- `HASH` indexes on `VARCHAR` columns with binary collations did not ignore trailing spaces from strings before comparisons. This could result in duplicate records being successfully inserted into a `MEMORY` table with unique key constraints. A consequence was that internal `MEMORY` tables used for `GROUP BY` calculation contained duplicate rows that resulted in duplicate-key errors when converting those temporary tables to `MyISAM`, and that error was incorrectly reported as a `table is full` error. ([Bug#27643](#))
- An error occurred trying to connect to `mysqld-debug.exe`. ([Bug#27597](#))
- A stack overrun could occur when storing `DATETIME` values using repeated prepared statements. ([Bug#27592](#))
- If a stored function or trigger was killed, it aborted but no error was thrown, permitting the calling statement to continue without noticing the problem. This could lead to incorrect results. ([Bug#27563](#))
- When `ALTER TABLE` was used to add a new `DATE` column with no explicit default value, '`0000-00-00`' was used as the default even if the SQL mode included the `NO_ZERO_DATE` mode to prohibit that value. A similar problem occurred for `DATETIME` columns. ([Bug#27507](#))
- `ALTER TABLE ... ENABLE KEYS` could cause `mysqld` to crash when executed on a table containing on a `MyISAM` table containing billions of rows. ([Bug#27029](#))
- Binary content `0x00` in a `BLOB` column sometimes became `0x5C 0x00` following a dump and reload, which could cause problems with data using multi-byte character sets such as `GBK` (Chinese). This was due to a problem with `SELECT INTO OUTFILE` whereby `LOAD DATA` later incorrectly interpreted `0x5C` as the second byte of a multi-byte sequence rather than as the `SOLIDUS` ("`\`") character, used by MySQL as the escape character. ([Bug#26711](#))
- The server crashed when attempting to open a table having a `#mysql150#` prefix in the database or table name. The server now

will not open such tables. (This prefix is reserved by `mysql_upgrade` for accessing 5.0 tables that have names not yet encoded for 5.1.) ([Bug#26402](#))

- A `FLUSH TABLES WITH READ LOCK` statement followed by a `FLUSH LOGS` statement caused a deadlock if the general log or the slow query log was enabled. ([Bug#26380](#))
- The query `SELECT /*2*/ user, host, db, info FROM INFORMATION_SCHEMA.PROCESSLIST WHERE (command != 'Daemon' || user = 'event_scheduler') AND (info IS NULL OR info NOT LIKE '%processlist%') ORDER BY INFO` yielded inconsistent results. ([Bug#26338](#))
- For a given user variable `@v`, the statements `SELECT @v` and `CREATE TABLE ... AS SELECT @v` did not return the same data type. ([Bug#26277](#))
- Statements within triggers ignored the value of the `low_priority_updates` system variable. ([Bug#26162](#))

See also [Bug#29963](#).

- The embedded server library displayed error messages at startup if the `mysql.plugin` table was not present. This no longer occurs. ([Bug#25800](#))
- On Windows, an application that called `mysql_thread_init()` but forgot to call `mysql_thread_end()` would get this error: `ERROR IN MY_THREAD_GLOBAL-END()`. ([Bug#25621](#))
- Embedded `/* ... */` comments were handled incorrectly within the definitions of stored programs and views, resulting in malformed definitions (the trailing `*/` was stripped). This also affected binary log contents. ([Bug#25411](#), [Bug#26302](#))
- Due to a race condition, executing `FLUSH PRIVILEGES` in one thread could cause brief table unavailability in other threads. ([Bug#24988](#))
- In `SHOW SLAVE STATUS` output, `Last_Errorno` and `Last_Error` were not set after `master_retry_count` errors had occurred. To provide additional information, the statement now displays four additional columns:
  - `Last_IO_Errorno`: The number of the last error that caused the I/O thread to stop
  - `Last_IO_Error`: A description of the last error that caused the I/O thread to stop
  - `Last_SQL_Errorno`: The number of the last error that caused the SQL thread to stop
  - `Last_SQL_Error`: A description of the last error that caused the SQL thread to stop

Also, `Last_Errorno` and `Last_Error` now are aliases for `Last_SQL_Errorno` and `Last_SQL_Error`. ([Bug#24954](#))

- A too-long `shared-memory-base-name` value could cause a buffer overflow and crash the server or clients. ([Bug#24924](#))
- When `mysqld` was run as a Windows service, shared memory objects were not created in the global namespace and could not be used by clients to connect. ([Bug#24731](#))
- On some Linux distributions where LinuxThreads and NPTL `glibc` versions both are available, statically built binaries can crash because the linker defaults to LinuxThreads when linking statically, but calls to external libraries (such as `libnss`) are resolved to NPTL versions. This cannot be worked around in the code, so instead if a crash occurs on such a binary/OS combination, print an error message that provides advice about how to fix the problem. ([Bug#24611](#))
- A number of `SHOW` statements caused `mysqld` to crash on recent versions of Solaris. This issue is believed to be present only in MySQL 5.1.12 and later. ([Bug#23810](#))
- The server deducted some bytes from the `key_cache_block_size` option value and reduced it to the next lower 512 byte boundary. The resulting block size was not a power of two. Setting the `key_cache_block_size` system variable to a value that is not a power of two resulted in `MyISAM` table corruption. ([Bug#23068](#), [Bug#28478](#), [Bug#25853](#))
- Conversion errors could occur when constructing the condition for an `IN` predicate. The predicate was treated as if the affected column contains `NULL`, but if the `IN` predicate is inside `NOT`, incorrect results could be returned. ([Bug#22855](#))
- Linux binaries were unable to dump core after executing a `setuid()` call. ([Bug#21723](#))
- Stack overflow caused server crashes. ([Bug#21476](#))
- The server was ignoring the return value of the `parse()` function for full-text parser plugins. ([Bug#18839](#))
- Granting access privileges to an individual table where the database or table name contained an underscore would fail. ([Bug#18660](#))

- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD::mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. ([Bug#18322](#))
- The `check-cpu` script failed to detect AMD64 Turion processors correctly. ([Bug#17707](#))
- When using `mysqlbinlog` with `--read-from-remote-server` to load the data direct from a remote MySQL server would cause a core dump when dumping certain binary log events. ([Bug#17654](#))
- Trying to shut down the server following a failed `LOAD DATA INFILE` caused `mysqld` to crash. ([Bug#17233](#))
- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. ([Bug#16377](#))
- Using up-arrow for command-line recall in `mysql` could cause a segmentation fault. ([Bug#10218](#))
- The result for `CAST()` when casting a value to `UNSIGNED` was limited to the maximum signed `BIGINT` value (9223372036854775808), rather than the maximum unsigned value (18446744073709551615). ([Bug#8663](#))
- The internal functions for table preparation, creation, and alteration were not re-execution friendly, causing problems in code that: repeatedly altered a table; repeatedly created and dropped a table; opened and closed a cursor on a table, altered the table, and then reopened the cursor; used `ALTER TABLE` to change a table's current `AUTO_INCREMENT` value; created indexes on `utf8` columns.

Re-execution of `CREATE DATABASE`, `CREATE TABLE`, and `ALTER TABLE` statements in stored routines or as prepared statements also caused incorrect results or crashes. ([Bug#4968](#), [Bug#6895](#), [Bug#19182](#), [Bug#19733](#), [Bug#22060](#), [Bug#24879](#))

## C.1.38. Changes in MySQL 5.1.19 (25 May 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** `INSERT DELAYED` is now downgraded to a normal `INSERT` if the statement uses functions that access tables or triggers, or that is called from a function or a trigger.

This was done to resolve the following interrelated issues:

- The server could abort or deadlock for `INSERT DELAYED` statements for which another insert was performed implicitly (for example, using a stored function that inserted a row).
- A trigger using an `INSERT DELAYED` caused the error `INSERT DELAYED CAN'T BE USED WITH TABLE ... BECAUSE IT IS LOCKED WITH LOCK TABLES` although the target table was not actually locked.
- `INSERT DELAYED` into a table with a `BEFORE INSERT` or `AFTER INSERT` trigger gave an incorrect `NEW` pseudo-column value and caused the server to deadlock or abort.

([Bug#21483](#))

See also [Bug#20497](#), [Bug#21714](#).

- **MySQL Cluster:** Formerly, restoring a cluster backup made on a MySQL 5.0 Cluster to a 5.1 cluster using a 5.1 version of `ndb_restore` did not resize `VARCHAR` columns as might be expected; now, the default behavior of `ndb_restore` in such cases is to resize the `VARCHAR` columns. This changed default behavior can be overridden using the `--no-upgrade` (or `-u`) option when invoking `ndb_restore`. ([Bug#22240](#))

- The `BLACKHOLE` storage engine now supports `INSERT DELAYED`. Previously, `INSERT DELAYED` statements for `BLACKHOLE` tables were not supported, and caused the server to crash. ([Bug#27998](#))
- A new status variable, `Com_call_procedure`, indicates the number of calls to stored procedures. ([Bug#27994](#))
- The `BLACKHOLE` storage engine now supports `LOCK TABLES` and `UNLOCK TABLES`. ([Bug#26241](#))
- `GLOBAL_STATUS`
- `GLOBAL_VARIABLES`
- `SESSION_VARIABLES`
- The data type used for the `VARIABLE_VALUE` column of the following `INFORMATION_SCHEMA` tables has been changed to `VARCHAR`:
  - `GLOBAL_STATUS`
  - `SESSION_STATUS`
  - `GLOBAL_VARIABLES`
  - `SESSION_VARIABLES`

For more information, see [Section 20.24, “The INFORMATION\\_SCHEMA GLOBAL\\_STATUS and SESSION\\_STATUS Tables”](#), and [Section 20.25, “The INFORMATION\\_SCHEMA GLOBAL\\_VARIABLES and SESSION\\_VARIABLES Tables”](#).

See also [Bug#26994](#).

- `SESSION_STATUS`

Bugs fixed:

- **Security Fix:** UDFs are supposed to be loadable only from the plugin directory, but this restriction was not being enforced. ([Bug#28341](#))
- **Security Fix:** Use of a view could enable a user to gain update privileges for tables in other databases. ([Bug#27878](#), [CVE-2007-3782](#))
- **MySQL Cluster:** When an API node sent more than 1024 signals in a single batch, `NDB` would process only the first 1024 of these, and then hang. ([Bug#28443](#))
- **MySQL Cluster:** A delay in obtaining `AUTO_INCREMENT` IDs could lead to excess temporary errors. ([Bug#28410](#))
- **MySQL Cluster:** Local checkpoint files relating to dropped `NDB` tables were not removed. ([Bug#28348](#))
- **MySQL Cluster:** Multiple operations involving deletes followed by reads were not handled correctly.

### Note

This issue could also affect MySQL Cluster Replication.

([Bug#28276](#))

- **MySQL Cluster:** Repeated insertion of data generated by `mysqldump` into `NDB` tables could eventually lead to failure of the cluster. ([Bug#27437](#))
- **MySQL Cluster:** Restarting a data node caused SQL nodes to log repeatedly and unnecessarily the status of the event buffer, causing a memory leak of approximately 4 MB for each `mysqld` process each time this occurred.

(This issue was known to occur in MySQL 5.1.16 and later only.) ([Bug#27292](#))

- **MySQL Cluster:** `ndb_mgmd` failed silently when the cluster configuration file contained invalid `[tcp]` entries. ([Bug#27207](#))
- **MySQL Cluster:** `ndb_connectstring` did not appear in the output of `SHOW VARIABLES`. ([Bug#26675](#))
- **MySQL Cluster:** A failure to release internal resources following an error could lead to problems with single user mode. ([Bug#25818](#))
- **MySQL Cluster:** DDL operations were not supported on a partially started cluster. ([Bug#24631](#))

- **Disk Data:** Extremely large inserts into Disk Data tables could lead to data node failure in some circumstances. ([Bug#27942](#))
- **Cluster API:** In a multi-operation transaction, a delete operation followed by the insertion of an implicit `NULL` failed to over-write an existing value. ([Bug#20535](#))
- Some `ALTER TABLE` statements that worked in MySQL 5.0 did not work in 5.1. ([Bug#28415](#))
- `mysql_upgrade` failed if certain SQL modes were set. Now it sets the mode itself to avoid this problem. ([Bug#28401](#))
- A query with a `NOT IN` subquery predicate could cause a crash when the left operand of the predicate evaluated to `NULL`. ([Bug#28375](#))
- A buffer overflow could occur when using `DECIMAL` columns on Windows operating systems. ([Bug#28361](#))
- `libmysql.dll` could not be dynamically loaded on Windows. ([Bug#28358](#))
- Grouping queries with correlated subqueries in `WHERE` conditions could produce incorrect results. ([Bug#28337](#))
- `EXPLAIN` for a query on an empty table immediately after its creation could result in a server crash. ([Bug#28272](#))
- Comparing a `DATETIME` column value with a user variable yielded incorrect results. ([Bug#28261](#))
- Portability problems caused by use of `isinf()` were corrected. ([Bug#28240](#))
- When dumping procedures, `mysqldump --compact` generated output that restored the session variable `sql_mode` without first capturing it. When dumping routines, `mysqldump --compact` neither set nor retrieved the value of `sql_mode`. ([Bug#28223](#))
- Comparison of the string value of a date showed as unequal to `CURTIME()`. Similar behavior was exhibited for `DATETIME` values. ([Bug#28208](#))
- For `InnoDB`, in some rare cases the optimizer preferred a more expensive `ref` access to a less expensive range access. ([Bug#28189](#))
- Comparisons of `DATE` or `DATETIME` values for the `IN()` function could yield incorrect results. ([Bug#28133](#))
- It was not possible to use the value `-9223372036854775808` (that is, `-MAXVALUE + 1`) when specifying a `LIST` partition. ([Bug#28005](#))
- The server could hang for `INSERT IGNORE ... ON DUPLICATE KEY UPDATE` if an update failed. ([Bug#28000](#))
- `CAST()` to `DECIMAL` did not check for overflow. ([Bug#27957](#))
- The second execution of a prepared statement from a `UNION` query with `ORDER BY RAND()` caused the server to crash. This problem could also occur when invoking a stored procedure containing such a query. ([Bug#27937](#))
- Views ignored precision for `CAST()` operations. ([Bug#27921](#))
- Changes to some system variables should invalidate statements in the query cache, but invalidation did not happen. ([Bug#27792](#))
- `LOAD DATA` did not use `CURRENT_TIMESTAMP` as the default value for a `TIMESTAMP` column for which no value was provided. ([Bug#27670](#))
- Selecting `MIN()` on an indexed column that contained only `NULL` values caused `NULL` to be returned for other result columns. ([Bug#27573](#))
- Using a `TEXT` local variable in a stored routine in an expression such as `SET var = SUBSTRING(var, 3)` produced an incorrect result. ([Bug#27415](#))
- The error message for error number `137` did not report which database/table combination reported the problem. ([Bug#27173](#))
- A large filesort could result in a division by zero error and a server crash. ([Bug#27119](#))
- Some `InnoDB` variables were missing from the output of `mysqld --verbose --help`. ([Bug#26987](#))
- Flow control optimization in stored routines could cause exception handlers to never return or execute incorrect logic. ([Bug#26977](#))
- Some test suite files were missing from some MySQL-test packages. ([Bug#26609](#))
- Running `CHECK TABLE` concurrently with a `SELECT, INSERT` or other statement on Windows could corrupt a MyISAM ta-

ble. ([Bug#25712](#))

- Concurrent execution of `CREATE TABLE ... SELECT` and other statements involving the target table suffered from various race conditions, some of which might have led to deadlocks. ([Bug#24738](#))
- An attempt to execute `CREATE TABLE ... SELECT` when a temporary table with the same name already existed led to the insertion of data into the temporary table and creation of an empty nontemporary table. ([Bug#24508](#))
- A statement of the form `CREATE TABLE IF NOT EXISTS t1 SELECT f1() AS i` failed with a deadlock error if the stored function `f1()` referred to a table with the same name as the to-be-created table. Now it correctly produces a message that the table already exists. ([Bug#22427](#))
- Quoted labels in stored routines were mishandled, rendering the routines unusable. ([Bug#21513](#))
- `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE(CAST(CURDATE() AS DATE) < NOW())` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. ([Bug#21103](#))
- `CREATE TABLE IF NOT EXISTS ... SELECT` caused a server crash if the target table already existed and had a `BEST-FORE INSERT` trigger. ([Bug#20903](#))
- Deadlock occurred for attempts to execute `CREATE TABLE IF NOT EXISTS ... SELECT` when `LOCK TABLES` had been used to acquire a read lock on the target table. ([Bug#20662](#), [Bug#15522](#))
- For dates with 4-digit year parts less than 200, an incorrect implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became '`2050-01-01 00:00:00`'.) ([Bug#18997](#))
- Changing the size of a key buffer that is under heavy use could cause a server crash. The fix partially removes the limitation that `LOAD INDEX INTO CACHE` fails unless all indexes in a table have the same block size. Now the statement fails only if `IGNORE LEAVES` is specified. ([Bug#17332](#))

## C.1.39. Changes in MySQL 5.1.18 (08 May 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see [ht tp://www.mysql.com/products/enterprise](http://www.mysql.com/products/enterprise).

Functionality added or changed:

- Incompatible Change: MySQL Cluster:** The internal specifications for columns in `NDB` tables has changed to enable compatibility with future MySQL Cluster releases that are expected to permit online adding and dropping of columns. This change is not backward compatible with earlier versions of MySQL Cluster.

See the related note in [Section 17.2.5.2, “MySQL Cluster 5.1 and MySQL Cluster NDB 6.x/7.x Upgrade and Downgrade Compatibility”](#), for important information prior to upgrading a MySQL Cluster to MySQL 5.1.18 or later from MySQL 5.1.17 or earlier.

See also [Bug#28205](#).

- Incompatible Change: Replication:** The `INFORMATION_SCHEMA.EVENTS` and `mysql.event` tables have been changed to facilitate replication of events. When upgrading to MySQL 5.1.18, you must run `mysql_upgrade` prior to working with events. Until you have done so, any statement relating to the Event Scheduler or these tables (including `SHOW EVENTS`) will fail with the errors `EXPECTED FIELD STATUS AT POSITION 12 TO HAVE TYPE ENUM ('ENABLED', 'SLAVESIDE_DISABLED', 'DISABLED'), FOUND ENUM('ENABLED', 'DISABLED')` and `TABLE`

MYSQL.EVENT IS DAMAGED. CAN NOT OPEN.

These changes were made as part of fixes for the following bugs:

- The effects of scheduled events were not replicated (that is, binary logging of scheduled events did not work).
- Effects of scheduled events on a replication master were both replicated and executed on the slave, causing double execution of events.
- `CREATE FUNCTION` statements and their effects were not replicated correctly.

For more information, see [Section 16.4.1.9, “Replication of Invoked Features”](#). ([Bug#17857](#), [Bug#16421](#), [Bug#20384](#), [Bug#17671](#))

- **Cluster Replication: Incompatible Change:** The definition of the `mysql.ndb_apply_status` table has changed such that an online upgrade is not possible from MySQL 5.1.17 or earlier for a replication slave cluster; you must shut down all SQL nodes as part of the upgrade procedure. See [Section 17.2.5.2, “MySQL Cluster 5.1 and MySQL Cluster NDB 6.x/7.x Upgrade and Downgrade Compatibility”](#) before upgrading for details.

For more information about the changes to `mysql.ndb_apply_status` see [Section 17.6.4, “MySQL Cluster Replication Schema and Tables”](#).

- **Incompatible Change:** Prior to this release, when `DATE` values were compared with `DATETIME` values, the time portion of the `DATETIME` value was ignored, or the comparison could be performed as a string compare. Now a `DATE` value is coerced to the `DATETIME` type by adding the time portion as `00:00:00`. To mimic the old behavior, use the `CAST()` function as shown in this example: `SELECT date_col = CAST(NOW() AS DATE) FROM table;`. ([Bug#28929](#))
- **Incompatible Change:** The plugin interface and its handling of system variables was changed. Command-line options such as `--skip-innodb` now cause an error if `InnoDB` is not built-in or plugin-loaded. You should use `--loose-skip-innodb` if you do not want any error even if `InnoDB` is not available. The `--loose` prefix modifier should be used for all command-line options where you are uncertain whether the plugin exists and when you want the operation to proceed even if the option is necessarily ignored due to the absence of the plugin. (For a description of how `--loose` works, see [Section 4.2.3.1, “Using Options on the Command Line”](#).)
- **Important Change:** When upgrading to MySQL 5.1.18 or later from a previous MySQL version and scheduled events have been used, the upgrade utilities do not accomodate changes in event-related system tables. As a workaround, you can dump events before the upgrade, then restore them from the dump afterward. This issue was fixed in MySQL 5.1.20.

See also [Bug#28521](#).

- **MySQL Cluster:** The behavior of the `ndb_restore` utility has been changed as follows:
  - It is now possible to restore selected databases or tables using `ndb_restore`.
  - Several options have been added for use with `ndb_restore --print_data` to facilitate the creation of structured data dump files. These options can be used to make dumps made using `ndb_restore` more like those produced by `mysql_dump`.For details of these changes, see [Section 17.4.17, “ndb\\_restore — Restore a MySQL Cluster Backup”](#). ([Bug#26899](#), [Bug#26900](#))
- **MySQL Cluster:** The following changes were made in the `ndb_size.pl` utility:
  - When `ndb_size.pl` calculates a value for a given configuration parameter that is less than the default value, it now suggests the default value instead.
  - The dependency on `HTML::Template` was removed, with the result that the file `ndb_size.tmp1` is no longer needed or included.  
([Bug#24227](#), [Bug#24228](#))
- **Cluster Replication: Replication:** Some circular replication setups are now supported for MySQL Cluster. See [Section 17.6.3, “Known Issues in MySQL Cluster Replication”](#), for detailed information. ([Bug#17095](#), [Bug#25688](#))
- **Cluster API:** The MGM API now supports explicit setting of network timeouts using the `ndb_mgm_set_timeout()` function. A utility function `ndb_mgm_number_of_mgmd_in_connect_string()` is also implemented to facilitate calculation of timeouts based on the number of management servers in the cluster.

For more information, see `ndb_mgm_set_timeout()`, and `ndb_mgm_number_of_mgmd_in_connect_string()`.

- `mysqld_multi` now understands the `--no-defaults`, `--defaults-file`, and `--defaults-extra-file` options. The `--config-file` option is deprecated; if given, it is treated like `--defaults-extra-file`. ([Bug#27390](#))

- If a set function `S` with an outer reference `S(outer_ref)` cannot be aggregated in the outer query against which the outer reference has been resolved, MySQL interprets `S(outer_ref)` the same way that it would interpret `S(const)`. However, standard SQL requires throwing an error in this situation. An error now is thrown for such queries if the `ANSI` SQL mode is enabled. ([Bug#27348](#))
- Several additional data types are supported for columns in `INFORMATION_SCHEMA` tables: `DATE`, `TIME`, `BLOB`, `FLOAT`, and all integer types. ([Bug#27047](#))
- The output of `mysql --xml` and `mysqldump --xml` now includes a valid XML namespace. ([Bug#25946](#))
- If you use SSL for a client connection, you can tell the client not to authenticate the server certificate by specifying neither `--ssl-ca` nor `--ssl-capath`. The server still verifies the client according to any applicable requirements established using `GRANT` statements for the client, and it still uses any `--ssl-ca/-ssl-capath` values that were passed to server at startup time. ([Bug#25309](#))
- Added a `MASTER_SSL_VERIFY_SERVER_CERT` option for the `CHANGE MASTER TO` statement, and a `Master_SSL_Verify_Server_Cert` output column to the `SHOW SLAVE STATUS` statement. The option value also is written to the `master.info` file. ([Bug#19991](#))
- The `innodb_log_archive` system variable has been removed. The impact of this change should be low because the variable was unused, anyway.
- Added the `--auto-generate-sql-add-autoincrement`, `--auto-generate-sql-execute-number`, `--auto-generate-sql-guid-primary`, `--auto-generate-sql-secondary-indexes`, `--auto-generate-sql-unique-query-number`, `--auto-generate-sql-unique-write-number`, `--post-query`, and `--pre-query`, options for `mysqlslap`. Removed the `--lock-directory`, `--slave`, and `--use-threads` options.
- Added `--write-binlog` option for `mysqlcheck`. This option is enabled by default, but can be given as `--skip-write-binlog` to cause `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` statements generated by `mysqlcheck` not to be written to the binary log. ([Bug#26262](#))
- New command-line options: To alleviate ambiguities in variable names, all variables related to plugins can be specified using a `plugin` part in the name. For example, every time where we used to have `innodb` in the command-line options, you can now write `plugin-innodb`:

```
--skip-plugin-innodb
--plugin-innodb-buffer-pool-size=#
```

Furthermore, this is the preferred syntax. It helps to avoid ambiguities when a plugin, say, `wait`, has an option called `timeout`. `--wait-timeout` will still set a system variable, but `--plugin-wait-timeout` will set the plugin variable. Also, there is a new command-line option `--plugin-load` to install or load plugins at initialization time without using the `mysql.plugin` table.

- Storage engine plugins may now be uninstalled at run time. However, a plugin is not actually uninstalled until after its reference count drops to zero. The `default_storage_engine` system variable consumes a reference count, so uninstalling will not complete until said reference is removed.
- The `mysql_create_system_tables` script was removed because `mysql_install_db` no longer uses it in MySQL 5.1.
- Renamed the `old_mode` system variable to `old`.

Bugs fixed:

- **Security Fix:** The requirement of the `DROP` privilege for `RENAME TABLE` was not enforced. ([Bug#27515](#), [CVE-2007-2691](#))
- **Security Fix:** If a stored routine was declared using `SQL SECURITY INVOKER`, a user who invoked the routine could gain privileges. ([Bug#27337](#), [CVE-2007-2692](#))
- **Security Fix:** A user with only the `ALTER` privilege on a partitioned table could obtain information about the table that should require the `SELECT` privilege. ([Bug#23675](#), [CVE-2007-2693](#))
- **MySQL Cluster: Replication:** (Replication): An `UPDATE` on the master became a `DELETE` on slaves. ([Bug#27378](#))
- **MySQL Cluster:** The cluster waited 30 seconds instead of 30 milliseconds before reading table statistics. ([Bug#28093](#))
- **MySQL Cluster:** Under certain rare circumstances, `ndbd` could get caught in an infinite loop when one transaction took a read lock and then a second transaction attempted to obtain a write lock on the same tuple in the lock queue. ([Bug#28073](#))

- **MySQL Cluster:** Under some circumstances, a node restart could fail to update the Global Checkpoint Index (GCI). ([Bug#28023](#))
- **MySQL Cluster:** `INSERT IGNORE` wrongly ignored `NULL` values in unique indexes. ([Bug#27980](#))
- **MySQL Cluster:** The name of the month “March” was given incorrectly in the cluster error log. ([Bug#27926](#))
- **MySQL Cluster:** `NDB` tables having `MEDIUMINT AUTO_INCREMENT` columns were not restored correctly by `ndb_restore`, causing spurious duplicate key errors. This issue did not affect `TINYINT`, `INT`, or `BIGINT` columns with `AUTO_INCREMENT`. ([Bug#27775](#))
- **MySQL Cluster:** `NDB` tables with indexes whose names contained space characters were not restored correctly by `ndb_restore` (the index names were truncated). ([Bug#27758](#))

This regression was introduced by [Bug#20612](#).
- **MySQL Cluster:** It was not possible to add a unique index to an `NDB` table while in single user mode. ([Bug#27710](#))
- **MySQL Cluster:** Under certain rare circumstances performing a `DROP TABLE` or `TRUNCATE TABLE` on an `NDB` table could cause a node failure or forced cluster shutdown. ([Bug#27581](#))
- **MySQL Cluster:** Memory usage of a `mysqld` process grew even while idle. ([Bug#27560](#))
- **MySQL Cluster:** Using more than 16GB for `DataMemory` caused problems with variable-size columns. ([Bug#27512](#))
- **MySQL Cluster:** A data node failing while another data node was restarting could leave the cluster in an inconsistent state. In certain rare cases, this could lead to a race condition and the eventual forced shutdown of the cluster. ([Bug#27466](#))
- **MySQL Cluster:** When using the `MemReportFrequency` configuration parameter to generate periodic reports of memory usage in the cluster log, `DataMemory` usage was not always reported for all data nodes. ([Bug#27444](#))
- **MySQL Cluster:** When trying to create an `NDB` table after the server was started with `--ndbcluster` but without `--ndb-connectstring`, `mysqld` produced a memory allocation error. ([Bug#27359](#))
- **MySQL Cluster:** Performing a delete followed by an insert during a local checkpoint could cause a `ROWID ALREADY ALLOCATED` error. ([Bug#27205](#))
- **MySQL Cluster:** In an `NDB` table having a `TIMESTAMP` column using `DEFAULT CURRENT_TIMESTAMP`, that column would assume a random value when another column in the same row was updated. ([Bug#27127](#))
- **MySQL Cluster:** Error messages displayed when running in single user mode were inconsistent. ([Bug#27021](#))
- **MySQL Cluster:** On Solaris, the value of an `NDB` table column declared as `BIT(33)` was always displayed as `0`. ([Bug#26986](#))
- **MySQL Cluster:** Performing `ALTER TABLE ... ENGINE=MERGE` on an `NDB` table caused `mysqld` to crash. ([Bug#26898](#))
- **MySQL Cluster:** The `NDBCLUSTER` table handler did not set bits in null bytes correctly. ([Bug#26591](#))
- **MySQL Cluster:** In some cases, `AFTER UPDATE` and `AFTER DELETE` triggers on `NDB` tables that referenced subject table did not see the results of operation which caused invocation of the trigger, but rather saw the row as it was prior to the update or delete operation.

This was most noticeable when an update operation used a subquery to obtain the rows to be updated. An example would be `UPDATE tbl1 SET col2 = val1 WHERE tbl1.col1 IN (SELECT col3 FROM tbl2 WHERE c4 = val2)` where there was an `AFTER UPDATE` trigger on table `tbl1`. In such cases, the trigger would fail to execute.

