd` could time out, causing it to fail. ([Bug#29621](#))
- **MySQL Cluster:** In some cases, the cluster management server logged entries multiple times following a restart of `mgmd`. ([Bug#29565](#))

- **MySQL Cluster:** `ndb_mgm --help` did not display any information about the `-a` option. ([Bug#29509](#))
  - **MySQL Cluster:** An interpreted program of sufficient size and complexity could cause all cluster data nodes to shut down due to buffer overruns. ([Bug#29390](#))
  - **MySQL Cluster:** `ndb_size.pl` failed on tables with `FLOAT` columns whose definitions included commas (for example, `FLOAT(6, 2)`). ([Bug#29228](#))
  - **MySQL Cluster:** The error message for `NDB` error code 275 (`OUT OF TRANSACTION RECORDS FOR COMPLETE PHASE`) was missing. ([Bug#29139](#))
  - **MySQL Cluster:** Reads on `BLOB` columns were not locked when they needed to be to guarantee consistency. ([Bug#29102](#))  
See also [Bug#31482](#).
  - **MySQL Cluster:** A query using joins between several large tables and requiring unique index lookups failed to complete, eventually returning `UNKNOWN_ERROR` after a very long period of time. This occurred due to inadequate handling of instances where the Transaction Coordinator ran out of `TransactionBufferMemory`, when the cluster should have returned NDB error code 4012 (`REQUEST_NDBD_TIME-OUT`). ([Bug#28804](#))
  - **MySQL Cluster:** There was a short interval during the startup process prior to the beginning of heartbeat detection such that, were an API or management node to reboot or a network failure to occur, data nodes could not detect this, with the result that there could be a lingering connection. ([Bug#28445](#))
  - **MySQL Cluster:** The description of the `--print` option provided in the output from `ndb_restore --help` was incorrect. ([Bug#27683](#))
  - **MySQL Cluster:** Restoring a backup made on a cluster host using one endian to a machine using the other endian failed for `BLOB` and `DATETIME` columns. ([Bug#27543](#), [Bug#30024](#))
  - **MySQL Cluster:** An invalid subselect on an `NDB` table could cause `mysqld` to crash. ([Bug#27494](#))
  - **MySQL Cluster:** An attempt to perform a `SELECT ... FROM INFORMATION_SCHEMA.TABLES` whose result included information about `NDB` tables for which the user had no privileges crashed the MySQL Server on which the query was performed. ([Bug#26793](#))
  - **MySQL Cluster:** Performing `DELETE` operations after a data node had been shut down could lead to inconsistent data following a restart of the node. ([Bug#26450](#))
  - **MySQL Cluster:** `UPDATE IGNORE` could sometimes fail on `NDB` tables due to the use of uninitialized data when checking for duplicate keys to be ignored. ([Bug#25817](#))
  - **MySQL Cluster:** The cluster log was formatted inconsistently and contained extraneous newline characters. ([Bug#25064](#))
  - **MySQL Cluster:** A restart of the cluster failed when more than 1 REDO phase was in use. ([Bug#22696](#))
  - **MySQL Cluster:** When inserting a row into an `NDB` table with a duplicate value for a nonprimary unique key, the error issued would reference the wrong key.  
This improves on an initial fix for this issue made in MySQL 5.1.13. ([Bug#21072](#))
- **MySQL Cluster:** An insufficiently descriptive and potentially misleading Error 4006 (`CONNECT FAILURE - OUT OF CONNECTION OBJECTS...`) was produced when either of the following two conditions occurred:
    1. There were no more transaction records in the transaction coordinator
    2. An `NDB` object in the `NDB` API was initialized with insufficient parallelism  
Separate error messages are now generated for each of these two cases. ([Bug#11313](#))
  - **Partitioning: Replication:** Replication of partitioned tables using the `InnoDB` storage engine failed with `binlog-format=ROW` or `binlog-format=MIXED`. ([Bug#28430](#))
  - **Partitioning:** It was possible to partition a table to which a foreign key referred. ([Bug#32948](#))
  - **Partitioning:** A query of the form `SELECT col1 FROM table GROUP BY (SELECT col2 FROM table LIMIT 1);` against a partitioned `table` having a `SET` column crashed the server. ([Bug#32772](#))
  - **Partitioning:** `SHOW CREATE TABLE` misreported the value of `AUTO_INCREMENT` for partitioned tables using either of the `InnoDB` or `ARCHIVE` storage engines. ([Bug#32247](#))
  - **Partitioning:** Selecting from `INFORMATION_SCHEMA.PARTITIONS` while partition management statements (for example,

`ALTER TABLE ... ADD PARTITION`) were executing caused the server to crash. ([Bug#32178](#))

- **Partitioning:** An error in the internal function `mysql_unpack_partition()` led to a fatal error in subsequent calls to `open_table_from_share()`. ([Bug#32158](#))
  - **Partitioning:** Repeated updates of a table that was partitioned by `KEY` on a `TIMESTAMP` column eventually crashed the server. ([Bug#32067](#))
  - **Partitioning:** Changing the storage engine used by a table having subpartitions led to a server crash. ([Bug#31893](#))
  - **Partitioning:** `ORDER BY ... DESC` did not always work correctly when selecting from partitioned tables. ([Bug#31890](#))
- See also [Bug#31001](#).
- **Partitioning:** Selecting from a table partitioned by `KEY` on a `VARCHAR` column whose size was greater than 65530 caused the server to crash. ([Bug#31705](#))
  - **Partitioning:** `INSERT DELAYED` on a partitioned table crashed the server. The server now rejects the statement with an error. ([Bug#31210](#))
  - **Partitioning:** Using `ALTER TABLE` to partition an existing table having an `AUTO_INCREMENT` column could crash the server. ([Bug#30878](#))

This regression was introduced by [Bug#27405](#).

- **Partitioning:** `ALTER TABLE ... COALESCE PARTITION` on a table partitioned by `[LINEAR] HASH` or `[LINEAR] KEY` caused the server to crash. ([Bug#30822](#))
  - **Partitioning:** `LIKE` queries on tables partitioned by `KEY` and using third-party storage engines could return incomplete results. ([Bug#30480](#))
- See also [Bug#29320](#), [Bug#29493](#), [Bug#30563](#).
- **Partitioning:** It was not possible to insert the greatest possible value for a given data type into a partitioned table. For example, consider a table defined as shown here:

```
CREATE TABLE t (c BIGINT UNSIGNED)
 PARTITION BY RANGE(c) (
 PARTITION p0 VALUES LESS THAN MAXVALUE
);
```

The largest possible value for a `BIGINT UNSIGNED` column is 18446744073709551615, but the statement `INSERT INTO t VALUES (18446744073709551615);` would fail, even though the same statement succeeded were `t` not a partitioned table.

In other words, `MAXVALUE` was treated as being equal to the greatest possible value, rather than as a least upper bound. ([Bug#29258](#))

- **Cluster Replication: Replication:** A node failure during replication could lead to buckets out of order; now active subscribers are checked for, rather than empty buckets. ([Bug#31701](#))
- **Cluster Replication: Replication:** Incorrect handling of `INSERT` plus `DELETE` operations with regard to local checkpoints caused data node failures in multi-master replication setups. ([Bug#30914](#))
- **Replication:** When dropping a database containing a stored procedure while using row-based replication, the delete of the stored procedure from the `mysql.proc` table was recorded in the binary log following the `DROP DATABASE` statement. To correct this issue, `DROP DATABASE` now uses statement-based replication. ([Bug#32435](#))
- **Replication:** It was possible for the name of the relay log file to exceed the amount of memory reserved for it, possibly leading to a crash of the server. ([Bug#31836](#))

See also [Bug#28597](#).

- **Replication:** Corruption of log events caused the server to crash on 64-bit Linux systems having 4 GB or more of memory. ([Bug#31793](#))
- **Replication:** Trying to replicate an update of a row that was missing on the slave led to a failure on the slave. ([Bug#31702](#))
- **Replication:** Use of the `@@hostname` system variable in inserts in `mysql_system_tables_data.sql` did not replicate. The workaround is to select its value into a user variable (which does replicate) and insert that. ([Bug#31167](#))
- **Replication:** Table names were displayed as binary “garbage” characters in slave error messages. The issue was observed on 64-bit Windows but may have effected other platforms. ([Bug#30854](#))

- **Replication:** One thread could read uninitialized memory from the stack of another thread. This issue was only known to occur in a `mysqld` process acting as both a master and a slave. ([Bug#30752](#))
- **Replication:** It was possible to set `SQL_SLAVE_SKIP_COUNTER` such that the slave would jump into the middle of a transaction. This fix improves on one made for this bug in MySQL 5.1.20; the previous fix insured that the slave could not be made to jump into the middle of an event group, but the slave failed to recognize that `BEGIN`, `COMMIT`, and `ROLLBACK` statements could begin or end an event group. ([Bug#28618](#))

See also [Bug#12691](#).

- **Replication:** Due a previous change in how the default name and location of the binary log file were determined, replication failed following some upgrades. ([Bug#28597](#), [Bug#28603](#))

See also [Bug#31836](#).

This regression was introduced by [Bug#20166](#).

- **Replication:** Stored procedures having `BIT` parameters were not replicated correctly. ([Bug#26199](#))
- **Replication:** Issuing `SHOW SLAVE STATUS` as `mysqld` was shutting down could cause a crash. ([Bug#26000](#))
- **Replication:** If a temporary error occurred inside an event group on an event that was not the first event of the group, the slave could get caught in an endless loop because the retry counter was reset whenever an event was executed successfully. ([Bug#24860](#))

See also [Bug#12691](#), [Bug#23171](#).

- **Replication:** An `UPDATE` statement using a stored function that modified a nontransactional table was not logged if it failed. This caused the copy of the nontransactional table on the master to have a row that the copy on the slave did not.

In addition, when an `INSERT ... ON DUPLICATE KEY UPDATE` statement encountered a duplicate key constraint, but the `UPDATE` did not actually change any data, the statement was not logged. As a result of this fix, such statements are now treated the same for logging purposes as other `UPDATE` statements, and so are written to the binary log. ([Bug#23333](#))

See also [Bug#12713](#).

- **Replication:** A replication slave sometimes failed to reconnect because it was unable to run `SHOW SLAVE HOSTS`. It was not necessary to run this statement on slaves (since the master should track connection IDs), and the execution of this statement by slaves was removed. ([Bug#21132](#))

See also [Bug#13963](#), [Bug#21869](#).

- **Replication:** A replication slave sometimes stopped for changes that were idempotent (that is, such changes should have been considered “safe”), even though it should have simply noted that the change was already done, and continued operation. ([Bug#19958](#))
- **Replication:** Replicating from a master table to a slave table where the size of a `CHAR` or `VARCHAR` column was a different size would cause `mysqld` to crash. For more information on replicating with different column definitions, see [Section 16.4.1.7, “Replication with Differing Table Definitions on Master and Slave”](#).
- **Cluster Replication:** A replication slave could return “garbage” data that was not in recognizable row format due to a problem with the internal `all_set()` method. ([Bug#33375](#))
- **Cluster Replication:** Memory was mistakenly freed for `NdbBlob` objects when adding an index while replicating the cluster, which could cause `mysqld` to crash. ([Bug#33142](#))

See also [Bug#18106](#).

- **Cluster Replication:** Under certain conditions, the slave stopped processing relay logs. This resulted in the logs never being cleared and the slave eventually running out of disk space. ([Bug#31958](#))
- **Cluster Replication:** Replicating `NDB` tables with extra `VARCHAR` columns on the master caused the slave to fail. ([Bug#31646](#))

See also [Bug#29549](#).

- **Cluster Replication:** When the master `mysqld` crashed or was restarted, no `LOST_EVENTS` entry was made in the binlog. ([Bug#31484](#))
- **Cluster Replication:** See also [Bug#21494](#).
- **Cluster Replication:** An issue with the `mysql.ndb_apply_status` table could cause `NDB` schema autodiscovery to fail in

certain rare circumstances. ([Bug#20872](#))

- **Cluster API:** A call to `CHECK_TIMEDOUT_RET()` in `mgmapi.cpp` should have been a call to `DBUG_CHECK_TIMEDOUT_RET()`. ([Bug#30681](#))
- **API:** When the language option was not set correctly, API programs calling `mysql_server_init()` crashed. This issue was observed only on Windows platforms. ([Bug#31868](#))
- Corrected a typecast involving `bool` on Mac OS X 10.5 (Leopard), which evaluated differently from earlier Mac OS X versions. ([Bug#38217](#))
- Use of uninitialized memory for `filesort` in a subquery caused a server crash. ([Bug#33675](#))
- `CREATE TABLE ... SELECT` created tables that for date columns used the obsolete `Field_date` type instead of `Field_newdate`. ([Bug#33256](#))
- Some valid `SELECT` statements could not be used as views due to incorrect column reference resolution. ([Bug#33133](#))
- The fix for [Bug#11230](#) and [Bug#26215](#) introduced a significant input-parsing slowdown for the `mysql` client. This has been corrected. ([Bug#33057](#))
- The correct data type for a `NULL` column resulting from a `UNION` could be determined incorrectly in some cases: 1) Not correctly inferred as `NULL` depending on the number of selects; 2) Not inferred correctly as `NULL` if one select used a subquery. ([Bug#32848](#))
- For queries containing `GROUP_CONCAT(DISTINCT col_list ORDER BY col_list)`, there was a limitation that the `DISTINCT` columns had to be the same as `ORDER BY` columns. Incorrect results could be returned if this was not true. ([Bug#32798](#))
- `SHOW EVENTS` and selecting from the `INFORMATION_SCHEMA.EVENTS` table failed if the current database was `INFORMATION_SCHEMA`. ([Bug#32775](#))
- Use of the `cp932` character set with `CAST()` in an `ORDER BY` clause could cause a server crash. ([Bug#32726](#))
- A subquery using an `IS NULL` check of a column defined as `NOT NULL` in a table used in the `FROM` clause of the outer query produced an invalid result. ([Bug#32694](#))
- `mysqld_safe` looked for error messages in the wrong location. ([Bug#32679](#))
- Specifying a nonexistent column for an `INSERT DELAYED` statement caused a server crash rather than producing an error. ([Bug#32676](#))
- An issue with the `NO_ENGINE_SUBSTITUTION` `sql_mode` database can cause the creation of stored routines to fail. If you are having problems with creating stored routines while using this `sql_mode` value, remove this value from your `sql_mode` setting. ([Bug#32633](#))
- Use of `CLIENT_MULTI_QUERIES` caused `libmysqld` to crash. ([Bug#32624](#))
- The `INTERVAL()` function incorrectly handled `NULL` values in the value list. ([Bug#32560](#))
- Use of a `NULL`-returning `GROUP BY` expression in conjunction with `WITH ROLLUP` could cause a server crash. ([Bug#32558](#))

See also [Bug#31095](#).