The problem occurred because the actual update or delete operations were deferred to be able to perform them later as one batch. The fix for this bug solves the problem by disabling this optimization for a given update or delete if the table has an `AFTER` trigger defined for this operation. ([Bug#26242](#))

- **MySQL Cluster:** Joins on multiple tables containing `BLOB` columns could cause data nodes run out of memory, and to crash with the error `NdbObjectIDMap::EXPAND UNABLE TO EXPAND`. ([Bug#26176](#))
- **MySQL Cluster:** `START BACKUP NOWAIT` caused a spurious `OUT OF BACKUP RECORD` error in the management client (`START BACKUP` and `START BACKUP WAIT STARTED` performed normally). ([Bug#25446](#))
- **MySQL Cluster:** Adding of indexes online failed for `NDB` tables having `BLOB` or `TEXT` columns. ([Bug#25431](#))

- **MySQL Cluster:** When a cluster data node suffered a “hard” failure (such as a power failure or loss of a network connection) TCP sockets to the missing node were maintained indefinitely. Now socket-based transporters check for a response and terminate the socket if there is no activity on the socket after 2 hours. ([Bug#24793](#))
- **MySQL Cluster:** The `ndb_resize.pl` utility did not calculate memory usage for indexes correctly. ([Bug#24229](#))
- **MySQL Cluster:** While a data node was stopped, dropping a table then creating an index on a different table caused that node to fail during restart. This was due to the re-use of the dropped table's internal ID for the index without verifying that the index now referred to a different database object. ([Bug#21755](#))
- **MySQL Cluster:** When trying to create tables on an SQL node not connected to the cluster, a misleading error message `TABLE 'TBL_NAME' ALREADY EXISTS` was generated. The error now generated is `COULD NOT CONNECT TO STORAGE ENGINE.`. ([Bug#11217](#), [Bug#18676](#))
- **Cluster Replication: Replication:** An SQL node acting as a replication master server could be a single point of failure; that is, if it failed, the replication slave had no way of knowing this, which could result in a mismatch of data between the master and the slave. ([Bug#21494](#))
- **Replication:** Out-of-memory errors were not reported. Now they are written to the error log. ([Bug#26844](#))
- **Replication:** Improved out-of-memory detection when sending logs from a master server to slaves, and log a message when allocation fails. ([Bug#26837](#))
- **Replication:** Aborting a statement on the master that applied to a nontransactional statement broke replication. The statement was written to the binary log but not completely executed on the master. Slaves receiving the statement executed it completely, resulting in loss of data synchrony. Now an error code is written to the error log so that the slaves stop without executing the aborted statement. (That is, replication stops, but synchrony to the point of the stop is preserved and you can investigate the problem.) ([Bug#26551](#))
- **Replication:** When `RAND()` was called multiple times inside a stored procedure, the server did not write the correct random seed values to the binary log, resulting in incorrect replication. ([Bug#25543](#))
- **Replication:** `GRANT` statements were not replicated if the server was started with the `--replicate-ignore-table` or `-replicate-wild-ignore-table` option. ([Bug#25482](#))
- **Replication:** Restoration of the default database after stored routine or trigger execution on a slave could cause replication to stop if the database no longer existed. ([Bug#25082](#))
- **Replication:** If a rotate event occurred in the middle of a nontransaction group, the group position would be updated by the rotate event indicating an illegal group start position that was effectively inside a group. This can happen if, for example, a rotate occurs between an `Intvar` event and the associated `Query` event, or between the table map events and the rows events when using row-based replication. ([Bug#23171](#))
- **Replication:** Row-based replication of `MyISAM` to non-`MyISAM` tables did not work correctly for `BIT` columns. This has been corrected, but the fix introduces an incompatibility into the binary log format. (The incompatibility is corrected by the fix for [Bug#27779](#).) ([Bug#22583](#))
- **Cluster Replication: Disk Data:** An issue with replication of Disk Data tables could in some cases lead to node failure. ([Bug#28161](#))
- **Disk Data:** Changes to a Disk Data table made as part of a transaction could not be seen by the client performing the changes until the transaction had been committed. ([Bug#27757](#))
- **Disk Data:** When in single user mode, it was possible to create log file groups and tablespaces from any SQL node connected to the cluster. ([Bug#27712](#))
- **Disk Data:** `CREATE TABLE ... LIKE disk_data_table` created an in-memory `NDB` table. ([Bug#25875](#))
- **Disk Data:** When restarting a data node following the creation of a large number of Disk Data objects (approximately 200 such objects), the cluster could not assign a node ID to the restarting node. ([Bug#25741](#))
- **Disk Data:** Creating an excessive number of Disk Data tables (1000 or more) could cause data nodes to fail. ([Bug#24951](#))
- **Disk Data:** Changing a column specification or issuing a `TRUNCATE TABLE` statement on a Disk Data table caused the table to become an in-memory table.

This fix supersedes an incomplete fix that was made for this issue in MySQL 5.1.15. ([Bug#24667](#), [Bug#25296](#))

- **Disk Data:** Setting the value of the `UNDO BUFFER SIZE` to 64K or less in a `CREATE LOGFILE GROUP` statement led to failure of cluster data nodes. ([Bug#24560](#))

- **Disk Data:** Creating an excessive number of data files for a single tablespace caused data nodes to crash. ([Bug#24521](#))
- **Disk Data:** It was possible to drop the last remaining datafile in a tablespace using `ALTER TABLESPACE`, even when there was still an empty table using the tablespace.

### Note

The datafile could be not dropped if the table still contained any rows, so this bug involved no loss of data.

([Bug#21699](#))

- **Cluster Replication:** Some queries that updated multiple tables were not backed up correctly. ([Bug#27748](#))
- **Cluster Replication:** It was possible for API nodes to begin interacting with the cluster subscription manager before they were fully connected to the cluster. ([Bug#27728](#))
- **Cluster Replication:** Under very high loads, checkpoints could be read or written with checkpoint indexes out of order. ([Bug#27651](#))
- **Cluster Replication:** Trying to replicate a large number of frequent updates with a relatively small relay log (`max-relay-log-size` set to 1M or less) could cause the slave to crash. ([Bug#27529](#))
- **Cluster Replication:** Setting `sql_log_bin` to zero did not disable binary logging.

This issue affected only the `NDB` storage engine. ([Bug#27076](#))

- **Cluster API:** For `BLOB` reads on operations with lock mode `LM_CommittedRead`, the lock mode was not upgraded to `LM_Read` before the state of the `BLOB` had already been calculated. The `NDB` API methods affected by this problem included the following:

- `NdbOperation::readTuple()`
- `NdbScanOperation::readTuples()`
- `NdbIndexScanOperation::readTuples()`  
([Bug#27320](#))
- **Cluster API:** Using `NdbBlob::writeData()` to write data in the middle of an existing blob value (that is, updating the value) could overwrite some data past the end of the data to be changed. ([Bug#27018](#))
- A performance degradation was observed for outer join queries to which a not-exists optimization was applied. ([Bug#28188](#))
- `SELECT * INTO OUTFILE ... FROM INFORMATION_SCHEMA.SCHEMATA` failed with an `ACCESS DENIED` error, even for a user who had the `FILE` privilege. ([Bug#28181](#))
- Early `NULL`-filtering optimization did not work for `eq_ref` table access. ([Bug#27939](#))
- Nongrouped columns were permitted by `*` in `ONLY_FULL_GROUP_BY` SQL mode. ([Bug#27874](#))
- Some equi-joins containing a `WHERE` clause that included a `NOT IN` subquery caused a server crash. ([Bug#27870](#))
- An error message suggested the use of `mysql_fix_privilege_tables` after an upgrade, but the recommended program is now `mysql_upgrade`. ([Bug#27818](#))
- Debug builds on Windows generated false alarms about uninitialized variables with some Visual Studio runtime libraries. ([Bug#27811](#))
- Certain queries that used uncorrelated scalar subqueries caused `EXPLAIN` to crash. ([Bug#27807](#))
- Performing a `UNION` on two views that had `ORDER BY` clauses resulted in an `Unknown column` error. ([Bug#27786](#))
- `mysql_install_db` is supposed to detect existing system tables and create only those that do not exist. Instead, it was exiting with an error if tables already existed. ([Bug#27783](#))
- The `LEAST()` and `GREATEST()` functions compared `DATE` and `DATETIME` values as strings, which in some cases could lead to an incorrect result. ([Bug#27759](#))
- A memory leak in the event scheduler was uncovered by Valgrind. ([Bug#27733](#))
- `mysqld` did not check the length of option values and could crash with a buffer overflow for long values. ([Bug#27715](#))

- Comparisons using row constructors could fail for rows containing `NULL` values. ([Bug#27704](#))
  - `mysqldump` could not connect using SSL. ([Bug#27669](#))
  - `SELECT DISTINCT` could return incorrect results if the select list contained duplicated columns. ([Bug#27659](#))
  - On Linux, the server could not create temporary tables if `lower_case_table_names` was set to 1 and the value of `tmp-dir` was a directory name containing any uppercase letters. ([Bug#27653](#))
  - For `InnoDB` tables, a multiple-row `INSERT` of the form `INSERT INTO t (id...) VALUES (NULL...) ON DUPLICATE KEY UPDATE id=VALUES(id)`, where `id` is an `AUTO_INCREMENT` column, could cause `ERROR 1062 (23000): Duplicate entry...` errors or lost rows. ([Bug#27650](#))
  - When MySQL logged slow query information to a `CSV` table, it used an incorrect formula to calculate the `query_time` and `lock_time` values. ([Bug#27638](#))
  - The XML output representing an empty result was an empty string rather than an empty `<resultset/>` element. ([Bug#27608](#))
  - Comparison of a `DATE` with a `DATETIME` did not treat the `DATE` as having a time part of `00:00:00`. ([Bug#27590](#))
- See also [Bug#32198](#).
- With `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LOAD DATA` operations could assign incorrect `AUTO_INCREMENT` values. ([Bug#27586](#))
  - Group relay log rotation updated only the log position and not the name, causing the slave to stop. ([Bug#27583](#))
  - Incorrect results could be returned for some queries that contained a select list expression with `IN` or `BETWEEN` together with an `ORDER BY` or `GROUP BY` on the same expression using `NOT IN` or `NOT BETWEEN`. ([Bug#27532](#))
  - The fix for [Bug#17212](#) provided correct sort order for misordered output of certain queries, but caused significant overall query performance degradation. (Results were correct (good), but returned much more slowly (bad).) The fix also affected performance of queries for which results were correct. The performance degradation has been addressed. ([Bug#27531](#))
  - The `CRC32()` function returns an unsigned integer, but the metadata was signed, which could cause certain queries to return incorrect results. (For example, queries that selected a `CRC32()` value and used that value in the `GROUP BY` clause.) ([Bug#27530](#))
  - An interaction between `SHOW TABLE STATUS` and other concurrent statements that modify the table could result in a divide-by-zero error and a server crash. ([Bug#27516](#))
  - Evaluation of an `IN()` predicate containing a decimal-valued argument caused a server crash. ([Bug#27513](#), [Bug#27362](#), [CVE-2007-2583](#))
  - A race condition between `DROP TABLE` and `SHOW TABLE STATUS` could cause the latter to display incorrect information. ([Bug#27499](#))
  - In out-of-memory conditions, the server might crash or otherwise not report an error to the Windows event log. ([Bug#27490](#))
  - Passing nested row expressions with different structures to an `IN` predicate caused a server crash. ([Bug#27484](#))
  - The `decimal.h` header file was incorrectly omitted from binary distributions. ([Bug#27456](#))
  - With `innodb_file_per_table` enabled, attempting to rename an `InnoDB` table to a nonexistent database caused the server to exit. ([Bug#27381](#))
  - Nested aggregate functions could be improperly evaluated. ([Bug#27363](#))
  - A stored function invocation in the `WHERE` clause was treated as a constant. ([Bug#27354](#))
  - For the `INFORMATION_SCHEMA SESSION_STATUS` and `GLOBAL_STATUS` tables, some status values were incorrectly converted to the data type of the `VARIABLE_VALUE` column. ([Bug#27327](#))
  - Failure to allocate memory associated with `transaction_prealloc_size` could cause a server crash. ([Bug#27322](#))
  - A subquery could get incorrect values for references to outer query columns when it contained aggregate functions that were aggregated in outer context. ([Bug#27321](#))
  - The server did not shut down cleanly. ([Bug#27310](#))

- In a view, a column that was defined using a `GEOMETRY` function was treated as having the `LONGBLOB` data type rather than the `GEOMETRY` type. ([Bug#27300](#))
- `mysqldump` crashed if it got no data from `SHOW CREATE PROCEDURE` (for example, when trying to dump a routine defined by a different user and for which the current user had no privileges). Now it prints a comment to indicate the problem. It also returns an error, or continues if the `--force` option is given. ([Bug#27293](#))
- Queries containing subqueries with `COUNT(*)` aggregated in an outer context returned incorrect results. This happened only if the subquery did not contain any references to outer columns. ([Bug#27257](#))
- Use of an aggregate function from an outer context as an argument to `GROUP_CONCAT()` caused a server crash. ([Bug#27229](#))
- String truncation upon insertion into an integer or year column did not generate a warning (or an error in strict mode). ([Bug#27176](#), [Bug#26359](#))
- `mysqlbinlog` produced different output with the `-R` option than without it. ([Bug#27171](#))
- Storing `NULL` values in spatial fields caused excessive memory allocation and crashes on some systems. ([Bug#27164](#))
- Row equalities in `WHERE` clauses could cause memory corruption. ([Bug#27154](#))
- `ON DUPLICATE KEY UPDATE` failed for a table partitioned by `KEY` on a primary key `VARCHAR` column. ([Bug#27123](#))
- `GROUP BY` on a `ucs2` column caused a server crash when there was at least one empty string in the column. ([Bug#27079](#))
- Duplicate members in `SET` or `ENUM` definitions were not detected. Now they result in a warning; if strict SQL mode is enabled, an error occurs instead. ([Bug#27069](#))
- For `FEDERATED` tables, `SHOW CREATE TABLE` could fail when the table name was longer than the connection name. ([Bug#27036](#))
- `mysql_install_db` could terminate with an error after failing to determine that a system table already existed. ([Bug#27022](#))
- In a `MEMORY` table, using a `BTREE` index to scan for updatable rows could lead to an infinite loop. ([Bug#26996](#))
- `make_win_bin_dist` neglected to copy some required `MyISAM` table files. ([Bug#26922](#))
- For `InnoDB` tables having a clustered index that began with a `CHAR` or `VARCHAR` column, deleting a record and then inserting another before the deleted record was purged could result in table corruption. ([Bug#26835](#))
- `mysqldump` would not dump a view for which the `DEFINER` no longer exists. ([Bug#26817](#))
- Duplicates were not properly identified among (potentially) long strings used as arguments for `GROUP_CONCAT(DISTINCT)`. ([Bug#26815](#))
- `ALTER VIEW` requires the `CREATE VIEW` and `DROP` privileges for the view. However, if the view was created by another user, the server erroneously required the `SUPER` privilege. ([Bug#26813](#))
- If the name of a table given to `myisamchk -rq` was a packed table and the name included the `.MYI` extension, `myisamchk` incorrectly created a file with a `.MYI.MYI` extension. ([Bug#26782](#))
- Creating a temporary table with `InnoDB` when using the one-file-per-table setting, and when the host file system for temporary tables was `tmpfs`, would cause an assertion within `mysqld`. This was due to the use of `O_DIRECT` when opening the temporary table file. ([Bug#26662](#))
- `mysql_upgrade` did not detect failure of external commands that it runs. ([Bug#26639](#))
- The range optimizer could cause the server to run out of memory. ([Bug#26625](#))
- The range optimizer could consume a combinatorial amount of memory for certain classes of `WHERE` clauses. ([Bug#26624](#))
- `mysqldump` could crash or exhibit incorrect behavior when some options were given very long values, such as `--fields-terminated-by="some very long string"`. The code has been cleaned up to remove a number of fixed-sized buffers and to be more careful about error conditions in memory allocation. ([Bug#26346](#))
- A possible buffer overflow in `SHOW PROCEDURE CODE` was removed. ([Bug#26303](#))
- The `FEDERATED` engine did not permit the local and remote tables to have different names. ([Bug#26257](#))
- The temporary file-creation code was cleaned up on Windows to improve server stability. ([Bug#26233](#))

- For `MyISAM` tables, `COUNT(*)` could return an incorrect value if the `WHERE` clause compared an indexed `TEXT` column to the empty string (' '). This happened if the column contained empty strings and also strings starting with control characters such as tab or newline. ([Bug#26231](#))
- For `INSERT ... SELECT` where index searches used column prefixes, insert errors could occur when key value type conversion was done. ([Bug#26207](#))
- `mysqlbinlog --base64-output` produced invalid SQL. ([Bug#26194](#))
- For `DELETE FROM tbl_name ORDER BY col_name` (with no `WHERE` or `LIMIT` clause), the server did not check whether `col_name` was a valid column in the table. ([Bug#26186](#))
- Executing an `INSERT ... SELECT ... FROM INFORMATION_SCHEMA.GLOBAL_STATUS` statement from within an event caused a server crash. ([Bug#26174](#))
- `mysqldump` could not dump log tables. ([Bug#26121](#))
- On Windows, trying to use backslash (\) characters in paths for `DATA DIRECTORY` and `INDEX DIRECTORY` when creating partitioned tables caused MySQL to crash.

(You must use / characters when specifying paths for these options, regardless of platform. See [Section 18.1, “Overview of Partitioning in MySQL”](#), for an example using absolute paths for `DATA DIRECTORY` and `INDEX DIRECTORY` when creating a partitioned table on Windows.) ([Bug#26074](#), [Bug#25141](#))

- `mysqldump` crashed for `MERGE` tables if the `--complete-insert (-c)` option was given. ([Bug#25993](#))
- Index hints (`USE INDEX`, `IGNORE INDEX`, `FORCE INDEX`) cannot be used with `FULLTEXT` indexes, but were not being ignored. ([Bug#25951](#))
- Setting a column to `NOT NULL` with an `ON DELETE SET NULL` clause foreign key crashes the server. ([Bug#25927](#))
- Corrupted `MyISAM` tables that have different definitions in the `.frm` and `.MYI` tables might cause a server crash. ([Bug#25908](#))
- If `CREATE TABLE t1 LIKE t2` failed due to a full disk, an empty `t2.frm` file could be created but not removed. This file then caused subsequent attempts to create a table named `t2` to fail. This is easily corrected at the file system level by removing the `t2.frm` file manually, but now the server removes the file if the create operation does not complete successfully. ([Bug#25761](#))
- In certain situations, `MATCH ... AGAINST` returned false hits for `NULL` values produced by `LEFT JOIN` when no full-text index was available. ([Bug#25729](#))
- Concurrent `CREATE SERVER` and `ALTER SERVER` statements could cause a deadlock. ([Bug#25721](#))
- `CREATE SERVER`, `DROP SERVER`, and `ALTER SERVER` did not require any privileges. Now these statements require the `SUPER` privilege. ([Bug#25671](#))
- On Windows, connection handlers did not properly decrement the server's thread count when exiting. ([Bug#25621](#))
- `OPTIMIZE TABLE` might fail on Windows when it attempts to rename a temporary file to the original name if the original file had been opened, resulting in loss of the `.MYD` file. ([Bug#25521](#))
- For `SHOW ENGINE INNODB STATUS`, the `LATEST DEADLOCK INFORMATION` was not always cleared properly. ([Bug#25494](#))
- `mysql_stmt_fetch()` did an invalid memory deallocation when used with the embedded server. ([Bug#25492](#))
- `mysql_upgrade` did not pass a password to `mysqlcheck` if one was given. ([Bug#25452](#))
- On Windows, `mysql_upgrade` was sensitive to lettercase of the names of some required components. ([Bug#25405](#))
- During a call to `mysql_change_user()`, when authentication fails or the database to change to is unknown, a subsequent call to any function that does network communication leads to packets out of order. This problem was introduced in MySQL 5.1.14. ([Bug#25371](#))
- Difficult repair or optimization operations could cause an assertion failure, resulting in a server crash. ([Bug#25289](#))
- For storage engines that permit the current auto-increment value to be set, using `ALTER TABLE ... ENGINE` to convert a table from one such storage engine to another caused loss of the current value. (For storage engines that do not support setting the value, it cannot be retained anyway when changing the storage engine.) ([Bug#25262](#))

- Duplicate entries were not assessed correctly in a `MEMORY` table with a `BTREE` primary key on a `utf8 ENUM` column. ([Bug#24985](#))
- Several math functions produced incorrect results for large unsigned values. `ROUND( )` produced incorrect results or a crash for a large number-of-decimals argument. ([Bug#24912](#))
- The result set of a query that used `WITH ROLLUP` and `DISTINCT` could lack some rollup rows (rows with `NULL` values for grouping attributes) if the `GROUP BY` list contained constant expressions. ([Bug#24856](#))
- Selecting the result of `AVG( )` within a `UNION` could produce incorrect values. ([Bug#24791](#))
- For queries that used `ORDER BY` with `InnoDB` tables, if the optimizer chose an index for accessing the table but found a covering index that enabled the `ORDER BY` to be skipped, no results were returned. ([Bug#24778](#))
- The `NO_DIR_IN_CREATE` server SQL mode was not enforced for partitioned tables. ([Bug#24633](#))
- `MBRDisjoint()`, `MBRequal()`, `MBRIntersects()`, `MBROverlaps()`, `MBRTouches()`, and `MBRWithin()` were inadvertently omitted from recent versions of MySQL (5.1.14 to 5.1.17). ([Bug#24588](#))
- Access through `my_pread()` or `my_pwrite()` to table files larger than 2GB could fail on some systems. ([Bug#24566](#))
- `MBROverlaps()` returned incorrect values in some cases. ([Bug#24563](#))
- A problem in handling of aggregate functions in subqueries caused predicates containing aggregate functions to be ignored during query execution. ([Bug#24484](#))
- The `MERGE` storage engine could return incorrect results when several index values that compare equality were present in an index (for example, '`gross`' and '`gross` ', which are considered equal but have different lengths). ([Bug#24342](#))
- Some upgrade problems are detected and better error messages suggesting that `mysql_upgrade` be run are produced. ([Bug#24248](#))
- The test for the `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for `mysql_options()` was performed incorrectly. Also changed as a result of this bug fix: The `arg` option for the `mysql_options()` C API function was changed from `char *` to `void *`. ([Bug#24121](#))
- Some views could not be created even when the user had the requisite privileges. ([Bug#24040](#))
- The values displayed for the `Innodb_row_lock_time`, `Innodb_row_lock_time_avg`, and `Innodb_row_lock_time_max` status variables were incorrect. ([Bug#23666](#))
- Using `CAST( )` to convert `DATETIME` values to numeric values did not work. ([Bug#23656](#))
- A damaged or missing `mysql.event` table caused `SHOW VARIABLES` to fail. ([Bug#23631](#))
- `SHOW CREATE VIEW` qualified references to stored functions in the view definition with the function's database name, even when the database was the default database. This affected `mysqldump` (which uses `SHOW CREATE VIEW` to dump views) because the resulting dump file could not be used to reload the database into a different database. `SHOW CREATE VIEW` now suppresses the database name for references to stored functions in the default database. ([Bug#23491](#))
- An `INTO OUTFILE` clause is permitted only for the final `SELECT` of a `UNION`, but this restriction was not being enforced correctly. ([Bug#23345](#))
- The `AUTO_INCREMENT` value would not be correctly reported for `InnoDB` tables when using `SHOW CREATE TABLE` statement or `mysqldump` command. ([Bug#23313](#))
- With the `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LAST_INSERT_ID()` could return 0 after `INSERT ... ON DUPLICATE KEY UPDATE`. Additionally, the next rows inserted (by the same `INSERT`, or the following `INSERT` with or without `ON DUPLICATE KEY UPDATE`), would insert 0 for the auto-generated value if the value for the `AUTO_INCREMENT` column was `NULL` or missing. ([Bug#23233](#))
- Implicit conversion of `9912101` to `DATE` did not match `CAST(9912101 AS DATE)`. ([Bug#23093](#))
- `SELECT COUNT(*)` from a table containing a `DATETIME NOT NULL` column could produce spurious warnings with the `NO_ZERO_DATE` SQL mode enabled. ([Bug#22824](#))
- Using `SET GLOBAL` to change the `lc_time_names` system variable had no effect on new connections. ([Bug#22648](#))
- `SOUNDEX()` returned an invalid string for international characters in multi-byte character sets. ([Bug#22638](#))
- A multiple-table `UPDATE` could return an incorrect rows-matched value if, during insertion of rows into a temporary table, the

table had to be converted from a `MEMORY` table to a `MyISAM` table. ([Bug#22364](#))

- `COUNT(decimal_expr)` sometimes generated a spurious truncation warning. ([Bug#21976](#))
- yaSSL crashed on pre-Pentium Intel CPUs. ([Bug#21765](#))
- A slave that used `--master-ssl-cipher` could not connect to the master. ([Bug#21611](#))
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were truncated to 64 bytes.

#### Note

This improves on a previous fix made for this bug in MySQL 5.1.12.

([Bug#21432](#))

- `InnoDB`: The first read statement, if served from the query cache, was not consistent with the `READ COMMITTED` isolation level. ([Bug#21409](#))
- On Windows, if the server was installed as a service, it did not auto-detect the location of the data directory. ([Bug#20376](#))
- Changing a `utf8` column in an `InnoDB` table to a shorter length did not shorten the data values. ([Bug#20095](#))
- In some cases, the optimizer preferred a range or full index scan access method over lookup access methods when the latter were much cheaper. ([Bug#19372](#))
- Conversion of `DATETIME` values in numeric contexts sometimes did not produce a double (`YYYYMMDDHHMMSS.uuuuuu`) value. ([Bug#16546](#))
- `INSERT...ON DUPLICATE KEY UPDATE` could cause `Error 1032: Can't find record in ...` for inserts into an `InnoDB` table unique index using key column prefixes with an underlying `utf8` string column. ([Bug#13191](#))
- Having the `EXECUTE` privilege for a routine in a database should make it possible to `USE` that database, but the server returned an error instead. This has been corrected. As a result of the change, `SHOW TABLES` for a database in which you have only the `EXECUTE` privilege returns an empty set rather than an error. ([Bug#9504](#))

## C.1.40. Changes in MySQL 5.1.17 (04 April 2007)

This is a new Beta development release, fixing recently discovered bugs.

#### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** Scheduled events now use the session time zone that is current when a `CREATE EVENT` or `ALTER EVENT` statement executes is used to interpret times specified in the event definition (rather than UTC as in previous releases). The session time zone becomes the event time zone; that is, the time zone that is used for event scheduling and is in effect within the event as it executes. Because of this change, scheduled event metadata now includes time zone information, which can be seen in the `TIME_ZONE` column of the `INFORMATION_SCHEMA.EVENTS` table and the `Time zone` column in the output of the `SHOW EVENTS` statement. These columns have been added in this release, along with a `time_zone` column in the `mysql.event` table. Due to these changes, events created in previous versions of MySQL cannot be created, viewed, or used until `mysql.event` has been upgraded.

For retrievals from `INFORMATION_SCHEMA.EVENTS` or `SHOW EVENTS`, times previously displayed using UTC now use the event time zone. ([Bug#16420](#))

- **Important Change: Replication:** The following options for controlling replication master configuration on a slave are now deprecated.

- `--master-host`
- `--master-user`
- `--master-password`
- `--master-port`
- `--master-connect-retry`
- `--master-ssl`
- `--master-ssl-ca`
- `--master-ssl-capath`
- `--master-ssl-cert`
- `--master-ssl-cipher`
- `--master-ssl-key`

To change the master configuration on a slave you should use the `CHANGE MASTER TO` statement.

See also [Bug#21490](#).

- **Important Change:** The `CREATE EVENT` and `ALTER EVENT` statements now support a `DEFINER` clause, similar to that used in the `CREATE TRIGGER` statement.

See [Section 12.1.11, “CREATE EVENT Syntax”](#), for detailed information. ([Bug#16425](#))

- **MySQL Cluster:** Added the `--skip-table-check` option (short form `-s`) for `ndb_restore`, which causes the restoration process to ignore any changes that may have occurred in table schemas after the backup was made. Previously, this was the default behavior.

See [Section 17.4.17, “ndb\\_restore — Restore a MySQL Cluster Backup”](#), for more information. ([Bug#24363](#))

- Added a `--no-beep` option to `mysqladmin`. It suppresses the warning beep that is emitted by default for errors such as a failure to connect to the server. ([Bug#26964](#))
- Added the `--service-startup-timeout` option for `mysql.server` to specify how long to wait for the server to start. If the server does not start within the timeout period, `mysql.server` exits with an error. ([Bug#26952](#))
- Prefix lengths for columns in `SPATIAL` indexes can no longer be specified. For tables created in older versions of MySQL that have `SPATIAL` indexes containing prefixed columns, dumping and reloading the table causes the indexes to be created with no prefixes. (The full column width of each column is indexed.) ([Bug#26794](#))
- Added the `innodb_stats_on_metadata` system variable to enable control over whether `InnoDB` performs statistics gathering when metadata statements are executed. See [Section 13.6.3, “InnoDB Startup Options and System Variables”](#). ([Bug#26598](#))
- Statements that affect `mysql` database tables now are written to the binary log using the following rules:
  - Data manipulation statements such as `INSERT` that change data in `mysql` database tables directly are logged according to the settings of the `binlog_format` system variable.
  - Statements such as `GRANT` that change the `mysql` database indirectly are logged as statements regardless of the value of `binlog_format`.

For more details, see [Section 5.2.4.4, “Logging Format for Changes to mysql Database Tables”](#). ([Bug#25091](#))

- The server now includes a timestamp in error messages that are logged as a result of unhandled signals (such as `mysqld got signal 11` messages). ([Bug#24878](#))
- The syntax for index hints has been extended to enable more fine-grained control over the optimizer's selection of an execution plan for various phases of query processing. See [Section 12.2.8.2, “Index Hint Syntax”](#). ([Bug#21174](#))
- Added the `--secure-file-priv` option for `mysqld`, which limits the effect of the `LOAD_FILE()` function and the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements to work only with files in a given directory. ([Bug#18628](#))

- Prepared statements now use the query cache under the conditions described in [Section 7.6.3.1, “How the Query Cache Operates”](#). ([Bug#735](#))
- Added the `thread_handling` system variable to control whether the server use a single thread or one thread per connection. The `--one-thread` option now is deprecated; use `--thread_handling=one-thread` instead.
- Statements such as `GRANT` that change the `mysql` database indirectly are logged as statements regardless of the value of `binlog_format`.
- Added the read-only `hostname` system variable, which the server sets at startup to the server host name.
- Online (noncopying) `ADD INDEX` and `DROP INDEX` operations are now performed on dynamic (variable-width) columns. Renaming of `NDB` and `MyISAM` tables and of columns in such tables is now performed without copying or locking the tables. As a result, these operations are now performed much more quickly than previously.

See [Section 12.1.7, “ALTER TABLE Syntax”](#), [Section 12.1.13, “CREATE INDEX Syntax”](#), and [Section 12.1.24, “DROP INDEX Syntax”](#), for more information.

- Data manipulation statements such as `INSERT` that change data in `mysql` database tables directly are logged according to the settings of the `binlog_format` system variable.
- Added the `old_mode` system variable to cause the server to revert to certain behaviors present in older versions. Currently, this variable affects handling of index hints. See [Section 12.2.8.2, “Index Hint Syntax”](#).

Bugs fixed:

- Incompatible Change:** `INSERT DELAYED` statements are not supported for `MERGE` tables, but the `MERGE` storage engine was not rejecting such statements, resulting in table corruption. Applications previously using `INSERT DELAYED` into `MERGE` table will break when upgrading to versions with this fix. To avoid the problem, remove `DELAYED` from such statements. ([Bug#26464](#))
- Important Note:** The parser accepted invalid code in SQL condition handlers, leading to server crashes or unexpected execution behavior in stored programs. Specifically, the parser permitted a condition handler to refer to labels for blocks that enclose the handler declaration. This was incorrect because block label scope does not include the code for handlers declared within the labeled block.

The parser now rejects this invalid construct, but if you perform a binary upgrade (without dumping and reloading your databases), existing handlers that contain the construct are still invalid and should be rewritten *even if they appear to function as you expect*.

To find affected handlers, use `mysqldump` to dump all stored procedures and functions, triggers, and events. Then attempt to reload them into an upgraded server. Handlers that contain illegal label references will be rejected.

For more information about condition handlers and writing them to avoid invalid jumps, see [Section 12.7.4.2, “DECLARE for Handlers”](#). ([Bug#26503](#))

- MySQL Cluster:** It was not possible to set `LockPagesInMainMemory` equal to 0. ([Bug#27291](#))
- MySQL Cluster:** A race condition could sometimes occur if the node acting as master failed while node IDs were still being allocated during startup. ([Bug#27286](#))
- MySQL Cluster:** When a data node was taking over as the master node, a race condition could sometimes occur as the node was assuming responsibility for handling of global checkpoints. ([Bug#27283](#))
- MySQL Cluster:** After putting the cluster in single user mode from one MySQL server, trying to drop an `NDB` table from a second MySQL server also connected to the cluster would cause the second MySQL server to hang. ([Bug#27254](#))
- MySQL Cluster:** `mysqld` could crash shortly after a data node failure following certain DML operations. ([Bug#27169](#))
- MySQL Cluster:** (Disk Data): Under some circumstances, a data node could fail during restart while flushing Disk Data UNDO logs. ([Bug#27102](#))
- MySQL Cluster:** The same failed request from an API node could be handled by the cluster multiple times, resulting in reduced performance. ([Bug#27087](#))
- MySQL Cluster:** The failure of a data node while restarting could cause other data nodes to hang or crash. ([Bug#27003](#))
- MySQL Cluster:** Creating a table on one SQL node while in single user mode caused other SQL nodes to crash. ([Bug#26997](#))

- **MySQL Cluster:** `mysqld` processes would sometimes crash under high load. ([Bug#26825](#))
- **MySQL Cluster:** Using only the `--print_data` option (and no other options) with `ndb_restore` caused `ndb_restore` to fail. ([Bug#26741](#))

This regression was introduced by [Bug#14612](#).

- **MySQL Cluster:** The output from `ndb_restore --print_data` was incorrect for a backup made of a database containing tables with `TINYINT` or `SMALLINT` columns. ([Bug#26740](#))
- **MySQL Cluster:** An infinite loop in an internal logging function could cause trace logs to fill up with `UNKNOWN SIGNAL TYPE` error messages and thus grow to unreasonable sizes. ([Bug#26720](#))
- **MySQL Cluster:** An invalid pointer was returned following a `FSCLOSECONF` signal when accessing the REDO logs during a node restart or system restart. ([Bug#26515](#))
- **MySQL Cluster:** The management client command `node_id STATUS` displayed the message `Node node_id: not connected` when `node_id` was not the node ID of a data node.

### Note

The `ALL STATUS` command in the cluster management client still displays status information for data nodes only. This is by design. See [Section 17.5.2, “Commands in the MySQL Cluster Management Client”](#), for more information.

([Bug#21715](#))

- **MySQL Cluster:** When performing an upgrade or downgrade, no specific error information was made available when trying to upgrade data nodes or SQL nodes before upgrading management nodes. ([Bug#21296](#))
- **MySQL Cluster:** Some values of `MaxNoOfTables` caused the error `JOB BUFFER CONGESTION` to occur. ([Bug#19378](#))
- **Replication:** A multiple-row delayed insert with an auto-increment column could cause duplicate entries to be created on the slave in a replication environment. ([Bug#26116](#), [Bug#25507](#))
- **Replication:** Duplicating the usage of a user variable in a stored procedure or trigger would not be replicated correctly to the slave. ([Bug#25167](#))
- **Replication:** `DROP TRIGGER` statements would not be filtered on the slave when using the `replication-wild-do-table` option. ([Bug#24478](#))
- **Replication:** For `INSERT ... ON DUPLICATE KEY UPDATE` statements where some `AUTO_INCREMENT` values were generated automatically for inserts and some rows were updated, one auto-generated value was lost per updated row, leading to faster exhaustion of the range of the `AUTO_INCREMENT` column.

Because the original problem can affect replication (different values on master and slave), it is recommended that the master and its slaves be upgraded to the current version. ([Bug#24432](#))

- **Replication:** Replication between master and slave would infinitely retry binary log transmission where the `max_allowed_packet` on the master was larger than that on the slave if the size of the transfer was between these two values. ([Bug#23775](#))
- **Replication:** Loading data using `LOAD DATA INFILE` may not replicate correctly (due to character set incompatibilities) if the `character_set_database` variable is set before the data is loaded. ([Bug#15126](#))
- **Replication:** User defined variables used within stored procedures and triggers are not replicated correctly when operating in statement-based replication mode. ([Bug#14914](#), [Bug#20141](#))
- **Disk Data:** A memory overflow could occur with tables having a large amount of data stored on disk, or with queries using a very high degree of parallelism on Disk Data tables. ([Bug#26514](#))
- **Disk Data:** Use of a tablespace whose `INITIAL_SIZE` was greater than 1 GB could cause the cluster to crash. ([Bug#26487](#))
- **Disk Data:** Creating multiple Disk Data tables using different tablespaces could sometimes cause the cluster to fail. ([Bug#25992](#))
- **Disk Data:** `ALTER TABLE ... ADD COLUMN ...` on a Disk Data table moved data for existing nonindexed columns from the tablespace into memory. ([Bug#25880](#))
- **Disk Data:** `DROP INDEX` on a Disk Data table did not always move data from memory into the tablespace. ([Bug#25877](#))
- **Disk Data:** When creating a log file group, setting `INITIAL_SIZE` to less than `UNDO_BUFFER_SIZE` caused data nodes to

crash. ([Bug#25743](#))

- **Cluster Replication:** The simultaneous failure of a data node and an SQL node could cause replication to fail. ([Bug#27005](#))
- **Cluster API:** A delete operation using a scan followed by an insert using a scan could cause a data node to fail. ([Bug#27203](#))
- **Cluster API:** (Cluster APIs): `NAND` and `NOR` operations with `NdbScanFilter` did not perform correctly. ([Bug#24568](#))
- **Cluster API:** You can now use the `ndb_mgm_check_connection()` function to determine whether a management server is running. See `ndb_mgm_check_connection()`.
- **MyISAM** tables converted to `ARCHIVE` were excessively large. ([Bug#27533](#))
- `SELECT ... INTO OUTFILE` with a long `FIELDS ENCLOSED BY` value could crash the server. ([Bug#27231](#))
- An `INSERT ... ON DUPLICATE KEY UPDATE` statement might modify values in a table but not flush affected data from the query cache, causing subsequent selects to return stale results. This made the combination of query cache plus `ON DUPLICATE KEY UPDATE` very unreliable. ([Bug#27210](#))

See also [Bug#27006](#), [Bug#27033](#).

This regression was introduced by [Bug#19978](#).

- For `INSERT ... ON DUPLICATE KEY UPDATE` statements on tables containing `AUTO_INCREMENT` columns, `LAST_INSERT_ID()` was reset to 0 if no rows were successfully inserted or changed. “Not changed” includes the case where a row was updated to its current values, but in that case, `LAST_INSERT_ID()` should not be reset to 0. Now `LAST_INSERT_ID()` is reset to 0 only if no rows were successfully inserted or touched, whether or not touched rows were changed. ([Bug#27033](#))

See also [Bug#27210](#), [Bug#27006](#).

This regression was introduced by [Bug#19978](#).

- Invalid optimization of pushdown conditions for queries where an outer join was guaranteed to read only one row from the outer table led to results with too few rows. ([Bug#26963](#))
- For `MERGE` tables defined on underlying tables that contained a short `VARCHAR` column (shorter than four characters), using `ALTER TABLE` on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the `MERGE` table, even if the `ALTER TABLE` did not change the definition. ([Bug#26881](#))
- Use of a subquery containing `GROUP BY` and `WITH ROLLUP` caused a server crash. ([Bug#26830](#))
- Setting `event_scheduler = 1` or `event_scheduler = ON` caused the server to crash if the server had been started with `--skip-grant-tables`. Starting the server with `--skip-grant-tables` now causes `event_scheduler` to be set to `DISABLED` automatically, overriding any other value that may have been set. ([Bug#26807](#))
- Added support for `--debugger=dbx` for `mysql-test-run.pl` and added support for `--debugger=devenv`, `--debugger=DevEnv`, and `--debugger=/path/to/devenv`. ([Bug#26792](#))
- A result set column formed by concatenation of string literals was incomplete when the column was produced by a subquery in the `FROM` clause. ([Bug#26738](#))
- SSL connections failed on Windows. ([Bug#26678](#))
- When using the result of `SEC_TO_TIME()` for time value greater than 24 hours in an `ORDER BY` clause, either directly or through a column alias, the rows were sorted incorrectly as strings. ([Bug#26672](#))
- Use of a subquery containing a `UNION` with an invalid `ORDER BY` clause caused a server crash. ([Bug#26661](#))
- In some error messages, inconsistent format specifiers were used for the translations in different languages. `comp_err` (the error message compiler) now checks for mismatches. ([Bug#26571](#))
- Views that used a scalar correlated subquery returned incorrect results. ([Bug#26560](#))
- `UNHEX() IS NULL` comparisons failed when `UNHEX()` returned `NULL`. ([Bug#26537](#))
- On 64-bit Windows, large timestamp values could be handled incorrectly. ([Bug#26536](#))
- `SHOW CREATE EVENT` failed to display the `STARTS` and `ENDS` clauses for an event defined with `STARTS NOW()`, `ENDS NOW()`, or both. ([Bug#26429](#))

- If the server was started with `--skip-grant-tables`, Selecting from `INFORMATION_SCHEMA` tables causes a server crash. ([Bug#26285](#))
- For some values of the position argument, the `INSERT()` function could insert a NUL byte into the result. ([Bug#26281](#))
- For an `INSERT` statement that should fail due to a column with no default value not being assigned a value, the statement succeeded with no error if the column was assigned a value in an `ON DUPLICATE KEY UPDATE` clause, even if that clause was not used. ([Bug#26261](#))
- `INSERT DELAYED` statements inserted incorrect values into `BIT` columns. ([Bug#26238](#))
- A query of type `index_merge`, and with a `WHERE` clause having the form `WHERE indexed_column_1=value_1 OR indexed_column_2=value_2` on a partitioned table caused the server to crash. ([Bug#26117](#))
- `BENCHMARK()` did not work correctly for expressions that produced a `DECIMAL` result. ([Bug#26093](#))
- For `MEMORY` tables, extending the length of a `VARCHAR` column with `ALTER TABLE` might result in an unusable table. ([Bug#26080](#))
- The server could hang during binary log rotation. ([Bug#26079](#))
- `LOAD DATA INFILE` sent an okay to the client before writing the binary log and committing the changes to the table had finished, thus violating ACID requirements. ([Bug#26050](#))
- `X() IS NULL` and `Y() IS NULL` comparisons failed when `X()` and `Y()` returned `NULL`. ([Bug#26038](#))
- Indexes on `TEXT` columns were ignored when `ref` accesses were evaluated. ([Bug#25971](#))
- If a thread previously serviced a connection that was killed, excessive memory and CPU use by the thread occurred if it later serviced a connection that had to wait for a table lock. ([Bug#25966](#))
- `VIEW` restrictions were applied to `SELECT` statements after a `CREATE VIEW` statement failed, as though the `CREATE` had succeeded. ([Bug#25897](#))
- Several deficiencies in resolution of column names for `INSERT ... SELECT` statements were corrected. ([Bug#25831](#))
- Inserting `utf8` data into a `TEXT` column that used a single-byte character set could result in spurious warnings about truncated data. ([Bug#25815](#))
- On Windows, debug builds of `mysqld` could fail with heap assertions. ([Bug#25765](#))
- In certain cases it could happen that deleting a row corrupted an `RTREE` index. This affected indexes on spatial columns. ([Bug#25673](#))
- Using `mysqlbinlog` on a binary log would crash if there were a large number of row-based events related to a single statement. ([Bug#25628](#))
- Expressions involving `SUM()`, when used in an `ORDER BY` clause, could lead to out-of-order results. ([Bug#25376](#))
- Use of a `GROUP BY` clause that referred to a stored function result together with `WITH ROLLUP` caused incorrect results. ([Bug#25373](#))
- A stored procedure that made use of cursors failed when the procedure was invoked from a stored function. ([Bug#25345](#))
- On Windows, the server exhibited a file-handle leak after reaching the limit on the number of open file descriptors. ([Bug#25222](#))
- The `REPEAT()` function did not permit a column name as the `count` parameter. ([Bug#25197](#))
- A reference to a nonexistent column in the `ORDER BY` clause of an `UPDATE ... ORDER BY` statement could cause a server crash. ([Bug#25126](#))
- A view on a join is insertable for `INSERT` statements that store values into only one table of the join. However, inserts were being rejected if the inserted-into table was used in a self-join because MySQL incorrectly was considering the insert to modify multiple tables of the view. ([Bug#25122](#))
- Creating a table with latin characters in the name caused the output of `SHOW FULL TABLES` to have `ERROR` for the table type. ([Bug#25081](#))
- MySQL would not compile when configured using `--without-query-cache`. ([Bug#25075](#))

- It was not possible to use XPath keywords as tag names for expressions used in the `ExtractValue()` function. ([Bug#24747](#))
- Increasing the width of a `DECIMAL` column could cause column values to be changed. ([Bug#24558](#))
- `IF(expr, unsigned_expr, unsigned_expr)` was evaluated to a signed result, not unsigned. This has been corrected. The fix also affects constructs of the form `IS [NOT] {TRUE|FALSE}`, which were transformed internally into `IF()` expressions that evaluated to a signed result.

For existing views that were defined using `IS [NOT] {TRUE|FALSE}` constructs, there is a related implication. The definitions of such views were stored using the `IF()` expression, not the original construct. This is manifest in that `SHOW CREATE VIEW` shows the transformed `IF()` expression, not the original one. Existing views will evaluate correctly after the fix, but if you want `SHOW CREATE VIEW` to display the original construct, you must drop the view and re-create it using its original definition. New views will retain the construct in their definition. ([Bug#24532](#))

- `SHOW ENGINE MUTEX STATUS` failed to produce an `UNKNOWN TABLE ENGINE` error.

See [Section 12.4.5.16, “SHOW ENGINE Syntax”](#). ([Bug#24392](#))

- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. ([Bug#24010](#))
- `mysqlimport` used a variable of the wrong type for the `--use-threads` option, which could cause a crash on some architectures. ([Bug#23814](#))
- Queries that used a temporary table for the outer query when evaluating a correlated subquery could return incorrect results. ([Bug#23800](#))
- On Windows, debug builds of `mysqlbinlog` could fail with a memory error. ([Bug#23736](#))
- When using certain server SQL modes, the `mysql.proc` table was not created by `mysql_install_db`. ([Bug#23669](#))
- `DOUBLE` values such as `20070202191048.000000` were being treated as illegal arguments by `WEEK()`. ([Bug#23616](#))
- The server could crash if two or more threads initiated query cache resize operation at moments very close in time. ([Bug#23527](#))
- `NOW()` returned the wrong value in statements executed at server startup with the `--init-file` option. ([Bug#23240](#))
- Setting the `slow_query_log_file` system variable caused log output to go to the general log, not the slow query log. ([Bug#23225](#))
- When nesting stored procedures within a trigger on a table, a false dependency error was thrown when one of the nested procedures contained a `DROP TABLE` statement. ([Bug#22580](#))
- Instance Manager did not remove the angel PID file on a clean shutdown. ([Bug#22511](#))
- `EXPLAIN EXTENDED` did not show `WHERE` conditions that were optimized away. ([Bug#22331](#))
- `IN ((subquery)), IN (((subquery)))`, and so forth, are equivalent to `IN (subquery)`, which is always interpreted as a table subquery (so that it is permitted to return more than one row). MySQL was treating the “over-parenthesized” subquery as a single-row subquery and rejecting it if it returned more than one row. This bug primarily affected automatically generated code (such as queries generated by Hibernate), because humans rarely write the over-parenthesized forms. ([Bug#21904](#))
- An `INSERT` trigger invoking a stored routine that inserted into a table other than the one on which the trigger was defined would fail with a `TABLE '...' DOESN'T EXIST` referring to the second table when attempting to delete records from the first table. ([Bug#21825](#))
- `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE(CAST(CURDATE() AS DATE) < NOW())` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. ([Bug#21103](#))
- When a stored routine attempted to execute a statement accessing a nonexistent table, the error was not caught by the routine's exception handler. ([Bug#20713](#), [Bug#8407](#))
- For a stored procedure containing a `SELECT` statement that used a complicated join with an `ON` expression, the expression could be ignored during re-execution of the procedure, yielding an incorrect result. ([Bug#20492](#))
- The conditions checked by the optimizer to permit use of indexes in `IN` predicate calculations were unnecessarily tight and

were relaxed. ([Bug#20420](#))

- When a `TIME_FORMAT()` expression was used as a column in a `GROUP BY` clause, the expression result was truncated. ([Bug#20293](#))
- The creation of MySQL system tables was not checked for by `mysql-test-run.pl`. ([Bug#20166](#))
- For index reads, the `BLACKHOLE` engine did not return end-of-file (which it must because `BLACKHOLE` tables contain no rows), causing some queries to crash. ([Bug#19717](#))
- For `expr IN(value_list)`, the result could be incorrect if `BIGINT UNSIGNED` values were used for `expr` or in the value list. ([Bug#19342](#))
- When attempting to call a stored procedure creating a table from a trigger on a table `tbl` in a database `db`, the trigger failed with `ERROR 1146 (42S02): TABLE 'DB.TBL' DOESN'T EXIST`. However, the actual reason that such a trigger fails is due to the fact that `CREATE TABLE` causes an implicit `COMMIT`, and so a trigger cannot invoke a stored routine containing this statement. A trigger which does so now fails with `ERROR 1422 (HY000): EXPLICIT OR IMPLICIT COMMIT IS NOT PERMITTED IN STORED FUNCTION OR TRIGGER`, which makes clear the reason for the trigger's failure. ([Bug#18914](#))
- While preparing prepared statements, the server acquired unnecessary table write locks. ([Bug#18326](#))
- The update columns for `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could be assigned incorrect values if a temporary table was used to evaluate the `SELECT`. ([Bug#16630](#))
- For `SUBSTRING()` evaluation using a temporary table, when `SUBSTRING()` was used on a `LONGTEXT` column, the `max_length` metadata value of the result was incorrectly calculated and set to 0. Consequently, an empty string was returned instead of the correct result. ([Bug#15757](#))
- Local variables in stored routines or triggers, when declared as the `BIT` type, were interpreted as strings. ([Bug#12976](#))
- For some operations, system tables in the `mysql` database must be accessed. For example, the `HELP` statement requires the contents of the server-side help tables, and `CONVERT_TZ()` might need to read the time zone tables. However, to perform such operations while a `LOCK TABLES` statement is in effect, the server required you to also lock the requisite system tables explicitly or a lock error occurred:

```
mysql> LOCK TABLE t1 READ;
Query OK, 0 rows affected (0.02 sec)
mysql> HELP HELP;
ERROR 1100 (HY000) at line 4: Table 'help_topic' was not
locked with LOCK TABLES
```

Now, the server implicitly locks the system tables for reading as necessary so that you need not lock them explicitly. These tables are treated as just described:

```
mysql.help_category
mysql.help_keyword
mysql.help_relation
mysql.help_topic
mysql.proc
mysql.time_zone
mysql.time_zone_leap_second
mysql.time_zone_name
mysql.time_zone_transition
mysql.time_zone_transition_type
```

If you want to explicitly place a `WRITE` lock on any of those tables with a `LOCK TABLES` statement, the table must be the only one locked; no other table can be locked with the same statement. ([Bug#9953](#))

## C.1.41. Changes in MySQL 5.1.16 (26 February 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

### Note

After release, a trigger failure problem was found to have been introduced. ([Bug#27006](#)) Users affected by this issue should upgrade to MySQL 5.1.17, which corrects the problem.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see [ht-tp://www.mysql.com/products/enterprise](http://www.mysql.com/products/enterprise).

Functionality added or changed:

- **Cluster API: Incompatible Change:** The `AbortOption` type is now a member of the `NdbOperation` class; its values and behavior have also changed. `NdbTransaction::AbortOption` can no longer be used, and applications written against the NDB API may need to be rewritten and recompiled to accomodate these changes. For more information about this change, see [The NdbOperation::AbortOption Type](#).

This also affects the behavior of the `NdbTransaction::execute()` method, which now reports failure only if the transaction was actually aborted. See [NdbTransaction::execute\(\)](#), for more information.

- **MySQL Cluster:** Previously, when a data node failed to start more than 8 times in succession, this caused a forced shutdown of the cluster. Now, when a data node fails to start 7 consecutive times, the node does not start again until it is started with the `--initial` option, and a warning to this effect is written to the error log. ([Bug#25984](#))
- **MySQL Cluster:** In the event that all cluster management and API nodes are configured with `ArbitrationRank = 0, ndb_mgmd` now issues the following warning when starting: `CLUSTER CONFIGURATION WARNING: NEITHER MGM NOR API NODES ARE CONFIGURED WITH ARBITRATOR, MAY CAUSE COMPLETE CLUSTER SHUTDOWN IN CASE OF HOST FAILURE.` ([Bug#23546](#))
- **MySQL Cluster:** A number of new and more descriptive error messages covering transporter errors were added. ([Bug#22025](#))
- **MySQL Cluster:** A new configuration parameter `MemReportFrequency` enables additional control of data node memory usage. Previously, only warnings at predetermined percentages of memory allocation were given; setting this parameter enables that behavior to be overridden. For more information, see [Section 17.3.2.6, “Defining MySQL Cluster Data Nodes”](#).
- **Cluster API:** A new `ndb_mgm_get_clusterlog_loglevel()` function was added to the MGM API.

For more information, see [ndb\\_mgm\\_get\\_clusterlog\\_loglevel\(\)](#).

- The `localhost` anonymous user account created during MySQL installation on Windows now has no global privileges. Formerly this account had all global privileges. For operations that require global privileges, the `root` account can be used instead. ([Bug#24496](#))
- In the `INFORMATION_SCHEMA REFERENTIAL_CONSTRAINTS` table, the `UNIQUE_CONSTRAINT_NAME` column incorrectly named the referenced table. Now it names the referenced constraint, and a new column, `REFERENCED_TABLE_NAME`, names the referenced table. ([Bug#21713](#))
- `RAND()` now permits nonconstant initializers (such as a column name) as its argument. In this case, the seed is initialized with the value for each invocation of `RAND()`. (One implication of this is that for equal argument values, `RAND()` will return the same value each time.) ([Bug#6172](#))
- Added the `--auto-generate-sql-load-type` and `--auto-generate-sql-write-number` options for `mysqlslap`.
- The bundled yaSSL library was upgraded to version 1.5.8.

Bugs fixed:

- **Security Fix:** Using an `INFORMATION_SCHEMA` table with `ORDER BY` in a subquery could cause a server crash.

We would like to thank Oren Isaacson of Flowgate Security Consulting and Stefan Streichsbier of SEC Consult for informing us of this problem. ([Bug#24630](#), [Bug#26556](#), [CVE-2007-1420](#))

- **Partitioning: MySQL Cluster:** A query with an `IN` clause against an `NDB` table employing explicit user-defined partitioning did not always return all matching rows. ([Bug#25821](#))
- **MySQL Cluster: Replication:** (Replication): Under some circumstances, the binary log thread could shut down while the slave SQL thread was still using it. ([Bug#26015](#), [Bug#26019](#))
- **MySQL Cluster: Replication:** (Replication): The error message `LAST_ERRNO: 4294967295, ERROR IN WRITE_ROWS`

`EVENT` now supplies a valid error code. ([Bug#19896](#))

- **MySQL Cluster:** An inadvertent use of unaligned data caused `ndb_restore` to fail on some 64-bit platforms, including Sparc and Itanium-2. ([Bug#26739](#))
- **MySQL Cluster:** The `InvalidUndoBufferSize` error used the same error code (763) as the `IncompatibleVersions` error. `InvalidUndoBufferSize` now uses its own error code (779). ([Bug#26490](#))
- **MySQL Cluster:** The failure of a data node when restarting it with `--initial` could lead to failures of subsequent data node restarts. ([Bug#26481](#))
- **MySQL Cluster:** Takeover for local checkpointing due to multiple failures of master nodes was sometimes incorrectly handled. ([Bug#26457](#))
- **MySQL Cluster:** The `LockPagesInMainMemory` parameter was not read until after distributed communication had already started between cluster nodes. When the value of this parameter was 1, this could sometimes result in data node failure due to missed heartbeats. ([Bug#26454](#))
- **MySQL Cluster:** Under some circumstances, following the restart of a management node, all data nodes would connect to it normally, but some of them subsequently failed to log any events to the management node. ([Bug#26293](#))
- **MySQL Cluster:** Condition pushdown did not work with prepared statements. ([Bug#26225](#))
- **MySQL Cluster:** A memory leak could cause problems during a node or cluster shutdown or failure. ([Bug#25997](#))
- **MySQL Cluster:** No appropriate error message was provided when there was insufficient REDO log file space for the cluster to start. ([Bug#25801](#))
- **MySQL Cluster:** An `UPDATE` using an `IN` clause on an `NDB` table on which there was a trigger caused `mysqld` to crash. ([Bug#25522](#))
- **MySQL Cluster:** A memory allocation failure in `SUMA` (the cluster Subscription Manager) could cause the cluster to crash. ([Bug#25239](#))
- **MySQL Cluster:** The `ndb_size.tmp1` file (necessary for using the `ndb_size.pl` script) was missing from binary distributions. ([Bug#24191](#))
- **MySQL Cluster:** The message `ERROR 0 IN READAUTOINCREMENTVALUE( ) : NO ERROR` was written to the error log whenever `SHOW TABLE STATUS` was performed on a Cluster table that did not have an `AUTO_INCREMENT` column.

### Note

This improves on and supersedes an earlier fix that was made for this issue in MySQL 5.1.12.

([Bug#21033](#))

- **MySQL Cluster:** When a node failed due to there being insufficient disk space to perform a local checkpoint, there was no indication that this was the source of the problem. Such a condition now produces an appropriate error message. ([Bug#20121](#))
- **MySQL Cluster:** In the event that cluster backup parameters such as `BackupWriteSize` were incorrectly set, no appropriate error was issued to indicate that this was the case. ([Bug#19146](#))
- **Replication:** If a slave server closed its relay log (for example, due to an error during log rotation), the I/O thread did not recognize this and still tried to write to the log, causing a server crash. ([Bug#10798](#))
- **Cluster API: Disk Data:** A delete and a read performed in the same operation could cause one or more data nodes to crash. This could occur when the operation affected more than 5 columns concurrently, or when one or more of the columns was of the `VARCHAR` type and was stored on disk. ([Bug#25794](#))
- **Cluster API:** After defining a delete operation (using `NdbOperation::deleteTuple()`) on a nonexistent primary key of a table having a `BLOB` or `TEXT` column, invoking `NdbTransaction::execute()` caused the calling application to enter an endless loop rather than raising an error.

This issue also affected `ndb_restore`; when restoring tables containing `BLOB` or `TEXT` columns, this could cause it to consume all available memory and then crash. ([Bug#24028](#))

See also [Bug#27308](#), [Bug#30177](#).

- **Cluster API:** `libndbclient.so` was not versioned. ([Bug#13522](#))
- Using `ORDER BY` or `GROUP BY` could yield different results when selecting from a view and selecting from the underlying ta-

ble. ([Bug#26209](#))

- `DISTINCT` queries that were executed using a loose scan for an `InnoDB` table that had been emptied caused a server crash. ([Bug#26159](#))
- A `WHERE` clause that used `BETWEEN` for `DATETIME` values could be treated differently for a `SELECT` and a view defined as that `SELECT`. ([Bug#26124](#))
- Collation for `LEFT JOIN` comparisons could be evaluated incorrectly, leading to improper query results. ([Bug#26017](#))
- The `WITH CHECK OPTION` clause for views was ignored for updates of multiple-table views when the updates could not be performed on fly and the rows to update had to be put into temporary tables first. ([Bug#25931](#))
- `LOAD DATA INFILE` did not work with pipes. ([Bug#25807](#))
- The `SEC_TO_TIME()` and `QUARTER()` functions sometimes did not handle `NULL` values correctly. ([Bug#25643](#))
- View definitions that used the `!` operator were treated as containing the `NOT` operator, which has a different precedence and can produce different results. . ([Bug#25580](#))
- An error in the name resolution of nested `JOIN ... USING` constructs was corrected. ([Bug#25575](#))
- `GROUP BY` and `DISTINCT` did not group `NULL` values for columns that have a `UNIQUE` index. . ([Bug#25551](#))
- The `--with-readline` option for `configure` did not work for commercial source packages, but no error message was printed to that effect. Now a message is printed. ([Bug#25530](#))
- A yaSSL program named `test` was installed, causing conflicts with the `test` system utility. It is no longer installed. ([Bug#25417](#))
- For a `UNIQUE` index containing many `NULL` values, the optimizer would prefer the index for `col IS NULL` conditions over other more selective indexes. . ([Bug#25407](#))
- An `AFTER UPDATE` trigger on an `InnoDB` table with a composite primary key caused the server to crash. ([Bug#25398](#))
- Passing a `NULL` value to a user-defined function from within a stored procedure crashes the server. ([Bug#25382](#))
- `perror` crashed on some platforms due to failure to handle a `NULL` pointer. ([Bug#25344](#))
- `mysql.server stop` timed out too quickly (35 seconds) waiting for the server to exit. Now it waits up to 15 minutes, to ensure that the server exits. ([Bug#25341](#))
- A query that contained an `EXIST` subquery with a `UNION` over correlated and uncorrelated `SELECT` queries could cause the server to crash. ([Bug#25219](#))
- `mysql_kill()` caused a server crash when used on an SSL connection. ([Bug#25203](#))
- yaSSL was sensitive to the presence of whitespace at the ends of lines in PEM-encoded certificates, causing a server crash. ([Bug#25189](#))
- A query with `ORDER BY` and `GROUP BY` clauses where the `ORDER BY` clause had more elements than the `GROUP BY` clause caused a memory overrun leading to a crash of the server. ([Bug#25172](#))
- Use of `ON DUPLICATE KEY UPDATE` defeated the usual restriction against inserting into a join-based view unless only one of the underlying tables is used. ([Bug#25123](#))
- `ALTER TABLE ... ENABLE KEYS` acquired a global lock, preventing concurrent execution of other statements that use tables. . ([Bug#25044](#))
- `OPTIMIZE TABLE` caused a race condition in the I/O cache. ([Bug#25042](#))
- A return value of `-1` from user-defined handlers was not handled well and could result in conflicts with server code. ([Bug#24987](#))
- Certain joins using `Range checked for each record` in the query execution plan could cause the server to crash. ([Bug#24776](#))
- `ALTER TABLE` caused loss of `CASCADE` clauses for `InnoDB` tables. ([Bug#24741](#))
- If an `ORDER BY` or `GROUP BY` list included a constant expression being optimized away and, at the same time, containing single-row subselects that returned more than one row, no error was reported. If a query required sorting by expressions contain-

ing single-row subselects that returned more than one row, execution of the query could cause a server crash. ([Bug#24653](#))

- For `ALTER TABLE`, using `ORDER BY expression` could cause a server crash. Now the `ORDER BY` clause permits only column names to be specified as sort criteria (which was the only documented syntax, anyway). ([Bug#24562](#))
- Within stored routines or prepared statements, inconsistent results occurred with multiple use of `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` when the `ON DUPLICATE KEY UPDATE` clause erroneously tried to assign a value to a column mentioned only in its `SELECT` part. ([Bug#24491](#))
- Expressions of the form `(a, b) IN (SELECT a, MIN(b) FROM t GROUP BY a)` could produce incorrect results when column `a` of table `t` contained `NULL` values while column `b` did not. ([Bug#24420](#))
- If a prepared statement accessed a view, access to the tables listed in the query after that view was checked in the security context of the view. ([Bug#24404](#))
- A nested query on a partitioned table returned fewer records than on the corresponding nonpartitioned table, when the subquery affected more than one partition. ([Bug#24186](#))
- Expressions of the form `(a, b) IN (SELECT c, d ...)` could produce incorrect results if `a, b`, or both were `NULL`. ([Bug#24127](#))
- Queries that evaluate `NULL IN (SELECT ... UNION SELECT ...)` could produce an incorrect result (`FALSE` instead of `NULL`). ([Bug#24085](#))
- Some `UPDATE` statements were slower than in previous versions when the search key could not be converted to a valid value for the type of the search column. ([Bug#24035](#))
- `ISNULL(DATE(NULL))` and `ISNULL(CAST(NULL AS DATE))` erroneously returned false. ([Bug#23938](#))
- Within a stored routine, accessing a declared routine variable with `PROCEDURE ANALYSE()` caused a server crash. ([Bug#23782](#))
- For an `InnoDB` table with any `ON DELETE` trigger, `TRUNCATE TABLE` mapped to `DELETE` and activated triggers. Now a fast truncation occurs and triggers are not activated. .

### Important

As a result of this fix, `TRUNCATE TABLE` now requires the `DROP` privilege rather than the `DELETE` privilege.