- `ORDER BY UpdateXML(...)` caused the server to crash in queries where `UpdateXML()` returned `NULL`. ([Bug#32557](#))
- A `SELECT ... GROUP BY bit_column` query failed with an assertion if the length of the `BIT` column used for the `GROUP BY` was not an integer multiple of 8. ([Bug#32556](#))
- Using `SELECT INTO OUTFILE` with 8-bit `ENCLOSED BY` characters led to corrupted data when the data was reloaded using `LOAD DATA INFILE`. This was because `SELECT INTO OUTFILE` failed to escape the 8-bit characters. ([Bug#32533](#))
- For `FLUSH TABLES WITH READ LOCK`, the server failed to properly detect write-locked tables when running with low-priority updates, resulting in a crash or deadlock. ([Bug#32528](#))
- The rules for valid column names were being applied differently for base tables and views. ([Bug#32496](#))
- A query of the form `SELECT @user_variable := constant AS alias FROM table GROUP BY alias WITH ROLLUP` crashed the server. ([Bug#32482](#))
- Sending several `KILL QUERY` statements to target a connection running `SELECT SLEEP()` could freeze the server.

**Bug#32436)**

- `ssl-cipher` values in option files were not being read by `libmysqlclient`. ([Bug#32429](#))
- Repeated execution of a query containing a `CASE` expression and numerous `AND` and `OR` relations could crash the server. The root cause of the issue was determined to be that the internal `SEL_ARG` structure was not properly initialized when created. ([Bug#32403](#))
- Referencing within a subquery an alias used in the `SELECT` list of the outer query was incorrectly permitted. ([Bug#32400](#))
- If a global read lock acquired with `FLUSH TABLES WITH READ LOCK` was in effect, executing `ALTER TABLE` could cause a server crash. ([Bug#32395](#))
- An `ORDER BY` query on a view created using a `FEDERATED` table as a base table caused the server to crash. ([Bug#32374](#))
- Comparison of a `BIGINT NOT NULL` column with a constant arithmetic expression that evaluated to `NULL` mistakenly caused the error `COLUMN '...' CANNOT BE NULL` (error 1048). ([Bug#32335](#))
- Assigning a 65,536-byte string to a `TEXT` column (which can hold a maximum of 65,535 bytes) resulted in truncation without a warning. Now a truncation warning is generated. ([Bug#32282](#))
- The `LAST_DAY()` function returns a `DATE` value, but internally the value did not have the time fields zeroed and calculations involving the value could return incorrect results. ([Bug#32270](#))
- `MIN()` and `MAX()` could return incorrect results when an index was present if a loose index scan was used. ([Bug#32268](#))
- Some uses of user variables in a query could result in a server crash. ([Bug#32260](#))
- Memory corruption could occur due to large index map in `Range checked for each record` status reported by `EXPLAIN SELECT`. The problem was based in an incorrectly calculated length of the buffer used to store a hexadecimal representation of an index map, which could result in buffer overrun and stack corruption under some circumstances. ([Bug#32241](#))
- Various test program cleanups were made: 1) `mytest` and `libmysqltest` were removed. 2) `bug25714` displays an error message when invoked with incorrect arguments or the `--help` option. 3) `mysql_client_test` exits cleanly with a proper error status. ([Bug#32221](#))
- The default grant tables on Windows contained information for host `production.mysql.com`, which should not be there. ([Bug#32219](#))
- Under certain conditions, the presence of a `GROUP BY` clause could cause an `ORDER BY` clause to be ignored. ([Bug#32202](#))
- For comparisons of the form `date_col OP datetime_const` (where `OP` is `=`, `<`, `>`, `<=`, or `>=`), the comparison is done using `DATETIME` values, per the fix for [Bug#27590](#). However that fix caused any index on `date_col` not to be used and compromised performance. Now the index is used again. ([Bug#32198](#))
- `DATETIME` arguments specified in numeric form were treated by `DATE_ADD()` as `DATE` values. ([Bug#32180](#))
- Killing a statement could lead to a race condition in the server. ([Bug#32148](#))
- `InnoDB` does not support `SPATIAL` indexes, but could crash when asked to handle one. Now an error is returned. ([Bug#32125](#))
- The server crashed on optimizations involving a join of `INT` and `MEDIUMINT` columns and a system variable in the `WHERE` clause. ([Bug#32103](#))
- `mysql-test-run.pl` used the `--user` option when starting `mysqld`, which produces warnings if the current user is not `root`. Now `--user` is added only for `root`. ([Bug#32078](#))
- `mysqlslap` was missing from the MySQL 5.1.22 Linux RPM packages. ([Bug#32077](#))
- With `lower_case_table_names` set, `CREATE TABLE LIKE` was treated differently by `libmysqld` than by the nonembedded server. ([Bug#32063](#))
- Within a subquery, `UNION` was handled differently than at the top level, which could result in incorrect results or a server crash. ([Bug#32036](#), [Bug#32051](#))
- On 64-bit platforms, assignments of values to enumeration-valued storage engine-specific system variables were not validated and could result in unexpected values. ([Bug#32034](#))
- A `DELETE` statement with a subquery in the `WHERE` clause would sometimes ignore an error during subquery evaluation and proceed with the delete operation. ([Bug#32030](#))

- Using dates in the range '`0000-00-01`' to '`0000-00-99`' range in the `WHERE` clause could result in an incorrect result set. (These dates are not in the supported range for `DATE`, but different results for a given query could occur depending on position of records containing the dates within a table.) ([Bug#32021](#))
- User-defined functions are not loaded if the server is started with the `--skip-grant-tables` option, but the server did not properly handle this case and issued an `OUT OF MEMORY` error message instead. ([Bug#32020](#))
- If a user-defined function was used in a `SELECT` statement, and an error occurred during UDF initialization, the error did not terminate execution of the `SELECT`, but rather was converted to a warning. ([Bug#32007](#))
- `HOUR()`, `MINUTE()`, and `SECOND()` could return nonzero values for `DATE` arguments. ([Bug#31990](#))
- Changing the SQL mode to cause dates with “zero” parts to be considered invalid (such as '`1000-00-00`') could result in indexed and nonindexed searches returning different results for a column that contained such dates. ([Bug#31928](#))
- The server used unnecessarily large amounts of memory when user variables were used as an argument to `CONCAT()` or `CONCAT_WS()`. ([Bug#31898](#))
- In debug builds, testing the result of an `IN` subquery against `NULL` caused an assertion failure. ([Bug#31884](#))
- `mysql-test-run.pl` sometimes set up test scenarios in which the same port number was passed to multiple servers, causing one of them to be unable to start. ([Bug#31880](#))
- `SHOW CREATE TRIGGER` caused a server crash. ([Bug#31866](#))
- The server crashed after insertion of a negative value into an `AUTO_INCREMENT` column of an `InnoDB` table. ([Bug#31860](#))
- For `libmysqld` applications, handling of `mysql_change_user()` calls left some pointers improperly updated, leading to server crashes. ([Bug#31850](#))
- Using `ORDER BY` led to the wrong result when using the `ARCHIVE` on a table with a `BLOB` when the table cache was full. The table could also be reported as crashed after the query had completed, even though the table data was intact. ([Bug#31833](#))
- Comparison results for `BETWEEN` were different from those for operators like `<` and `>` for `DATETIME`-like values with trailing extra characters such as '`2007-10-01 00:00:00 GMT-6`'. `BETWEEN` treated the values as `DATETIME`, whereas the other operators performed a binary-string comparison. Now they all uniformly use a `DATETIME` comparison, but generate warnings for values with trailing garbage. ([Bug#31800](#))
- Name resolution for correlated subqueries and `HAVING` clauses failed to distinguish which of two was being performed when there was a reference to an outer aliased field. This could result in error messages about a `HAVING` clause for queries that had no such clause. ([Bug#31797](#))
- The server could crash during `filesort` for `ORDER BY` based on expressions with `INET_NTOA()` or `OCT()` if those functions returned `NULL`. ([Bug#31758](#))
- For tables with certain definitions, `UPDATE` statements could fail to find the correct record to update and report an error when the record did in fact exist. ([Bug#31747](#))
- For a fatal error during a filesort in `find_all_keys()`, the error was returned without the necessary handler uninitialized, causing an assertion failure. ([Bug#31742](#))
- `mysqlslap` failed to commit after the final record load. ([Bug#31704](#))
- The examined-rows count was not incremented for `const` queries. ([Bug#31700](#))
- The server crashed if a thread was killed while locking the `general_log` table at the beginning of statement processing. ([Bug#31692](#))
- The `mysql_change_user()` C API function was subject to buffer overflow. ([Bug#31669](#))
- For `SELECT ... INTO OUTFILE`, if the `ENCLOSED BY` string is empty and the `FIELDS TERMINATED BY` string started with a special character (one of `n`, `t`, `r`, `b`, `0`, `Z`, or `N`), every occurrence of the character within field values would be duplicated. ([Bug#31663](#))
- `SHOW COLUMNS` and `DESCRIBE` displayed `null` as the column type for a view with no valid definer. This caused `mysql-dump` to produce a nonreloadable dump file for the view. ([Bug#31662](#))
- The `mysqlbug` script did not include the correct values of `CFLAGS` and `CXXFLAGS` that were used to configure the distribution. ([Bug#31644](#))
- Queries that include a comparison of an `INFORMATION_SCHEMA` table column to `NULL` caused a server crash. ([Bug#31633](#))

- `EXPLAIN EXTENDED` for `SELECT` from `INFORMATION_SCHEMA` tables caused an assertion failure. ([Bug#31630](#))
- `ucs2` does not work as a client character set, but attempts to use it as such were not rejected. Now `character_set_client` cannot be set to `ucs2`. This also affects statements such as `SET NAMES` and `SET CHARACTER SET`. ([Bug#31615](#))
- A buffer used when setting variables was not dimensioned to accommodate the trailing '`\0`' byte, so a single-byte buffer overrun was possible. ([Bug#31588](#))
- `HAVING` could treat lowercase of table aliases incorrectly if `lower_case_table_names` was enabled. ([Bug#31562](#))
- Spurious duplicate-key errors could occur for multiple-row inserts into an `InnoDB` table that activate a trigger. ([Bug#31540](#))
- Using `ALTER EVENT` to rename a disabled event caused it to become enabled. ([Bug#31539](#))
- The fix for [Bug#24989](#) introduced a problem such that a `NULL` thread handler could be used during a rollback operation. This problem is unlikely to be seen in practice. ([Bug#31517](#))
- The length of the result from `IFNULL()` could be calculated incorrectly because the sign of the result was not taken into account. ([Bug#31471](#))
- Queries that used the `ref` access method or index-based subquery execution over indexes that have `DECIMAL` columns could fail with an error `Column col_name cannot be null.` ([Bug#31450](#))
- `InnoDB` now tracks locking and use of tables by MySQL only after a table has been successfully locked on behalf of a transaction. Previously, the locked flag was set and the table in-use counter was updated before checking whether the lock on the table succeeded. A subsequent failure in obtaining a lock on the table led to an inconsistent state as the table was neither locked nor in use. ([Bug#31444](#))
- `SELECT 1 REGEX NULL` caused an assertion failure for debug servers. ([Bug#31440](#))
- The `UpdateXML()` function did not check for the validity of all its arguments; in some cases, this could lead to a crash of the server. ([Bug#31438](#))
- The `mysql_change_user()` C API function caused advisory locks (obtained with `GET_LOCK()`) to malfunction. ([Bug#31418](#))
- NDB libraries and include files were missing from some binary `tar` file distributions. ([Bug#31414](#))
- Executing `RENAME` while tables were open for use with `HANDLER` statements could cause a server crash. ([Bug#31409](#))
- `mysql-test-run.pl` tried to create files in a directory where it could not be expected to have write permission. `mysqldtest` created `.reject` files in a directory other than the one where test results go. ([Bug#31398](#))
- For a table that had been opened with `HANDLER` and marked for reopening after being closed with `FLUSH TABLES, DROP TABLE` did not properly discard the handler. ([Bug#31397](#))
- Automatically allocated memory for string options associated with a plugin was not freed if the plugin did not get installed. ([Bug#31382](#))
- `INFORMATION_SCHEMA.TABLES` was returning incorrect information. ([Bug#31381](#))
- `DROP USER` caused an increase in memory usage. ([Bug#31347](#))
- For `InnoDB` tables with `READ COMMITTED` isolation level, semi-consistent reads used for `UPDATE` statements skipped rows locked by another transaction, rather than waiting for the locks to be released. Consequently, rows that possibly should have been updated were never examined. ([Bug#31310](#))
- For an almost-full `MyISAM` table, an insert that failed could leave the table in a corrupt state. ([Bug#31305](#))
- `myisamchk --unpack` could corrupt a table that when unpacked has static (fixed-length) row format. ([Bug#31277](#))
- `CONVERT(val, DATETIME)` would fail on invalid input, but processing was not aborted for the `WHERE` clause, leading to a server crash. ([Bug#31253](#))
- Allocation of an insufficiently large group-by buffer following creation of a temporary table could lead to a server crash. ([Bug#31249](#))
- Use of `DECIMAL(n, n) ZEROFILL` in `GROUP_CONCAT()` could cause a server crash. ([Bug#31227](#))
- When a `TIMESTAMP` with a nonzero time part was converted to a `DATE` value, no warning was generated. This caused index

lookups to assume that this is a valid conversion and was returning rows that match a comparison between a `TIMESTAMP` value and a `DATE` keypart. Now a warning is generated so that `TIMESTAMP` with a nonzero time part will not match `DATE` values. ([Bug#31221](#))

- Server variables could not be set to their current values on Linux platforms. ([Bug#31177](#))

See also [Bug#6958](#).

- With small values of `myisam_sort_buffer_size`, `REPAIR TABLE` for `MyISAM` tables could cause a server crash. ([Bug#31174](#))
- If `MAKETIME()` returned `NULL` when used in an `ORDER BY` that was evaluated using `filesort`, a server crash could result. ([Bug#31160](#))
- Data in `BLOB` or `GEOMETRY` columns could be cropped when performing a `UNION` query. ([Bug#31158](#))
- `LAST_INSERT_ID()` execution could be handled improperly in subqueries. ([Bug#31157](#))
- An assertion designed to detect a bug in the `ROLLUP` implementation would incorrectly be triggered when used in a subquery context with noncacheable statements. ([Bug#31156](#))
- Selecting spatial types in a `UNION` could cause a server crash. ([Bug#31155](#))
- Use of `GROUP_CONCAT(DISTINCT bit_column)` caused an assertion failure. ([Bug#31154](#))
- The server crashed in the parser when running out of memory. Memory handling in the parser has been improved to gracefully return an error when out-of-memory conditions occur in the parser. ([Bug#31153](#))
- MySQL declares a `UNIQUE` key as a `PRIMARY` key if it doesn't have `NULL` columns and is not a partial key, and the `PRIMARY` key must always be the first key. However, in some cases, a nonfirst key could be reported as `PRIMARY`, leading to an assert failure by `InnoDB`. This is fixed by correcting the key sort order. ([Bug#31137](#))
- `mysqldump` failed to handle databases containing a '-' character in the name. ([Bug#31113](#))
- Starting the server using `--read-only` and with the Event Scheduler enabled caused it to crash.

### Note

This issue occurred only when the server had been built with certain nonstandard combinations of `configure` options.

([Bug#31111](#))

- `GROUP BY NULL WITH ROLLUP` could cause a server crash. ([Bug#31095](#))

See also [Bug#32558](#).

- A rule to prefer `filesort` over an indexed `ORDER BY` when accessing all rows of a table was being used even if a `LIMIT` clause was present. ([Bug#31094](#))
- `REGEXP` operations could cause a server crash for character sets such as `ucs2`. Now the arguments are converted to `utf8` if possible, to permit correct results to be produced if the resulting strings contain only 8-bit characters. ([Bug#31081](#))
- Expressions of the form `WHERE col NOT IN (col, ...)`, where the same column was named both times, could cause a server crash in the optimizer. ([Bug#31075](#))
- Internal conversion routines could fail for several multi-byte character sets (`big5, cp932, euckr, gb2312, sjis`) for empty strings or during evaluation of `SOUNDS LIKE`. ([Bug#31069](#), [Bug#31070](#))
- Many nested subqueries in a single query could lead to excessive memory consumption and possibly a crash of the server. ([Bug#31048](#))
- Using `ORDER BY` with `ARCHIVE` tables caused a server crash. ([Bug#31036](#))
- A server crash could occur when a non-`DETERMINISTIC` stored function was used in a `GROUP BY` clause. ([Bug#31035](#))
- The `MOD()` function and the `%` operator crashed the server for a divisor less than 1 with a very long fractional part. ([Bug#31019](#))
- Transactions were committed prematurely when `LOCK TABLE` and `SET autocommit = 0` were used together. ([Bug#30996](#))

- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. ([Bug#30992](#))
- A character set introducer followed by a hexadecimal or bit-value literal did not check its argument and could return an ill-formed result for invalid input. ([Bug#30986](#))
- `CHAR(str USING charset)` did not check its argument and could return an ill-formed result for invalid input. ([Bug#30982](#))
- The result from `CHAR(str USING ucs2)` did not add a leading 0x00 byte for input strings with an odd number of bytes. ([Bug#30981](#))
- The `GeomFromText()` function could cause a server crash if the first argument was `NULL` or the empty string. ([Bug#30955](#))
- `MAKEDATE()` incorrectly moved year values in the 100 to 200 range into the 1970 to 2069 range. (This is legitimate for 00 to 99, but three-digit years should be used unchanged.) ([Bug#30951](#))
- When invoked with constant arguments, `STR_TO_DATE()` could use a cached value for the format string and return incorrect results. ([Bug#30942](#))
- `GROUP_CONCAT()` returned ', ' rather than an empty string when the argument column contained only empty strings. ([Bug#30897](#))
- For `MEMORY` tables, lookups for `NULL` values in `BTREE` indexes could return incorrect results. ([Bug#30885](#))
- A server crash could occur if a stored function that contained a `DROP TEMPORARY TABLE` statement was invoked by a `CREATE TEMPORARY TABLE` statement that created a table of the same name. ([Bug#30882](#))
- Calling `NAME_CONST()` with nonconstant arguments triggered an assertion failure. Nonconstant arguments are no longer permitted. ([Bug#30832](#))
- For a spatial column with a regular (non-`SPATIAL`) index, queries failed if the optimizer tried to use the index. ([Bug#30825](#))
- Values for the `--tc-heuristic-recover` option incorrectly were treated as values for the `--myisam-stats-method` option. ([Bug#30821](#))
- `INFORMATION_SCHEMA.SCHEMATA` was returning incorrect information. ([Bug#30795](#))
- The optimizer incorrectly optimized conditions out of the `WHERE` clause in some queries involving subqueries and indexed columns. ([Bug#30788](#))
- Improper calculation of `CASE` expression results could lead to value truncation. ([Bug#30782](#))
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. One symptom was that invalidating the query cache could cause a server crash. ([Bug#30768](#))
- A multiple-table `UPDATE` involving transactional and nontransactional tables caused an assertion failure. ([Bug#30763](#))
- User-supplied names foreign key names might not be set to the right key, leading to foreign keys with no name. ([Bug#30747](#))
- Under some circumstances, `CREATE TABLE ... SELECT` could crash the server or incorrectly report that the table row size was too large. ([Bug#30736](#))
- Using the `MIN()` or `MAX()` function to select one part of a multi-part key could cause a crash when the function result was `NULL`. ([Bug#30715](#))
- The embedded server did not properly check column-level privileges. ([Bug#30710](#))
- `INFORMATION_SCHEMA.VIEWS.VIEW_DEFINITION` was incorrect for views that were defined to select from other `INFORMATION_SCHEMA` tables. ([Bug#30689](#))
- Issuing an `ALTER SERVER` statement to update the settings for a `FEDERATED` server would cause the `mysqld` to crash. ([Bug#30671](#))
- The optimizer could ignore `ORDER BY` in cases when the result set is ordered by `filesort`, resulting in rows being returned in incorrect order. ([Bug#30666](#))
- A different execution plan was displayed for `EXPLAIN` than would actually have been used for the `SELECT` because the test of sort keys for `ORDER BY` did not consider keys mentioned in `IGNORE KEYS FOR ORDER BY`. ([Bug#30665](#))
- The `thread_handling` system variable was treated as having a `SESSION` value and as being settable at runtime. Now it has only a `GLOBAL` read-only value. ([Bug#30651](#))

- On Windows, `LIMIT` arguments greater than  $2^{32}$  did not work correctly. ([Bug#30639](#))
- `MyISAM` tables could not exceed 4294967295 ( $2^{32} - 1$ ) rows on Windows. ([Bug#30638](#))
- A failed `HANDLER ... READ` operation could leave the table in a locked state. ([Bug#30632](#))
- `mysql-test-run.pl` could not run `mysqld` with `root` privileges. ([Bug#30630](#))
- The `mysqld_safe` script contained a syntax error. ([Bug#30624](#))
- The optimization that uses a unique index to remove `GROUP BY` did not ensure that the index was actually used, thus violating the `ORDER BY` that is implied by `GROUP BY`. ([Bug#30596](#))
- `SHOW STATUS LIKE 'Ssl_cipher_list'` from a MySQL client connected using SSL returned an empty string rather than a list of available ciphers. ([Bug#30593](#))
- For `MEMORY` tables, `DELETE` statements that remove rows based on an index read could fail to remove all matching rows. ([Bug#30590](#))
- Using `GROUP BY` on an expression of the form `timestamp_col DIV number` caused a server crash due to incorrect calculation of number of decimals. ([Bug#30587](#))
- Executing a `SELECT COUNT(*)` query on an `InnoDB` table partitioned by `KEY` that used a `DOUBLE` column as the partitioning key caused the server to crash. ([Bug#30583](#))
- The options available to the `CHECK TABLE` statement were also permitted in `OPTIMIZE TABLE` and `ANALYZE TABLE` statements, but caused corruption during their execution. These options were never supported for these statements, and an error is now raised if you try to apply these options to these statements. ([Bug#30495](#))
- A self-referencing trigger on a partitioned table caused the server to crash instead of failing with an error. ([Bug#30484](#))
- The `mysql_change_user()` C API function did not correctly reset the character set variables to the values they had just after initially connecting. ([Bug#30472](#))
- When expanding a `*` in a `USING` or `NATURAL` join, the check for table access for both tables in the join was done using only the grant information of the first table. ([Bug#30468](#))
- When casting a string value to an integer, cases where the input string contained a decimal point and was long enough to overrun the `unsigned long long` type were not handled correctly. The position of the decimal point was not taken into account which resulted in miscalculated numbers and incorrect truncation to appropriate SQL data type limits. ([Bug#30453](#))
- Versions of `mysqldump` from MySQL 4.1 or higher tried to use `START TRANSACTION WITH CONSISTENT SNAPSHOT` if the `--single-transaction` and `--master-data` options were given, even with servers older than 4.1 that do not support consistent snapshots. ([Bug#30444](#))
- With `libmysqld`, use of prepared statements and the query cache at the same time caused problems. ([Bug#30430](#))
- Issuing a `DELETE` statement having both an `ORDER BY` clause and a `LIMIT` clause could cause `mysqld` to crash. ([Bug#30385](#))
- For `CREATE ... SELECT ... FROM`, where the resulting table contained indexes, adding `SQL_BUFFER_RESULT` to the `SELECT` part caused index corruption in the table. ([Bug#30384](#))
- The `Last_query_cost` status variable value can be computed accurately only for simple “flat” queries, not complex queries such as those with subqueries or `UNION`. However, the value was not consistently being set to 0 for complex queries. ([Bug#30377](#))
- The optimizer made incorrect assumptions about the value of the `is_member` value for user-defined functions, sometimes resulting in incorrect ordering of UDF results. ([Bug#30355](#))
- Queries that had a `GROUP BY` clause and selected `COUNT(DISTINCT bit_column)` returned incorrect results. ([Bug#30324](#))
- Some valid `euc-kr` characters having the second byte in the ranges `[0x41..0x5A]` and `[0x61..0x7A]` were rejected. ([Bug#30315](#))
- When loading a dynamic plugin on FreeBSD, the plugin would fail to load. This was due to a build error where the required symbols would be not exported correctly. ([Bug#30296](#))
- Simultaneous `ALTER TABLE` statements for `BLACKHOLE` tables caused 100% CPU use due to locking problems. ([Bug#30294](#))

- Setting certain values on a table using a spatial index could cause the server to crash. ([Bug#30286](#))
- Tables with a `GEOMETRY` column could be marked as corrupt if you added a non-`SPATIAL` index on a `GEOMETRY` column. ([Bug#30284](#))
- Flushing a merge table between the time it was opened and its child table were actually attached caused the server to crash. ([Bug#30273](#))

This regression was introduced by [Bug#26379](#).

- The query cache does not support retrieval of statements for which column level access control applies, but the server was still caching such statements, thus wasting memory. ([Bug#30269](#))
- Using `DISTINCT` or `GROUP BY` on a `BIT` column in a `SELECT` statement caused the column to be cast internally as an integer, with incorrect results being returned from the query. ([Bug#30245](#))
- `GROUP BY` on `BIT` columns produced incorrect results. ([Bug#30219](#))
- Short-format `mysql` commands embedded within `/*! ... */` comments were parsed incorrectly by `mysql`, which discarded the rest of the comment including the terminating `*/` characters. The result was a malformed (unclosed) comment. Now `mysql` does not discard the `*/` characters. ([Bug#30164](#))
- If the server crashed during an `ALTER TABLE` statement, leaving a temporary file in the database directory, a subsequent `DROP DATABASE` statement failed due to the presence of the temporary file. ([Bug#30152](#))
- When `mysqldump` wrote `DROP DATABASE` statements within version-specific comments, it included the terminating semi-colon in the wrong place, causing following statements to fail when the dump file was reloaded. ([Bug#30126](#))
- It was not possible for client applications to distinguish between auto-set and auto-updated `TIMESTAMP` column values.

To rectify this problem, a new `ON_UPDATE_NOW_FLAG` flag is set by `Field_timestamp` constructors whenever a column should be set to `NOW` on `UPDATE`, and the `get_schema_column_record()` function now reports whether a timestamp column is set to `NOW` on `UPDATE`. In addition, such columns now display `on update CURRENT_TIMESTAMP` in the `Extra` column in the output from `SHOW COLUMNS`. ([Bug#30081](#))

- Some `INFORMATION_SCHEMA` tables are intended for internal use, but could be accessed by using `SHOW` statements. ([Bug#30079](#))
- On some 64-bit systems, inserting the largest negative value into a `BIGINT` column resulted in incorrect data. ([Bug#30069](#))
- `mysqlslap` did not properly handle multiple result sets from stored procedures. ([Bug#29985](#))
- Specifying the `--without-geometry` option for `configure` caused server compilation to fail. ([Bug#29972](#))
- Statements within stored procedures ignored the value of the `low_priority_updates` system variable. ([Bug#29963](#))

See also [Bug#26162](#).

- With auto-reconnect enabled, row fetching for a prepared statement could crash after reconnect occurred because loss of the statement handler was not accounted for. ([Bug#29948](#))
- `mysqldump --skip-events --all-databases` dumped data from the `mysqld.event` table, and when restoring from this dump, events were created in spite of the `--skip-events` option. ([Bug#29938](#))
- When `mysqlslap` was given a query to execute from a file using a `--query=file_name` option, it executed the query one too many times. ([Bug#29803](#))
- `configure` did not find `nss` on some Linux platforms. ([Bug#29658](#))
- It was possible when creating a partitioned table using `CREATE TABLE ... SELECT` to refer in the `PARTITION BY` clause to columns in the table being selected from, which could cause the server to crash. An example of such a statement is:

```
CREATE TABLE t1 (b INT)
PARTITION BY RANGE(t2.b) (
 PARTITION p1 VALUES LESS THAN (10),
 PARTITION p2 VALUES LESS THAN (20)
) SELECT * FROM t2;
```

The fix is to disallow references in `PARTITION BY` clauses to columns not in the table being created. ([Bug#29444](#))

- If a view used a function in its `SELECT` statement, the columns from the view were not inserted into the `INFORMATION_SCHEMA.COLUMNS` table. ([Bug#29408](#))

- The `mysql` client program now ignores Unicode byte order mark (BOM) characters at the beginning of input files. Previously, it read them and sent them to the server, resulting in a syntax error.  
Presence of a BOM does not cause `mysql` to change its default character set. To do that, invoke `mysql` with an option such as `--default-character-set=utf8`. ([Bug#29323](#))
- For transactional tables, an error during a multiple-table `DELETE` statement did not roll back the statement. ([Bug#29136](#))
- The `log` and `log_slow_queries` system variables were displayed by `SHOW VARIABLES` but could not be accessed in expressions as `@log` and `@log_slow_queries`. Also, attempting to set them with `SET` produced an incorrect `Unknown system variable` message. Now these variables are treated as synonyms for `general_log` and `slow_query_log`, which means that they can be accessed in expressions and their values can be changed with `SET`. ([Bug#29131](#))
- Denormalized double-precision numbers cannot be handled properly by old MIPS processors. For IRIX, this is now handled by enabling a mode to use a software workaround. ([Bug#29085](#))
- `SHOW VARIABLES` did not display the `relay_log`, `relay_log_index`, or `relay_log_info_file` system variables. ([Bug#28893](#))
- When doing a `DELETE` on a table that involved a `JOIN` with `MyISAM` or `MERGE` tables and the `JOIN` referred to the same table, the operation could fail reporting `ERROR 1030 (HY000): Got error 134 from storage engine`. This was because scans on the table contents would change because of rows that had already been deleted. ([Bug#28837](#))
- Killing an SSL connection on platforms where MySQL is compiled with `-DSIGNAL_WITH_VIO_CLOSE` (Windows, Mac OS X, and some others) could crash the server. ([Bug#28812](#))
- `SHOW VARIABLES` did not correctly display the value of the `thread_handling` system variable. ([Bug#28785](#))
- On Windows, `mysql_upgrade` created temporary files in `C:\` and did not clean them up. ([Bug#28774](#))
- Index hints specified in view definitions were ignored when using the view to select from the base table. ([Bug#28702](#))
- Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is no longer permitted. ([Bug#28701](#))
- After changing the SQL mode to a restrictive value that would make already-inserted dates in a column be considered invalid, searches returned different results depending on whether the column was indexed. ([Bug#28687](#))
- When running the MySQL Instance Configuration Wizard, a race condition could exist that would fail to connect to a newly configured instance. This was because `mysqld` had not completed the startup process before the next stage of the installation process. ([Bug#28628](#))
- A `SELECT` in one connection could be blocked by `INSERT ... ON DUPLICATE KEY UPDATE` in another connection even when `low_priority_updates` is set. ([Bug#28587](#))
- `mysql_upgrade` could run binaries dynamically linked against incorrect versions of shared libraries. ([Bug#28560](#))
- The result from `CHAR()` was incorrectly assumed in some contexts to return a single-byte result. ([Bug#28550](#))
- `mysqldump` reversed the event name and program name in one of its error messages. ([Bug#28535](#))
- The parser confused user-defined function (UDF) and stored function creation for `CREATE FUNCTION` and required that there be a default database when creating UDFs, although there is no such requirement. ([Bug#28318](#), [Bug#29816](#))
- Fast-mutex locking was not thread-safe and optimization-safe on some platforms, which could cause program failures such as out-of-memory errors. ([Bug#28284](#))
- The result of a comparison between `VARBINARY` and `BINARY` columns differed depending on whether the `VARBINARY` column was indexed. ([Bug#28076](#))
- The metadata in some `MYSQL_FIELD` members could be incorrect when a temporary table was used to evaluate a query. ([Bug#27990](#))
- Partition pruning was not used for queries having `<=` or `>=` conditions in the `WHERE` clause on a table using `TO_DAYS()` in the partitioning expression. ([Bug#27927](#))
- `mysqlbinlog` produced incorrectly formatted `DATETIME` and `TIMESTAMP` values. ([Bug#27894](#))
- Failure to log to the `general_log` or `slow_log` log tables were not logged to the error log at all or were logged incorrectly. ([Bug#27858](#))

- An `ORDER BY` at the end of a `UNION` affected individual `SELECT` statements rather than the overall query result. ([Bug#27848](#))
- `comp_err` created files with permissions such that they might be inaccessible during `make install` operations. ([Bug#27789](#))
- `SHOW COLUMNS` returned `NULL` instead of the empty string for the `Default` value of columns that had no default specified. ([Bug#27747](#))
- With recent versions of DBD::mysql, `mysqlhotcopy` generated table names that were doubly qualified with the database name. ([Bug#27694](#))
- The anonymous accounts were not being created during MySQL installation. ([Bug#27692](#))
- Some `SHOW` statements and `INFORMATION_SCHEMA` queries could expose information not permitted by the user's access privileges. ([Bug#27629](#))
- `ALTER TABLE tbl_name ROW_FORMAT=format_type` did not cause the table to be rebuilt. ([Bug#27610](#))
- A race condition between killing a statement and the thread executing the statement could lead to a situation such that the binary log contained an event indicating that the statement was killed, whereas the statement actually executed to completion. ([Bug#27571](#))
- Some character mappings in the `ascii.xml` file were incorrect.