([Bug#23556](#))

- With `ONLY_FULL_GROUP_BY` enabled, the server was too strict: Some expressions involving only aggregate values were rejected as nonaggregate (for example, `MAX(a) - MIN(a)`). ([Bug#23417](#))
- The arguments to the `ENCODE()` and the `DECODE()` functions were not printed correctly, causing problems in the output of `EXPLAIN EXTENDED` and in view definitions. ([Bug#23409](#))
- Some queries against `INFORMATION_SCHEMA` that used subqueries failed. . ([Bug#23299](#))
- `readline` detection did not work correctly on NetBSD. ([Bug#23293](#))
- The number of `setsockopt()` calls performed for reads and writes to the network socket was reduced to decrease system call overhead. ([Bug#22943](#))
- Storing values specified as hexadecimal values 64 or more bits long in `BIT(64)`, `BIGINT`, or `BIGINT UNSIGNED` columns did not raise any warning or error if the value was out of range. ([Bug#22533](#))
- Type conversion errors during formation of index search conditions were not correctly checked, leading to incorrect query results. ([Bug#22344](#))
- For the `IF()` and `COALESCE()` function and `CASE` expressions, large unsigned integer values could be mishandled and result in warnings. ([Bug#22026](#))
- Inserting `DEFAULT` into a column with no default value could result in garbage in the column. Now the same result occurs as when inserting `NULL` into a `NOT NULL` column. ([Bug#20691](#))
- Indexes disabled with `ALTER TABLE ... DISABLE KEYS` could in some cases be used by specifying `FORCE INDEX`. ([Bug#20604](#))
- If a duplicate key value was present in the table, `INSERT ... ON DUPLICATE KEY UPDATE` reported a row count indicating that a record was updated, even when no record actually changed due to the old and new values being the same. Now it

reports a row count of zero. ([Bug#19978](#))

See also [Bug#27006](#), [Bug#27033](#), [Bug#27210](#).

- `ORDER BY` values of the `DOUBLE` or `DECIMAL` types could change the result returned by a query. ([Bug#19690](#))
- The `readline` library wrote to uninitialized memory, causing `mysql` to crash. ([Bug#19474](#))
- Use of already freed memory caused SSL connections to hang forever. ([Bug#19209](#))
- The server might fail to use an appropriate index for `DELETE` when `ORDER BY`, `LIMIT`, and a nonrestricting `WHERE` are present. ([Bug#17711](#))
- The optimizer used a filesort rather than a `const` table read in some cases when the latter was possible. ([Bug#16590](#))
- To enable installation of MySQL RPMs on Linux systems running RHEL 4 (which includes SE-Linux) additional information was provided to specify some actions that are permitted to the MySQL binaries. ([Bug#12676](#))
- `CONNECTION` is no longer treated as a reserved word. ([Bug#12204](#))
- The presence of `ORDER BY` in a view definition prevented the `MERGE` algorithm from being used to resolve the view even if nothing else in the definition required the `TEMPTABLE` algorithm. ([Bug#12122](#))

## C.1.42. Changes in MySQL 5.1.15 (25 January 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change: MySQL Cluster:** The `LockPagesInMainMemory` configuration parameter has changed its type and possible values. For more information, see [LockPagesInMainMemory](#) .

### Important

The values `true` and `false` are no longer accepted for this parameter. If you were using this parameter and had it set to `false` in a previous release, you must change it to `0`. If you had this parameter set to `true`, you should instead use `1` to obtain the same behavior as previously, or `2` to take advantage of new functionality introduced with this release, as described in the section cited above.

([Bug#25686](#))

- **Incompatible Change: InnoDB** rolls back only the last statement on a transaction timeout. A new option, `-innodb_rollback_on_timeout`, causes InnoDB to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as in MySQL 5.0.13 and earlier). ([Bug#24200](#))
- **Incompatible Change:** Previously, the `DATE_FORMAT( )` function returned a binary string. Now it returns a string with a character set and collation given by `character_set_connection` and `collation_connection` so that it can return month and weekday names containing non-ASCII characters. ([Bug#22646](#))
- **Incompatible Change:** The following conditions apply to enabling the `read_only` system variable:
  - If you attempt to enable `read_only` while you have any explicit locks (acquired with `LOCK TABLES` or have a pending transaction, an error will occur.
  - If other clients hold explicit table locks or have pending transactions, the attempt to enable `read_only` blocks until the

locks are released and the transactions end. While the attempt to enable `read_only` is pending, requests by other clients for table locks or to begin transactions also block until `read_only` has been set.

- `read_only` can be enabled while you hold a global read lock (acquired with `FLUSH TABLES WITH READ LOCK`) because that does not involve table locks.

Previously, the attempt to enable `read_only` would return immediately even if explicit locks or transactions were pending, so some data changes could occur for statements executing in the server at the same time. ([Bug#22009](#), [Bug#11733](#))

- **Incompatible Change:** Previously, the `ARCHIVE` storage engine created a metadata file with an extension of `.ARM` for each table. The engine no longer creates this file.
- **Important Change:** When using a `MERGE` table, the definition of the table and the underlying `MyISAM` tables are checked each time the tables are opened for access (including any `SELECT` or `INSERT` statement). Each table is compared for column order, types, sizes, and associated indexes. If there is a difference in any one of the tables, the statement will fail.
- **Important Change:** Previously, duplicate-key errors were indicated by the `ER_DUP_ENTRY` error code (1062). This code is no longer used. Instead, the server returns `ER_DUP_ENTRY_WITH_KEY_NAME` (1582), and the error message indicates the name of the index for which the duplicate occurred. Applications that test for duplicate keys should look for both error codes if they need to be compatible with current and older servers.

See also [Bug#28842](#).

- **MySQL Cluster:** The `NDB` storage engine could leak memory during file operations. ([Bug#21858](#))
- **Replication:** Calling a nondeterministic stored routine when using statement-based replication now throws an error. Formerly, defining such a stored routine would cause an error to be thrown. ([Bug#16456](#))
- On Unix, when searching the standard locations for option files, MySQL programs now also look for `/etc/mysql/my.cnf` after checking for `/etc/my.cnf` and before checking the remaining locations. ([Bug#25104](#))
- The default value of the `max_connections` variable has been increased to 151 in order that Websites running on Apache and using MySQL will not have more processes trying to access MySQL than the default number of connections available.

(The maximum number of Apache processes is determined by the Apache `MaxClient`, which defaults to 256, but is usually set to 150 in the `httpd.conf` commonly distributed with Apache. For more information about `MaxClient`, see [http://httpd.apache.org/docs/2.2/mod/mpm\\_common.html#maxclients](http://httpd.apache.org/docs/2.2/mod/mpm_common.html#maxclients).) ([Bug#23883](#))

- The `Com_create_user` status variable was added (for counting `CREATE USER` statements). ([Bug#22958](#))
- The `--memlock` option relies on system calls that are unreliable on some operating systems. If a crash occurs, the server now checks whether `--memlock` was specified and if so issues some information about possible workarounds. ([Bug#22860](#))
- The (undocumented) `UNIQUE_USERS()` and `GROUP_UNIQUE_USERS()` functions were removed. ([Bug#22687](#))
- Partitioning of tables using the `FEDERATED` storage engine is no longer permitted. Attempting to create such a table or to modify an existing table so that it uses both partitioning and `FEDERATED` now fails with an error. ([Bug#22451](#))
- The `--skip-thread-priority` option now is enabled by default for binary Mac OS X distributions. Use of thread priorities degrades performance on Mac OS X. ([Bug#18526](#))
- `read_only` can be enabled while you hold a global read lock (acquired with `FLUSH TABLES WITH READ LOCK`) because that does not involve table locks.
- The bundled yaSSL library was upgraded to version 1.5.0.
- Remote servers for use with the `FEDERATED` storage engine now can be managed with the new `CREATE/ALTER/DROP SERVER` syntax.
- Added the `--disable-grant-options` option to `configure`. If `configure` is run with this option, the `--bootstrap`, `--skip-grant-tables`, and `--init-file` options for `mysqld` are disabled and cannot be used. For Windows, the `configure.js` script recognizes the `DISABLE_GRANT_OPTIONS` flag, which has the same effect.
- If other clients hold explicit table locks or have pending transactions, the attempt to enable `read_only` blocks until the locks are released and the transactions end. While the attempt to enable `read_only` is pending, requests by other clients for table locks or to begin transactions also block until `read_only` has been set.
- If you attempt to enable `read_only` while you have any explicit locks (acquired with `LOCK TABLES` or have a pending transaction, an error will occur.

Bugs fixed:

- **Incompatible Change:** For `ENUM` columns that had enumeration values containing commas, the commas were mapped to `0xff` internally. However, this rendered the commas indistinguishable from true `0xff` characters in the values. This no longer occurs. However, the fix requires that you dump and reload any tables that have `ENUM` columns containing any true `0xff` values. Dump the tables using `mysqldump` with the current server before upgrading from a version of MySQL 5.1 older than 5.1.15 to version 5.1.15 or newer. ([Bug#24660](#))
- **Partitioning: MySQL Cluster:** Non-32-bit, nonaligned columns were not handled correctly in explicitly partitioned `NDB` tables. ([Bug#25587](#))
- **MySQL Cluster: Replication:** (Replication): Connecting a `mysqld` to a cluster where not all nodes were running, starting the remaining cluster nodes, and then disconnecting from the cluster caused the `mysqld` process to crash. ([Bug#25387](#))
- **MySQL Cluster:** It was not possible to create an `NDB` table with a key on two `VARCHAR` columns where both columns had a storage length in excess of 256. ([Bug#25746](#))
- **MySQL Cluster:** Hosts in clusters with large numbers of nodes could experience excessive CPU usage while obtaining configuration data. ([Bug#25711](#))
- **MySQL Cluster:** In some circumstances, shutting down the cluster could cause connected `mysqld` processes to crash. ([Bug#25668](#))
- **MySQL Cluster:** Some aggregate queries such as `SELECT COUNT(*)` performed a table scan on `NDB` tables rather than checking table statistics, causing such queries to perform much more slowly in MySQL Cluster 5.1 than in 5.0. ([Bug#25567](#))
- **MySQL Cluster:** Memory allocations for `TEXT` columns were calculated incorrectly, resulting in space being wasted and other issues. ([Bug#25562](#))
- **MySQL Cluster:** The failure of a master node during a node restart could lead to a resource leak, causing later node failures. ([Bug#25554](#))
- **MySQL Cluster:** The failure of a node during a local checkpoint could lead to other node failures. ([Bug#25468](#))
- **MySQL Cluster:** A node shutdown occurred if the master failed during a commit. ([Bug#25364](#))
- **MySQL Cluster:** Creating a nonunique index with the `USING HASH` clause silently created an ordered index instead of issuing a warning. ([Bug#24820](#))
- **MySQL Cluster:** `ndb_config` failed when trying to use 2 management servers and node IDs. ([Bug#23887](#))
- **MySQL Cluster:** When a data node was shut down using the management client `STOP` command, a connection event (`NDB_LIE_Connected`) was logged instead of a disconnection event (`NDB_LIE_Disconnected`). ([Bug#22773](#))
- **MySQL Cluster:** The management server did not handle logging of node shutdown events correctly in certain cases. ([Bug#22013](#))
- **MySQL Cluster:** `SELECT` statements with a `BLOB` or `TEXT` column in the selected column list and a `WHERE` condition including a primary key lookup on a `VARCHAR` primary key produced empty result sets. ([Bug#19956](#))
- **MySQL Cluster:** When stopping and restarting multiple data nodes, the last node to be restarted would sometimes hang in Phase 100. ([Bug#19645](#))
- **Replication:** Using row-based replication to replicate to a table having at least one extra `BIT` column with a default value on the slave as compared to the master could cause the slave to fail. ([Bug#24490](#))
- **Replication:** When `SET PASSWORD` was written to the binary log, double quotation marks were included in the statement. If the slave was running in with the server SQL mode set to `ANSI_QUOTES`, then the event failed, which halted the replication process. ([Bug#24158](#))
- **Replication:** A stored procedure, executed from a connection using a binary character set, and which wrote multibyte data, would write incorrectly escaped entries to the binary log. This caused syntax errors, and caused replication to fail. ([Bug#23619](#), [Bug#24492](#))
- **Replication:** Using `CREATE TABLE ... SELECT` and rolling back the transaction would leave an empty table on the master, but the instructions would not be recorded in the binary log and therefore replicated to the slave. This would result in a difference between the master and slave databases. An implicit commit has been added to ensure consistency. ([Bug#22865](#))
- **Replication:** Changes to the `lc_time_names` system variable were not replicated. ([Bug#22645](#))

- **Replication:** For `SET`, `SELECT`, and `DO` statements that invoked a stored function from a database other than the default database, the function invocation could fail to be replicated. ([Bug#19725](#))
- **Disk Data:** Following 3 or more missed local checkpoints by a cluster node, a restart of the node caused incorrect undo information to be used for Disk Data tables. ([Bug#25636](#))
- **Disk Data:** `MEDIUMTEXT` columns of Disk Data tables were stored in memory rather than on disk, even if the columns were not indexed. ([Bug#25001](#))
- **Disk Data:** Performing a node restart with a newly dropped Disk Data table could lead to failure of the node during the restart. ([Bug#24917](#))
- **Disk Data:** Changing a column specification or issuing a `TRUNCATE TABLE` statement on a Disk Data table caused the table to become an in-memory table. ([Bug#24667](#), [Bug#25296](#))
- **Disk Data:** When restoring from backup a cluster containing any Disk Data tables with hidden primary keys, a node failure resulted which could lead to a crash of the cluster. ([Bug#24166](#))
- **Disk Data:** Repeated `CREATE`, `DROP`, or `TRUNCATE TABLE` in various combinations with system restarts between these operations could lead to the eventual failure of a system restart. ([Bug#21948](#))
- **Disk Data:** Extents that should have been available for re-use following a `DROP TABLE` operation were not actually made available again until after the cluster had performed a local checkpoint. ([Bug#17605](#))
- **Cluster Replication:** Certain errors in replication setups could lead to unexpected node failures. ([Bug#25755](#))
- **Cluster Replication:** Connecting an API node to the cluster during a node restart while performing database operations could cause the restarting node to fail. ([Bug#25329](#))
- **Cluster Replication:** Following a restart of the master cluster, the latest GCI was set to 0 upon reconnection to the slave. ([Bug#21806](#))
- **Cluster API:** Deletion of an `Ndb_cluster_connection` object took a very long time. ([Bug#25487](#))
- **Cluster API:** Invoking the `NdbTransaction::execute()` method using execution type `Commit` and abort option `AO_IgnoreError` could lead to a crash of the transaction coordinator (`DBTC`). ([Bug#25090](#))
- **Cluster API:** A unique index lookup on a nonexistent tuple could lead to a data node timeout (error 4012). ([Bug#25059](#))
- **Cluster API:** When using the `NdbTransaction::execute()` method, a very long timeout (greater than 5 minutes) could result if the last data node being polled was disconnected from the cluster. ([Bug#24949](#))
- **Cluster API:** Due to an error in the computation of table fragment arrays, some transactions were not executed from the correct starting point. ([Bug#24914](#))
- `mysqltest_embedded` crashed at startup. ([Bug#25890](#))
- Referencing an ambiguous column alias in an expression in the `ORDER BY` clause of a query caused the server to crash. ([Bug#25427](#))
- A number of issues were uncovered by Valgrind. ([Bug#25396](#))
- Using a view in combination with a `USING` clause caused column aliases to be ignored. ([Bug#25106](#))
- A multiple-table `DELETE QUICK` could sometimes cause one of the affected tables to become corrupted. ([Bug#25048](#))
- An assertion failed incorrectly for prepared statements that contained a single-row uncorrelated subquery that was used as an argument of the `IS NULL` predicate. ([Bug#25027](#))
- In the `INFORMATION_SCHEMA.KEY_COLUMN_USAGE` table, the value displayed for the `REFERENCED_TABLE_NAME` column was the table name as encoded for disk storage, not the actual table name. ([Bug#25026](#))
- The `REPEAT()` function could return `NULL` when passed a column for the count argument. ([Bug#24947](#))
- `mysql_upgrade` failed if the `--password` (or `-p`) option was given. ([Bug#24896](#))
- Accessing a fixed record format table with a crashed key definition results in server/`myisamchk` segmentation fault. ([Bug#24855](#))
- `mysqld_multi` and `mysqlaccess` looked for option files in `/etc` even if the `--sysconfdir` option for `configure` had been given to specify a different directory. ([Bug#24780](#))

- If there was insufficient memory available to `mysqld`, this could sometimes cause the server to hang during startup. ([Bug#24751](#))
- Optimizations that are legal only for subqueries without tables and `WHERE` conditions were applied for any subquery without tables. ([Bug#24670](#))
- Under certain rare circumstances, local checkpoints were not performed properly, leading to an inability to restart one or more data nodes. ([Bug#24664](#))
- A workaround was implemented to avoid a race condition in the NPTL `pthread_exit()` implementation. ([Bug#24507](#))
- Under some circumstances, a `REORGANIZE PARTITION` statement could crash `mysqld`. ([Bug#24502](#))
- `mysqltest` crashed with a stack overflow. ([Bug#24498](#))
- Attempts to access a `MyISAM` table with a corrupt column definition caused a server crash. ([Bug#24401](#))
- `ALTER ENABLE KEYS` or `ALTER TABLE DISABLE KEYS` combined with another `ALTER TABLE` option other than `RENAME TO` did nothing. In addition, if `ALTER TABLE` was used on a table having disabled keys, the keys of the resulting table were enabled. ([Bug#24395](#))
- When opening a corrupted `.frm` file during a query, the server crashes. ([Bug#24358](#))
- The `--extern` option for `mysql-test-run.pl` did not function correctly. ([Bug#24354](#))
- Some joins in which one of the joined tables was a view could return erroneous results or crash the server. ([Bug#24345](#))
- The `mysql.server` script used the `source` command, which is less portable than the `.` command; it now uses `.` instead. ([Bug#24294](#))
- A view was not handled correctly if the `SELECT` part contained “\Z”. ([Bug#24293](#))
- `mysql_install_db` did not create the `mysql.plugin` table if strict SQL mode was enabled. ([Bug#24270](#))
- A query using `WHERE unsigned_column NOT IN ('negative_value')` could cause the server to crash. ([Bug#24261](#))
- `ALTER TABLE` statements that performed both `RENAME TO` and `{ENABLE|DISABLE} KEYS` operations caused a server crash. ([Bug#24219](#))
- A `FETCH` statement using a cursor on a table which was not in the table cache could sometimes cause the server to crash. ([Bug#24117](#))
- Hebrew-to-Unicode conversion failed for some characters. Definitions for the following Hebrew characters (as specified by the ISO/IEC 8859-8:1999) were added: LEFT-TO-RIGHT MARK (LRM), RIGHT-TO-LEFT MARK (RLM) ([Bug#24037](#))
- On HP-UX, `mysqltest` (nonthread-safe) crashed due to being linked against a thread-safe `libmysys` library. ([Bug#23984](#))
- The server was built even when `configure` was run with the `--without-server` option. ([Bug#23973](#))

See also [Bug#32898](#).

- The MySQL 5.1.12 binaries for Windows were missing the `FEDERATED`, `EXAMPLE`, and `BLACKHOLE` storage engines. ([Bug#23900](#))
- `ROW_COUNT()` did not work properly as an argument to a stored procedure. ([Bug#23760](#))
- When reading from the standard input on Windows, `mysqlbinlog` opened the input in text mode rather than binary mode and consequently misinterpreted some characters such as Control-Z. ([Bug#23735](#))
- `OPTIMIZE TABLE` tried to sort R-tree indexes such as spatial indexes, although this is not possible (see [Section 12.4.2.5, “`OPTIMIZE TABLE` Syntax”](#)). ([Bug#23578](#))
- The row count for `MyISAM` tables was not updated properly, causing `SHOW TABLE STATUS` to report incorrect values. ([Bug#23526](#))
- The Instance Manager `DROP INSTANCE` command did not work. ([Bug#23476](#))
- User-defined variables could consume excess memory, leading to a crash caused by the exhaustion of resources available to the `MEMORY` storage engine, due to the fact that this engine is used by MySQL for variable storage and intermediate results of `GROUP BY` queries. Where `SET` had been used, such a condition could instead give rise to the misleading error message `You`

MAY ONLY USE CONSTANT EXPRESSIONS WITH SET, rather than OUT OF MEMORY (NEEDED NNNNNN BYTES). ([Bug#23443](#))

- A table created with the `ROW_FORMAT = FIXED` table option lost the option if an index was added or dropped with `CREATE INDEX` or `DROP INDEX`. ([Bug#23404](#))
- A deadlock could occur, with the server hanging on `Closing tables`, with a sufficient number of concurrent `INSERT DELAYED`, `FLUSH TABLES`, and `ALTER TABLE` operations. ([Bug#23312](#))
- Accuracy was improved for comparisons between `DECIMAL` columns and numbers represented as strings. ([Bug#23260](#))
- The Instance Manager `STOP INSTANCE` command took too much time and caused Instance Manager to be unresponsive. ([Bug#23215](#))
- If there was insufficient memory to store or update a blob record in a `MyISAM` table then the table will be marked as crashed. ([Bug#23196](#))
- A compressed `MyISAM` table that became corrupted could crash `myisamchk` and possibly the MySQL Server. ([Bug#23139](#))
- `CREATE TABLE ... SELECT` statements were not rolled back correctly. As part of the fix, such a statement now causes an implicit commit before and after it is executed. However, it does not cause a commit when used to create a temporary table. ([Bug#22864](#))
- `mysql_upgrade` failed when called with a `--basedir` path name containing spaces. ([Bug#22801](#))
- Using `INSTALL PLUGIN` followed by a restart of the server caused an error due to memory not being properly initialized. ([Bug#22694](#))
- `SET lc_time_names = value` permitted only exact literal values, not expression values. ([Bug#22647](#))
- A partitioned table that used the `DATA DIRECTORY` option, where the data directory was the same as the directory in which the table definition file resided, became corrupted following `ALTER TABLE ENGINE=ARCHIVE`. This was actually due to an issue with the `ARCHIVE` storage engine, and not with partitioned tables in general. ([Bug#22634](#))
- The `STDDEV()` function returned a positive value for data sets consisting of a single value. ([Bug#22555](#))
- `SHOW COLUMNS` reported some `NOT NULL` columns as `NULL`. ([Bug#22377](#))
- A server crash occurred when using `LOAD DATA` to load a table containing a `NOT NULL` spatial column, when the statement did not load the spatial column. Now a `NULL supplied to NOT NULL column` error occurs. ([Bug#22372](#))
- An `ALTER TABLE` statement that used a `RENAME` clause in combination with a `MODIFY` or `CHANGE` that did not actually change the table (for example, when it changed a column's type from `INT` to `INT`). The behavior caused by this bug differed according to whether or not the storage engine used by the table was transactional or nontransactional. For transactional tables (such as those using the `InnoDB` storage engine), the statement simply failed; for nontransactional tables (such as those using the `MyISAM` storage engine), the `ALTER TABLE` statement succeeding renaming the table, but subsequent `SELECT` statements against the renamed table would fail. ([Bug#22369](#))
- The Instance Manager `STOP INSTANCE` command could not be applied to instances in the `Crashed`, `Failed`, or `Abandoned` state. ([Bug#22306](#))
- `DATE_ADD()` requires complete dates with no “zero” parts, but sometimes did not return `NULL` when given such a date. ([Bug#22229](#))
- Some small double precision numbers (such as `1.0000001e-300`) that should have been accepted were truncated to zero. ([Bug#22129](#))
- Changing the value of `MI_KEY_BLOCK_LENGTH` in `myisam.h` and recompiling MySQL resulted in a `myisamchk` that saw existing `MyISAM` tables as corrupt. ([Bug#22119](#))
- For a nonexistent table, `DROP TEMPORARY TABLE` failed with an incorrect error message if `read_only` was enabled. ([Bug#22077](#))
- A crash of the MySQL Server could occur when unpacking a `BLOB` column from a row in a corrupted MyISAM table. This could happen when trying to repair a table using either `REPAIR TABLE` or `myisamchk`; it could also happen when trying to access such a “broken” row using statements like `SELECT` if the table was not marked as crashed. ([Bug#22053](#))
- The code for generating `USE` statements for binary logging of `CREATE PROCEDURE` statements resulted in confusing output from `mysqlbinlog` for `DROP PROCEDURE` statements. ([Bug#22043](#))
- `STR_TO_DATE()` returned `NULL` if the format string contained a space following a nonformat character. ([Bug#22029](#))

- It was possible to use `DATETIME` values whose year, month, and day parts were all zeros but whose hour, minute, and second parts contained nonzero values, an example of such an illegal `DATETIME` being '`0000-00-00 11:23:45`'.

**Note**

This fix was reverted in MySQL 5.1.18.

([Bug#21789](#))

See also [Bug#25301](#).

- SSL connections could hang at connection shutdown. ([Bug#21781](#), [Bug#24148](#))
- yaSSL crashed on pre-Pentium Intel CPUs. ([Bug#21765](#))
- Using `FLUSH TABLES` in one connection while another connection is using `HANDLER` statements caused a server crash.

**Note**

This fix was reverted in MySQL 5.1.22

([Bug#21587](#))

See also [Bug#29474](#).

- The `FEDERATED` storage engine did not support the `euckr` character set. ([Bug#21556](#))
- `InnoDB` crashed while performing XA recovery of prepared transactions. ([Bug#21468](#))
- It was possible to set the backslash character ("`\`") as the delimiter character using `DELIMITER`, but not actually possible to use it as the delimiter. ([Bug#21412](#))
- Using `ALTER TABLE` to convert a `CSV` table containing `NULL` values to `MyISAM` resulted in warnings. ([Bug#21328](#))
- When updating a table that used a `JOIN` of the table itself (for example, when building trees) and the table was modified on one side of the expression, the table would either be reported as crashed or the wrong rows in the table would be updated. ([Bug#21310](#))
- `mysqld_error.h` was not installed when only the client libraries were built. ([Bug#21265](#))
- `InnoDB`: During a restart of the MySQL Server that followed the creation of a temporary table using the `InnoDB` storage engine, MySQL failed to clean up in such a way that `InnoDB` still attempted to find the files associated with such tables. ([Bug#20867](#))
- Selecting into variables sometimes returned incorrect wrong results. ([Bug#20836](#))
- Queries of the form `SELECT ... WHERE string = ANY(...)` failed when the server used a single-byte character set and the client used a multi-byte character set. ([Bug#20835](#))

See also [Bug#34760](#).

- `mysql_fix_privilege_tables.sql` altered the `table_privs.table_priv` column to contain too few privileges, causing loss of the `CREATE VIEW` and `SHOW VIEW` privileges. ([Bug#20589](#))
- A stored routine containing semicolon in its body could not be reloaded from a dump of a binary log. ([Bug#20396](#))
- `SELECT ... FOR UPDATE`, `SELECT ... LOCK IN SHARE MODE`, `DELETE`, and `UPDATE` statements executed using a full table scan were not releasing locks on rows that did not satisfy the `WHERE` condition. ([Bug#20390](#))
- The `BUILD/check-cpu` script did not recognize Celeron processors. ([Bug#20061](#))
- Unsigned `BIGINT` values treated as signed values by the `MOD( )` function. ([Bug#19955](#))
- Compiling PHP 5.1 with the MySQL static libraries failed on some versions of Linux. ([Bug#19817](#))
- The `DELIMITER` statement did not work correctly when used in an SQL file run using the `SOURCE` statement. ([Bug#19799](#))
- `mysqltest` incorrectly tried to retrieve result sets for some queries where no result set was available. ([Bug#19410](#))
- `VARBINARY` column values inserted on a MySQL 4.1 server had trailing zeros following upgrade to MySQL 5.0 or later. ([Bug#19371](#))

- Some `CASE` statements inside stored routines could lead to excessive resource usage or a crash of the server. ([Bug#19194](#), [Bug#24854](#))
- Instance Manager could crash during shutdown. ([Bug#19044](#))
- `myisampack` wrote to unallocated memory, causing a crash. ([Bug#17951](#))
- `FLUSH LOGS` or `mysqladmin flush-logs` caused a server crash if the binary log was not open. ([Bug#17733](#))
- `mysql_fix_privilege_tables` did not accept a password containing embedded space or apostrophe characters. ([Bug#17700](#))
- No warning was issued for use of the `DATA DIRECTORY` or `INDEX DIRECTORY` table options on a platform that does not support them. ([Bug#17498](#))
- The `FEDERATED` storage engine did not support the `utf8` character set. ([Bug#17044](#))
- The optimizer removes expressions from `GROUP BY` and `DISTINCT` clauses if they happen to participate in `expression = constant` predicates of the `WHERE` clause, the idea being that, if the expression is equal to a constant, then it cannot take on multiple values. However, for predicates where the expression and the constant item are of different result types (for example, when a string column is compared to 0), this is not valid, and can lead to invalid results in such cases. The optimizer now performs an additional check of the result types of the expression and the constant; if their types differ, then the expression is not removed from the `GROUP BY` list. ([Bug#15881](#))
- When a prepared statement failed during the prepare operation, the error code was not cleared when it was reused, even if the subsequent use was successful. ([Bug#15518](#))
- Dropping a user-defined function sometimes did not remove the UDF entry from the `mysql.proc` table. ([Bug#15439](#))
- Inserting a row into a table without specifying a value for a `BINARY(N) NOT NULL` column caused the column to be set to spaces, not zeros. ([Bug#14171](#))
- On Windows, the `SLEEP()` function could sleep too long, especially after a change to the system clock. ([Bug#14094](#), [Bug#24686](#), [Bug#17635](#))
- `mysqldump --order-by-primary` failed if the primary key name was an identifier that required quoting. ([Bug#13926](#))
- Subqueries of the form `NULL IN (SELECT ...)` returned invalid results. ([Bug#8804](#), [Bug#23485](#))

## C.1.43. Changes in MySQL 5.1.14 (05 December 2006)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Cluster Replication: Incompatible Change:** Two major changes have taken place with regard to the MySQL Cluster system tables. These are:
  1. The `cluster` database is no longer used. The tables formerly found in the `cluster` database are now in the `mysql` database, and have been renamed as `ndb_binlog_index`, `ndb_apply_status`, and `ndb_schema`.
  2. The `mysql.ndb_apply_status` and `mysql.ndb_schema` tables (formerly `cluster.apply_status` and `cluster.schema`) are now created by `ndb_restore`, in the event that they do not already exist on the slave cluster.

### Note

When upgrading from versions of MySQL previous to 5.1.14 to 5.1.14 or later, `mysql_fix_privilege_tables` merely creates a new `mysql.ndb_binlog_index` table, but does not remove the existing `cluster` database (or, if upgrading from MySQL 5.1.7 or earlier, the existing `cluster_replication` database), nor any of the tables in it.

For more information, see [Section 17.6.4, “MySQL Cluster Replication Schema and Tables”](#). ([Bug#14612](#))

- **Cluster Replication: Incompatible Change:** The `cluster` database is no longer used. The tables formerly found in the `cluster` database are now in the `mysql` database, and have been renamed as `ndb_binlog_index`, `ndb_apply_status`, and `ndb_schema`.
- **Incompatible Change:** The `prepared_stmt_count` system variable has been converted to the `Prepared_stmt_count` global status variable (viewable with the `SHOW GLOBAL STATUS` statement). ([Bug#23159](#))
- **Incompatible Change:** Previously, you could create a user-defined function (UDF) or stored function with the same name as a built-in function, but could not invoke the UDF. Now an error occurs if you try to create such a UDF. The server also now generates a warning if you create a stored function with the same name as a built-in function. It is not considered an error to create a stored function with the same name as a built-in function because you can invoke the function using `db_name.func_name()` syntax. However, the server now generates a warning in this case.

See [Section 8.2.4, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions. ([Bug#22619](#), [Bug#18239](#))

- **Disk Data: Important Change:** The output of `mysqldump` now includes by default all tablespace and logfile group definitions used by any tables or databases that are dumped.