As a result of this bug fix, indexes must be rebuilt for columns that use the `ascii_general_ci` collation for columns that contain any of these characters: `'`'`, `'[`, `'\'`, `']'`, `'~'`. See [Section 2.12.3, “Checking Whether Tables or Indexes Must Be Rebuilt”](#). ([Bug#27562](#))

- Some queries using the `NAME_CONST()` function failed to return either a result or an error to the client, causing it to hang. This was due to the fact that there was no check to insure that both arguments to this function were constant expressions. ([Bug#27545](#), [Bug#32559](#))
- With the `read_only` system variable enabled, `CREATE DATABASE` and `DROP DATABASE` were permitted to users who did not have the `SUPER` privilege. ([Bug#27440](#))
- For an event with an `ON COMPLETION` value of `PRESERVE`, an `ALTER EVENT` statement that specified no `ON COMPLETION` option caused the value to become `NOT PRESERVE`. ([Bug#27407](#))
- MySQL failed to generate or retrieve an `AUTO_INCREMENT` primary key for `InnoDB` tables with user-defined partitioning. ([Bug#27405](#))
- Changes to the `sql_mode` system variable were not tracked by `INSERT DELAYED`. ([Bug#27358](#))
- A `SELECT` with more than 31 nested dependent subqueries returned an incorrect result. ([Bug#27352](#))
- The `ExtractValue()` and `UpdateXML()` functions performed extremely slowly for large amounts of XML data (greater than 64 KB). These functions now execute approximately 2000 times faster than previously. ([Bug#27287](#))
- On Windows, writes to the debug log were using `freopen()` instead of `fflush()`, resulting in slower performance. ([Bug#27099](#))
- For a table that used different full-text parsers for different `FULLTEXT` indexes, `SHOW CREATE TABLE` displayed the first parser name for all of them. ([Bug#27040](#))
- `STR_TO_DATE()` displayed an error message that referred to `STR_TO_TIME()`. ([Bug#27014](#))
- The `mysql_insert_id()` C API function sometimes returned different results for `libmysqld` and `libmysqlclient`. ([Bug#26921](#))
- Symbolic links on Windows could fail to work. ([Bug#26811](#))
- `mysqld` sometimes miscalculated the number of digits required when storing a floating-point number in a `CHAR` column. This caused the value to be truncated, or (when using a debug build) caused the server to crash. ([Bug#26788](#))

See also [Bug#12860](#).

- `LOAD DATA INFILE` ran very slowly when reading large files into partitioned tables. ([Bug#26527](#))
- It makes no sense to attempt to use `ALTER TABLE ... ORDER BY` to order an `InnoDB` table if there is a user-defined clustered index, because rows are always ordered by the clustered index. Such attempts now are ignored and produce a warn-

ing.

Also, in some cases, `InnoDB` incorrectly used a secondary index when the clustered index would produce a faster scan. `EXPLAIN` output now indicates use of the clustered index (for tables that have one) as lines with a `type` value of `index`, a `key` value of `PRIMARY`, and without `Using index` in the `Extra` value. ([Bug#26447](#))

See also [Bug#35850](#).

- Using `HANDLER` to open a table having a storage engine not supported by `HANDLER` properly returned an error, but also improperly prevented the table from being dropped by other connections. ([Bug#25856](#))
  - For a prepared statement `stmt`, changing the default database following `PREPARE stmt` but before `EXECUTE stmt` caused `stmt` to be recorded incorrectly in the binary log. ([Bug#25843](#))
  - `CREATE TABLE LIKE` did not work when the source table was an `INFORMATION_SCHEMA` table. ([Bug#25629](#))
  - Threads that were calculating the estimated number of records for a range scan did not respond to the `KILL` statement. That is, if a `range` join type is possible (even if not selected by the optimizer as a join type of choice and thus not shown by `EXPLAIN`), the query in the `statistics` state (shown by the `SHOW PROCESSLIST`) did not respond to the `KILL` statement. ([Bug#25421](#))
  - For `InnoDB` tables, `CREATE TABLE a AS SELECT * FROM A` would fail. ([Bug#25164](#))
  - For `mysql --show-warnings`, warnings were in some cases not displayed. ([Bug#25146](#))
  - The `returns` column of the `mysql.proc` table was `CHAR(64)`, which is not long enough to store long data types such as `ENUM` types. The column has been changed to `LONGLOB` and a warning is generated if truncation occurs when storing a row into the `proc` table. ([Bug#24923](#))
  - If the expected precision of an arithmetic expression exceeded the maximum precision supported by MySQL, the precision of the result was reduced by an unpredictable or arbitrary amount, rather than to the maximum precision. In some cases, exceeding the maximum supported precision could also lead to a crash of the server. ([Bug#24907](#))
  - For Vista installs, `MySQLInstanceConfig.exe` did not add the default MySQL port to the firewall exceptions. It now provides a checkbox that enables the user a choice of whether to do this. ([Bug#24853](#))
  - A `CREATE TRIGGER` statement could cause a deadlock or server crash if it referred to a table for which a table lock had been acquired with `LOCK TABLES`. ([Bug#23713](#))
  - For storage engines that do not redefine `handler::index_next_same()` and are capable of indexes, statements that include a `WHERE` clause might select incorrect data. ([Bug#22351](#))
  - The parser treated the `INTERVAL()` function incorrectly, leading to situations where syntax errors could result depending on which side of an arithmetic operator the function appeared. ([Bug#22312](#))
  - Entries in the general query log were truncated at 1000 characters. ([Bug#21557](#))
  - A memory leak occurred when `CREATE TEMPORARY TABLE ... SELECT` was invoked from a stored function that in turn was called from `CREATE TABLE ... SELECT`. ([Bug#21136](#))
  - It was possible to execute `CREATE TABLE t1 ... SELECT ... FROM t2` with the `CREATE` privilege for `t1` and `SELECT` privilege for `t2`, even in the absence of the `INSERT` privilege for `t1`. ([Bug#20901](#))
  - Worked around an `icc` problem with an incorrect machine instruction being generated in the context of software pre-fetching after a subroutine got in-lined. (Upgrading to `icc` 10.0.026 makes the workaround unnecessary.) ([Bug#20803](#))
  - If a column selected by a view referred to a stored function, the data type reported for the column in `INFORMATION_SCHEMA.COLUMNS` could be incorrect. ([Bug#20550](#))
  - The `mysql_change_user()` C API function changed the value of the `sql_big_selects` session variable. ([Bug#20023](#))
- See also [Bug#40363](#).
- Host names sometimes were treated as case sensitive in account-management statements (`CREATE USER`, `GRANT`, `REVOKE`, and so forth). ([Bug#19828](#))
  - Issuing an SQL `KILL` of the active connection caused an error on Mac OS X. ([Bug#19723](#))
  - The `readline` library has been updated to version 5.2. This addresses issues in the `mysql` client where history and editing within the client would fail to work as expected. ([Bug#18431](#))

- The `-lmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD::mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. ([Bug#18322](#))
- `MySQLInstanceConfig.exe` failed to grant certain privileges to the '`root'@'%'` account. ([Bug#17303](#))
- The `Aborted_clients` status variable was incremented twice if a client exited without calling `mysql_close()`. ([Bug#16918](#))
- Use of `GRANT` statements with grant tables from an old version of MySQL could cause a server crash. ([Bug#16470](#))
- Clients were ignoring the TCP/IP port number specified as the default port using the `--with-tcp-port` configuration option. ([Bug#15327](#))
- Parameters of type `DATETIME` or `DATE` in stored procedures were silently converted to `VARBINARY`. ([Bug#13675](#))
- Zero-padding of exponent values was not the same across platforms. ([Bug#12860](#))
- Values of types `REAL`, `ZEROFILL`, `DOUBLE`, `ZEROFILL`, `FLOAT`, `ZEROFILL`, were not zero-filled when converted to a character representation in the C prepared statement API. ([Bug#11589](#))
- `mysql` stripped comments from statements sent to the server. Now the `--comments` or `--skip-comments` option can be used to control whether to retain or strip comments. The default is `--skip-comments`. ([Bug#11230](#), [Bug#26215](#))
- Several buffer-size system variables were either being handled incorrectly for large values (for settings larger than 4GB, they were truncated to values less than 4GB without a warning), or were limited unnecessarily to 4GB even on 64-bit systems. The following changes were made:
  - For `key_buffer_size`, values larger than 4GB are permitted on 64-bit platforms.
  - For `join_buffer_size`, `sort_buffer_size`, and `myisam_sort_buffer_size`, values larger than 4GB are permitted on 64-bit platforms (except Windows, for which large values are truncated to 4GB with a warning).

In addition, settings for `read_buffer_size` and `read_rnd_buffer_size` are limited to 2GB on all platforms. Larger values are truncated to 2GB with a warning. ([Bug#5731](#), [Bug#29419](#), [Bug#29446](#))

- Executing `DISABLE KEYS` and `ENABLE KEYS` on a nonempty table would cause the size of the index file for the table to grow considerably. This was because the `DISABLE KEYS` operation would only mark the existing index, without deleting the index blocks. The `ENABLE KEYS` operation would re-create the index, adding new blocks, while the previous index blocks would remain. Existing indexes are now dropped and recreated when the `ENABLE KEYS` statement is executed. ([Bug#4692](#))
- Grant table checks failed in `libmysqld`.

## C.1.35. Changes in MySQL 5.1.22 (24 September 2007 Release Candidate)

Functionality added or changed:

- There is a new `innodb_autoinc_lock_mode` system variable to configure the locking behavior that `InnoDB` uses for generating auto-increment values. The default behavior now is slightly different from before, which involves a minor incompatibility for multiple-row inserts that specify an explicit value for the auto-increment column in some but not all rows. See [Section 13.6.4.3, “AUTO\\_INCREMENT Handling in InnoDB”](#).

Bugs fixed:

- **MySQL Cluster: Replication:** (Replication): Multi-master replication setups did not handle `--log-slave-updates` correctly. ([Bug#30017](#))
- **MySQL Cluster:** Backups of `TIMESTAMP` columns made with `ndb_restore` on a MySQL Cluster using data nodes hosts of one endian could not be used to restore the cluster's data to data node hosts of the other endian. ([Bug#30134](#))
- **Replication:** Row-based replication from a pre-5.1.22 MySQL Server to a MySQL 5.1.22 was unstable due to an uninitialized variable. ([Bug#31076](#))
- **Replication:** Operations that used the time zone replicated the time zone only for successful operations, but did not replicate the time zone for errors that need to know it. ([Bug#29536](#))
- For an `InnoDB` table if a `SELECT` was ordered by the primary key and also had a `WHERE field = value` clause on a dif-

ferent field that was indexed, a `DESC` order instruction would be ignored. ([Bug#31001](#))

- `mysql_install_db` could fail to find its message file. ([Bug#30678](#))
- Memory corruption occurred for some queries with a top-level `OR` operation in the `WHERE` condition if they contained equality predicates and other sargable predicates in disjunctive parts of the condition. ([Bug#30396](#))
- `CONNECTION_ID()` always returned 0 for the embedded server (`libmysqld`). ([Bug#30389](#))
- The server created temporary tables for filesort operations in the working directory, not in the directory specified by the `tmpdir` system variable. ([Bug#30287](#))
- Using `KILL QUERY` or `KILL CONNECTION` to kill a `SELECT` statement caused a server crash if the query cache was enabled. ([Bug#30201](#))
- `mysqldump` from the MySQL 5.1.21 distribution could not be used to create a dump from a MySQL 5.1.20 or older server. ([Bug#30123](#))
- Under some circumstances, a UDF initialization function could be passed incorrect argument lengths. ([Bug#29804](#))
- When using a combination of `HANDLER ... READ` and `DELETE` on a table, MySQL continued to open new copies of the table every time, leading to an exhaustion of file descriptors. ([Bug#29474](#))

This regression was introduced by [Bug#21587](#).

- The `mysql_list_fields()` C API function incorrectly set `MYSQL_FIELD::decimals` for some view columns. ([Bug#29306](#))
- Tables using the `InnoDB` storage engine incremented `AUTO_INCREMENT` values incorrectly with `ON DUPLICATE KEY UPDATE`. ([Bug#28781](#))
- Nonrange queries of the form `SELECT ... FROM ... WHERE keypart1=constant, ..., keypartN=constant ORDER BY ... FOR UPDATE` sometimes were unnecessarily blocked waiting for a lock if another transaction was using `SELECT ... FOR UPDATE` on the same table. ([Bug#28570](#))
- On Windows, symbols for yaSSL and taocrypt were missing from `mysqlclient.lib`, resulting in unresolved symbol errors for clients linked against that library. ([Bug#27861](#))
- Read lock requests that were blocked by a pending write lock request were not permitted to proceed if the statement requesting the write lock was killed. ([Bug#21281](#))

## C.1.36. Changes in MySQL 5.1.21 (16 August 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

### Note

Subsequent to release, it was discovered that on some platforms, `mysql_install_db` could fail to find its message file, resulting in error messages of the following form:

```
shell> mysql_install_db
Installing MySQL system tables...
070830 9:33:24 [ERROR] Can't find messagefile 'path/share/english/errmsg.sys'
070830 9:33:24 [ERROR] Aborting
```

To deal with this problem, specify a `--language` option to specify the proper path name to the language file directory. For example:

```
shell> mysql_install_db --language=/path/to/share/english/
```

This problem is corrected in MySQL 5.1.22.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** In MySQL 5.1.6, when log tables were implemented, the default log destination for the general query and slow query log was `TABLE`. This default has been changed to `FILE`, which is compatible with MySQL 5.0, but incompatible with earlier releases of MySQL 5.1 from 5.1.6 to 5.1.20. If you are upgrading from MySQL 5.0 to 5.1.21 or higher, no logging option changes should be necessary. However, if you are upgrading from 5.1.6 through 5.1.20 to 5.1.21 or higher and were using `TABLE` logging, use the `--log-output=TABLE` option explicitly to preserve your server's table-logging behavior.

A further fix for this issue was made in MySQL 5.1.23. ([Bug#29993](#))

- **Incompatible Change:** The `innodb_log_arch_dir` system variable (which has been deprecated since MySQL 5.0.24) has been removed and should no longer be used.
- **Incompatible Change:** On Windows only, the `mysqld-nt` has been removed from this release and all future releases. The `mysqld` server now includes named-pipe support as standard, and you do not have to use the `mysqld-nt` version to enable named-pipe support.
- **Important Change:** The default `mysqld_safe` logging behavior now is `--skip-syslog` rather than `--syslog`, which is compatible with the default behavior of writing an error log file for releases prior to 5.1.20.
- **Replication:** The SQL thread on a slave now is always permitted to enter `InnoDB` even if this would exceed the limit imposed by the `innodb_thread_concurrency` system variable. In cases of high load on the slave server (when `innodb_thread_concurrency` is reached), this change helps the slave stay more up to date with the master; in the previous behavior, the SQL thread was competing for resources with all client threads active on the slave server. ([Bug#25078](#))
- **Replication:** Replication between master and slaves now supports different column numbers within a table on both master and slave. The rules for replication where the table definitions are different has also changed. This supercedes the functionality for replication from the master table to a slave table with more columns that was added in MySQL 5.1.12. For more information, see [Section 16.4.1.7, “Replication with Differing Table Definitions on Master and Slave”](#).
- Several programs now accept `--debug-check` and `--debug-info` options: `mysql`, `mysqladmin`, `mysqlbinlog`, `mysqlcheck`, `mysqldump`, `mysqlimport`, `mysqlshow`, `mysqlslap`, `mysqltest`, `mysql_upgrade`. (Note: `mysql`, `mysqladmin`, `mysqlcheck`, `mysqldump`, `mysqlimport`, `mysqlshow`, and `mysqltest` already accepted `--debug-info`.) `--debug-check` prints debugging information at program exit. `--debug-info` is similar but also prints memory and CPU usage statistics. This patch also corrects a problem for `mysql` that `--debug-info` did not display statistics at exit time. ([Bug#30127](#))
- The `--syslog` option that was introduced in 5.1.20 for `mysqld_safe` (to send error output to `syslog`) did not work correctly: Error output was buffered and not logged immediately. This has been corrected. In addition, some feature changes were made:
  - **Important**

The default `mysqld_safe` logging behavior now is `--skip-syslog` rather than `--syslog`, which is compatible with the default behavior of writing an error log file for releases prior to 5.1.20.

    - A new option, `--syslog-tag=tag`, modifies the default tags written by `mysqld_safe` and `mysqld` to `syslog` to be `mysqld_safe-tag` and `mysqld-tag` rather than the default tags of `mysqld_safe` and `mysqld`.  
([Bug#29992](#))

- Transaction support in the `FEDERATED` storage engine has been disabled due to issues with multiple active transactions and sessions on the same `FEDERATED` table. ([Bug#29875](#))
- Previously, prepared statements processed using `PREPARE` and `EXECUTE` were not subject to caching in the query cache if they contained any `?` parameter markers. This limitation has been lifted. ([Bug#29318](#))
- It is now possible to set `long_query_time` in microseconds or to 0. Setting this value to 0 causes all queries to be recorded in the slow query log.

Currently, fractional values can be used only when logging to files. We plan to provide this functionality for logging to tables when time-related data types are enhanced to support microsecond resolution. ([Bug#25412](#))

- `INFORMATION_SCHEMA` implementation changes were made that optimize certain types of queries for `INFORMA-`

`TION_SCHEMA` tables so that they execute more quickly. [Section 7.3.3, “INFORMATION\\_SCHEMA Optimization”](#), provides guidelines on how to take advantage of these optimizations by writing queries that minimize the need for the server to access the file system to obtain the information contained in `INFORMATION_SCHEMA` tables. By writing queries that enable the server to avoid directory scans or opening table files, you will obtain better performance. ([Bug#19588](#))

- Log table locking was redesigned, eliminating several lock-related problems:
  - Truncating `mysql.slow_log` in a stored procedure after use of a cursor caused the thread to lock.
  - Flushing a log table resulted in unnecessary warnings.
  - The server would hang when performing concurrent `ALTER TABLE` or `TRUNCATE TABLE` statements against the log tables.
  - Changing the value of the `general_log` system variable while a global read lock was in place resulted in deadlock.

The changes provide better-defined interface characteristics. See [Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”](#). ([Bug#17876](#), [Bug#23044](#), [Bug#25422](#), [Bug#29129](#))

- Added the `--commit`, `--detach`, `--post-system`, and `--pre-system` options for `mysqlslap`.
- A new option, `--syslog-tag=tag`, modifies the default tags written by `mysqld_safe` and `mysqld` to syslog to be `mysqld_safe-tag` and `mysqld-tag` rather than the default tags of `mysqld_safe` and `mysqld`.
- Two options relating to slow query logging have been added for `mysqld`. `--log-slow-slave-statements` causes slow statements executed by a replication slave to be written to the slow query log; `min_examined_row_limit` can be used to cause queries which examine fewer than the stated number of rows not to be logged.

Bugs fixed:

- **Incompatible Change:** Failure to consider collation when comparing space characters could result in incorrect index entry order, leading to incorrect comparisons, inability to find some index values, misordered index entries, misordered `ORDER BY` results, or tables that `CHECK TABLE` reports as having corrupt indexes.

As a result of this bug fix, indexes must be rebuilt for columns that use any of these character sets: `euc_jpms`, `euc_kr`, `gb2312`, `latin7`, `macce`, `ujis`. See [Section 2.12.3, “Checking Whether Tables or Indexes Must Be Rebuilt”](#). ([Bug#29461](#))

- **Incompatible Change:** Several issues were identified for stored programs (stored procedures and functions, triggers, and events) and views containing non-ASCII symbols. These issues involved conversion errors due to incomplete character set information when translating these objects to and from stored format, such as:
  - Parsing the original object definition so that it can be stored.
  - Compiling the stored definition into executable form when the object is invoked.
  - Retrieval of object definitions from `INFORMATION_SCHEMA` tables.
  - Displaying the object definition in `SHOW` statements. This issue also affected `mysqldump`, which uses `SHOW`.

The fix for the problems is to store character set information from the object creation context so that this information is available when the object needs to be used later. The context includes the client character set, the connection character set and collation, and the collation of the database with which the object is associated.

As a result of the patch, several tables have new columns:

- In the `mysql` database, the `proc` and `event` tables now have these columns: `character_set_client`, `collation_connection`, `db_collation`, `body_utf8`.
- In `INFORMATION_SCHEMA`, the `VIEWS` table now has these columns: `CHARACTER_SET_CLIENT`, `COLLATION_CONNECTION`. The `ROUTINES`, `TRIGGERS`, and `EVENTS` tables now have these columns: `CHARACTER_SET_CLIENT`, `COLLATION_CONNECTION`, `DATABASE_COLLATION`.

These columns store the session values of the `character_set_client` and `collation_connection` system variables, and the collation of the database with which the object is associated. The values are those in effect at object creation time. (The saved database collation is not the value of the `collation_database` system variable, which applies to the default database; the database that contains the object is not necessarily the default database.)

Several `SHOW` statements now display additional columns corresponding to the new table columns. These statements are: `SHOW CREATE EVENT`, `SHOW CREATE FUNCTION`, `SHOW CREATE PROCEDURE`, `SHOW CREATE VIEW`, `SHOW EVENTS`,

`SHOW FUNCTION STATUS, SHOW PROCEDURE STATUS, SHOW TRIGGERS.`

A new statement, `SHOW CREATE TRIGGER` is introduced and is used by `mysqldump` for producing `CREATE TRIGGER` statements.

Subsequent to the patch just described, it was discovered that the patch broke `mysql_upgrade`; this has been corrected.

### Important

The fixes for the problems just describe affect *all* existing stored programs and views. (For example, you will see warnings about “no creation context.”) To avoid warnings from the server about the use of old definitions from any release prior to 5.1.21, you should dump stored programs and views with `mysqldump` after upgrading to 5.1.21, and then reload them to recreate them with new definitions. Invoke `mysqldump` with a `--default-character-set` option that names the non-ASCII character set that was used for the definitions when the objects were originally defined.

(Bug#25221, Bug#21249, Bug#30027, Bug#16291, Bug#11986, Bug#25212, Bug#19443, Bug#30029)

- **MySQL Cluster: Replication:** (Replication): Inconsistencies could occur between the master and the slave when replicating Disk Data tables. (Bug#19259, Bug#19227)
- **MySQL Cluster:** `DELETE FROM table WHERE primary_key IN (value_list)`, where the `value_list` contained more than one value, called from an `AFTER DELETE` trigger on an NDB table, caused `mysqld` to crash. (Bug#30337)
- **MySQL Cluster:** When restarting a data node, queries could hang during that node's start phase 5, and continue only after the node had entered phase 6. (Bug#29364)
- **MySQL Cluster:** Replica redo logs were inconsistently handled during a system restart. (Bug#29354)
- **MySQL Cluster:** When a node failed to respond to a `COPY_GCI` signal as part of a global checkpoint, the master node was killed instead of the node that actually failed. (Bug#29331)
- **MySQL Cluster:** An invalid comparison made during `REDO` validation that could lead to an `ERROR WHILE READING REDO LOG` condition. (Bug#29118)
- **MySQL Cluster:** The wrong data pages were sometimes invalidated following a global checkpoint. (Bug#29067)
- **MySQL Cluster:** If at least 2 files were involved in `REDO` invalidation, then file 0 of page 0 was not updated and so pointed to an invalid part of the redo log. (Bug#29057)
- **MySQL Cluster:** If a storage engine has its own logging capability, then any statement using both this engine and some other engine not having its own logging could not be correctly logged, due to the fact that entries from one engine could be logged before entries from the other engine were. This did not generate any error messages when it occurred.

Now, if multiple storage engines are used in a statement and at least one of them has its own logging capability, then an error message is generated and the statement is not executed.

### Note

Currently, the only storage engine to have its own logging capability is `NDBCLUSTER`.

(Bug#28722)

- **MySQL Cluster:** Warnings and errors generated by `ndb_config --config-file=file` were sent to `stdout`, rather than to `stderr`. (Bug#25941)
- **MySQL Cluster:** When a cluster backup was terminated using the `ABORT BACKUP` command in the management client, a misleading error message `BACKUP ABORTED BY APPLICATION: PERMANENT ERROR: INTERNAL ERROR` was returned. The error message returned in such cases now reads `BACKUP ABORTED BY USER REQUEST`. (Bug#21052)
- **MySQL Cluster:** Large file support did not work in AIX server binaries. (Bug#10776)
- **Replication:** The thread ID was not reset properly after execution of `mysql_change_user()`, which could cause replication failure when replicating temporary tables. (Bug#29734)
- **Replication:** Storage engine error conditions in row-based replication were not correctly reported to the user. (Bug#29570)
- **Replication:** `INSERT DELAYED` statements on a master server are replicated as non-`DELAYED` inserts on slaves (which is normal, to preserve serialization), but the inserts on the slave did not use concurrent inserts. Now `INSERT DELAYED` on a slave is converted to a concurrent insert when possible, and to a normal insert otherwise. (Bug#29152)

- **Replication:** An error that happened inside `INSERT`, `UPDATE`, or `DELETE` statements performed from within a stored function or trigger could cause inconsistency between master and slave servers. ([Bug#27417](#))
- **Replication:** Slave servers could incorrectly interpret an out-of-memory error from the master and reconnect using the wrong binary log position. ([Bug#24192](#))
- **Replication:** Using the `READ COMMITTED` transaction isolation level caused mixed and statement-based replication to fail. ([Bug#23051](#))
- **Disk Data:** Performing Disk Data schema operations during a node restart could cause forced shutdowns of other data nodes. ([Bug#29501](#))
- **Disk Data:** When dropping a page, the stack's bottom entry could sometime be left "cold" rather than "hot", violating the rules for stack pruning. ([Bug#29176](#))
- **Disk Data:** Disk data meta-information that existed in `ndbd` might not be visible to `mysqld`. ([Bug#28720](#))
- **Disk Data:** The number of free extents was incorrectly reported for some tablespaces. ([Bug#28642](#))
- **Cluster Replication:** When executing a statement where `binlog_format = statement`, the result of the statement was logged both as a statement and as rows. ([Bug#29222](#))
- **Cluster Replication:** `mysqld` would segfault on startup when the `NDB` storage engine was enabled and the default character set was a strictly multi-byte character set such as UCS2.

This issue does *not* apply to character sets that can contain single-byte characters in addition to multi-byte characters such as UTF-8.

Additional issues remain with regard to the use of multi-byte character sets in MySQL Cluster Replication; see [Section 17.6.3, “Known Issues in MySQL Cluster Replication”](#), for more information. ([Bug#27404](#))

- Prepared statements containing `CONNECTION_ID()` could be written improperly to the binary log. ([Bug#30200](#))
- Use of local variables with non-ASCII names in stored procedures crashed the server. ([Bug#30120](#))
- On Windows, client libraries lacked symbols required for linking. ([Bug#30118](#))
- `--myisam-recover=''` (empty option value) did not disable `MyISAM` recovery. ([Bug#30088](#))
- For the `SHOW TABLE TYPES` statement, the server sent incorrect output to clients, possibly causing them to crash. ([Bug#30036](#))
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. ([Bug#30020](#))
- `SHOW` statements were being written to the slow query log that should not have been. ([Bug#30000](#))
- `REPAIR TABLE ... USE_FRM` could corrupt tables. ([Bug#29980](#))
- For `MyISAM` tables on Windows, `INSERT`, `DELETE`, or `UPDATE` followed by `ALTER TABLE` within `LOCK TABLES` could cause table corruption. ([Bug#29957](#))
- `LOCK TABLES` did not pre-lock tables used in triggers of the locked tables. Unexpected locking behavior and statement failures similar to `FAILED: 1100: TABLE 'xx' WAS NOT LOCKED WITH LOCK TABLES` could result. ([Bug#29929](#))
- `INSERT ... VALUES(CONNECTION_ID(), ...)` statements were written to the binary log in such a way that they could not be properly restored. ([Bug#29928](#))
- Adding `DISTINCT` could cause incorrect rows to appear in a query result. ([Bug#29911](#))
- On Windows, the CMake build process did not produce the embedded server library or related binaries. ([Bug#29903](#))
- Using the `DATE()` function in a `WHERE` clause did not return any records after encountering `NULL`. However, using `TRIM()` or `CAST()` produced the correct results. ([Bug#29898](#))
- `SESSION_USER()` returned garbage data (rather than the correct value of the empty string) when executed by a slave SQL thread. ([Bug#29878](#))
- Very long prepared statements in stored procedures could cause a server crash. ([Bug#29856](#))
- If query execution involved a temporary table, `GROUP_CONCAT()` could return a result with an incorrect character set. ([Bug#29850](#))

- If one thread was performing concurrent inserts, other threads reading from the same table using equality key searches could see the index values for new rows before the data values had been written, leading to reports of table corruption. ([Bug#29838](#))
- Repeatedly accessing a view in a stored procedure (for example, in a loop) caused a small amount of memory to be allocated per access. Although this memory is deallocated on disconnect, it could be a problem for a long running stored procedures that make repeated access of views. ([Bug#29834](#))

- `mysqldump` produced output that incorrectly discarded the `NO_AUTO_VALUE_ON_ZERO` value of the `sql_mode` variable after dumping triggers. ([Bug#29788](#))
- An assertion failure occurred within yaSSL for very long keys. ([Bug#29784](#))

See also [Bug#53463](#).