This fix also introduces the `--no-tablespaces` option (short form: `-y`) for `mysqldump`, which has the effect of suppressing all `CREATE LOGFILE GROUP` and `CREATE TABLESPACE` statements in the output.

### Note

The working of the `--all-tablespaces` or `-Y` option for `mysqldump` remains unaffected by this change.

([Bug#20839](#))

- **MySQL Cluster:** Backup messages are now printed to the Cluster log. ([Bug#24544](#))
- **MySQL Cluster:** Setting the configuration parameter `LockPagesInMainMemory` had no effect. ([Bug#24461](#))
- **MySQL Cluster:** The error message `MANAGEMENT SERVER CLOSED CONNECTION`, when recorded in the MySQL error log, now includes a timestamp indicating when the error took place. ([Bug#21519](#))
- **MySQL Cluster:** It is now possible to create a unique hashed index on a column that is not defined as `NOT NULL`.

### Note

This change applies only to tables using the `NDB` storage engine.

Unique indexes on columns in `NDB` tables do not store null values because they are mapped to primary keys in an internal index table (and primary keys cannot contain nulls).

Normally, an additional ordered index is created when one creates unique indexes on `NDB` table columns; this can be used to search for `NULL` values. However, if `USING HASH` is specified when such an index is created, no ordered index is created.

The reason for permitting unique hash indexes with null values is that, in some cases, the user wants to save space if a large number of records are pre-allocated but not fully initialized. This also assumes that the user will *not* try to search for null values. Since MySQL does not support indexes that are not permitted to be searched in some cases, the `NDB` storage engine uses a full table scan with pushed conditions for the referenced index columns to return the correct result.

A warning is returned if one creates a unique nullable hash index, since the query optimizer should be provided a hint not to use it with `NULL` values if this can be avoided. ([Bug#21507](#))

- `DROP TRIGGER` now supports an `IF EXISTS` clause. ([Bug#23703](#))
- Direct and indirect usage of stored routines, user-defined functions, and table references is now prohibited in `CREATE EVENT` and `ALTER EVENT` statements.

See [Section 12.1.11, “CREATE EVENT Syntax”](#), and [Section 12.1.2, “ALTER EVENT Syntax”](#), for more specific information. ([Bug#22830](#))

- The XPath operators < and >, as implemented in the `ExtractValue()` function, operated in reverse. With this fix, all standard XPath comparison operators should now be supported correctly for use with the `ExtractValue()` and `UpdateXML()` functions. ([Bug#22823](#))
- For the `mysql` client, display of result set metadata now is enabled with the `--column-type-info` option rather than with `--debug-info/-T`.
- `mysqladmin`, `mysqlcheck`, `mysqldump`, `mysqlimport`, and `mysqlshow` now accept the `--debug-info` option, which displays debugging information and memory and CPU usage statistics at program exit.

Bugs fixed:

- **Performance:** Evaluation of subqueries that require the filesort algorithm were allocating and freeing the `sort_buffer_size` buffer many times, resulting in slow performance. Now the buffer is allocated once and reused. ([Bug#21727](#))
- **MySQL Cluster: Replication:** (Replication): If errors occurred during purging of the binary logs, extraneous rows could remain left in the `binlog_index` table. ([Bug#15021](#))
- **MySQL Cluster:** The failure of a data node failure during a schema operation could lead to additional node failures. ([Bug#24752](#))
- **MySQL Cluster:** A committed read could be attempted before a data node had time to connect, causing a timeout error. ([Bug#24717](#))
- **MySQL Cluster:** The simultaneous shutdown of `mysqld` and `ndbd` processes caused unnecessary locking. ([Bug#24655](#))
- **MySQL Cluster:** The failure of the master node in a node group during the allocation of node IDs could cause `ndb_mgmd` to hang. ([Bug#24543](#))
- **MySQL Cluster:** In certain rare cases, a data node could crash due to a typographical error in the MySQL Cluster source code. ([Bug#24476](#))
- **MySQL Cluster:** Creating a new tables containing a `BLOB` column when the server was short of memory could cause the server to crash. ([Bug#24470](#))
- **MySQL Cluster:** Sudden disconnection of an SQL or data node could lead to shutdown of data nodes with the error `FAILED_NDBREQUIRE`. ([Bug#24447](#))
- **MySQL Cluster:** Any statement following the execution of `CREATE TABLE ... LIKE ndb_table` (where `ndb_table` was a table using the `NDB` storage engine), would cause the `mysql` client to hang. ([Bug#24301](#))
- **MySQL Cluster:** (Disk Data): Excessive fragmentation of Disk Data files (including log files and data files) could occur during the course of normal use. ([Bug#24143](#))
- **MySQL Cluster:** When the management client command `ALL RESTART -i` was executed while one data node was not running, all data nodes in the cluster were shut down. ([Bug#24105](#))
- **MySQL Cluster:** A query using an index scan followed by a delete operation, and then a rollback could cause one or more data nodes to crash. ([Bug#24039](#))
- **MySQL Cluster:** (Disk Data): Under some circumstances, a `DELETE` from a Disk Data table could cause `mysqld` to crash. ([Bug#23542](#))
- **MySQL Cluster:** It was possible for the sum of the `MaxNoOfTables`, `MaxNoOfOrderedIndexes`, and `MaxNoOfUniqueHashIndexes` configuration parameters, plus the number of system tables to exceed the maximum value for a `UInt32` number. In such a case, the cluster's data nodes failed to start, and no reason for this could easily be determined from the error messages provided. ([Bug#22548](#))
- **MySQL Cluster:** A value equal to or greater than the permitted maximum for `LongMessageBuffer` caused all data nodes to crash. ([Bug#22547](#))
- **MySQL Cluster:** Multiple occurrences of error conditions were logged with duplicate error messages rather than being reported with a single error message stating that the error was encountered `N` times. ([Bug#22313](#))
- **MySQL Cluster:** Given a table `mytbl` in a database `mydb` on a MySQL Server acting as an SQL node in a MySQL Cluster, then, following multiple `ALTER TABLE mytbl ENGINE=engine` statements—first, to change the storage engine used for a table to `NDB`, and then again to change the table to use a non-`NDB` storage engine—a `DROP DATABASE mydb` statement ex-

ecuted on any SQL node in the cluster would cause `mydb` to be dropped on *all* SQL nodes in the cluster, even if `mydb` contained non-NDB tables. ([Bug#21495](#))

- **MySQL Cluster:** An incorrect error message was displayed in the event that the value of the `MaxNoOfOrderedIndexes` parameter was set too low. ([Bug#20065](#))
- **MySQL Cluster:** An incorrect error message was displayed in the event that the value of the `DataMemory` parameter was insufficient for the amount of data to be stored by the cluster. ([Bug#19808](#))
- **MySQL Cluster:** Some values of `MaxNoOfTriggers` could cause the server to become inaccessible following startup of the data nodes. ([Bug#19454](#))
- **MySQL Cluster:** If the value set for `MaxNoOfAttributes` is excessive, a suitable error message is now returned. ([Bug#19352](#))
- **MySQL Cluster:** Different error messages were returned for similar cases involving failure to allocate memory for Cluster operations. ([Bug#19203](#))
- **MySQL Cluster:** A unique constraint violation was not ignored by an `UPDATE IGNORE` statement when the constraint violation occurred on a nonprimary key. ([Bug#18487](#), [Bug#24303](#))
- **Replication:** With row-based binary logging, replicated multiple-statement transaction deadlocks did not return the correct error code, causing the slave SQL thread to stop rather than roll back and re-execute. ([Bug#23831](#))
- **Replication:** Changes to character set variables prior to an action on a replication-ignored table were forgotten by slave servers. ([Bug#22877](#))
- **Replication:** On slave servers, transactions that exceeded the lock wait timeout failed to roll back properly. ([Bug#20697](#))
- **Replication:** SQL statements close to the size of `max_allowed_packet` could produce binary log events larger than `max_allowed_packet` that could not be read by slave servers. ([Bug#19402](#))
- **Disk Data:** `ndb_restore` sometimes failed when attempting to restore Disk Data tables due to data node failure caused by accessing uninitialized memory. ([Bug#24331](#))
- **Disk Data:** It was possible to execute a statement for creating a Disk Data table that referred to a nonexistent tablespace, in which case the table created was actually an in-memory NDB table. Such a statement now fails instead, with an appropriate error message. ([Bug#23576](#))
- **Cluster API:** Using `BIT` values with any of the comparison methods of the `NdbScanFilter` class caused data nodes to fail. ([Bug#24503](#))
- **Cluster API:** Some MGM API function calls could yield incorrect return values in certain cases where the cluster was operating under a very high load, or experienced timeouts in inter-node communications. ([Bug#24011](#))
  - In some cases, a function that should be parsed as a user-defined function was parsed as a stored function. ([Bug#24736](#))
  - Some unnecessary Valgrind warnings were removed from the server. ([Bug#24488](#), [Bug#24533](#))
  - The server source code had multiple exportable definitions of the `field_in_record_is_null()` function. These are now all declared `static`. ([Bug#24190](#))
  - The loose index scan optimization for `GROUP BY` with `MIN` or `MAX` was not applied within other queries, such as `CREATE TABLE ... SELECT ... , INSERT ... SELECT ...`, or in the `FROM` clauses of subqueries. ([Bug#24156](#))
  - Subqueries for which a pushed-down condition did not produce exactly one key field could cause a server crash. ([Bug#24056](#))
  - The size of `MEMORY` tables and internal temporary tables was limited to 4GB on 64-bit Windows systems. ([Bug#24052](#))
  - `LAST_DAY('0000-00-00')` could cause a server crash. ([Bug#23653](#))
  - A trigger that invoked a stored function could cause a server crash when activated by different client connections. ([Bug#23651](#))
  - The stack size for NetWare binaries was increased to 128KB to prevent problems caused by insufficient stack size. ([Bug#23504](#))
  - If elements in a nontop-level `IN` subquery were accessed by an index and the subquery result set included a `NULL` value, the quantified predicate that contained the subquery was evaluated to `NULL` when it should return a non-`NULL` value. ([Bug#23478](#))
  - When applying the `group_concat_max_len` limit, `GROUP_CONCAT()` could truncate multi-byte characters in the middle. ([Bug#23451](#))

- `mysql_affected_rows()` could return values different from `mysql_stmt_affected_rows()` for the same sequence of statements. ([Bug#23383](#))
- Calculation of `COUNT(DISTINCT)`, `AVG(DISTINCT)`, or `SUM(DISTINCT)` when they are referenced more than once in a single query with `GROUP BY` could cause a server crash. ([Bug#23184](#))
- With row-based binary logging, for `CREATE TABLE IF NOT EXISTS LIKE temporary_table` statements, the `IF NOT EXISTS` clause was not logged. ([Bug#22762](#))
- `BENCHMARK()`, `ENCODE()`, `DECODE()`, and `FORMAT()` could only accept a constant for some parameters, and could not be used in prepared statements. ([Bug#22684](#))
- Queries using a column alias in an expression as part of an `ORDER BY` clause failed, an example of such a query being `SELECT mycol + 1 AS mynum FROM mytable ORDER BY 30 - mynum.` ([Bug#22457](#))
- Using `EXPLAIN` caused a server crash for queries that selected from `INFORMATION_SCHEMA` in a subquery in the `FROM` clause. ([Bug#22413](#))
- Instance Manager option-parsing code caused memory-allocation errors. ([Bug#22242](#))
- Trailing spaces were not removed from Unicode `CHAR` column values when used in indexes. This resulted in excessive usage of storage space, and could affect the results of some `ORDER BY` queries that made use of such indexes.

### Note

When upgrading, it is necessary to re-create any existing indexes on Unicode `CHAR` columns to take advantage of the fix. This can be done by using a `REPAIR TABLE` statement on each affected table.

([Bug#22052](#))

- With row-based binary logging, `CREATE TABLE IF NOT EXISTS SELECT` statements were not logged properly. ([Bug#22027](#))
- In some cases, the parser failed to distinguish a user-defined function from a stored function. ([Bug#21809](#))
- Inserting a default or invalid value into a spatial column could fail with `Unknown error` rather than a more appropriate error. ([Bug#21790](#))
- Through the C API, the member strings in `MYSQL_FIELD` for a query that contains expressions may return incorrect results. ([Bug#21635](#))
- View columns were always handled as having implicit derivation, leading to `illegal mix of collation errors` for some views in `UNION` operations. Now view column derivation comes from the original expression given in the view definition. ([Bug#21505](#))
- `INET_ATON()` returned a signed `BIGINT` value, not an unsigned value. ([Bug#21466](#))
- For debug builds, `mysqladmin shutdown` displayed an extraneous `skipped 9 bytes from file: socket (3)` message. ([Bug#21428](#))
- For renaming of views, encoding of table name to file names was not performed. ([Bug#21370](#))
- `CREATE FUNCTION X()` and `CREATE FUNCTION Y()` failed with a syntax error instead of warning the user that these function names are already used (for GIS functions). ([Bug#21025](#))
- `CONCURRENT` did not work correctly for `LOAD DATA INFILE`. ([Bug#20637](#))
- With `lower_case_table_names` set to 1, `SHOW CREATE TABLE` printed incorrect output for table names containing Turkish I (LATIN CAPITAL LETTER I WITH DOT ABOVE). ([Bug#20404](#))
- A query with a subquery that references columns of a view from the outer `SELECT` could return an incorrect result if used from a prepared statement. ([Bug#20327](#))
- For queries that select from a view, the server was returning `MYSQL_FIELD` metadata inconsistently for view names and table names. For view columns, the server now returns the view name in the `table` field and, if the column selects from an underlying table, the table name in the `org_table` field. ([Bug#20191](#))
- Invalidating the query cache caused a server crash for `INSERT INTO ... SELECT` statements that selected from a view. ([Bug#20045](#))
- For a cast of a `DATETIME` value containing microseconds to `DECIMAL`, the microseconds part was truncated without generating an error. ([Bug#19977](#))

ing a warning. Now the microseconds part is preserved. ([Bug#19491](#))

- The server could send incorrect column count information to the client for queries that produce a larger number of columns than can fit in a two-byte number. ([Bug#19216](#))
- For some problems relating to character set conversion or incorrect string values for `INSERT` or `UPDATE`, the server was reporting truncation or length errors instead. ([Bug#18908](#))
- Constant expressions and some numeric constants used as input parameters to user-defined functions were not treated as constants. ([Bug#18761](#))
- Attempting to use a view containing `DEFINER` information for a nonexistent user resulted in an error message that revealed the definer account. Now the definer is revealed only to superusers. Other users receive only an `access denied` message. ([Bug#17254](#))
- `IN()` and `CHAR()` can return `NULL`, but did not signal that to the query processor, causing incorrect results for `IS NULL` operations. ([Bug#17047](#))
- Warnings were generated when explicitly casting a character to a number (for example, `CAST('x' AS SIGNED)`), but not for implicit conversions in simple arithmetic operations (such as `'x' + 0`). Now warnings are generated in all cases. ([Bug#11927](#))
- Metadata for columns calculated from scalar subqueries was limited to integer, double, or string, even if the actual type of the column was different. ([Bug#11032](#))

## C.1.44. Changes in MySQL 5.1.13 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see [ht tp://www.mysql.com/products/enterprise](http://www.mysql.com/products/enterprise).

Functionality added or changed:

- **Incompatible Change:** The number of function names affected by `IGNORE_SPACE` was reduced significantly in MySQL 5.1.13, from about 200 to about 30. (For details about `IGNORE_SPACE`, see Section 8.2.4, “Function Name Parsing and Resolution”.) This change improves the consistency of parser operation. However, it also introduces the possibility of incompatibility for old SQL code that relies on the following conditions:
  - `IGNORE_SPACE` is disabled.
  - The presence or absence of whitespace following a function name is used to distinguish between a built-in function and stored function that have the same name (for example, `PI()` versus `PI ()`).

For functions that are no longer affected by `IGNORE_SPACE` as of MySQL 5.1.13, that strategy no longer works. Either of the following approaches can be used if you have code that is subject to the preceding incompatibility:

- If a stored function has a name that conflicts with a built-in function, refer to the stored function with a schema name qualifier, regardless of whether whitespace is present. For example, write `schema_name.PI()` or `schema_name.PI ()`.
- Alternatively, rename the stored function to use a nonconflicting name and change invocations of the function to use the new name.

([Bug#21114](#))

- **Incompatible Change:** The `innodb_buffer_pool_awe_mem_mb` system variable has been removed and should no longer be used.

- **MySQL Cluster:** A change in the interfaces for the `INFORMATION_SCHEMA.FILES` table has made the table accessible to storage engines other than `NDB`. ([Bug#23013](#))
- Binary distributions of MySQL 5.1.12 were built without support for partitioning. This has been corrected except for NetWare. ([Bug#23949](#))
- If the user specified the server options `--max-connections=N` or `--table-open-cache=M`, a warning would be given in some cases that some values were recalculated, with the result that `--table-open-cache` could be assigned greater value.

In such cases, both the warning and the increase in the `--table-open-cache` value were completely harmless. Note also that it is not possible for the MySQL Server to predict or to control limitations on the maximum number of open files, since this is determined by the operating system.

The value of `--table-open-cache` is no longer increased automatically, and a warning is now given only if some values had to be decreased due to operating system limits. ([Bug#21915](#))

- For the `CALL` statement, stored procedures that take no arguments now can be invoked without parentheses. That is, `CALL p()` and `CALL p` are equivalent. ([Bug#21462](#))
- `mysql_upgrade` now passes all the parameters specified on the command line to both `mysqlcheck` and `mysql` using the `upgrade_defaults` file. ([Bug#20100](#))
- `mysqldump --single-transaction` now uses `START TRANSACTION /*!40100 WITH CONSISTENT SNAPSHOT */` rather than `BEGIN` to start a transaction, so that a consistent snapshot will be used on those servers that support it. ([Bug#19660](#))

Bugs fixed:

- **Performance:** `InnoDB` showed substandard performance with multiple queries running concurrently. ([Bug#15815](#))
- **Important Change:** When installing MySQL on AIX 5.3, you must upgrade AIX to technology level 7 (5300-07) to ensure the required thread libraries are available.
- **MySQL Cluster:** Backup of a cluster failed if there were any tables with 128 or more columns. ([Bug#23502](#))
- **MySQL Cluster:** Cluster backups failed when there were more than 2048 schema objects in the cluster. ([Bug#23499](#))
- **MySQL Cluster:** Restoring a cluster failed if there were any tables with 128 or more columns. ([Bug#23494](#))
- **MySQL Cluster:** The management client command `ALL DUMP 1000` would cause the cluster to crash if data nodes were connected to the cluster but not yet fully started. ([Bug#23203](#))
- **MySQL Cluster:** `INSERT ... ON DUPLICATE KEY UPDATE` on an `NDB` table could lead to deadlocks and memory leaks. ([Bug#23200](#))
- **MySQL Cluster:** An `NDB` source file included a `memset()` call with reversed arguments. ([Bug#23169](#))
- **MySQL Cluster:** If a node restart could not be performed from the REDO log, no node takeover took place. This could cause partitions to be left empty during a system restart. ([Bug#22893](#))
- **MySQL Cluster:** Multiple node restarts in rapid succession could cause a system restart to fail, or induce a race condition. ([Bug#22892](#), [Bug#23210](#))
- **MySQL Cluster:** Attempting to create a unique constraint with `USING HASH` on an `NDB` table caused `mysqld` to crash. ([Bug#21873](#))
- **MySQL Cluster:** When inserting a row into an `NDB` table with a duplicate value for a nonprimary unique key, the error issued would reference the wrong key. ([Bug#21072](#))
- **MySQL Cluster:** Aborting a cluster backup too soon after starting it caused a forced shutdown of the data nodes. ([Bug#19148](#))
- **Replication:** Column names were not quoted properly for replicated views. ([Bug#19736](#))
- **Replication:** Transient errors in replication from master to slave may trigger multiple `Got fatal error 1236: 'bin-log truncated in the middle of event'` errors on the slave. ([Bug#4053](#))
- **Disk Data:** In the event of an aborted multiple update, the space in the Disk Data log buffer to be freed as a result was actually freed twice, which could eventually lead to a crash. ([Bug#23430](#))

- **Cluster API:** When multiple processes or threads in parallel performed the same ordered scan with exclusive lock and updated the retrieved records, the scan could skip some records, which as a result were not updated. ([Bug#20446](#))
- `FORMAT(X,D)` did not accept a nonconstant value for `D`. ([Bug#48374](#))
- There was a race condition in the `InnoDB fil_flush_file_spaces()` function. ([Bug#24098](#))
- yaSSL-related memory leaks were detected by Valgrind. ([Bug#23981](#))
- MySQL 5.0.26 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.26 are not compatible with any other version and must be recompiled. ([Bug#23427](#))
- `M % 0` returns `NULL`, but `(M % 0) IS NULL` evaluated to false. ([Bug#23411](#))
- For not-yet-authenticated connections, the `Time` column in `SHOW PROCESSLIST` was a random value rather than `NULL`. ([Bug#23379](#))
- `InnoDB` crashed when trying to display an error message about a foreign key constraint violation when the two tables are in different schemas. ([Bug#23368](#))
- MySQL failed to build on Linux/Alpha. ([Bug#23256](#))

This regression was introduced by [Bug#21250](#).

- If `COMPRESS()` returned `NULL`, subsequent invocations of `COMPRESS()` within a result set or within a trigger also returned `NULL`. ([Bug#23254](#))
- Insufficient memory (`myisam_sort_buffer_size`) could cause a server crash for several operations on `MyISAM` tables: repair table, create index by sort, repair by sort, parallel repair, bulk insert. ([Bug#23175](#))
- The column default value in the output from `SHOW COLUMNS` or `SELECT FROM INFORMATION_SCHEMA.COLUMNS` was truncated to 64 characters. ([Bug#23037](#))
- `mysql` did not check for errors when fetching data during result set printing. ([Bug#22913](#))
- The return value from `my_seek()` was ignored. ([Bug#22828](#))
- Use of `SQL_BIG_RESULT` did not influence the sort plan for query execution. ([Bug#22781](#))
- The optimizer failed to use equality propagation for `BETWEEN` and `IN` predicates with string arguments. ([Bug#22753](#))
- The `Handler_rollback` status variable sometimes was incremented when no rollback had taken place. ([Bug#22728](#))
- The `Host` column in `SHOW PROCESSLIST` output was blank when the server was started with the `-skip-grant-tables` option. ([Bug#22723](#))
- If a table contains an `AUTO_INCREMENT` column, inserting into an insertable view on the table that does not include the `AUTO_INCREMENT` column should not change the value of `LAST_INSERT_ID()`, because the side effects of inserting default values into columns not part of the view should not be visible. MySQL was incorrectly setting `LAST_INSERT_ID()` to zero. ([Bug#22584](#))
- The optimizer used the `ref` join type rather than `eq_ref` for a simple join on strings. ([Bug#22367](#))
- Some queries that used `MAX()` and `GROUP BY` could incorrectly return an empty result. ([Bug#22342](#))
- If an `init_connect` SQL statement produced an error, the connection was silently terminated with no error message. Now the server writes a warning to the error log. ([Bug#22158](#))
- An unhandled `NULL` pointer caused a server crash. ([Bug#22138](#))
- Incorrect warnings occurred for use of `CREATE TABLE ... LIKE` or `REPAIR TABLE` with the log tables. ([Bug#21966](#))
- The optimizer sometimes mishandled R-tree indexes for `GEOMETRY` data types, resulting in a server crash. ([Bug#21888](#))
- Use of a DES-encrypted SSL certificate file caused a server crash. ([Bug#21868](#))
- Use of `PREPARE` with a `CREATE PROCEDURE` statement that contained a syntax error caused a server crash. ([Bug#21856](#))
- Adding a day, month, or year interval to a `DATE` value produced a `DATE`, but adding a week interval produced a `DATETIME` value. Now all produce a `DATE` value. ([Bug#21811](#))
- Use of a subquery that invoked a function in the column list of the outer query resulted in a memory leak. ([Bug#21798](#))

- It was not possible to do an atomic rename of the log tables without the possibility of losing rows. Now you can do this:

```
USE mysql;
CREATE TABLE IF NOT EXISTS general_log2 LIKE general_log;
RENAME TABLE general_log TO general_log_backup, general_log2 TO general_log;
```

(Bug#21785, Bug#17544)

- Within a prepared statement, `SELECT (COUNT(*) = 1)` (or similar use of other aggregate functions) did not return the correct result for statement re-execution. (Bug#21354)
- Within a stored routine, a view definition cannot refer to routine parameters or local variables. However, an error did not occur until the routine was called. Now it occurs during parsing of the routine creation statement.

### Note

A side effect of this fix is that if you have already created such routines, and error will occur if you execute `SHOW CREATE PROCEDURE` or `SHOW CREATE FUNCTION`. You should drop these routines because they are erroneous.

(Bug#20953)

- In `mysql`, invoking `connect` or `\r` with very long `db_name` or `host_name` parameters caused buffer overflow. (Bug#20894)
- `WITH ROLLUP` could group unequal values. (Bug#20825)
- Range searches on columns with an index prefix could miss records. (Bug#20732)
- The server did not allocate sufficient memory for some queries for which a `DISTINCT` to `GROUP BY` conversion is possible and an `ORDER BY` clause is present, resulting in a server crash. (Bug#20503)
- `LIKE` searches failed for indexed `utf8` character columns. (Bug#20471)
- With `sql_mode = TRADITIONAL`, MySQL incorrectly aborted on warnings within stored routines and triggers. (Bug#20028)
- `mysqldump --xml` produced invalid XML for `BLOB` data. (Bug#19745)
- The range analysis optimizer did not take into account predicates for which an index could be used after reading `const` tables. In some cases this resulted in nonoptimal execution plans. (Bug#19579)
- `FLUSH INSTANCES` in Instance Manager triggered an assertion failure. (Bug#19368)
- For a debug server, a reference to an undefined user variable in a prepared statement executed with `EXECUTE` caused an assertion failure. (Bug#19356)
- Within a trigger for a base table, selecting from a view on that base table failed. (Bug#19111)
- The value of the `warning_count` system variable was not being calculated correctly (also affecting `SHOW COUNT(*) WARNINGS`). (Bug#19024)
- `DELETE IGNORE` could hang for foreign key parent deletes. (Bug#18819)
- `InnoDB` used table locks (not row locks) within stored functions. (Bug#18077)
- `mysql` would lose its connection to the server if its standard output was not writable. (Bug#17583)
- At shutdown, Instance Manager told guarded server instances to stop, but did not wait until they actually stopped. (Bug#17486)
- `mysql-test-run` did not work correctly for RPM-based installations. (Bug#17194)
- A client library crash was caused by executing a statement such as `SELECT * FROM t1 PROCEDURE ANALYSE()` using a server side cursor on a table `t1` that does not have the same number of columns as the output from `PROCEDURE ANALYSE()`. (Bug#17039)
- The `WITH CHECK OPTION` for a view failed to prevent storing invalid column values for `UPDATE` statements. (Bug#16813)
- `ALTER TABLE` was not able to rename a view. (Bug#14959)
- Statements such as `DROP PROCEDURE` and `DROP VIEW` were written to the binary log too late due to a race condition. (Bug#14262)

- A literal string in a `GROUP BY` clause could be interpreted as a column name. ([Bug#14019](#))
- Entries in the slow query log could have an incorrect `Rows_examined` value. ([Bug#12240](#))
- Lack of validation for input and output `TIME` values resulted in several problems: `SEC_TO_TIME()` in some cases did not clip large values to the `TIME` range appropriately; `SEC_TO_TIME()` treated `BIGINT UNSIGNED` values as signed; only truncation warnings were produced when both truncation and out-of-range `TIME` values occurred. ([Bug#11655](#), [Bug#20927](#))
- Several string functions could return incorrect results when given very large length arguments. ([Bug#10963](#))
- `FROM_UNIXTIME()` did not accept arguments up to `POWER(2, 31)-1`, which it had previously. ([Bug#9191](#))
- `OPTIMIZE TABLE` with `myisam_repair_threads > 1` could result in `MyISAM` table corruption. ([Bug#8283](#))

## C.1.45. Changes in MySQL 5.1.12 (24 October 2006)

This is a new Beta development release, fixing recently discovered bugs.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change: MySQL Cluster:** MySQL Cluster node and system restarts formerly required that all fragments use the same local checkpoint (LCP); beginning with this version, it is now possible for different fragments to use different LCPs during restarts. This means that data node file systems must be rebuilt as part of any upgrade to this version by restarting all data nodes with the `--initial` option.

See [Section 17.2.5.2, “MySQL Cluster 5.1 and MySQL Cluster NDB 6.x/7.x Upgrade and Downgrade Compatibility”](#), and related sections of the Manual before upgrading a MySQL Cluster to version 5.1.12 or later. ([Bug#21478](#), [Bug#21271](#))

- **Incompatible Change:** In the `INFORMATION_SCHEMA.EVENTS` table, the `EVENT_DEFINITION` column now contains the SQL executed by a scheduled event.

The `EVENT_BODY` column now contains the language used for the statement or statements shown in `EVENT_DEFINITION`. In MySQL 5.1, the value shown in `EVENT_BODY` is always `SQL`.

These changes were made to bring this table into line with the `INFORMATION_SCHEMA.ROUTINES` table, and that table's `ROUTINE_BODY` and `ROUTINE_DEFINITION` columns. ([Bug#16992](#))

- **Incompatible Change:** For `GRANT` and `REVOKE`, `ON *` previously granted and revoked privileges for the default database if there was a default database and global privileges if there was none. Now `ON *` requires a default database and produces an error if there is none.
- **Incompatible Change:** Support for the BerkeleyDB (`BDB`) engine has been dropped from this release. Any existing tables that are in BDB format will not be readable from within MySQL from 5.1.12 or newer. You should convert your tables to another storage engine *before* upgrading to 5.1.12.

Because of this change, the `SHOW [BDB] LOGS` statement has been dropped.

- **Incompatible Change:** A number of MySQL constructs are now prohibited in partitioning expressions, beginning with this release. These include the following:
  - A number of MySQL functions. For a complete list of these, see [Section 18.5.3, “Partitioning Limitations Relating to Functions”](#).
  - The bit operators `|`, `&`, `^`, `<<`, `>>`, and `~`.
  - Nested function calls.
  - Calls to stored routines, UDFs, or plugins.
  - Character-to-integer conversions involving non-8-bit character sets or any of the `latin1_german2_ci`, `latin2_czech_ci`, or `cp1250_czech_ci` collations.

These restrictions were added in part as a result of [Bug#18198](#) and related bug reports.

For more information about these and other restrictions on partitioned tables in MySQL, see [Section 18.5, “Restrictions and Limitations on Partitioning”](#).

- **Incompatible Change:** The permitted values for and behavior of the `event_scheduler` system variable have changed. Permitted values are now `ON`, `OFF`, and `DISABLED`, with `OFF` being the default. It is not possible to change its value to or from `DISABLED` while the server is running.

For details, see [Section 19.4.1, “Event Scheduler Overview”](#).

- **Incompatible Change:** The plugin interface has changed: The `st_mysql_plugin` structure has a new `license` member to indicate the license type. (The permissible values are defined in `mysql/plugin.h`.) This change is not backward compatible, so the API version (`MYSQL_PLUGIN_INTERFACE_VERSION`) has changed. For additional information, see [Section 22.2.5, “Writing Plugins”](#).

- **Incompatible Change:** The full-text parser plugin interface has changed in two ways:

- The `MYSQL_FTPARSER_PARAM` structure has a new `flags` member. This is zero if there are no special flags, or `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- The `mysql_parse()` and `mysql_add_word()` functions now take a `MYSQL_FTPARSER_PARAM` as their first argument, not a `MYSQL_FTPARSER_PARAM::mysql_ftparam` as before.