- For `MEMORY` tables, the `index_merge` union access method could return incorrect results. ([Bug#29740](#))
- Comparison of `TIME` values using the `BETWEEN` operator led to string comparison, producing incorrect results in some cases. Now the values are compared as integers. ([Bug#29739](#))
- For a table with a `DATE` column `date_col` such that selecting rows with `WHERE date_col = 'date_val 00:00:00'` yielded a nonempty result, adding `GROUP BY date_col` caused the result to be empty. ([Bug#29729](#))
- In some cases, `INSERT INTO ... SELECT ... GROUP BY` could insert rows even if the `SELECT` by itself produced an empty result. ([Bug#29717](#))
- Single-row inserts could report a row count greater than one. ([Bug#29692](#))
- For the embedded server, the `mysql_stmt_store_result()` C API function caused a memory leak for empty result sets. ([Bug#29687](#))
- `EXPLAIN` produced `Impossible where` for statements of the form `SELECT ... FROM t WHERE c=0`, where `c` was an `ENUM` column defined as a primary key. ([Bug#29661](#))
- On Windows, `ALTER TABLE` hung if records were locked in share mode by a long-running transaction. ([Bug#29644](#))
- `mysqld_safe` produced error messages and did not create the error log file under some circumstances. ([Bug#29634](#))
- On 64-bit platforms, the filesort code (for queries with `GROUP BY` or `ORDER BY`) could crash due to an incorrect pointer size. ([Bug#29610](#))
- A left join between two views could produce incorrect results. ([Bug#29604](#))
- Certain statements with unions, subqueries, and joins could result in huge memory consumption. ([Bug#29582](#))
- Clients using SSL could hang the server. ([Bug#29579](#))
- A slave running with `--log-slave-updates` would fail to write `INSERT DELAY IGNORE` statements to its binary log, resulting in different binary log contents on the master and slave. ([Bug#29571](#))
- An incorrect result was returned when comparing string values that were converted to `TIME` values with `CAST()`. ([Bug#29555](#))
- `gcov` coverage-testing information was not written if the server crashed. ([Bug#29543](#))
- In the `ascii` character set, conversion of `DEL (0x7F)` to Unicode incorrectly resulted in `QUESTION MARK (0x3F)` rather than `DEL`. ([Bug#29499](#))
- A field packet with `NULL` fields caused a `libmysqlclient` crash. ([Bug#29494](#))
- On Windows, the `mysql` client died if the user entered a statement and Return after entering Control-C. ([Bug#29469](#))
- The full-text parser could enter an infinite loop if it encountered an illegal multi-byte sequence or a sequence that has no mapping to Unicode. ([Bug#29464](#))
- Searching a `FULLTEXT` index for a word with the boolean mode truncation operator could cause an infinite loop. ([Bug#29445](#))
- Corrupt data resulted from use of `SELECT ... INTO OUTFILE 'file_name' FIELDS ENCLOSED BY 'c'`, where `c` is a digit or minus sign, followed by `LOAD DATA INFILE 'file_name' FIELDS ENCLOSED BY 'c'`. ([Bug#29442](#))
- Killing an `INSERT DELAYED` thread caused a server crash. ([Bug#29431](#))

- Use of `SHOW BINLOG EVENTS` for a nonexistent log file followed by `PURGE BINARY LOGS` caused a server crash. ([Bug#29420](#))
- Assertion failure could occur for grouping queries that employed `DECIMAL` user variables with assignments to them. ([Bug#29417](#))
- For `CAST(expr AS DECIMAL(M,D))`, the limits of 65 and 30 on the precision (`M`) and scale (`D`) were not enforced. ([Bug#29415](#))
- Deleting from a `CSV` table could corrupt it. ([Bug#29411](#))
- Results for a select query that aliases the column names against a view could duplicate one column while omitting another. This bug could occur for a query over a multiple-table view that includes an `ORDER BY` clause in its definition. ([Bug#29392](#))
- `mysqldump` created a stray file when given a too-long file name argument. ([Bug#29361](#))
- The special “zero” `ENUM` value was coerced to the normal empty string `ENUM` value during a column-to-column copy. This affected `CREATE ... SELECT` statements and `SELECT` statements with aggregate functions on `ENUM` columns in the `GROUP BY` clause. ([Bug#29360](#))
- Inserting a negative number into a `CSV` table could corrupt it. ([Bug#29353](#))
- Optimization of queries with `DETERMINISTIC` stored functions in the `WHERE` clause was ineffective: A sequential scan was always used. ([Bug#29338](#))
- `MyISAM` corruption could occur with the `cp932_japanese_ci` collation for the `cp932` character set due to incorrect comparison for trailing space. ([Bug#29333](#))
- For updates to `InnoDB` tables, a `TIMESTAMP` column with the `ON UPDATE CURRENT_TIMESTAMP` attribute could be updated even when no values actually changed. ([Bug#29310](#))
- `FULLTEXT` indexes could be corrupted by certain `gbk` characters. ([Bug#29299](#))
- `SELECT ... INTO OUTFILE` followed by `LOAD DATA` could result in garbled characters when the `FIELDS ENCLOSED BY` clause named a delimiter of '`0`', '`b`', '`n`', '`r`', '`t`', '`N`', or '`Z`' due to an interaction of character encoding and doubling for data values containing the enclosed-by character. ([Bug#29294](#))
- Sort order of the collation wasn't used when comparing trailing spaces. This could lead to incorrect comparison results, incorrectly created indexes, or incorrect result set order for queries that include an `ORDER BY` clause. ([Bug#29261](#))
- `CHECK TABLE` could erroneously report table corruption for a `CSV` table if multiple threads were modifying the table at the same time. ([Bug#29253](#))
- Many threads accessing a `CSV` table simultaneously could cause an assertion failure. ([Bug#29252](#))
- If an `ENUM` column contained '' as one of its members (represented with numeric value greater than 0), and the column contained error values (represented as 0 and displayed as ''), using `ALTER TABLE` to modify the column definition caused the 0 values to be given the numeric value of the nonzero '' member. ([Bug#29251](#))
- Calling `mysql_options()` after `mysql_real_connect()` could cause clients to crash. ([Bug#29247](#))
- `CHECK TABLE` for `ARCHIVE` tables could falsely report table corruption or cause a server crash. ([Bug#29207](#))
- Mixing binary and `utf8` columns in a union caused field lengths to be calculated incorrectly, resulting in truncation. ([Bug#29205](#))
- `AsText()` could fail with a buffer overrun. ([Bug#29166](#))
- Under some circumstances, a `SELECT ... FROM mysql.event` could cause the server to crash. ([Bug#29156](#))
- `InnoDB` refused to start on some versions of FreeBSD with LinuxThreads. This is fixed by enabling file locking on FreeBSD. ([Bug#29155](#))
- `LOCK TABLES` was not atomic when more than one `InnoDB` tables were locked. ([Bug#29154](#))
- `mysqld` failed to exit during shutdown. ([Bug#29133](#))
- A network structure was initialized incorrectly, leading to embedded server crashes. ([Bug#29117](#))
- An assertion failure occurred if a query contained a conjunctive predicate of the form `view_column = constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to a different view column. The fix also enables application of

an optimization that was being skipped if a query contained a conjunctive predicate of the form `view_column = constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to the same view column. ([Bug#29104](#))

- A maximum of 4TB `InnoDB` free space was reported by `SHOW TABLE STATUS`, which is incorrect on systems with more than 4TB space. ([Bug#29097](#))
- If an `INSERT INTO ... SELECT` statement inserted into the same table that the `SELECT` retrieved from, and the `SELECT` included `ORDER BY` and `LIMIT` clauses, different data was inserted than the data produced by the `SELECT` executed by itself. ([Bug#29095](#))
- Queries that performed a lookup into a `BINARY` index containing key values ending with spaces caused an assertion failure for debug builds and incorrect results for nondebug builds. ([Bug#29087](#))
- The semantics of `BIGINT` depended on platform-specific characteristics. ([Bug#29079](#))
- A byte-order issue in writing a spatial index to disk caused bad index files on some systems. ([Bug#29070](#))
- Creation of a legal stored procedure could fail if no default database had been selected. ([Bug#29050](#))
- `REPLACE`, `INSERT IGNORE`, and `UPDATE IGNORE` did not work for `FEDERATED` tables. ([Bug#29019](#))
- Inserting into `InnoDB` tables and executing `RESET MASTER` in multiple threads cause assertion failure in debug server binaries. ([Bug#28983](#))
- Updates to a `CSV` table could cause a server crash or update the table with incorrect values. ([Bug#28971](#))
- For a `ucs2` column, `GROUP_CONCAT( )` did not convert separators to the result character set before inserting them, producing a result containing a mixture of two different character sets. ([Bug#28925](#))
- Dropping the definer of an active event caused the server to crash. ([Bug#28924](#))
- For a join with `GROUP BY` or `ORDER BY` and a view reference in the `FROM` list, the query metadata erroneously showed empty table aliases and database names for the view columns. ([Bug#28898](#))
- Creating an event using `ON SCHEDULE AT CURRENT_TIMESTAMP + INTERVAL ...` could in some cases cause `mysqld` to crash. ([Bug#28881](#))
- Coercion of ASCII values to character sets that are a superset of ASCII sometimes was not done, resulting in `ILLEGAL MIX OF COLLATIONS` errors. These cases now are resolved using repertoire, a new string expression attribute (see [Section 9.1.8, “String Repertoire”](#)). ([Bug#28875](#))
- Executing `ALTER EVENT` on an event whose definer's event creation privileges had been revoked cause the server to crash. ([Bug#28873](#))
- `ALTER VIEW` is not supported as a prepared statement but was not being rejected. `ALTER VIEW` is now prohibited as a prepared statement or when called within stored routines. ([Bug#28846](#))
- In strict SQL mode, errors silently stopped the SQL thread even for errors named using the `--slave-skip-errors` option. ([Bug#28839](#))
- Fast `ALTER TABLE` (that works without rebuilding the table) acquired duplicate locks in the storage engine. In `MyISAM`, if `ALTER TABLE` was issued under `LOCK TABLE`, it caused all data inserted after `LOCK TABLE` to disappear. ([Bug#28838](#))
- Runtime changes to the `log_queries_not_using_indexes` system variable were ignored. ([Bug#28808](#))
- Selecting a column not present in the selected-from table caused an extra error to be produced by `SHOW ERRORS`. ([Bug#28677](#))
- Creating an event to be executed at a time close to the end of the permitted range (2038-01-19 03:14:07 UTC) would cause the server to crash. ([Bug#28641](#))
- For a statement of the form `CREATE t1 SELECT integer_constant`, the server created the column using the `DECIMAL` data type for large negative values that are within the range of `BIGINT`. ([Bug#28625](#))
- Starting the server with an `innodb_force_recovery` value of 4 did not work. ([Bug#28604](#))
- For `InnoDB` tables, MySQL unnecessarily sorted records in certain cases when the records were retrieved by `InnoDB` in the proper order already. ([Bug#28591](#))
- `mysql_install_db` could fail to find script files that it needs. ([Bug#28585](#))

- If a stored procedure was created and invoked prior to selecting a default database with `USE`, a `NO DATABASE SELECTED` error occurred. ([Bug#28551](#))
- On Mac OS X, shared-library installation path names were incorrect. ([Bug#28544](#))
- Using the `--skip-add-drop-table` option with `mysqldump` generated incorrect SQL if the database included any views. The recreation of views requires the creation and removal of temporary tables. This option suppressed the removal of those temporary tables. The same applied to `--compact` since this option also invokes `--skip-add-drop-table`. ([Bug#28524](#))
- `mysqlbinlog --hexdump` generated incorrect output due to omission of the “`#`” comment character for some comment lines. ([Bug#28293](#))
- `InnoDB` could crash if the server was shut down while `innodb_table_monitor` was running. ([Bug#28254](#))
- A race condition in the interaction between `MyISAM` and the query cache code caused the query cache not to invalidate itself for concurrently inserted data. ([Bug#28249](#))
- A duplicate-key error message could display an incorrect key value when not all columns of the key were used to select rows for update. ([Bug#28158](#))
- Indexing column prefixes in `InnoDB` tables could cause table corruption. ([Bug#28138](#))
- Index creation could fail due to truncation of key values to the maximum key length rather than to a multiple of the maximum character length. ([Bug#28125](#))
- Instance Manager had a race condition when it received a shutdown request while a guarded `mysqld` instance was starting such that it could fail to stop the `mysqld` instance. ([Bug#28030](#))
- `SELECT ... FOR UPDATE` with partitioned tables could cause a server crash. ([Bug#28026](#))
- On Windows, Instance Manager would crash if an instance object failed to initialize during startup. This could happen if an incorrect `mysqld` path was supplied in the configuration file. ([Bug#28012](#))
- The `LOCATE()` function returned `NULL` if any of its arguments evaluated to `NULL`. Likewise, the predicate, `LOCATE(str,NULL) IS NULL`, erroneously evaluated to `FALSE`. ([Bug#27932](#))
- Dropping a user-defined function could cause a server crash if the function was still in use by another thread. ([Bug#27564](#))
- For some event-creation problems, the server displayed messages that implied the problems were errors when they were only warnings. ([Bug#27406](#))
- Unsafe aliasing in the source caused a client library crash when compiled with `gcc 4` at high optimization levels. ([Bug#27383](#))
- Index-based range reads could fail for comparisons that involved contraction characters (such as `ch` in Czech or `ll` in Spanish). ([Bug#27345](#))
- Aggregations in subqueries that refer to outer query columns were not always correctly referenced to the proper outer query. ([Bug#27333](#))
- Error returns from the `time()` system call were ignored. ([Bug#27198](#))
- Phantom reads could occur under `InnoDB SERIALIZABLE` isolation level. ([Bug#27197](#))
- The `SUBSTRING()` function returned the entire string instead of an empty string when it was called from a stored procedure and when the length parameter was specified by a variable with the value “`0`”. ([Bug#27130](#))
- Some functions when used in partitioning expressions could cause `mysqld` to crash. ([Bug#27084](#))
- The server acquired a global mutex for temporary tables, although such tables are thread-specific. This affected performance by blocking other threads. ([Bug#27062](#))
- `FEDERATED` tables had an artificially low maximum of key length. ([Bug#26909](#))
- Updates to rows in a partitioned table could update the wrong column. ([Bug#26827](#))
- Index creation could corrupt the table definition in the `.frm` file: 1) A table with the maximum number of key segments and maximum length key name would have a corrupted `.frm` file, due to incorrect calculation of the total key length. 2) `MyISAM` would reject a table with the maximum number of keys and the maximum number of key segments in all keys. (It would permit one less than this total maximum.) Now `MyISAM` accepts a table defined with the maximum. ([Bug#26642](#))