These changes are not backward compatible, so the API version (`MYSQL_FTPARSER_INTERFACE_VERSION`) has changed. For additional information, see [Section 22.2.5, “Writing Plugins”](#).

- **Incompatible Change:** Storage engines can be pluggable at runtime, so the distinction between disabled and invalid storage engines no longer applies. This affects the `NO_ENGINE_SUBSTITUTION` SQL mode, as described in [Section 5.1.7, “Server SQL Modes”](#).
- **Incompatible Change:** The namespace for scheduled events has changed, such that events are no longer unique to individual users. This also means that a user with the `EVENT` privilege on a given database can now view, alter, or drop any events defined on that database.

If you used scheduled events in an earlier MySQL 5.1 release, you should rename any of them having the same name and defined on the same database but belonging to different users—so that all events in a given database have unique names—*before* upgrading to 5.1.12 (or newer).

For additional information, see [Section 19.4.6, “The Event Scheduler and MySQL Privileges”](#).

- **Important Change: Partitioning: MySQL Cluster:** It is no longer possible to create Cluster tables using any partitioning type other than `[LINEAR] KEY`. Attempting to do so now raises an error.
- **Important Change: MySQL Cluster:** `LOAD DATA INFILE` no longer causes an implicit commit for all storage engines. It now causes an implicit commit only for tables using the `NDB` storage engine. ([Bug#11151](#))
- **Important Change: MySQL Cluster:** The status variables `Ndb_connected_host` and `Ndb_connected_port` were renamed to `Ndb_config_from_host` and `Ndb_config_from_port`, respectively.
- **Important Change: Replication:** The default value for the `--binlog-format` server option is now `MIXED`.
- **MySQL Cluster:** The `ndb_config` utility now accepts `-c` as a short form of the `--ndb-connectstring` option. ([Bug#22295](#))
- **MySQL Cluster:** Added the `--bind-address` option for `ndbd`. This permits a data node process to be bound to a specific network interface. ([Bug#22195](#))
- **MySQL Cluster:** The `Ndb_number_of_storage_nodes` system variable was renamed to `Ndb_number_of_data_nodes`. ([Bug#20848](#))
- **MySQL Cluster:** The `HELP` command in the Cluster management client now provides command-specific help. For example, `HELP RESTART` in `ndb_mgm` provides detailed information about the `RESTART` command. ([Bug#19620](#))
- **MySQL Cluster:** A number of erroneous, misleading, or missing error messages have been corrected. ([Bug#17297](#), [Bug#19543](#))
- **MySQL Cluster:** Backup messages are no longer printed to the cluster log.

- **MySQL Cluster:** Added the `--ndb-use-copying-alter-table` option to `mysqld` to provide a fallback in case of problems with online `ALTER TABLE` operations on NDB tables.
- **Replication:** The default binary log format (as used during replication) is now Mixed based, automatically using a combination of row-based and statement based log events as appropriate.
- **Cluster API:** Two new NDB API methods—`aggregate()` and `validate()`—were added to the `NdbDictionary::Object::Table` class. See `Table::aggregate()`, and `Table::validate()`, for more information. This was done to rectify the following issues:
  - Under some conditions, the data distribution could become unbalanced in a MySQL Cluster with 2 or more node groups following the creation of a new table.
  - Data was stored unevenly between partitions due to all `BLOB` data being placed in partition 0. ([Bug#21690](#))
  - The number of `InnoDB` threads is no longer limited to 1,000 on Windows. ([Bug#22268](#))
  - The `STATE` column of the `INFORMATION_SCHEMA.PROCESSLIST` table was increased from 30 to 64 characters to accommodate longer state values. ([Bug#21652](#))
  - `mysqldump` now has a `--flush-privileges` option. It causes `mysqldump` to emit a `FLUSH PRIVILEGES` statement after dumping the `mysql` database. This option should be used any time the dump contains the `mysql` database and any other database that depends on the data in the `mysql` database for proper restoration. ([Bug#21424](#))
  - `mysqlslap` threads now try to connect up to 10 times if the initial connect attempt fails. ([Bug#21297](#))
  - For `mysqldump`, the output generated by the server when using the `--xml` option has changed with regard to null values. It now matches the output from `mysqldump --xml`. That is, a column containing a `NULL` value is now reported as

```
<field name="column_name" xsi:nil="true" />
```

whereas a column containing the string value '`NULL`' is reported as

```
<field name="column_name">NULL</field>
```

and a column containing an empty string is reported as

```
<field name="column_name"></field>
```

([Bug#21263](#))

- The `mysqld` and `mysqlmanager` man pages have been reclassified from volume 1 to volume 8. ([Bug#21220](#))
- `InnoDB` now honors `IGNORE INDEX`. Previously using `IGNORE INDEX` in cases where an index sort would be slower than a filesort had no effect when used with `InnoDB` tables. ([Bug#21174](#))
- `TIMESTAMP` columns that are `NOT NULL` now are reported that way by `SHOW COLUMNS` and `INFORMATION_SCHEMA`. ([Bug#20910](#))
- Memory consumption of the `InnoDB` data dictionary cache was roughly halved by cleaning up the data structures. ([Bug#20877](#))
- The `BINARY` keyword now is forbidden as a data type attribute in stored routines (for example, `DECLARE v1 VARCHAR(25) BINARY`), because `DECLARE` does not support collations, and in this context `BINARY` specifies the binary collation of the variable's character set. ([Bug#20701](#))
- The following statements now can be executed as prepared statements (using `PREPARE` plus `EXECUTE`):

```
CACHE INDEX
CHANGE MASTER
CHECKSUM {TABLE | TABLES}
{CREATE | RENAME | DROP} DATABASE
{CREATE | RENAME | DROP} USER
FLUSH {TABLE | TABLES | TABLES WITH READ LOCK | HOSTS | PRIVILEGES
 | LOGS | STATUS | MASTER | SLAVE | DES_KEY_FILE | USER_RESOURCES}
GRANT
REVOKE
KILL
LOAD INDEX INTO CACHE
RESET {MASTER | SLAVE | QUERY CACHE}
SHOW BINLOG EVENTS
SHOW CREATE {PROCEDURE | FUNCTION | EVENT | TABLE | VIEW}
SHOW {AUTHORS | CONTRIBUTORS | WARNINGS | ERRORS}
```

```
SHOW {MASTER | BINARY} LOGS
SHOW {MASTER | SLAVE} STATUS
SLAVE {START | STOP}
INSTALL PLUGIN
UNINSTALL PLUGIN
```

(Bug#20665)

- In the `INFORMATION_SCHEMA.ROUTINES` table the `ROUTINE_DEFINITION` column now is defined as `NULL` rather than `NOT NULL`. Also, `NULL` rather than the empty string is returned as the column value if the user does not have sufficient privileges to see the routine definition. (Bug#20230)
- The `mysqldumpslow` script has been moved from client RPM packages to server RPM packages. This corrects a problem where `mysqldumpslow` could not be used with a client-only RPM install, because it depends on `my_print_defaults` which is in the server RPM. (Bug#20216)
- The MySQL distribution now compiles on UnixWare 7.13. (Bug#20190)
- `configure` now defines the symbol `DEBUG_ON` in `config.h` to indicate whether the source tree is configured to be compiled with debugging support. (Bug#19517)
- `TEXT` and `BLOB` columns do not support `DEFAULT` values. However, when a default of `' '` was specified, the specification was silently ignored. This now results in a warning, or an error in strict mode. (Bug#19498)
- For `mysqlshow`, if a database name argument contains wildcard characters (such as `"_"`) but matches a single database name exactly, treat the name as a literal name. This enables a command such as `mysqlshow information_schema` to work without having to escape the wildcard character. (Bug#19147)
- The source distribution has been updated so that the UDF example can be compiled under Windows with CMake. See Section 22.3.2.5, “Compiling and Installing User-Defined Functions”. (Bug#19121)
- The default value of the `tmp_table_size` system variable was lowered from 32MB to 16MB because it is bounded by the value of `max_heap_table_size`, which has a default of 16MB. (Bug#18875)
- Log table changes: By default, the log tables use the `CSV` storage engine, as before. But now the log tables can be altered to use the `MyISAM` storage engine. You cannot use `ALTER TABLE` to alter a log table that is in use. The log must be disabled first. No engines other than `CSV` or `MyISAM` are legal for the log tables. The use of `DROP TABLE` for log tables is similarly restricted: It cannot be used to drop a log table that is in use. The log must be disabled first. (These changes also correct a deadlock that occurred for an attempt to drop an in-use log table.) (Bug#18559)
- Added the `--set-charset` option to `mysqlbinlog` to enable the character set to be specified for processing binary log files. (Bug#18351)
- The `ExtractValue()` function now produces an error when passed an XML fragment that is not well-formed.

(Previously, the function permitted invalid XML fragments to be used.) (Bug#18201)

- On Windows, typing Control-C while a query was running caused the `mysql` client to crash. Now it causes `mysql` to attempt to kill the current statement. If this cannot be done, or Control-C is typed again before the statement is killed, `mysql` exits. (In other words, `mysql`'s behavior with regard to Control-C is now the same as it is on Unix platforms.) (Bug#17926)

See also Bug#1989.

- The bundled yaSSL library licensing has added a FLOSS exception similar to MySQL to resolve licensing incompatibilities with MySQL. (See the `extra/yassl/FLOSS-EXCEPTIONS` file in a MySQL source distribution for details.) (Bug#16755)
- `SHOW CREATE TABLE` now shows constraints for `InnoDB` tables. (Bug#16614)
- `EXPLAIN EXTENDED` now shows a `filtered` column that is an estimated percentage of the examined rows that will be joined with the previous tables. This was added while dealing with a problem of MySQL choosing the wrong index for some queries. (Bug#14940)
- The `mysql` client now permits `\l` in the `prompt` command argument, to insert the current delimiter into the prompt. (Bug#14448)
- The `mysql` client used the default character set if it automatically reconnected to the server, which is incorrect if the character set had been changed. To enable the character set to remain synchronized on the client and server, the `mysql` command `charset` (or `\C`) that changes the default character set and now also issues a `SET NAMES` statement. The changed character set is used for reconnects. (Bug#11972)
- The `LEFT()` and `RIGHT()` functions return `NULL` if any argument is `NULL`. (Bug#11728)

- If a `DROP VIEW` statement named multiple views, it stopped with an error if a nonexistent view was named and did not drop the remaining views. Now it continues on and reports an error at the end, similar to `DROP TABLE`. ([Bug#11551](#))
- For a successful dump, `mysqldump` now writes a SQL comment to the end of the dump file in the following format:

```
-- Dump completed on YYYY-MM-DD hh:mm:ss
```

([Bug#10877](#))

- There were several issues regarding how `SHOW STATUS` affected some status variables and logging which could impact monitoring the MySQL Server. The behavior of this statement has been modified in two ways:
  - `SHOW STATUS` is no longer logged to the slow query log.
  - `SHOW STATUS` no longer updates any session status variables, except for `com_show_status`.

However, `SHOW STATUS` continues to update *global* status variables to enable monitoring of what the server is actually doing. This is because `SHOW STATUS` creates temporary tables that may affect performance if it is called excessively often.  
([Bug#10210](#))

See also [Bug#19764](#).

- For spatial data types, the server formerly returned these as `VARSTRING` values with a binary collation. Now the server returns spatial values as `BLOB` values. ([Bug#10166](#))
- The `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` statements are deprecated. See [Section 12.5.2.2, “LOAD DATA FROM MASTER Syntax”](#), for recommended alternatives. ([Bug#9125](#), [Bug#20596](#), [Bug#14399](#), [Bug#12187](#), [Bug#15025](#), [Bug#18822](#))
- For the `mysql` client, typing Control-C causes `mysql` to attempt to kill the current statement. If this cannot be done, or Control-C is typed again before the statement is killed, `mysql` exits. Previously, Control-C caused `mysql` to exit in all cases. ([Bug#1989](#))
- It is no longer possible to create partitioned tables using the `CSV` storage engine.
- Binary MySQL distributions no longer include a `mysqld-max` server. Instead, distributions contain a binary that includes the features previously included in the `mysqld-max` binary.
- `SHOW STATUS` is no longer logged to the slow query log.
- Program Database files (extension `.pdb`) are now included by default in Windows distributions. These can be used to help diagnose problems with `mysqld` and other tools. See [Section 22.5.1, “Debugging a MySQL Server”](#).
- `INFORMATION_SCHEMA` contains new tables, `GLOBAL_STATUS`, `SESSION_STATUS`, `GLOBAL_VARIABLES`, and `SESSION_VARIABLES`, that correspond to the output from the `SHOW {GLOBAL|SESSION} STATUS` and `SHOW {GLOBAL|SESSION} VARIABLES` statements.
- `SHOW STATUS` no longer updates any session status variables, except for `com_show_status`.
- A new system variable, `lc_time_names`, specifies the locale that controls the language used to display day and month names and abbreviations. This variable affects the output from the `DATE_FORMAT()`, `DAYNAME()` and `MONTHNAME()` functions. See [Section 9.7, “MySQL Server Locale Support”](#).
- Using `--with-debug` to configure MySQL with debugging support enables you to use the `-debug="d,parser_debug"` option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server's standard error output. Typically, this output is written to the error log.
- The bundled yaSSL library was upgraded to version 1.3.7.
- The Instance Manager `--passwd` option has been renamed to `--print-password-line`. Other options were added to enable management of the IM password file from the command line: `--add-user`, `--drop-user`, `--edit-user`, `--list-users`, `--check-password-file`, `--clean-password-file`, `--username`, and `--password`. The `--mysqld-safe-compatible` option was added to cause the Instance Manner to act similarly to `mysqld_safe`.
- Added the `SHOW CONTRIBUTORS` statement.
- The general query log and slow query logs now can be enabled or disabled at runtime with the `general_log` and `slow_query_log` system variables, and the name of the log files can be changed by setting the `general_log_file` and `slow_query_log_file` system variables. See [Section 5.2.3, “The General Query Log”](#), and [Section 5.2.5, “The Slow Query Log”](#).

Bugs fixed:

- **Security Fix:** A stored routine created by one user and then made accessible to a different user using `GRANT EXECUTE` could be executed by that user with the privileges of the routine's definer. ([Bug#18630](#), [CVE-2006-4227](#))
- **Security Fix:** On Linux, and possibly other platforms using case-sensitive file systems, it was possible for a user granted rights on a database to create or access a database whose name differed only from that of the first by the case of one or more letters. ([Bug#17647](#), [CVE-2006-4226](#))
- **Security Fix:** If a user has access to `MyISAM` table `t`, that user can create a `MERGE` table `m` that accesses `t`. However, if the user's privileges on `t` are subsequently revoked, the user can continue to access `t` by doing so through `m`. If this behavior is undesirable, you can start the server with the new `--skip-merge` option to disable the `MERGE` storage engine. ([Bug#15195](#), [CVE-2006-4031](#))
- **Incompatible Change:** For `utf8` columns, the full-text parser incorrectly considered several nonword punctuation and whitespace characters as word characters, causing some searches to return incorrect results.

The fix involves a change to the full-text parser, so any tables that have `FULLTEXT` indexes on `utf8` columns must be repaired with `REPAIR TABLE`:

```
REPAIR TABLE tbl_name QUICK;
```

([Bug#19580](#))

- **MySQL Cluster: Packaging:** The `ndb_mgm` program was included in both the `MySQL-ndb-tools` and `MySQL-ndb-management` RPM packages, resulting in a conflict if both were installed. Now `ndb_mgm` is included only in `MySQL-ndb-tools`. ([Bug#21058](#))
- **MySQL Cluster: Replication:** A `DELETE FROM table` with no `WHERE` clause (deleting all rows) running concurrently with `INSERT` statements on a storage engine with row-level locking (such as `NDB`) could produce inconsistent results when using statement-based replication. ([Bug#19066](#))
- **MySQL Cluster: Replication:** (Replication): A node failure could send duplicate events, causing a `mysqld` replicating tables containing `BLOBs` to crash.
- **MySQL Cluster:** (NDB API): Inactivity timeouts for scans were not correctly handled. ([Bug#23107](#))
- **MySQL Cluster:** Inserting into an `NDB` table failed when the table had no primary key but had a unique key added after table was created on one or more `NOT NULL` columns. This occurred when the unique key had been adding using either `ALTER TABLE` or `CREATE UNIQUE KEY`. ([Bug#22838](#))
- **MySQL Cluster:** (NDB API): Attempting to read a nonexistent tuple using `Commit` mode for `NdbTransaction::execute()` caused node failures. ([Bug#22672](#))
- **MySQL Cluster:** The `--help` output from `NDB` binaries did not include file-related options. ([Bug#21994](#))
- **MySQL Cluster:** Setting `TransactionDeadlockDetectionTimeout` to a value greater than 12000 would cause scans to deadlock, time out, fail to release scan records, until the cluster ran out of scan records and stopped processing. ([Bug#21800](#))
- **MySQL Cluster:** A scan timeout returned Error 4028 (`NODE FAILURE CAUSED ABORT OF TRANSACTION`) instead of Error 4008 (`NODE FAILURE CAUSED ABORT OF TRANSACTION...`). ([Bug#21799](#))
- **MySQL Cluster:** The node recovery algorithm was missing a version check for tables in the `ALTER_TABLE_COMMITTED` state (as opposed to the `TABLE_ADD_COMMITTED` state, which has the version check). This could cause inconsistent schemas across nodes following node recovery. ([Bug#21756](#))
- **MySQL Cluster:** A memory leak occurred when running `ndb_mgm -e "SHOW"`. ([Bug#21670](#))
- **MySQL Cluster:** The server provided a nondescriptive error message when encountering a fatally corrupted REDO log. ([Bug#21615](#))
- **MySQL Cluster:** The output for the `--help` option used with `NDB` executable programs (such as `ndbd`, `ndb_mgm`, `ndb_restore`, `ndb_config`, and others mentioned in [Section 17.4, “MySQL Cluster Programs”](#)) referred to the `Ndb.cfg` file, instead of to `my.cnf`. ([Bug#21585](#))
- **MySQL Cluster:** A partial rollback could lead to node restart failures. ([Bug#21536](#))
- **MySQL Cluster:** Partition distribution keys were updated only for the primary and starting replicas during node recovery. This could lead to node failure recovery for clusters having an odd number of replicas.

**Note**

For best results, use values for `NumberOfReplicas` that are even powers of 2.

([Bug#21535](#))

- **MySQL Cluster:** The `ndb_mgm` management client did not set the exit status on errors, always returning 0 instead. ([Bug#21530](#))
- **MySQL Cluster:** The failure of a unique index read due to an invalid schema version could be handled incorrectly in some cases, leading to unpredictable results. ([Bug#21384](#))
- **MySQL Cluster:** Attempting to create an `NDB` table on a MySQL server with an existing non-Cluster table with the same name in the same database could result in data loss or corruption. Now, if such a table is encountered during autodiscovery, a warning is written to the error log of the affected `mysqld`, and the local table is overwritten. ([Bug#21378](#))
- **MySQL Cluster:** Cluster logs were not rotated following the first rotation cycle. ([Bug#21345](#))
- **MySQL Cluster:** In a cluster with more than 2 replicas, a manual restart of one of the data nodes could fail and cause the other nodes in the same node group to shut down. ([Bug#21213](#))
- **MySQL Cluster:** The `ndb_size.pl` script did not account for `TEXT` and `BLOB` column values correctly. ([Bug#21204](#))
- **MySQL Cluster:** Some queries involving joins on very large `NDB` tables could crash the MySQL server. ([Bug#21059](#))
- **MySQL Cluster:** Condition pushdown did not work correctly with `DATETIME` columns. ([Bug#21056](#))
- **MySQL Cluster:** Responses to the `ALL DUMP 1000` management client command were printed multiple times in the cluster log for each cluster node. ([Bug#21044](#))
- **MySQL Cluster:** The message `ERROR 0 IN READAUTOINCREMENTVALUE( ) : NO ERROR` was written to the error log whenever `SHOW TABLE STATUS` was performed on a Cluster table that did not have an `AUTO_INCREMENT` column. ([Bug#21033](#))
- **MySQL Cluster:** Restarting a data node while DDL operations were in progress on the cluster could cause other data nodes to fail. This could also lead to `mysqld` hanging or crashing under some circumstances. ([Bug#21017](#), [Bug#21050](#))
- **MySQL Cluster:** In some situations with a high disk-load, writing of the redo log could hang, causing a crash with the error message `GCP STOP DETECTED`. ([Bug#20904](#))
- **MySQL Cluster:** A race condition could in some circumstances following a `DROP TABLE`. ([Bug#20897](#))
- **MySQL Cluster:** Under some circumstances, local checkpointing would hang, keeping any unstopped nodes from being started. ([Bug#20895](#))
- **MySQL Cluster:** When the redo buffer ran out of space, a `POINTER TOO LARGE` error was raised and the cluster could become unusable until restarted with `--initial`. ([Bug#20892](#))
- **MySQL Cluster:** A vague error message was returned when reading both schema files during a restart of the cluster. ([Bug#20860](#))
- **MySQL Cluster:** The repeated creating and dropping of a table would eventually lead to `NDB` Error 826, `TOO MANY TABLES AND ATTRIBUTES ... INSUFFICIENT SPACE`. ([Bug#20847](#))
- **MySQL Cluster:** When attempting to restart the cluster following a data import, the cluster failed during Phase 4 of the restart with `ERROR 2334: JOB BUFFER CONGESTION`. ([Bug#20774](#))
- **MySQL Cluster:** `REPLACE` statements did not work correctly on an `NDB` table having both a primary key and a unique key. In such cases, proper values were not set for columns which were not explicitly referenced in the statement. ([Bug#20728](#))
- **MySQL Cluster:** The server did not honor the value set for `ndb_cache_check_time` in the `my.cnf` file. ([Bug#20708](#))
- **MySQL Cluster:** Truncating a table on one `mysqld` caused other `mysqld` processes connected to the cluster to return `ERROR 1412 (HY000): TABLE DEFINITION HAS CHANGED, PLEASE RETRY TRANSACTION` on subsequent queries. ([Bug#20705](#))
- **MySQL Cluster:** Using an invalid node ID with the management client `STOP` command could cause `ndb_mgm` to hang. ([Bug#20575](#))
- **MySQL Cluster:** Renaming of table columns was not supported as fast a `ALTER TABLE` for NDB tables. ([Bug#20456](#))
- **MySQL Cluster:** `ndb_size.pl` and `ndb_error_reporter` were missing from RPM packages. ([Bug#20426](#))

- **MySQL Cluster:** Running `ndbd --nowait-nodes=id` where `id` was the node ID of a node that was already running would fail with an invalid error message. ([Bug#20419](#))
- **MySQL Cluster:** Data nodes added while the cluster was running in single user mode were all assigned node ID 0, which could later cause multiple node failures. Adding nodes while in single user mode is no longer possible. ([Bug#20395](#))
- **MySQL Cluster:** The `ndb_mgm` client command `ALL CLUSTERLOG STATISTICS=15` had no effect. ([Bug#20336](#))
- **MySQL Cluster:** (Direct APIs): `NdbScanOperation::readTuples()` and `NdbIndexScanOperation::readTuples()` ignored the `batch` parameter. ([Bug#20252](#))
- **MySQL Cluster:** A node failure during a scan could sometime cause the node to crash when restarting too quickly following the failure. ([Bug#20197](#))
- **MySQL Cluster:** The failure of a data node when preparing to commit a transaction (that is, while the node's status was `CS_PREPARE_TO_COMMIT`) could cause the failure of other cluster data nodes. ([Bug#20185](#))
- **MySQL Cluster:** `SHOW ENGINE NDB STATUS` could sometimes return an incorrect value of `0` for the latest epoch, which could cause problems with synchronizing the binlog. ([Bug#20142](#))
- **MySQL Cluster:** An internal formatting error caused some management client error messages to be unreadable. ([Bug#20016](#))
- **MySQL Cluster:** Creating tables with variable-size columns caused `DataMemory` to be used but not freed when the tables were dropped. ([Bug#20007](#))
- **MySQL Cluster:** Renaming a table in such a way as to move it to a different database failed to move the table's indexes. ([Bug#19967](#))
- **MySQL Cluster:** Running management client commands while `mgmd` was in the process of disconnecting could cause the management server to fail. ([Bug#19932](#))
- **MySQL Cluster:** Under certain conditions, a starting node could miss transactions, leading to inconsistencies between the primary and backup replicas. ([Bug#19929](#))
- **MySQL Cluster:** An uncommitted row could sometimes be checkpointed and thus incorrectly included in a backup. ([Bug#19928](#))
- **MySQL Cluster:** In some cases where `SELECT COUNT(*)` from an `NDB` table should have yielded an error, `MAX_INT` was returned instead. ([Bug#19914](#))
- **MySQL Cluster:** `TEXT` columns in Cluster tables having both an explicit primary key and a unique key were not correctly updated by `REPLACE` statements. ([Bug#19906](#))
- **MySQL Cluster:** The cluster's data nodes failed while trying to load data when `NoOfFrangmentLogFiles` was set equal to 1. ([Bug#19894](#))
- **MySQL Cluster:** Following the restart of a management node, the Cluster management client did not automatically reconnect. ([Bug#19873](#))
- **MySQL Cluster:** Restoring a backup with `ndb_restore` failed when the backup had been taken from a cluster whose `DataMemory` had been completely used up. ([Bug#19852](#))
- **MySQL Cluster:** Error messages given when trying to make online changes to parameters such as `NoOfReplicas` that can only be changed using a complete shutdown and restart of the cluster did not indicate the true nature of the problem. ([Bug#19787](#))
- **MySQL Cluster:** Under some circumstances, repeated DDL operations on one `mysqld` could cause failure of a second `mysqld` attached to the same cluster. ([Bug#19770](#))
- **MySQL Cluster:** `ndb_restore` did not always make clear that it had recovered successfully from temporary errors while restoring a cluster backup. ([Bug#19651](#))
- **MySQL Cluster:** Resources for unique indexes on Cluster table columns were incorrectly allocated, so that only one-fourth as many unique indexes as indicated by the value of `UniqueHashIndexes` could be created. ([Bug#19623](#))
- **MySQL Cluster:** `LOAD DATA LOCAL` failed to ignore duplicate keys in Cluster tables. ([Bug#19496](#))
- **MySQL Cluster:** For `ndb_mgmd`, Valgrind revealed problems with a memory leak and a dependency on an uninitialized variable. ([Bug#19318](#), [Bug#20333](#))
- **MySQL Cluster:** A `DELETE` of many rows immediately followed by an `INSERT` on the same table could cause the `ndbd` pro-

cess on the backup replica to crash. ([Bug#19293](#))

- **MySQL Cluster:** An excessive number of `ALTER TABLE` operations could cause the cluster to fail with `NDB` error code 773 (`OUT OF STRING MEMORY, PLEASE MODIFY STRINGMEMORY`). ([Bug#19275](#))
- **MySQL Cluster:** A problem with error handling when `ndb_use_exact_count` was enabled could lead to incorrect values returned from queries using `COUNT()`. A warning is now returned in such cases. ([Bug#19202](#))
- **MySQL Cluster:** In rare situations with resource shortages, a crash could result from insufficient `IndexScanOperations`. ([Bug#19198](#))
- **MySQL Cluster:** Running out of `DataMemory` could sometimes crash `ndbd` and `mysqld` processes. ([Bug#19185](#))
- **MySQL Cluster:** It was possible to use port numbers greater than 65535 for `ServerPort` in the `config.ini` file. ([Bug#19164](#))
- **MySQL Cluster:** `ndb_mgm -e show | head` would hang after displaying the first 10 lines of output. ([Bug#19047](#))
- **MySQL Cluster:** The error returned by the cluster when too many nodes were defined did not make clear the nature of the problem. ([Bug#19045](#))
- **MySQL Cluster:** The management client `ALL STOP` command shut down `mgmd` processes (as well as `ndbd` processes). ([Bug#18966](#))
- **MySQL Cluster:** `TRUNCATE TABLE` failed to reset the `AUTO_INCREMENT` counter. ([Bug#18864](#))
- **MySQL Cluster:** Restarting a failed node could sometimes crash the cluster. ([Bug#18782](#))
- **MySQL Cluster:** Trying to create or drop a table while a node was restarting caused the node to crash. This is now handled by raising an error. ([Bug#18781](#))
- **MySQL Cluster:** Repeated `CREATE - INSERT - DROP` operations on tables could in some circumstances cause the MySQL table definition cache to become corrupt, so that some `mysqld` processes could access table information but others could not. ([Bug#18595](#))
- **MySQL Cluster:** A `CREATE TABLE` statement involving foreign key constraints raised an error rather than being silently ignored (see [Section 12.1.17, “CREATE TABLE Syntax”](#)).

This bug affected Cluster in MySQL 5.1 only. ([Bug#18483](#))

- **MySQL Cluster:** The server failed with a nondescriptive error message when out of data memory. ([Bug#18475](#))
- **MySQL Cluster:** For `NDB` and possibly `InnoDB` tables, a `BEFORE UPDATE` trigger could insert incorrect values. ([Bug#18437](#))
- **MySQL Cluster:** The `DATA_LENGTH` and `AVG_ROW_LENGTH` columns of the `INFORMATION_SCHEMA.TABLES` table did not report the size of variable-width column values correctly.

See [Section 20.2, “The INFORMATION\\_SCHEMA TABLES Table”](#), for more information. ([Bug#18413](#))

- **MySQL Cluster:** `SELECT ... FOR UPDATE` failed to lock the selected rows. ([Bug#18184](#))
- **MySQL Cluster:** (Disk Data): Deletes from Disk Data tables used a nonoptimal scan to find the rows to be deleted, resulting in poor performance. The fix causes disk order rather than memory order to be used, and can improve performance of Disk Data deletes by up to ~300% in some cases. ([Bug#17929](#))
- **MySQL Cluster:** `perror` did not properly report `NDB` error codes. ([Bug#16561](#))
- **MySQL Cluster:** A problem with takeover during a system restart caused ordered indexes to be rebuilt incorrectly. This also adversely affected MySQL Cluster Replication. ([Bug#15303](#))
- **MySQL Cluster:** A cluster data node could crash when an ordered index became full before the table containing the index was full. ([Bug#14935](#))
- **MySQL Cluster:** The management client `ALL STATUS` command could sometimes report the status of some data nodes incorrectly. ([Bug#13985](#))
- **MySQL Cluster:** New `mysqld` processes were permitted to connect without a restart of the cluster, causing the cluster to crash. ([Bug#13266](#))
- **MySQL Cluster:** Cluster system status variables were not updated properly. ([Bug#11459](#))

- **MySQL Cluster:** (NDBAPI): Update operations on blobs were not checked for illegal operations.

### Note

Read locks with blob update operations are now upgraded from read committed to read shared.

- **MySQL Cluster:** The loss of one or more data nodes could sometimes cause `ndb_mgmd` to use a high amount of CPU (15 percent or more, as opposed to 1 to 2 percent normally).
- **Partitioning:** Old partition and subpartition files were not always removed following `ALTER TABLE ... REORGANIZE PARTITION` statements. ([Bug#20770](#))
- **Cluster Replication: Replication:** In some cases, a large number of MySQL servers sending requests to the cluster simultaneously could cause the cluster to crash. This could also be triggered by many NDB API clients making simultaneous event subscriptions or unsubscriptions. ([Bug#20683](#))
- **Cluster Replication: Replication:** Data definition and data manipulation statements on different tables were not serialised correctly in the binary log. For example, there was no guarantee that a `CREATE TABLE` statement and an update on a different table would occur in the same order in the binary log as they did on the cluster being replicated. ([Bug#18947](#))
- **Replication:** `BIT` columns were not replicated properly under row-based replication. ([Bug#22550](#))
- **Replication:** For row-based replication, log rotation could occur at an improper time. ([Bug#21474](#))
- **Replication:** In mixed-format binary logging mode, stored functions, triggers, and views that use functions in their body that require row-based logging did not replicate reliably because the logging did not switch from statement-based to row-based format. For example, `INSERT INTO t SELECT FROM v`, where `v` is a view that selects `UUID()` could cause problems. This limitation has been removed. ([Bug#20930](#))
- **Replication:** A race condition during slave server shutdown caused an assert failure. ([Bug#20850](#))
- **Replication:** With mixed-format binary logging, `INSERT DELAYED` statements were logged using statement-based logging, and they did not replicate properly for statements that used values such as `UUID()`, `RAND()`, or user-defined variables that require row-based logging. To correct this, the `DELAYED` handler thread now switches to row-based logging if the logging format is mixed. ([Bug#20633](#), [Bug#20649](#))
- **Replication:** With the `auto_increment_increment` system variable set larger than 1, if the next generated `AUTO_INCREMENT` value would be larger than the column's maximum value, the value would be clipped down to that maximum value and inserted, even if the resulting value would not be in the generated sequence. This could cause problems for master-master replication. Now the server clips the value down to the previous value in the sequence, which correctly produces a duplicate-key error if that value already exists in the column. ([Bug#20524](#))
- **Replication:** In mixed binary logging mode, a temporary switch from statement-based logging to row-based logging occurs when storing a row that uses a function such as `UUID()` into a temporary table. However, temporary table changes are not written to the binary log under row-based logging, so the row does not exist on the slave. A subsequent select from the temporary table to a nontemporary table using statement-based logging works correctly on the master, but not on the slave where the row does not exist. Replication no longer switches back from row-based logging to statement-based logging until there are no temporary tables for the session. ([Bug#20499](#))
- **Replication:** `CREATE PROCEDURE`, `CREATE FUNCTION`, `CREATE TRIGGER`, and `CREATE VIEW` statements containing multi-line comments (`/* ... */`) could not be replicated. ([Bug#20438](#))
- **Replication:** A stored procedure that used `LAST_INSERT_ID()` did not replicate properly using statement-based binary logging. ([Bug#20339](#))
- **Replication:** When using row based replication, a `CREATE TABLE ... SELECT` statement was replicated, even if the table creation failed on the master (for example, due to a duplicate key failure). ([Bug#20265](#))
- **Replication:** If a table on a slave server had a higher `AUTO_INCREMENT` counter than the corresponding master table (even though all rows of the two tables were identical), in some cases `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` would not replicate properly using statement-based logging. (Different values would be inserted on the master and slave.) ([Bug#20188](#))
- **Replication:** Shutting down a slave in a replication scenario where temporary tables are in use would cause the slave to produce a core dump. ([Bug#19881](#))
- **Replication:** The effect of a stored function or trigger that caused `AUTO_INCREMENT` values to be generated for multiple tables was not logged properly if statement-based logging was used. Only the first table's value was logged, causing replication to fail. Under mixed logging format, this is dealt with by switching to row-based logging for the function or trigger. For statement-based logging, this remains a problem. ([Bug#19630](#))

- **Replication:** For row-based replication, the `BINLOG` statement did not lock tables properly, causing a crash for some table types. ([Bug#19459](#))
- **Replication:** Column names supplied for a view created on a master server could be lost on a slave server. ([Bug#19419](#))
- **Replication:** The dropping of a temporary table whose name contained a backtick (`) character was not correctly written to the binary log, which also caused it not to be replicated correctly. ([Bug#19188](#))
- **Replication:** With row-based replication, replicating a statement to a slave where the table had additional columns relative to the master table did not work. ([Bug#19069](#))
- **Replication:** Valgrind revealed an issue with `mysqld` that was corrected: memory corruption in replication slaves when switching databases. ([Bug#19022](#))
- **Replication:** A redundant table map event could be generated in the binary log when there were no actual changes to a table being replicated. In addition, a slave failed to stop when attempting to replicate a table that did not exist on the slave. ([Bug#18948](#))
- **Replication:** Row-based replication failed when the query cache was enabled on the slave. ([Bug#17620](#))
- **Replication:** Compilation on Windows would fail if row based replication was disabled using `-without-row-based-replication`. ([Bug#16837](#))
- **Replication:** An invalid `GRANT` statement for which `Ok` was returned on a replication master caused an error on the slave and replication to fail. ([Bug#6774](#))
- **Disk Data:** On some platforms, `ndbd` compiled with `gcc` 4 would crash when attempting to run `CREATE LOGFILE GROUP`. ([Bug#21981](#))
- **Disk Data:** Trying to create a Disk Data table using a nonexistent tablespace or to drop a nonexistent data file from a tablespace produced an uninformative error message. ([Bug#21751](#))
- **Disk Data:** Errors could occur when dropping a data file during a node local checkpoint. ([Bug#21710](#))
- **Disk Data:** Creating a tablespace and log file group, then attempting to restart the cluster without using the `--initial` option and without having created any Disk Data tables could cause a forced shutdown of the cluster and raise a configuration error. ([Bug#21172](#))
- **Disk Data:** `mysqldump` did not back up tablespace or log file group information for Disk Data tables correctly. Specifically, `UNDO_BUFFER_SIZE` and `INITIAL_SIZE` values were misreported. This meant that trying to restore from such a backup would produce error 1296: `GOT ERROR 1504 'OUT OF LOGBUFFER MEMORY' FROM NDB`. ([Bug#20809](#))
- **Disk Data:** Running a large number of scans on Disk Data could cause subsequent scans to perform poorly. ([Bug#20334](#))
- **Disk Data:** `INFORMATION_SCHEMA.FILES` records for UNDO files showed incorrect values in the `EXTENT_SIZE`, `FREE_EXTENTS`, and `TOTAL_EXTENTS` columns. ([Bug#20073](#))
- **Disk Data:** A data file created for one tablespace could be dropped using `ALTER TABLESPACE ... DROP DATAFILE` using a different tablespace. ([Bug#20053](#))
- **Disk Data:** Trying to create Disk Data tables when running the cluster in diskless mode caused cluster data nodes to crash.

### Note

Disk Data tables are now disabled when running in diskless mode.

([Bug#20008](#))

- **Disk Data:** An issue with disk allocation could sometimes cause a forced shutdown of the cluster when running a mix of memory and Disk Data tables. ([Bug#18780](#))
- **Disk Data:** The failure of a `CREATE TABLESPACE` or `CREATE LOGFILE GROUP` statement did not revert all changes made prior to the point of failure. ([Bug#16341](#))
- **Cluster Replication:** One or more of the `mysqld` processes could fail when subjecting a Cluster replication setup with multiple `mysqld` processes on both the master and slave clusters to high loads. ([Bug#19768](#))
- **Cluster API:** The `storage/ndb` directory was missing from the server binary distribution, making it impossible to compile `NDB` API and `MGM` API applications. This directory can be found as `/usr/include/storage/ndb` after installing that distribution. ([Bug#21955](#))

- **Cluster API:** Invoking the MGM API function `ndb_mgm_listen_event()` caused a memory leak. ([Bug#21671](#))
- **Cluster API:** The inclusion of `my_config.h` in `NdbApi.h` required anyone wishing to write NDB API applications against MySQL 5.1 to have a complete copy of the 5.1 sources. ([Bug#21253](#))
- **Cluster API:** The MGM API function `ndb_logevent_get_fd()` was not implemented. ([Bug#21129](#))
- **Cluster API:** The `NdbOperation::getBlobHandle()` method, when called with the name of a nonexistent column, caused a segmentation fault. ([Bug#21036](#))
- **ALTER EVENT** statements including only a `COMMENT` clause failed with a syntax error on two platforms: Linux for S/390, and OS X 10.4 for 64-bit PPC. ([Bug#23423](#))
- When `event_scheduler` was set to `DISABLED`, its value was not displayed correctly by `SHOW VARIABLES` or `SELECT @@global.event_scheduler`. ([Bug#22662](#))
- **ALTER EVENT** in the body of a stored procedure led to a crash when the procedure was called. This affected only those `ALTER EVENT` statements which changed the interval of the event. ([Bug#22397](#))
- The optimizer could make an incorrect index choice for indexes with a skewed key distribution. ([Bug#22393](#))
- Deleting entries from a large `MyISAM` index could cause index corruption when it needed to shrink. Deletes from an index can happen when a record is deleted, when a key changes and must be moved, and when a key must be un-inserted because of a duplicate key. This can also happen in `REPAIR TABLE` when a duplicate key is found and in `myisamchk` when sorting the records by an index. ([Bug#22384](#))
- Instance Manager had a race condition involving `mysqld` PID file removal. ([Bug#22379](#))
- yaSSL had a conflicting definition for `socklen_t` on hurd-i386 systems. ([Bug#22326](#))
- Conversion of values inserted into a `BIT` column could affect adjacent columns. ([Bug#22271](#))
- Some Linux-x86\_64-icc packages (of previous releases) mistakenly contained 32-bit binaries. Only `ICC` builds are affected, not `gcc` builds. Solaris and FreeBSD x86\_64 builds are not affected. ([Bug#22238](#))
- `mysql_com.h` unnecessarily referred to the `ulong` type. ([Bug#22227](#))
- The source distribution would not build on Windows due to a spurious dependency on `ib_config.h`. ([Bug#22224](#))
- Execution of a prepared statement that uses an `IN` subquery with aggregate functions in the `HAVING` clause could cause a server crash. ([Bug#22085](#))
- The `CSV` storage engine failed to detect some table corruption. ([Bug#22080](#))
- Using `GROUP_CONCAT()` on the result of a subquery in the `FROM` clause that itself used `GROUP_CONCAT()` could cause a server crash. ([Bug#22015](#))
- Running `SHOW MASTER LOGS` at the same time as binary log files were being switched would cause `mysqld` to hang. ([Bug#21965](#))
- `libmysqlclient` defined a symbol `BN_bin2bn` which belongs to OpenSSL. This could break applications that also linked against OpenSSL's `libcrypto` library. The fix required correcting an error in a build script that was failing to add rename macros for some functions. ([Bug#21930](#))
- `character_set_results` can be `NULL` to signify “no conversion,” but some code did not check for `NULL`, resulting in a server crash. ([Bug#21913](#))
- A misleading error message was displayed when attempting to define a unique key that was not valid for a partitioned table. ([Bug#21862](#))
- A query that used `GROUP BY` and an `ALL` or `ANY` quantified subquery in a `HAVING` clause could trigger an assertion failure. ([Bug#21853](#))
- An `InnoDB` mutex was not acquired and released under the same condition, leading to deadlock in some rare situations involving XA transactions. ([Bug#21833](#))
- A `NUL` byte within a prepared statement string caused the rest of the string not to be written to the query log, permitting logging to be bypassed. ([Bug#21813](#))
- `COUNT(*)` queries with `ORDER BY` and `LIMIT` could return the wrong result.

**Note**

This problem was introduced by the fix for [Bug#9676](#), which limited the rows stored in a temporary table to the `LIMIT` clause. This optimization is not applicable to nongroup queries with aggregate functions. The current fix disables the optimization in such cases.

([Bug#21787](#))

- Using `DROP TABLE` with concurrent queries causes `mysqld` to crash. ([Bug#21784](#))
- `INSERT ... SELECT` sometimes generated a spurious `Column count doesn't match value count` error. ([Bug#21774](#))
- `UPGRADE` was treated as a reserved word, although it is not. ([Bug#21772](#))
- A function result in a comparison was replaced with a constant by the optimizer under some circumstances when this optimization was invalid. ([Bug#21698](#))
- Selecting from `INFORMATION_SCHEMA.FILES` could crash the server. ([Bug#21676](#))
- Errors could be generated during the execution of certain prepared statements that ran queries on partitioned tables. ([Bug#21658](#))
- The presence of a subquery in the `ON` clause of a join in a view definition prevented the `MERGE` algorithm from being used for the view in cases where it should be permitted. ([Bug#21646](#))
- When records are merged from the insert buffer and the page needs to be reorganized, `InnoDB` used incorrect column length information when interpreting the records of the page. This caused a server crash due to apparent corruption of secondary indexes in `ROW_FORMAT=COMPACT` that contain prefix indexes of fixed-length columns. Data files should not be corrupted, but the crash was likely to repeat every time the server was restarted. ([Bug#21638](#))
- For character sets having a `mbmaxlen` value of 2, any `ALTER TABLE` statement changed `TEXT` columns to `MEDIUMTEXT`. ([Bug#21620](#))
- `mysql` displayed an empty string for `NULL` values. ([Bug#21618](#))
- Selecting from a `MERGE` table could result in a server crash if the underlying tables had fewer indexes than the `MERGE` table itself. ([Bug#21617](#), [Bug#22937](#))
- A loaded storage engine plugin did not load after a server restart. ([Bug#21610](#))
- For `INSERT ... ON DUPLICATE KEY UPDATE`, use of `VALUES(col_name)` within the `UPDATE` clause sometimes was handled incorrectly. ([Bug#21555](#))
- Subqueries with aggregate functions but no `FROM` clause could return incorrect results. ([Bug#21540](#))
- `mysqldump` incorrectly tried to use `LOCK TABLES` for tables in the `INFORMATION_SCHEMA` database. ([Bug#21527](#))
- The server could crash for the second execution of a function containing a `SELECT` statement that uses an aggregating `IN` subquery. ([Bug#21493](#))
- Memory overruns could occur for certain kinds of subqueries. ([Bug#21477](#))
- A `DATE` can be represented as an integer (such as `20060101`) or as a string (such as `'2006.01.01'`). When a `DATE` (or `TIME`) column is compared in one `SELECT` against both representations, constant propagation by the optimizer led to comparison of `DATE` as a string against `DATE` as an integer. This could result in integer comparisons such as `2006` against `20060101`, erroneously producing a false result. ([Bug#21475](#))
- `myisam_ftdump` produced bad counts for common words. ([Bug#21459](#))
- Adding `ORDER BY` to a `SELECT DISTINCT(expr)` query could produce incorrect results. ([Bug#21456](#))
- The URL into the online manual that is printed in the stack trace message by the server was out of date. ([Bug#21449](#))
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were truncated to 64 bytes.

**Note**

An additional fix was made in MySQL 5.1.18.

(Bug#21432)

- With `max_sp_recursion` set to 0, a stored procedure that executed a `SHOW CREATE PROCEDURE` statement for itself triggered a recursion limit exceeded error, though the statement involves no recursion. (Bug#21416)
- After `FLUSH TABLES WITH READ LOCK` followed by `UNLOCK TABLES`, attempts to drop or alter a stored routine failed with an error that the routine did not exist, and attempts to execute the routine failed with a lock conflict error. (Bug#21414)
- On 64-bit Windows, a missing table generated error 1017, not the correct value of 1146. (Bug#21396)
- Table aliases in multiple-table `DELETE` statements sometimes were not resolved. (Bug#21392)
- The optimizer sometimes produced an incorrect row-count estimate after elimination of `const` tables. This resulted in choosing extremely inefficient execution plans in same cases when distribution of data in joins were skewed. (Bug#21390)
- For multiple-table `UPDATE` statements, storage engines were not notified of duplicate-key errors. (Bug#21381)
- Using relative paths for `DATA DIRECTORY` or `INDEX DIRECTORY` with a partitioned table generated a warning rather than an error, and caused “junk” files to be created in the server's data directory. (Bug#21350)
- Using `EXPLAIN PARTITIONS` with a query on a table whose partitioning expression was based on the value of a `DATE` column could sometimes cause the server to crash. (Bug#21339)
- The feature of being able to recover a temporary table named `#sql_id` in `InnoDB` by creating a table named `rsql_id_recover_innodb_tmp_table` was broken by the introduction of the new identifier encoding in MySQL 5.1.6 (Bug#21313)
- It was possible for a stored routine with a non-`latin1` name to cause a stack overrun. (Bug#21311)
- A query result could be sorted improperly when using `ORDER BY` for the second table in a join. (Bug#21302)
- Query results could be incorrect if the `WHERE` clause contained `t.key_part NOT IN (val_list)`, where `val_list` is a list of more than 1000 constants. (Bug#21282)
- Queries that used the `index_merge` and `sort_union` methods to access an `InnoDB` table could produce inaccurate results. This issue was introduced in MySQL 5.1.10 when a new handler and bitmap interface was implemented. (Bug#21277)
- For user-defined functions created with `CREATE FUNCTION`, the `DEFINER` clause is not legal, but no error was generated. (Bug#21269)
- The `SELECT` privilege was required for an insert on a view, instead of the `INSERT` privilege. (Bug#21261)

This regression was introduced by Bug#20989.

- `mysql_config --libmysqld-libs` did not produce any SSL options necessary for linking `libmysqld` with SSL support enabled. (Bug#21239)
- Subqueries on `INFORMATION_SCHEMA` tables could erroneously return an empty result. (Bug#21231)
- `mysql_upgrade` created temporary files in a possibly insecure way. (Bug#21224)
- When `DROP DATABASE` or `SHOW OPEN TABLES` was issued while concurrently in another connection issuing `DROP TABLE`, `RENAME TABLE`, `CREATE TABLE LIKE` or any other statement that required a name lock, the server crashed. (Bug#21216, Bug#19403)
- The `--master-data` option for `mysqldump` requires certain privileges, but `mysqldump` generated a truncated dump file without producing an appropriate error message or exit status if the invoking user did not have those privileges. (Bug#21215)
- Using `ALTER TABLE ... REORGANIZE PARTITIONS` to reduce the number of subpartitions to 1 caused the server to crash. (Bug#21210)
- In the package of pre-built time zone tables that is available for download at <http://dev.mysql.com/downloads/timezones.html>, the tables now explicitly use the `utf8` character set so that they work the same way regardless of the system character set value. (Bug#21208)
- Under heavy load (executing more than 1024 simultaneous complex queries), a problem in the code that handles internal temporary tables could lead to writing beyond allocated space and memory corruption.

Use of more than 1024 simultaneous cursors server wide also could lead to memory corruption. This applies to both stored procedure cursors and C API cursors. (Bug#21206)

- When run with the `--use-threads` option, `mysqlimport` returned a random exit code. ([Bug#21188](#))
- A subquery that uses an index for both the `WHERE` and `ORDER BY` clauses produced an empty result. ([Bug#21180](#))
- Running `SHOW TABLE STATUS` on any `InnoDB` table having at least one record could crash the server. Note that this was not due to any issue in the `InnoDB` storage engine, but rather with `AUTO_INCREMENT` handling in the partitioning code—however, the table did not have to have an `AUTO_INCREMENT` column for the bug to manifest. ([Bug#21173](#))
- Some prepared statements caused a server crash when executed a second time. ([Bug#21166](#))
- The optimizer assumed that if `(a=x AND b=x)` is true, `(a=x AND b=x) AND a=b` is also true. But that is not always so if `a` and `b` have different data types. ([Bug#21159](#))
- Some `ALTER TABLE` statements affecting a table's subpartitioning could hang. ([Bug#21143](#))
- Certain malformed `INSERT` statements could crash the `mysql` client. ([Bug#21142](#))
- `SHOW INNODB STATUS` contained some duplicate output. ([Bug#21113](#))
- `InnoDB` was slow with more than 100,000 `.idb` files. ([Bug#21112](#))
- Creating a `TEMPORARY` table with the same name as an existing table that was locked by another client could result in a lock conflict for `DROP TEMPORARY TABLE` because the server unnecessarily tried to acquire a name lock. ([Bug#21096](#))
- Performing an `INSERT` on a view that was defined using a `SELECT` that specified a collation and a column alias caused the server to crash. ([Bug#21086](#))
- Incorrect results could be obtained from re-execution of a parametrized prepared statement or a stored routine with a `SELECT` that uses `LEFT JOIN` with a second table having only one row. ([Bug#21081](#))
- `ALTER VIEW` did not retain existing values of attributes that had been originally specified but were not changed in the `ALTER VIEW` statement. ([Bug#21080](#))
- The `myisam_stats_method` variable was mishandled when set from an option file or on the command line. ([Bug#21054](#))
- With `query_cache_type` set to 0, `RESET QUERY CACHE` was very slow and other threads were blocked during the operation. Now a cache reset is faster and nonblocking. ([Bug#21051](#))
- `mysql` crashed for very long arguments to the `connect` command. ([Bug#21042](#))
- When creating a table using `CREATE . . . SELECT` and a stored procedure, there would be a mismatch between the binary log and transaction cache which would cause a server crash. ([Bug#21039](#))
- A query using `WHERE column = constant OR column IS NULL` did not return consistent results on successive invocations. The `column` in each part of the `WHERE` clause could be either the same column, or two different columns, for the effect to be observed. ([Bug#21019](#))
- `mysqldump` sometimes did not select the correct database before trying to dump views from it, resulting in an empty result set that caused `mysqldump` to die with a segmentation fault. ([Bug#21014](#))
- Performance during an import on a table with a trigger that called a stored procedure was severely degraded. ([Bug#21013](#))
- `mysql_upgrade` produced a malformed `upgrade_defaults` file by overwriting the `[client]` group header with a `password` option. This prevented `mysqlcheck` from running successfully when invoked by `mysql_upgrade`. ([Bug#21011](#))
- A query of the form shown here caused the server to crash:

```
SELECT * FROM t1 NATURAL JOIN (
 t2 JOIN (
 t3 NATURAL JOIN t4,
 t5 NATURAL JOIN t6
)
 ON (t3.id3 = t2.id3 AND t5.id5 = t2.id5)
);
```

([Bug#21007](#))

- A `SELECT` that used a subquery in the `FROM` clause that did not select from a table failed when the subquery was used in a join. ([Bug#21002](#))
- `REPLACE . . . SELECT` for a view required the `INSERT` privilege for tables other than the table being modified. ([Bug#20989](#))

- `STR_TO_DATE()` sometimes would return `NULL` if the `%D` format specifier was not the last specifier in the format string. ([Bug#20987](#))
- A query using `WHERE NOT (column < ANY (subquery))` yielded a different result from the same query using the same `column` and `subquery` with `WHERE (column > ANY (subquery))`. ([Bug#20975](#))
- Under certain circumstances, `AVG(key_val)` returned a value but `MAX(key_val)` returned an empty set due to incorrect application of `MIN()`/`MAX()` optimization. ([Bug#20954](#))
- Closing of temporary tables failed if binary logging was not enabled. ([Bug#20919](#))
- Use of zero-length variable names caused a server crash. ([Bug#20908](#))
- Building `mysql` on Windows with CMake 2.4 would fail to create `libmysqld` correctly. ([Bug#20907](#))
- Creating a partitioned table that used the `InnoDB` storage engine and then restarting `mysqld` with `--skip-innodb` caused MySQL to crash. ([Bug#20871](#))
- For certain queries, the server incorrectly resolved a reference to an aggregate function and crashed. ([Bug#20868](#))
- If the binary logging format was changed between the times when a locked table was modified and when it was unlocked, the binary log contents were incorrect. ([Bug#20863](#))
- It was possible to provide the `ExtractValue()` function with input containing “tags” that were not valid XML; for example, it was possible to use tag names beginning with a digit, which are not permitted by the W3C’s XML 1.0 specification. Such cases caused the function to return “junk” output rather than an error message signalling the user as to the true nature of the problem. ([Bug#20854](#))
- `InnoDB` (Partitioning): Updating an `InnoDB` table using `HASH` partitioning with a composite primary key would cause the server to hang. ([Bug#20852](#))
- `mysqldump` did not add version-specific comments around `WITH PARSE` and `TABLESPACE ... STORAGE DISK` clauses for `CREATE TABLE` statements, causing dump files from servers where these features were in use to fail when loaded into older servers. ([Bug#20841](#))
- For multiple `INSERT DELAYED` statements executed in a batch by the delayed-insert handler thread, not all rows were written to the binary log. ([Bug#20821](#))
- The `ExtractValue()` function did not accept XML tag names containing a period (.) character. ([Bug#20795](#))
- Using aggregate functions in subqueries yielded incorrect results under certain circumstances due to incorrect application of `MIN()`/`MAX()` optimization. ([Bug#20792](#))
- On Windows, inserting into a `MERGE` table after renaming an underlying `MyISAM` table caused a server crash. ([Bug#20789](#))
- Within stored routines, some error messages were printed incorrectly. A nonnull-terminated string was passed to a message-printing routine that expected a null-terminated string. ([Bug#20778](#))
- Merging multiple partitions having subpartitions into a single partition with subpartitions, or splitting a single partition having subpartitions into multiple partitions with subpartitions, could sometimes crash the server. These issues were associated with a failure reported in the `partition_range` test. ([Bug#20767](#), [Bug#20893](#), [Bug#20766](#), [Bug#21357](#))
- Searches against a `ZEROFILL` column of a partitioned table could fail when the `ZEROFILL` column was part of the table’s partitioning key. ([Bug#20733](#))
- If a column definition contained a character set declaration, but a `DEFAULT` value began with an introducer, the introducer character set was used as the column character set. ([Bug#20695](#))
- An `UPDATE` that referred to a key column in the `WHERE` clause and activated a trigger that modified the column resulted in a loop. ([Bug#20670](#))
- Issuing a `SHOW CREATE FUNCTION` or `SHOW CREATE PROCEDURE` statement without sufficient privileges could crash the `mysql` client. ([Bug#20664](#))
- `INSERT DELAYED` did not honor `SET INSERT_ID` or the `auto_increment_*` system variables. ([Bug#20627](#), [Bug#20830](#))
- A buffer overwrite error in Instance Manager caused a crash. ([Bug#20622](#))
- Loading a plugin caused any existing plugin with the same name to be lost. ([Bug#20615](#))

- A query selecting records from a single partition of a partitioned table and using `ORDER BY ic DESC` (where `ic` represents an indexed column) could cause errors or crash the server. ([Bug#20583](#))
- Valgrind revealed several issues with `mysqld` that were corrected: A dangling stack pointer being overwritten; possible uninitialized data in a string comparison; `syscall()` write parameter pointing to an uninitialized byte. ([Bug#20579](#), [Bug#20769](#), [Bug#20783](#), [Bug#20791](#))
- If the `auto_increment_offset` setting causes MySQL to generate a value larger than the column's maximum possible value, the `INSERT` statement is accepted in strict SQL mode, whereas it should fail with an error. ([Bug#20573](#))
- In a view defined with `SQL SECURITY DEFINER`, the `CURRENT_USER()` function returned the invoker, not the definer. ([Bug#20570](#))
- The `fill_help_tables.sql` file did not contain a `SET NAMES 'utf8'` statement to indicate its encoding. This caused problems for some settings of the MySQL character set such as `big5`. ([Bug#20551](#))
- Scheduled events that invoked stored procedures executing DDL operations on partitioned tables could crash the server. ([Bug#20548](#))
- Users who had the `SHOW VIEW` privilege for a view and privileges on one of the view's base tables could not see records in `INFORMATION_SCHEMA` tables relating to the base table. ([Bug#20543](#))
- The `MD5()`, `SHA1()`, and `ENCRYPT()` functions should return a binary string, but the result sometimes was converted to the character set of the argument. `MAKE_SET()` and `EXPORT_SET()` now use the correct character set for their default separators, resulting in consistent result strings which can be coerced according to normal character set rules. ([Bug#20536](#))
- If a partitioned `InnoDB` table contained an `AUTO_INCREMENT` column, a `SHOW` statement could cause an assertion failure with more than one connection. ([Bug#20493](#))
- Using `EXPLAIN PARTITIONS` with a `UNION` query could crash the server. This could occur whether or not the query actually used any partitioned tables. ([Bug#20484](#))
- Creation of a view as a join of views or tables could fail if the views or tables are in different databases. ([Bug#20482](#))
- `SELECT` statements using `GROUP BY` against a view could have missing columns in the output when there was a trigger defined on one of the base tables for the view. ([Bug#20466](#))
- For connections that required a `SUBJECT` value, a check was performed to verify that the value was correct, but the connection was not refused if not. ([Bug#20411](#))
- `mysql_upgrade` was missing from binary MySQL distributions. ([Bug#20403](#), [Bug#18516](#), [Bug#20556](#))
- Some user-level errors were being written to the server's error log, which is for server errors. ([Bug#20402](#))
- Using `ALTER TABLE ... ENGINE = x`, where `x` was not a storage engine supported by the server, would cause `mysqld` to crash. ([Bug#20397](#))
- User names have a maximum length of 16 characters (even if they contain multi-byte characters), but were being truncated to 16 bytes. ([Bug#20393](#))
- Some queries using `ORDER BY ... DESC` on subpartitioned tables could crash the server. ([Bug#20389](#))
- `mysqlslap` did not enable the `CLIENT_MULTI_RESULTS` flag when connecting, which is necessary for executing stored procedures. ([Bug#20365](#))
- Queries using an indexed column as the argument for the `MIN()` and `MAX()` functions following an `ALTER TABLE ... DISABLE KEYS` statement returned `GOT ERROR 124 FROM STORAGE ENGINE` until `ALTER TABLE ... ENABLE KEYS` was run on the table. ([Bug#20357](#))
- When a statement used a stored function that inserted into an `AUTO_INCREMENT` column, the generated `AUTO_INCREMENT` value was not written into the binary log, so a different value could in some cases be inserted on the slave. ([Bug#20341](#))
- Partitions were represented internally as the wrong data type, which led in some cases to failures of queries such as `SELECT COUNT(*) FROM INFORMATION_SCHEMA.PARTITIONS WHERE PARTITION_NAME = 'partition_name'`. ([Bug#20340](#))
- `PROCEDURE ANALYSE()` returned incorrect values of `M FLOAT(M, D)` and `DOUBLE(M, D)`. ([Bug#20305](#))
- Defining a table partitioned by `LIST` with a single `PARTITION ... VALUES IN (NULL)` clause could lead to server

crashes, particularly with queries having `WHERE` conditions comparing the partitioning key with a constant. ([Bug#20268](#), [Bug#19801](#))

- Partition pruning could cause incorrect results from queries, such missing rows, when the partitioning expression relied on a `BIGINT UNSIGNED` column. ([Bug#20257](#))
- For a `MyISAM` table locked with `LOCK TABLES ... WRITE`, queries optimized using the `index_merge` method did not show rows inserted with the lock in place. ([Bug#20256](#))
- `mysqldump` produced a malformed dump file when dumping multiple databases that contained views. ([Bug#20221](#))
- Running `InnoDB` with many concurrent threads could cause memory corruption and a seg fault due to a bug introduced in MySQL 5.1.11. ([Bug#20213](#))
- `SUBSTRING()` results sometimes were stored improperly into a temporary table when multi-byte character sets were used. ([Bug#20204](#))
- The thread for `INSERT DELAYED` rows was maintaining a separate `AUTO_INCREMENT` counter, resulting in incorrect values being assigned if `DELAYED` and non-`DELAYED` inserts were mixed. ([Bug#20195](#))
- The `--default-storage-engine` server option did not work. ([Bug#20168](#))
- For a table having `LINEAR HASH` subpartitions, the `LINEAR` keyword did not appear in the `SUBPARTITION_METHOD` column of the `INFORMATION_SCHEMA.PARTITIONS` table. ([Bug#20161](#))
- For a `DATE` parameter sent using a `MYSQL_TIME` data structure, `mysql_stmt_execute()` zeroed the hour, minute, and second members of the structure rather than treating them as read only. ([Bug#20152](#))
- `perror` crashed on Solaris due to `NULL` return value of `strerror()` system call. ([Bug#20145](#))
- `FLUSH TABLES` followed by a `LOCK TABLES` statement to lock a log table and a nonlog table caused an infinite loop and high CPU use. Now `FLUSH TABLES` ignores log tables. To flush the log tables, use `FLUSH LOGS` instead. ([Bug#20139](#))
- On Linux, `libmysqlclient` when compiled with yaSSL using the `icc` compiler had a spurious dependency on C++ libraries. ([Bug#20119](#))
- For an `ENUM` column that used the `ucs2` character set, using `ALTER TABLE` to modify the column definition caused the default value to be lost. ([Bug#20108](#))
- For `mysql`, escaping with backslash sometimes did not work. ([Bug#20103](#))
- Queries on tables that were partitioned by `KEY` and had a `VARCHAR` column as the partitioning key produced an empty result set. ([Bug#20086](#))
- A number of dependency issues in the RPM `bench` and `test` packages caused installation of these packages to fail. ([Bug#20078](#))
- Use of `MIN()` or `MAX()` with `GROUP BY` on a `ucs2` column could cause a server crash. ([Bug#20076](#))
- `mysqld --flush` failed to flush `MyISAM` table changes to disk following an `UPDATE` statement for which no updated column had an index. ([Bug#20060](#))
- In MySQL 5.1.11, the `--with-openssl` and `--with-yassl` options were replaced by `--with-ssl`. But no message was issued if the old options were given. Now `configure` produces a message indicating that the new option should be used and exits. ([Bug#20002](#))
- When a statement is executed that does not generate any rows, an extra table map event and associated binrows event would be generated and written to the binary log. ([Bug#19995](#))
- Join conditions using index prefixes on `utf8` columns of `InnoDB` tables incorrectly ignored rows where the length of the actual value was greater than the length of the index prefix. ([Bug#19960](#))
- `AUTHORS` and `CONTRIBUTORS` were not treated as reserved words. ([Bug#19939](#))
- The `query` command for `mysqltest` did not work. ([Bug#19890](#))
- Identifiers with embedded escape characters were not handled correctly by some `SHOW` statements due to some old code that was doing some extra unescaping. ([Bug#19874](#))
- When executing a `SELECT` with `ORDER BY` on a view that is constructed from a `SELECT` statement containing a stored function, the stored function was evaluated too many times. ([Bug#19862](#))