- The Windows implementation of `pthread_join()` was incorrect and could cause crashes. ([Bug#26564](#))
- After the first read of a `TEMPORARY` table, `CHECK TABLE` could report the table as being corrupt. ([Bug#26325](#))
- If an operation had an `InnoDB` table, and two triggers, `AFTER UPDATE` and `AFTER INSERT`, competing for different resources (such as two distinct `MyISAM` tables), the triggers were unable to execute concurrently. In addition, `INSERT` and `UPDATE` statements for the `InnoDB` table were unable to run concurrently. ([Bug#26141](#))
- A number of unsupported constructs—including prohibited constructs, the `UCASE()` function, and nested function calls—were permitted in partitioning expressions. ([Bug#26082](#), [Bug#18198](#), [Bug#29308](#))
- `ALTER DATABASE` did not require at least one option. ([Bug#25859](#))
- The index merge union access algorithm could produce incorrect results with `InnoDB` tables. The problem could also occur for queries that used `DISTINCT`. ([Bug#25798](#))
- When using a `FEDERATED` table, the value of `LAST_INSERT_ID()` would not correctly update the C API interface, which would affect the autogenerated ID returned both through the C API and the MySQL protocol, affecting Connectors that used the protocol or C API. ([Bug#25714](#))
- The server was blocked from opening other tables while the `FEDERATED` engine was attempting to open a remote table. Now the server does not check the correctness of a `FEDERATED` table at `CREATE TABLE` time, but waits until the table actually is accessed. ([Bug#25679](#))
- Under ActiveState Perl, `mysql-test-run.pl` could kill itself when attempting to kill other processes. ([Bug#25657](#))
- Several `InnoDB` assertion failures were corrected. ([Bug#25645](#))
- A query with `DISTINCT` in the select list to which the loose-scan optimization for grouping queries was applied returned an incorrect result set when the query was used with the `SQL_BIG_RESULT` option. ([Bug#25602](#))
- For a multiple-row insert into a `FEDERATED` table that refers to a remote transactional table, if the insert failed for a row due to constraint failure, the remote table would contain a partial commit (the rows preceding the failed one) instead of rolling back the statement completely. This occurred because the rows were treated as individual inserts.

Now `FEDERATED` performs bulk-insert handling such that multiple rows are sent to the remote table in a batch. This provides a performance improvement and enables the remote table to perform statement rollback properly should an error occur. This capability has the following limitations:

- The size of the insert cannot exceed the maximum packet size between servers. If the insert exceeds this size, it is broken into multiple packets and the rollback problem can occur.
  - Bulk-insert handling does not occur for `INSERT ... ON DUPLICATE KEY UPDATE`.  
[\(Bug#25513\)](#)
  - The `FEDERATED` storage engine failed silently for `INSERT ... ON DUPLICATE KEY UPDATE` if a duplicate key violation occurred. `FEDERATED` does not support `ON DUPLICATE KEY UPDATE`, so now it correctly returns an `ER_DUP_KEY` error if a duplicate key violation occurs. ([Bug#25511](#))
  - In a stored function or trigger, when `InnoDB` detected deadlock, it attempted rollback and displayed an incorrect error message (`EXPLICIT OR IMPLICIT COMMIT IS NOT PERMITTED IN STORED FUNCTION OR TRIGGER`). Now `InnoDB` returns an error under these conditions and does not attempt rollback. Rollback is handled outside of `InnoDB` above the function/trigger level. ([Bug#24989](#))
  - Dropping a temporary `InnoDB` table that had been locked with `LOCK TABLES` caused a server crash. ([Bug#24918](#))
  - On Windows, executables did not include Vista manifests. ([Bug#24732](#))
- See also [Bug#22563](#).
- If MySQL/`InnoDB` crashed very quickly after starting up, it would not force a checkpoint. In this case, `InnoDB` would skip crash recovery at next startup, and the database would become corrupt. Now, if the redo log scan at `InnoDB` startup goes past the last checkpoint, crash recovery is forced. ([Bug#23710](#))
  - `SHOW INNODB STATUS` caused an assertion failure under high load. ([Bug#22819](#))
  - `SHOW BINLOG EVENTS` displayed incorrect values of `End_log_pos` for events associated with transactional storage engines. ([Bug#22540](#))
  - When determining which transaction to kill after deadlock has been detected, `InnoDB` now adds the number of locks to a trans-

action's weight, and avoids killing transactions that have modified nontransactional tables. This should reduce the likelihood of killing long-running transactions containing `SELECT ... FOR UPDATE` or `INSERT/REPLACE INTO ... SELECT` statements, and of causing partial updates if the target is a MyISAM table. ([Bug#21293](#))

- `InnoDB` displayed an incorrect error message when a `CREATE TABLE` statement exceeded the `InnoDB` maximum permissible row size. ([Bug#21101](#))
- Under heavy load with a large query cache, invalidating part of the cache could cause the server to freeze (that is, to be unable to service other operations until the invalidation was complete). ([Bug#21074](#))

See also [Bug#39253](#).

- On Windows, the server used 10MB of memory for each connection thread, resulting in memory exhaustion. Now each thread uses 1MB. ([Bug#20815](#))
- `InnoDB` produced an unnecessary (and harmless) warning: `InnoDB: Error: trying to declare trx to enter InnoDB, but InnoDB: it already is declared.` ([Bug#20090](#))
- If a slave timed out while registering with the master to which it was connecting, auto-reconnect failed thereafter. ([Bug#19328](#))
- If `InnoDB` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. ([Bug#18828](#))

See also [Bug#46672](#).

- Under ActiveState Perl, `mysql-test-run.pl` would not run. ([Bug#18415](#))
- The server crashed when the size of an `ARCHIVE` table grew larger than 2GB. ([Bug#15787](#))
- `SQL_BIG_RESULT` had no effect for `CREATE TABLE ... SELECT SQL_BIG_RESULT ...` statements. ([Bug#15130](#))
- On 64-bit Windows systems, the Config Wizard failed to complete the setup because 64-bit Windows does not resolve dynamic linking of the 64-bit `libmysql.dll` to a 32-bit application like the Config Wizard. ([Bug#14649](#))
- `mysql_setpermission` tried to grant global-only privileges at the database level. ([Bug#14618](#))
- For the general query log, logging of prepared statements executed using the C API differed from logging of prepared statements performed with `PREPARE` and `EXECUTE`. Logging for the latter was missing the `Prepare` and `Execute` lines. ([Bug#13326](#))
- The `TABLE_COMMENT` column of `INFORMATION_SCHEMA.TABLES` and the `Comment` column in the output of `SHOW TABLE STATUS` displayed extraneous information for `InnoDB` and `NDBCLUSTER` tables. ([Bug#11379](#))

See also [Bug#32440](#).

- The server returned data from `SHOW CREATE TABLE` statement or a `SELECT` statement on an `INFORMATION_SCHEMA` table using the `binary` character set. ([Bug#10491](#))
- Backup software can cause `ERROR_SHARING_VIOLATION` or `ERROR_LOCK_VIOLATION` conditions during file operations. `InnoDB` now retries forever until the condition goes away. ([Bug#9709](#))

## C.1.37. Changes in MySQL 5.1.20 (25 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** It is no longer possible to partition the log tables. ([Bug#27816](#))
- **Incompatible Change:** `mysqld_safe` now supports error logging to `syslog` on systems that support the `logger` command. The new `--syslog` and `--skip-syslog` options can be used instead of the `--log-error` option to control logging behavior, as described in [Section 4.3.2, “`mysqld\_safe` — MySQL Server Startup Script”](#). The default is to use `syslog`, which differs from the previous default behavior of writing an error log file.

**Currently, logging to `syslog` may fail to operate correctly in some cases; if so, use `--skip-syslog` or `--log-error`.** To maintain the older behavior if you were using no error-logging option, use `--skip-syslog`. If you were using `--log-error`, continue to use it.

Note: In 5.1.21, the default is changed to `--skip-syslog`, which is compatible with releases prior to 5.1.20. ([Bug#4858](#))

- **Important Change: MySQL Cluster:** The `TimeBetweenWatchdogCheckInitial` configuration parameter was added to enable setting of a separate watchdog timeout for memory allocation during startup of the data nodes. See [Section 17.3.2.6, “Defining MySQL Cluster Data Nodes”](#), for more information. ([Bug#28899](#))
- **MySQL Cluster:** The cluster management client now stores command history between sessions. ([Bug#29073](#))
- **MySQL Cluster:** `auto_increment_increment` and `auto_increment_offset` are now supported for `NDB` tables. ([Bug#26342](#))
- **MySQL Cluster:** The server source tree now includes scripts to simplify building MySQL with SCI support. For more information about SCI interconnects and these build scripts, see [Section 17.3.5.1, “Configuring MySQL Cluster to use SCI Sockets”](#). ([Bug#25470](#))
- **MySQL Cluster:** A new configuration parameter `ODirect` causes `NDB` to attempt using `O_DIRECT` writes for LCP, backups, and redo logs, often lowering CPU usage.
- **Replication:** The `sql_mode`, `foreign_key_checks`, `unique_checks`, character set/collations, and `sql_auto_is_null` session variables are written to the binary log and honored during replication. See [Section 5.2.4, “The Binary Log”](#).
- If a `MERGE` table cannot be opened or used because of a problem with an underlying table, `CHECK TABLE` now displays information about which table caused the problem. ([Bug#26976](#))
- User variables and stored procedure variables are now supported for use in XPath expressions employed as arguments to the `ExtractValue()` and `UpdateXML()` functions.

This means that:

- XPath can now be used to load data from XML files using virtually any format, and so able to import data from most third party software which either has XML export functionality, or uses XML natively as a storage format.
- Various complex conditions can be put on rows and columns, so one can filter for desired rows (or skip unwanted rows) when loading XML.
- Various types of preprocessing using SQL functions are now possible when loading XML. For example, you can concatenate two XML tag or attribute values into a single column value using `CONCAT()`, or remove some parts of the data using `REPLACE()`.

See [Section 11.11, “XML Functions”](#), for more information. ([Bug#26518](#))

- Binary distributions for some platforms did not include shared libraries; now shared libraries are shipped for all platforms except AIX 5.2 64-bit. *Exception:* The library for the `libmysqld` embedded server is not shared except on Windows. ([Bug#16520](#), [Bug#26767](#), [Bug#13450](#))
- Added a new `PAD_CHAR_TO_FULL_LENGTH` SQL mode. By default, trailing spaces are trimmed from `CHAR` column values on retrieval. If `PAD_CHAR_TO_FULL_LENGTH` is enabled, trimming does not occur and retrieved `CHAR` values are padded to their full length. This mode does not apply to `VARCHAR` columns, for which trailing spaces are retained on retrieval.
- XPath can now be used to load data from XML files using virtually any format, and so able to import data from most third party software which either has XML export functionality, or uses XML natively as a storage format.
- Various complex conditions can be put on rows and columns, so one can filter for desired rows (or skip unwanted rows) when loading XML.
- Various types of preprocessing using SQL functions are now possible when loading XML. For example, you can concatenate two XML tag or attribute values into a single column value using `CONCAT()`, or remove some parts of the data using `REPLACE()`.

Bugs fixed:

- **Security Fix:** A malformed password packet in the connection protocol could cause the server to crash. Thanks for Dormando for reporting this bug, and for providing details and a proof of concept. ([Bug#28984](#), [CVE-2007-3780](#))
- **Security Fix:** `CREATE TABLE LIKE` did not require any privileges on the source table. Now it requires the `SELECT` privilege.

In addition, `CREATE TABLE LIKE` was not isolated from alteration by other connections, which resulted in various errors and incorrect binary log order when trying to execute concurrently a `CREATE TABLE LIKE` statement and either DDL statements on the source table or DML or DDL statements on the target table. ([Bug#23667](#), [Bug#25578](#), [CVE-2007-3781](#))

- **Incompatible Change:** Some error codes had error numbers in MySQL 5.1 different from the numbers in MySQL 5.0. In MySQL 5.1, error numbers have been changed to match the MySQL 5.0 values: Error codes with value of 1458 or higher have changed in MySQL 5.1 now. Client applications designed to work with MySQL 5.1 with hard-coded error code values (for example, in statements such as `if (mysql_errno(mysql) == 1463) { ... }`) need to be updated in the source code. All clients designed to work with MySQL 5.1 that test error codes (for example, in statements such as `if (mysql_errno(mysql) == ER_VIEW_RECURSIVE) { ... }`) should be recompiled. Existing 5.0 clients should now work, without changes or recompilation, against servers for MySQL 5.1.20 or higher. ([Bug#29245](#))
- **Incompatible Change:** The names of stored functions referenced by views were not properly displayed by `SHOW CREATE VIEW`.

The fix corrects a problem introduced by [Bug#23491](#). There is an incompatibility when upgrading from versions affected by that bug fix (MySQL 5.0.40 through 5.0.43, MySQL 5.1.18 through 5.1.19): If you use `mysqldump` before upgrading from an affected version and reload the data after upgrading to a higher version, you must drop and recreate your views. ([Bug#28605](#))

- **Incompatible Change:** When `mysqldump` was run with the `--delete-master-logs` option, binary log files were deleted before it was known that the dump had succeeded, not after. (The method for removing log files used `RESET MASTER` prior to the dump. This also reset the binary log sequence numbering to `.000001`.) Now `mysqldump` flushes the logs (which creates a new binary log number with the next sequence number), performs the dump, and then uses `PURGE BINARY LOGS` to remove the log files older than the new one. This also preserves log numbering because the new log with the next number is generated and only the preceding logs are removed. However, this may affect applications if they rely on the log numbering sequence being reset. ([Bug#24733](#))
- **Incompatible Change:** The use of an `ORDER BY` or `DISTINCT` clause with a query containing a call to the `GROUP_CONCAT()` function caused results from previous queries to be redisplayed in the current result. The fix for this includes replacing a `BLOB` value used internally for sorting with a `VARCHAR`. This means that for long results (more than 65,535 bytes), it is possible for truncation to occur; if so, an appropriate warning is issued. ([Bug#23856](#), [Bug#28273](#))
- **MySQL Cluster: Replication:** (Replication): A replicated unique key permitted duplicate key inserts on the slave. ([Bug#27044](#))
- **MySQL Cluster:** Memory corruption could occur due to a problem in the `DBTUP` kernel block. ([Bug#29229](#))
- **MySQL Cluster:** A query having a large `IN(...)` or `NOT IN(...)` list in the `WHERE` condition on an `NDB` table could cause `mysqld` to crash. ([Bug#29185](#))
- **MySQL Cluster:** In the event that two data nodes in the same node group and participating in a GCP crashed before they had written their respective `P0.sysfile` files, `QMGR` could refuse to start, issuing an invalid `INSUFFICIENT NODES FOR RESTART` error instead. ([Bug#29167](#))
- **MySQL Cluster:** Attempting to restore a `NULL` row to a `VARBINARY` column caused `ndb_restore` to fail. ([Bug#29103](#))
- **MySQL Cluster:** `ndb_error_reporter` now preserves timestamps on files. ([Bug#29074](#))
- **MySQL Cluster:** It is now possible to set the maximum size of the allocation unit for table memory using the `MaxAllocate` configuration parameter. ([Bug#29044](#))
- **MySQL Cluster:** When shutting down `mysqld`, the `NDB` binlog process was not shut down before log cleanup began. ([Bug#28949](#))
- **MySQL Cluster:** `ndb_mgm` could hang when connecting to a nonexistent host. ([Bug#28847](#))
- **MySQL Cluster:** A regression in the heartbeat monitoring code could lead to node failure under high load. This issue affected MySQL 5.1.19 and MySQL Cluster NDB 6.1.10 only. ([Bug#28783](#))
- **MySQL Cluster:** A corrupt schema file could cause a `FILE ALREADY OPEN` error. ([Bug#28770](#))
- **MySQL Cluster:** Having large amounts of memory locked caused swapping to disk. ([Bug#28751](#))

- **MySQL Cluster:** Setting `InitialNoOpenFiles` equal to `MaxNoOfOpenFiles` caused an error. This was due to the fact that the actual value of `MaxNoOfOpenFiles` as used by the cluster was offset by 1 from the value set in `config.ini`. ([Bug#28749](#))
- **MySQL Cluster:** LCP files were not removed following an initial system restart. ([Bug#28726](#))
- **MySQL Cluster:** `UPDATE IGNORE` statements involving the primary keys of multiple tables could result in data corruption. ([Bug#28719](#))
- **MySQL Cluster:** A race condition could result when nonmaster nodes (in addition to the master node) tried to update active status due to a local checkpoint (that is, between `NODE_FAILREP` and `COPY_GCIREQ` events). Now only the master updates the active status. ([Bug#28717](#))
- **MySQL Cluster:** A fast global checkpoint under high load with high usage of the redo buffer caused data nodes to fail. ([Bug#28653](#))
- **MySQL Cluster:** The management client's response to `START BACKUP WAIT COMPLETED` did not include the backup ID. ([Bug#27640](#))
- **Cluster Replication: Replication:** When replicating `MyISAM` or `InnoDB` tables to a MySQL Cluster, it was not possible to determine exactly what had been applied following a shutdown of the slave cluster or `mysqld` process. ([Bug#26783](#))
- **Replication:** `DROP USER` statements that named multiple users, only some of which could be dropped, were replicated incorrectly. ([Bug#29030](#))
- **Replication:** Using events in replication could cause the slave to crash. ([Bug#28953](#))
- **Replication:** It was possible to set `SQL_SLAVE_SKIP_COUNTER` such that the slave would jump into the middle of an event group. ([Bug#28618](#))

See also [Bug#12691](#).

- **Replication:** The result of executing of a prepared statement created with `PREPARE s FROM "SELECT 1 LIMIT ?"` was not replicated correctly. ([Bug#28464](#))
- **Replication:** Recreating a view that already exists on the master would cause a replicating slave to terminate replication with a 'different error message on slave and master' error. ([Bug#28244](#))
- **Replication:** Binary logging of prepared statements could produce syntactically incorrect queries in the binary log, replacing some parameters with variable names rather than variable values. This could lead to incorrect results on replication slaves. ([Bug#26842](#), [Bug#12826](#))
- **Replication:** Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. ([Bug#26664](#))

See also [Bug#29083](#).

- **Replication:** When using transactions and replication, shutting down the master in the middle of a transaction would cause all slaves to stop replicating. ([Bug#22725](#))
- **Replication:** Using `CREATE TABLE LIKE ...` would raise an assertion when replicated to a slave. ([Bug#18950](#))
- **Disk Data:** When loading data into a cluster following a version upgrade, the data nodes could forcibly shut down due to page and buffer management failures (that is, `ndbrequire` failures in `PGMAN`). ([Bug#28525](#))
- **Disk Data:** Repeated `INSERT` and `DELETE` operations on a Disk Data table having one or more large `VARCHAR` columns could cause data nodes to fail. ([Bug#20612](#))
- **Cluster API:** The timeout set using the MGM API `ndb_mgm_set_timeout()` function was incorrectly interpreted as seconds rather than as milliseconds. ([Bug#29063](#))
- **Cluster API:** An invalid error code could be set on transaction objects by `BLOB` handling code. ([Bug#28724](#))
- The `TRUNCATE TABLE` statement was handled differently by the server when row-based logging was in effect, even though the binlogging format in effect does not effect the fact that `TRUNCATE TABLE` is always logged as a statement. ([Bug#29130](#))
- If one of the queries in a `UNION` used the `SQL_CACHE` option and another query in the `UNION` contained a nondeterministic function, the result was still cached. For example, this query was incorrectly cached:

```
SELECT NOW() FROM t1 UNION SELECT SQL_CACHE 1 FROM t1;
```

([Bug#29053](#))

- Long path names for internal temporary tables could cause stack overflows. ([Bug#29015](#))
- Using an `INTEGER` column from a table to `ROUND( )` a number produced different results than using a constant with the same value as the `INTEGER` column. ([Bug#28980](#))
- If a program binds a given number of parameters to a prepared statement handle and then somehow changes `stmt->param_count` to a different number, `mysql_stmt_execute()` could crash the client or server. ([Bug#28934](#))
- Queries using UDFs or stored functions were cached. ([Bug#28921](#))
- `INSERT .. ON DUPLICATE KEY UPDATE` could under some circumstances silently update rows when it should not have. ([Bug#28904](#))
- Queries that used `UUID()` were incorrectly permitted into the query cache. (This should not happen because `UUID()` is non-deterministic.) ([Bug#28897](#))
- Using a `VIEW` created with a nonexistent `DEFINER` could lead to incorrect results under some circumstances. ([Bug#28895](#))
- For `InnoDB` tables that use the `utf8` character set, incorrect results could occur for DML statements such as `DELETE` or `UPDATE` that use an index on character-based columns. ([Bug#28878](#))

See also [Bug#29449](#), [Bug#30485](#), [Bug#31395](#).

This regression was introduced by [Bug#13195](#).

- Non-`utf8` characters could get mangled when stored in `CSV` tables. ([Bug#28862](#))
- On Windows, `USE_TLS` was not defined for `mysqlclient.lib`. ([Bug#28860](#))
- In MySQL 5.1.15, a new error code `ER_DUP_ENTRY_WITH_KEY_NAME` (1582) was introduced to replace `ER_DUP_ENTRY` (1062) so that the key name could be provided instead of the key number. This was unnecessary, so `ER_DUP_ENTRY` is used again and the key name is printed. The incompatibility introduced in 5.1.15 no longer applies. ([Bug#28842](#))
- A subquery with `ORDER BY` and `LIMIT 1` could cause a server crash. ([Bug#28811](#))
- Running `SHOW TABLE STATUS` while performing a high number of inserts on partitioned tables with a great many partitions could cause the server to crash. ([Bug#28806](#))
- Using `BETWEEN` with nonindexed date columns and short formats of the date string could return incorrect results. ([Bug#28778](#))
- Selecting `GEOMETRY` columns in a `UNION` caused a server crash. ([Bug#28763](#))
- When constructing the path to the original `.frm` file, `ALTER .. RENAME` was unnecessarily (and incorrectly) lowercasing the entire path when not on a case-insensitive file system, causing the statement to fail. ([Bug#28754](#))
- The `binlog_format` system variable value was empty if the server was started with binary logging disabled. Now it is set to `MIXED`. ([Bug#28752](#))
- Searches on indexed and nonindexed `ENUM` columns could return different results for empty strings. ([Bug#28729](#))
- Executing `EXPLAIN EXTENDED` on a query using a derived table over a grouping subselect could lead to a server crash. This occurred only when materialization of the derived tables required creation of an auxiliary temporary table, an example being when a grouping operation was carried out with usage of a temporary table. ([Bug#28728](#))
- The result of evaluation for a view's `CHECK OPTION` option over an updated record and records of merged tables was arbitrary and dependant on the order of records in the merged tables during the execution of the `SELECT` statement. ([Bug#28716](#))
- The “manager thread” of the LinuxThreads implementation was unintentionally started before `mysqld` had dropped privileges (to run as an unprivileged user). This caused signaling between threads in `mysqld` to fail when the privileges were finally dropped. ([Bug#28690](#))
- Setting an interval of `EVERY 0 SECOND` for a scheduled event caused the server to crash. ([Bug#28666](#))
- For debug builds, `ALTER TABLE` could trigger an assertion failure due to occurrence of a deadlock when committing changes. ([Bug#28652](#))
- Attempting to create an index on a `BIT` column failed after modifying the column. ([Bug#28631](#))
- Conversion of U+00A5 YEN SIGN and U+203E OVERLINE from `ucs2` to `ujis` produced incorrect results. ([Bug#28600](#))
- Killing from one connection a long-running `EXPLAIN QUERY` started from another connection caused `mysqld` to crash.

**Bug#28598**

- `SHOW GLOBAL VARIABLES` repeated some variable names. ([Bug#28580](#))
- When one thread attempts to lock two (or more) tables and another thread executes a statement that aborts these locks (such as `REPAIR TABLE`, `OPTIMIZE TABLE`, or `CHECK TABLE`), the thread might get a table object with an incorrect lock type in the table cache. The result is table corruption or a server crash. ([Bug#28574](#))
- Outer join queries with `ON` conditions over constant outer tables did not return `NULL`-complemented rows when conditions were evaluated to `FALSE`. ([Bug#28571](#))
- An update on a multiple-table view with the `CHECK OPTION` clause and a subquery in the `WHERE` condition could cause an assertion failure. ([Bug#28561](#))
- Calling the `UpdateXML()` function using invalid XPath syntax caused memory corruption possibly leading to a crash of the server. ([Bug#28558](#))
- `PURGE MASTER LOGS BEFORE (subquery)` caused a server crash. Subqueries are forbidden in the `BEFORE` clause now. ([Bug#28553](#))
- `mysqldump` calculated the required memory for a hex-blob string incorrectly causing a buffer overrun. This in turn caused `mysqldump` to crash silently and produce incomplete output. ([Bug#28522](#))
- When upgrading from MySQL 5.1.17 to 5.1.18, `mysql_upgrade` and `mysql_fix_privilege_tables` did not upgrade the system tables relating to the Event Scheduler correctly. ([Bug#28521](#))
- Passing a `DECIMAL` value as a parameter of a statement prepared with `PREPARE` resulted in an error. ([Bug#28509](#))
- `mysql_affected_rows()` could return an incorrect result for `INSERT ... ON DUPLICATE KEY UPDATE` if the `CLIENT_FOUND_ROWS` flag was set. ([Bug#28505](#))
- A query that grouped by the result of an expression returned a different result when the expression was assigned to a user variable. ([Bug#28494](#))
- Subselects returning `LONG` values in MySQL versions later than 5.0.24a returned `LONGLONG` prior to this. The previous behavior was restored. ([Bug#28492](#))

This regression was introduced by [Bug#19714](#).

- Performing `ALTER TABLE ... ADD PARTITION` or `ALTER TABLE DROP PARTITION` could result in inconsistent data, or cause the server to crash, if done concurrently with other accesses to the table. ([Bug#28477](#), [Bug#28488](#))
- Forcing the use of an index on a `SELECT` query when the index had been disabled would raise an error without running the query. The query now executes, with a warning generated noting that the use of a disabled index has been ignored. ([Bug#28476](#))
- The query `SELECT '2007-01-01' + INTERVAL column_name DAY FROM table_name` caused `mysqld` to fail. ([Bug#28450](#))
- A server crash could happen under rare conditions such that a temporary table outgrew heap memory reserved for it and the remaining disk space was not big enough to store the table as a `MyISAM` table. ([Bug#28449](#))
- Using `ALTER TABLE` to move columns resulted only in the columns being renamed. The table contents were not changed. ([Bug#28427](#))
- The test case for `mysqldump` failed with `bin-log` disabled. ([Bug#28372](#))
- Attempting to `LOAD_FILE` from an empty floppy drive under Windows, caused the server to hang. For example, if you opened a connection to the server and then issued the command `SELECT LOAD_FILE('a:test') ;`, with no floppy in the drive, the server was inaccessible until the modal pop-up dialog box was dismissed. ([Bug#28366](#))
- `mysqldtest` used a too-large stack size on PPC/Debian Linux, causing thread-creation failure for tests that use many threads. ([Bug#28333](#))
- When using a `MEMORY` table on Mac OS X, dropping a table and then creating a table with the same name could cause the information of the deleted table to remain accessible, leading to index errors. ([Bug#28309](#))
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. ([Bug#28266](#))
- For `CAST()` of a `NULL` value with type `DECIMAL`, the return value was incorrectly initialized, producing a runtime error for binaries built using Visual C++ 2005. ([Bug#28250](#))

- When the query cache was fully used, issuing `RENAME DATABASE` or `RENAME SCHEMA` could cause the server to hang, with 100% CPU usage. ([Bug#28211](#))
- The `Bytes_received` and `Bytes_sent` status variables could hold only 32-bit values (not 64-bit values) on some platforms. ([Bug#28149](#))
- Some valid identifiers were not parsed correctly. ([Bug#28127](#))
- Storing a large number into a `FLOAT` or `DOUBLE` column with a fixed length could result in incorrect truncation of the number if the column's length was greater than 31. ([Bug#28121](#))
- Sending debugging information from a dump of the Event Scheduler to `COM_DEBUG` could cause the server to crash. ([Bug#28075](#))
- The `PARTITION_COMMENT` column of the `INFORMATION_SCHEMA.PARTITIONS` table had the wrong default value. ([Bug#28007](#))
- `DECIMAL` values beginning with nine `9` digits could be incorrectly rounded. ([Bug#27984](#))
- For attempts to open a nonexistent table, the server should report `ER_NO SUCH_TABLE` but sometimes reported `ER_TABLE_NOT_LOCKED`. ([Bug#27907](#))
- Following an invalid call to `UpdateXML( )`, calling the function again (even if valid) crashed the server. ([Bug#27898](#))
- A stored program that uses a variable name containing multibyte characters could fail to execute. ([Bug#27876](#))
- The server made strong assumptions about the structure of the `general_log` and `slow_log` log tables: It supported only the table structure defined in the `mysql` database creation scripts. The server also permitted limited `ALTER TABLE` operations on the log tables, but adding an `AUTO_INCREMENT` column did not properly initialize the column, and subsequent inserts into the table could fail to generate correct sequence numbers. Now an `ALTER TABLE` statement that adds an `AUTO_INCREMENT` column populates the column correctly. In addition, when the server writes a log table row, it will set columns not present in the original table structure to their default values. ([Bug#27857](#))
- `ON` conditions from `JOIN` expressions were ignored when checking the `CHECK OPTION` clause while updating a multiple-table view that included such a clause. ([Bug#27827](#))
- On some systems, `udf_example.c` returned an incorrect result length. Also on some systems, `mysql-test-run.pl` could not find the shared object built from `udf_example.c`. ([Bug#27741](#))
- The modification of a table by a partially completed multi-column update was not recorded in the binlog, rather than being marked by an event and a corresponding error code. ([Bug#27716](#))
- `SHOW ENGINES` and queries on `INFORMATION_SCHEMA.ENGINES` did not use the same values for representing the same storage engine states. ([Bug#27684](#))