- Using `SELECT` on a corrupt `MyISAM` table using the dynamic record format could cause a server crash. ([Bug#19835](#))
- Using cursors with `READ COMMITTED` isolation level could cause `InnoDB` to crash. ([Bug#19834](#))
- `CREATE DATABASE`, `RENAME DATABASE`, and `DROP DATABASE` could deadlock in cases where there was a global read lock. ([Bug#19815](#))
- The yaSSL library bundled with `libmysqlclient` had some conflicts with OpenSSL. Now macros are used to rename the conflicting symbols to have a prefix of `ya`. ([Bug#19810](#))
- The `WITH CHECK OPTION` was not enforced when a `REPLACE` statement was executed against a view. ([Bug#19789](#))
- Multiple-table updates with `FEDERATED` tables could cause a server crash. ([Bug#19773](#))
- On 64-bit systems, use of the `cp1250` character set with a primary key column in a `LIKE` clause caused a server crash for patterns having letters in the range 128..255. ([Bug#19741](#))
- `make install` tried to build files that should already have been built by `make all`, causing a failure if installation was performed using a different account than the one used for the initial build. ([Bug#19738](#))
- `InnoDB` unlocked its data directory before committing a transaction, potentially resulting in nonrecoverable tables if a server crash occurred before the commit. ([Bug#19727](#))
- An issue with yaSSL prevented Connector/J clients from connecting to the server using a certificate. ([Bug#19705](#))
- For a `MyISAM` table with a `FULLTEXT` index, compression with `myisampack` or a check with `myisamchk` after compression resulted in table corruption. ([Bug#19702](#))
- The `EGNINE` clause was displayed in the output of `SHOW CREATE TABLE` for partitioned tables when the SQL mode included `no_table_options`. ([Bug#19695](#))
- A cast problem caused incorrect results for prepared statements that returned float values when MySQL was compiled with `gcc` 4.0. ([Bug#19694](#))
- `EXPLAIN PARTITIONS` would produce illegible output in the `partitions` column if the length of text to be displayed in that column was too long. This could occur when very many partitions were defined for the table, partitions were given very long names, or due to a combination of the two. ([Bug#19684](#))
- The `mysql_list_fields()` C API function returned the incorrect table name for views. ([Bug#19671](#))
- If a query had a condition of the form `tableX.key = tableY.key` , which participated in equality propagation and also was used for `ref` access, then early `ref`-access `NULL` filtering was not performed for the condition. This could make query execution slower. ([Bug#19649](#))
- Re-execution of a prepared multiple-table `DELETE` statement that involves a trigger or stored function can result in a server crash. ([Bug#19634](#))
- File size specifications for `InnoDB` data files were case sensitive. ([Bug#19609](#))
- `CHECK TABLE` on a `MyISAM` table briefly cleared its `AUTO_INCREMENT` value, while holding only a read lock. Concurrent inserts to that table could use the wrong `AUTO_INCREMENT` value. `CHECK TABLE` no longer modifies the `AUTO_INCREMENT` value. ([Bug#19604](#))
- Some yaSSL public function names conflicted with those from OpenSSL, causing conflicts for applications that linked against both OpenSSL and a version of `libmysqlclient` that was built with yaSSL support. The yaSSL public functions now are renamed to avoid this conflict. ([Bug#19575](#))
- In the `INFORMATION_SCHEMA.FILES` table, the `INITIAL_SIZE`, `MAXIMUM_SIZE`, and `AUTOEXTEND_SIZE` columns incorrectly were being stored as `VARCHAR` rather than `BIGINT` .. ([Bug#19544](#))
- `InnoDB` failed to increment the `handler_read_prev` counter. ([Bug#19542](#))
- Portions of statements related to partitioning were not surrounded by version-specific comments by `mysqldump`, breaking backward compatibility for dump files. ([Bug#19488](#))
- Repeated `DROP TABLE` statements in a stored procedure could sometimes cause the server to crash. ([Bug#19399](#))
- Renaming a database to itself caused a server crash. ([Bug#19392](#))
- Race conditions on certain platforms could cause the Instance Manager to fail to initialize. ([Bug#19391](#))

- When not running in strict mode, the server failed to convert the invalid years portion of a `DATE` or `DATETIME` value to '`0000`' when inserting it into a table.

### Note

This fix was reverted in MySQL 5.1.18.

([Bug#19370](#))

See also [Bug#25301](#).

- Use of the `--no-pager` option caused `mysql` to crash. ([Bug#19363](#))
- Multiple calls to a stored procedure that altered a partitioned `MyISAM` table would cause the server to crash. ([Bug#19309](#))
- `ALTER TABLE ... COALESCE PARTITION` did not delete the files associated with the partitions that were removed. ([Bug#19305](#))
- Adding an index to a partitioned table that had been created using `AUTO_INCREMENT = value` caused the `AUTO_INCREMENT` value to be reset. ([Bug#19281](#))
- Multiple-table `DELETE` statements containing a subquery that selected from one of the tables being modified caused a server crash. ([Bug#19225](#))
- The final parenthesis of a `CREATE INDEX` statement occurring in a stored procedure was omitted from the binary log when the stored procedure was called. ([Bug#19207](#))
- An `ALTER TABLE` operation that does not need to copy data, when executed on a table created prior to MySQL 4.0.25, could result in a server crash for subsequent accesses to the table. ([Bug#19192](#))
- SSL connections using yaSSL on OpenBSD could fail. ([Bug#19191](#))
- `ALTER TABLE ... REBUILD PARTITION` could cause the server to hang or crash. ([Bug#19122](#))
- Using `ALTER TABLE` on a subpartitioned table caused the server to crash. ([Bug#19067](#))
- Trying to execute a query having a `WHERE` clause using `int_col = "string_value"` OR `int_col IS NULL` on a partitioned table whose partitioning or subpartitioning function used the integer column `int_col` would crash the server. ([Bug#19055](#))
- A `SELECT` with a subquery that was bound to the outer query over multiple columns returned different results when a constant was used instead of one of the dependant columns. ([Bug#18925](#))
- It was possible using `ALTER EVENT ... RENAME ...` to move an event to a database on which the user did not have the `EVENT` privilege. ([Bug#18897](#))
- When used in the `DO` clause of a `CREATE EVENT` statement, the statements `CREATE EVENT`, `CREATE FUNCTION`, and `CREATE PROCEDURE` caused the server to crash. (These statements are not permitted inside `CREATE EVENT`.) ([Bug#18896](#), [Bug#16409](#))
- `BIT` columns in a table could cause joins that use the table to fail. ([Bug#18895](#))
- The build process incorrectly tried to overwrite `sql/lex_hash.h`. This caused the build to fail when using a shadow link tree pointing to original sources that were owned by another account. ([Bug#18888](#))
- Setting `myisam_repair_threads` caused any repair operation on a `MyISAM` table to fail to update the cardinality of indexes, instead making them always equal to 1. ([Bug#18874](#))
- The MySQL server startup script `/etc/init.d/mysql` (created from `mysql.server`) is now marked to ensure that the system services `ypbind`, `nsqd`, `ldap`, and `NTP` are started first (if these are configured on the machine). ([Bug#18810](#))
- InnoDB:** Quoted Unicode identifiers were not handled correctly. This included names of tables, columns, and foreign keys. ([Bug#18800](#))
- Intermediate tables created during the execution of an `ALTER TABLE` statement were visible in the output of `SHOW TABLES`. ([Bug#18775](#))
- FEDERATED** tables raised invalid duplicate key errors when attempting on one server to insert rows having the same primary key values as rows that had been deleted from the linked table on the other server. ([Bug#18764](#))
- Memory used by scheduled events was not freed when the events were dropped. ([Bug#18683](#))

- The implementation for `UNCOMPRESS()` did not indicate that it could return `NULL`, causing the optimizer to do the wrong thing. ([Bug#18539](#))
- Referring to a stored function qualified with the name of one database and tables in another database caused a “table doesn't exist” error. ([Bug#18444](#))
- Identifiers could not contain bytes with a value of 255, though that should be permitted as of the identifier-encoding changes made in MySQL 5.1.6. ([Bug#18396](#))
- Triggers on tables in the `mysql` database caused a server crash. Triggers for tables in this database are no longer permitted. ([Bug#18361](#), [Bug#18005](#))
- Incorrect type aggregation for `IN()` and `CASE` expressions could lead to an incorrect result. ([Bug#18360](#))
- The length of the pattern string prefix for `LIKE` operations was calculated incorrectly for multi-byte character sets. As a result, the scanned range was wider than necessary if the prefix contained any multi-byte characters, and rows could be missing from the result set. ([Bug#18359](#), [Bug#16674](#))
- On Windows, corrected a crash stemming from differences in Visual C runtime library routines from POSIX behavior regarding invalid file descriptors. ([Bug#18275](#))
- Linking the `pthreads` library to single-threaded MySQL libraries caused `dlopen()` to fail at runtime on HP-UX. ([Bug#18267](#))
- The source distribution failed to compile when configured with the `--with-libwrap` option. ([Bug#18246](#))
- On Windows, terminating `mysqld` with Control-C could result in a crash during shutdown. ([Bug#18235](#))
- Selecting data from a `MEMORY` table with a `VARCHAR` column and a `HASH` index over it returned only the first row matched. ([Bug#18233](#))
- The use of `MIN()` and `MAX()` on columns with an index prefix produced incorrect results in some queries. ([Bug#18206](#))
- A `UNION` over more than 128 `SELECT` statements that use an aggregate function failed. ([Bug#18175](#))
- The optimizer did not take advantage of indexes on columns used for the second or third arguments of `BETWEEN`. ([Bug#18165](#))
- Performing `INSERT ... SELECT ... JOIN ... USING` without qualifying the column names caused `ERROR 1052 "column 'x' in field list is ambiguous"` even in cases where the column references were unambiguous. ([Bug#18080](#))
- An update that used a join of a table to itself and modified the table on both sides of the join reported the table as crashed. ([Bug#18036](#))
- Race conditions on certain platforms could cause the Instance Manager to try to restart the same instance multiple times. ([Bug#18023](#))
- Changing the definition of a `DECIMAL` column with `ALTER TABLE` caused loss of column values. ([Bug#18014](#))
- For table-format output, `mysql` did not always calculate columns widths correctly for columns containing multi-byte characters in the column name or contents. ([Bug#17939](#))
- The character set was not being properly initialized for `CAST()` with a type such as `CHAR(2) BINARY`, which resulted in incorrect results or a server crash. ([Bug#17903](#))
- Checking a `MyISAM` table (using `CHECK TABLE`) having a spatial index and only one row would wrongly indicate that the table was corrupted. ([Bug#17877](#))
- For a reference to a nonexistent index in `FORCE INDEX`, the error message referred to a column, not an index. ([Bug#17873](#))
- A stored procedure that created and invoked a prepared statement was not executed when called in a `mysqld` init-file. ([Bug#17843](#))
- It is possible to create `MERGE` tables into which data cannot be inserted (by not specifying a `UNION` clause). However, when an insert was attempted, the error message was confusing. Now an error occurs indicating that the table is read only. ([Bug#17766](#))
- Attempting to insert a string of greater than 4096 bytes into a `FEDERATED` table resulted in the error `ERROR 1296 (HY000) AT LINE 2: GOT ERROR 10000 'ERROR ON REMOTE SYSTEM: 1054: UNKNOWN COLUMN 'STRING-VALUE' FROM FEDERATED.` This error was raised regardless of the type of column involved (`VARCHAR`, `TEXT`, and so on.) ([Bug#17608](#))

- If a file name was specified for the `--log` or `--log-slow-queries` options but the server was logging to tables and not files, the server produced no error message. ([Bug#17599](#))
- If the general log table reached a large enough file size (27GB), `SELECT COUNT(*)` on the table caused a server crash. ([Bug#17589](#))
- Using the extended syntax for `TRIM()`—that is, `TRIM(... FROM ...)`—in a `SELECT` statement defining a view caused an invalid syntax error when selecting from the view. ([Bug#17526](#))
- Use of the `--prompt` option or `prompt` command caused `mysql` to be unable to connect to the Instance Manager. ([Bug#17485](#))
- `OPTIMIZE TABLE` and `REPAIR TABLE` yielded incorrect messages or warnings when used on partitioned tables. ([Bug#17455](#))
- `mysqldump` would not dump views that had become invalid because a table named in the view definition had been dropped. Instead, it quit with an error message. Now you can specify the `--force` option to cause `mysqldump` to keep going and write an SQL comment containing the view definition to the dump output. ([Bug#17371](#))
- `N'xxx'` and `_utf8'xxx'` were not treated as equivalent because `N'xxx'` failed to unescape backslashes (\) and doubled apostrophe/single quote characters (''). ([Bug#17313](#))
- Following a failed attempt to add an index to an `ARCHIVE` table, it was no longer possible to drop the database in which the table had been created. ([Bug#17310](#))
- Assignments of values to variables of type `TEXT` were handled incorrectly in stored routines. ([Bug#17225](#))
- Views created from prepared statements inside of stored procedures were created with a definition that included both `SQL_CACHE` and `SQL_NO_CACHE`. ([Bug#17203](#))
- `mysqldump` wrote an extra pair of `DROP DATABASE` and `CREATE DATABASE` statements if run with the `--add-drop-database` option and the database contained views. ([Bug#17201](#))
- A `TABLE ... DOESN'T EXIST` error could occur for statements that called a function defined in another database. ([Bug#17199](#))
- A prepared statement that altered partitioned table within a stored procedure failed with the error `UNKNOWN PREPARED STATEMENT HANDLER`. ([Bug#17138](#))
- `myisam_ftdump` would fail when trying to open a MyISAM index file that you did not have write permissions to access, even though the command would only be reading from the file. ([Bug#17122](#))
- `ALTER TABLE` on a table created prior to 5.0.3 would cause table corruption if the `ALTER TABLE` did one of the following:
  - Change the default value of a column.
  - Change the table comment.
  - Change the table password.

([Bug#17001](#))
- For statements that have a `DEFINER` clause such as `CREATE TRIGGER` or `CREATE VIEW`, long user names or host names could cause a buffer overflow. ([Bug#16899](#))
- The `PASSWORD()` function returned invalid results when used in some `UNION` queries. ([Bug#16881](#))
- `ORDER BY RAND() LIMIT 1` always set a user variable to the last possible value from the table. ([Bug#16861](#))
- Queries containing a subquery that used aggregate functions could return incorrect results. ([Bug#16792](#))
- Concatenating the results of multiple constant subselects produced incorrect results. ([Bug#16716](#))
- When performing a `GROUP_CONCAT()`, the server transformed `BLOB` columns `VARCHAR` columns, which could cause erroneous results when using Connector/J and possibly other MySQL APIs. ([Bug#16712](#))
- Stored procedures did not use the character set defined for the database in which they were created. ([Bug#16676](#))
- Some server errors were not reported to the client, causing both to try to read from the connection until a hang or crash resulted. ([Bug#16581](#))

- If the files for an open table were removed at the OS level (external to the server), the server exited with an assertion failure. ([Bug#16532](#))
- On Windows, a definition for `mysql_set_server_option()` was missing from the C client library. ([Bug#16513](#))
- `mysqlcheck` tried to check views instead of ignoring them. ([Bug#16502](#))
- Updating a column of a `FEDERATED` table to `NULL` sometimes failed. ([Bug#16494](#))
- For `SELECT ... FOR UPDATE` statements that used `DISTINCT` or `GROUP BY` over all key parts of a unique index (or primary key), the optimizer unnecessarily created a temporary table, thus losing the linkage to the underlying unique index values. This caused a `Result set not updatable` error. (The temporary table is unnecessary because under these circumstances the distinct or grouped columns must also be unique.) ([Bug#16458](#))
- A scheduled event that took longer to execute than the length of time scheduled between successive executions could “skip” executions. For example, an event defined with `EVERY 1 SECOND`—but which required longer than 1 second to complete—might be executed only once every 2 seconds. ([Bug#16417](#))
- A subselect used in the `ON SCHEDULE` clause of a `CREATE EVENT` or `ALTER EVENT` statement caused the server to crash, rather than producing an error as expected. ([Bug#16394](#))
- Grant table modifications sometimes did not refresh the in-memory tables if the host name was ‘’ or not specified. ([Bug#16297](#))
- A subquery in the `WHERE` clause of the outer query and using `IN` and `GROUP BY` returned an incorrect result. ([Bug#16255](#))
- A query could produce different results with and without an index, if the `WHERE` clause contained a range condition that used an invalid `DATETIME` constant. ([Bug#16249](#))
- `TIMESTAMPDIFF()` examined only the date and ignored the time when the requested difference unit was months or quarters. ([Bug#16226](#))
- Using tables from MySQL 4.x in MySQL 5.x, in particular those with `VARCHAR` fields and using `INSERT DELAYED` to update data in the table would result in either data corruption or a server crash. ([Bug#16218](#), [Bug#17294](#), [Bug#16611](#))
- The value returned by a stored function returning a string value was not of the declared character set. ([Bug#16211](#))
- The `index_merge/Intersection` optimizer could experience a memory overrun when the number of table columns covered by an index was sufficiently large, possibly resulting in a server crash. ([Bug#16201](#))
- Row equalities (such as `WHERE (a,b) = (c,d)`) were not taken into account by the optimizer, resulting in slow query execution. Now they are treated as conjunctions of equalities between row elements. ([Bug#16081](#))
- Some memory leaks in the `libmysqld` embedded server were corrected. ([Bug#16017](#))
- Values greater than 2 gigabytes used in the `VALUES LESS THAN` clause of a table partitioned by `RANGE` were treated as negative numbers. ([Bug#16002](#))
- A `CREATE TABLE` that produced a `THE PARTITION FUNCTION RETURNS THE WRONG TYPE` error also caused an `INCORRECT INFORMATION IN FILE` to be printed to `STDERR`, and a junk file to be left in the database directory. ([Bug#16000](#))
- The `max_length` metadata value for columns created from `CONCAT()` could be incorrect when the collation of an argument differed from the collation of the `CONCAT()` itself. In some contexts such as `UNION`, this could lead to truncation of the column contents. ([Bug#15962](#))
- When `NOW()` was used in a `BETWEEN` clause of the definition for a view, it was replaced with a constant in the view. ([Bug#15950](#))
- The server’s handling of the number of partitions or subpartitions specified in a `PARTITIONS` or `SUBPARTITIONS` clause was changed. Beginning with this release, the number of partitions must:
  - be a positive, nonzero integer
  - not have any leading zeros
  - not be an expression

Also beginning with this version, no attempt is made to convert, truncate, or evaluate a `PARTITIONS` or `SUBPARTITIONS` value; instead, the `CREATE TABLE` or `ALTER TABLE` statement containing the `PARTITIONS` or `SUBPARTITIONS` clause now fails with an appropriate error message. ([Bug#15890](#))

- Long multiple-row `INSERT` statements could take a very long time for some multi-byte character sets. ([Bug#15811](#))
- The C API failed to return a status message when invoking a stored procedure. ([Bug#15752](#))
- `mysqldump` sends a `set @@character_set_database=binary` statement to the server, but this is not understood by pre-4.1 servers. Now `mysqldump` encloses the statement within a `/*!40101 ... */` comment so that old servers will ignore it. ([Bug#15690](#))
- `DELETE` with `LEFT JOIN` for `InnoDB` tables could crash the server if `innodb_locks_unsafe_for_binlog` was enabled. ([Bug#15650](#))
- `BIN()`, `OCT()`, and `CONV()` did not work with BIT values. ([Bug#15583](#))
- Nested natural joins worked correctly when executed as a nonprepared statement could fail with an `Unknown column 'col_name' in 'field list'` error when executed as a prepared statement, due to a name resolution problem. ([Bug#15355](#))
- The `MD5()` and `SHA()` functions treat their arguments as case-sensitive strings. But when they are compared, their arguments were compared as case-insensitive strings, which leads to two function calls with different arguments (and thus different results) compared as being identical. This can lead to a wrong decision made in the range optimizer and thus to an incorrect result set. ([Bug#15351](#))
- Invalid escape sequences in option files caused MySQL programs that read them to abort. ([Bug#15328](#))
- `SHOW GRANTS FOR CURRENT_USER` did not return definer grants when executed in `DEFINER` context (such as within a stored procedure defined with `SQL SECURITY DEFINER`), it returned the invoker grants. ([Bug#15298](#))
- The `--collation-server` server option was being ignored. With the fix, if you choose a nondefault character set with `--character-set-server`, you should also use `--collation-server` to specify the collation. ([Bug#15276](#))
- Re-executing a stored procedure with a complex stored procedure cursor query could lead to a server crash. ([Bug#15217](#))
- The server crashed if it tried to access a `CSV` table for which the data file had been removed. ([Bug#15205](#))
- When using tables containing `VARCHAR` columns created under MySQL 4.1 with a 5.0 or later server, for some queries the metadata sent to the client could have an empty column name. ([Bug#14897](#))
- An invalid comparison between keys with index prefixes over multi-byte character fields could lead to incorrect result sets if the selected query execution plan used a range scan by an index prefix over a `UTF8` character field. This also caused incorrect results under similar circumstances with many other character sets. ([Bug#14896](#))
- When setting a column to its implicit default value as the result of inserting a `NULL` into a `NOT NULL` column as part of a multi-row insert or `LOAD DATA` operation, the server returned a misleading warning message. ([Bug#14770](#))
- For `BOOLEAN` mode full-text searches on nonindexed columns, `NULL` rows generated by a `LEFT JOIN` caused incorrect query results. ([Bug#14708](#), [Bug#25637](#))
- The parser rejected queries that selected from a table twice using a `UNION` within a subquery. The parser now supports arbitrary subquery, join, and parenthesis operations within `EXISTS` subqueries. A limitation still exists for scalar subqueries: If the subquery contains `UNION`, the first `SELECT` of the `UNION` cannot be within parentheses. For example, `SELECT (SELECT a FROM t1 UNION SELECT b FROM t2)` will work, but `SELECT ((SELECT a FROM t1) UNION (SELECT b FROM t2))` will not. ([Bug#14654](#))
- Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. ([Bug#14400](#))
- Prepared statements caused general log and server memory corruption. ([Bug#14346](#))
- The binary log lacked character set information for table names when dropping temporary tables. ([Bug#14157](#))
- `libmysqld` produced some warnings to `stderr` which could not be silenced. These warnings now are suppressed. ([Bug#13717](#))
- RPM packages had spurious dependencies on Perl modules and other programs. ([Bug#13634](#))
- `InnoDB` locking was improved by removing a gap lock for the case that you try to delete the same row twice within a transaction. ([Bug#13544](#))
- `REPLACE` statements caused activation of `UPDATE` triggers, not `DELETE` and `INSERT` triggers. ([Bug#13479](#))
- The source distribution failed to compile when configured with the `--without-geometry` option. ([Bug#12991](#))

- With settings of `read_buffer_size` >= 2G and `read_rnd_buffer_size` >= 2G, `LOAD DATA INFILE` failed with no error message or caused a server crash for files larger than 2GB. ([Bug#12982](#))
- A `B-TREE` index on a `MEMORY` table erroneously reported duplicate entry error for multiple `NULL` values. ([Bug#12873](#))
- Instance Manager didn't close the client socket file when starting a new `mysqld` instance. `mysqld` inherited the socket, causing clients connected to Instance Manager to hang. ([Bug#12751](#))
- On Mac OS X, zero-byte `read()` or `write()` calls to an SMB-mounted file system could return a nonstandard return value, leading to data corruption. Now such calls are avoided. ([Bug#12620](#))
- `DATE_ADD()` and `DATE_SUB()` returned `NULL` when the result date was on the day '`9999-12-31`'. ([Bug#12356](#))
- For very complex `SELECT` statements could create temporary tables that were too large, and for which the temporary files were not removed, causing subsequent queries to fail. ([Bug#11824](#))
- After an `INSERT ... ON DUPLICATE KEY UPDATE` statement that updated an existing row, `LAST_INSERT_ID()` could return a value not in the table. ([Bug#11460](#))
- `USE` did not refresh database privileges when employed to re-select the current database. ([Bug#10979](#))
- The server returns a more informative error message when it attempts to open a `MERGE` table that has been defined to use non-`MyISAM` tables. ([Bug#10974](#))
- The type of the value returned by the `VARIANCE()` function varied according to the type of the input value. The function should always return a `DOUBLE` value. ([Bug#10966](#))
- The same trigger error message was produced under two conditions: The trigger duplicated an existing trigger name, or the trigger duplicated an existing combination of action and event. Now different messages are produced for the two conditions so as to be more informative. ([Bug#10946](#))
- A locking safety check in `InnoDB` reported a spurious error `STORED_SELECT_LOCK_TYPE IS 0 INSIDE ::START_STMT()` for `INSERT ... SELECT` statements in `innodb_locks_unsafe_for_binlog` mode. The safety check was removed. ([Bug#10746](#))
- `CREATE USER` did not respect the 16-character user name limit. ([Bug#10668](#))
- A server or network failure with an open client connection would cause the client to hang even though the server was no longer available.

As a result of this change, the `MYSQL_OPT_READ_TIMEOUT` and `MYSQL_OPT_WRITE_TIMEOUT` options for `mysql_options()` now apply to TCP/IP connections on all platforms. Previously, they applied only to Windows. ([Bug#9678](#))

- `INSERT INTO ... SELECT ... LIMIT 1` could be slow because the `LIMIT` was ignored when selecting candidate rows. ([Bug#9676](#))
- The optimizer could produce an incorrect result after `AND` with collations such as `latin1_german2_ci`, `utf8_czech_ci`, and `utf8_lithuanian_ci`. ([Bug#9509](#))
- The `DATA DIRECTORY` table option did not work for `TEMPORARY` tables. ([Bug#8706](#))
- A stored procedure with a `CONTINUE` handler that encountered an error continued to execute a statement that caused an error, rather with the next statement following the one that caused the error. ([Bug#8153](#))
- For ODBC compatibility, MySQL supports use of `WHERE col_name IS NULL` for `DATE` or `DATETIME` columns that are `NOT NULL`, to permit column values of '`0000-00-00`' or '`0000-00-00 00:00:00`' to be selected. However, this was not working for `WHERE` clauses in `DELETE` statements. ([Bug#8143](#))
- A user variable set to a value selected from an unsigned column was stored as a signed value. ([Bug#7498](#))
- The `--with-collation` option was not honored for client connections. ([Bug#7192](#))
- With `TRADITIONAL` SQL mode, assignment of out-of-bound values and rounding of assigned values was done correctly, but assignment of the same numbers represented as strings sometimes was handled differently. ([Bug#6147](#))
- On an `INSERT` into an updatable but noninsertable view, an error message was issued stating that the view was not updatable. Now the message says the view is not insertable-into. ([Bug#5505](#))
- `EXPLAIN` sometimes returned an incorrect `select_type` for a `SELECT` from a view, compared to the `select_type` for the equivalent `SELECT` from the base table. ([Bug#5500](#))

- Some queries that used `ORDER BY` and `LIMIT` performed quickly in MySQL 3.23, but slowly in MySQL 4.x/5.x due to an optimizer problem. ([Bug#4981](#))
- Incorporated portability fixes into the definition of `__attribute__` in `my_global.h`. ([Bug#2717](#))
- User-created tables having a name beginning with `#sql` were not visible to `SHOW TABLES` and could collide with internal temporary table names. Now they are not hidden and do not collide. ([Bug#1405](#))

## C.1.46. Changes in MySQL 5.1.11 (26 May 2006)

This is a new Beta development release, fixing recently discovered bugs.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** The Event Scheduler can now be in one of three states (on, off, or the new suspended state). In addition, due to the fact that `SET GLOBAL event_scheduler;` now acts in a synchronous rather than asynchronous manner, the Event Scheduler thread can no longer be activated or deactivated at run time.

For more information regarding these changes, see [Section 19.4.1, “Event Scheduler Overview”](#). ([Bug#17619](#))

- **MySQL Cluster:** The limit of 2048 ordered indexes per cluster has been lifted. There is now no upper limit on the number of ordered indexes (including `AUTO_INCREMENT` columns) that may be used. ([Bug#14509](#))
- Added the `log_queries_not_using_indexes` system variable. ([Bug#19616](#))
- Added the `ssl_ca`, `ssl_capath`, `ssl_cert`, `ssl_cipher`, and `ssl_key` system variables, which display the values given using the corresponding command options. See [Section 5.5.6.3, “SSL Command Options”](#). ([Bug#19606](#))
- The `ENABLE KEYS` and `DISABLE KEYS` clauses for the `ALTER TABLE` statement are now supported for partitioned tables. ([Bug#19502](#))
- Added the `--ssl-verify-server-cert` option to MySQL client programs. This option causes the server's Common Name value in its certificate to be verified against the host name used when connecting to the server, and the connection is rejected if there is a mismatch. Added `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for the `mysql_options()` C API function to enable this verification. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default. ([Bug#17208](#))
- The default for the `innodb_thread_concurrency` system variable was changed to 8. ([Bug#15868](#))
- It is now possible to use `NEW.var_name` values within triggers as `INOUT` parameters to stored procedures. ([Bug#14635](#))
- Added the `--angel-pid-file` option to `mysqlmanager` for specifying the file in which the angel process records its process ID when `mysqlmanager` runs in daemon mode. ([Bug#14106](#))
- Previously, to build MySQL from source with SSL support enabled, you would invoke `configure` with either the `--with-openssl` or `--with-yassl` option. Those options both have been replaced by the `--with-ssl` option. By default, `--with-ssl` causes the bundled yaSSL library to be used. To select OpenSSL instead, give the option as `--with-ssl=path`, where `path` is the directory where the OpenSSL header files and libraries are located.
- The `mysql_get_ssl_cipher()` C API function was added.
- `mysql_explain_log` (a third-party program) is no longer included in MySQL distributions.

Bugs fixed:

- **Security Fix:** An SQL-injection security hole has been found in multi-byte encoding processing. The bug was in the server, incorrectly parsing the string escaped with the `mysql_real_escape_string()` C API function.

This vulnerability was discovered and reported by Josh Berkus <[josh@postgresql.org](mailto:josh@postgresql.org)> and Tom Lane <[tgl@sss.pgh.pa.us](mailto:tgl@sss.pgh.pa.us)> as part of the inter-project security collaboration of the OSDB consortium. For more information about SQL injection, please see the following text.

**Discussion.** An SQL injection security hole has been found in multi-byte encoding processing. An SQL injection security hole can include a situation whereby when a user supplied data to be inserted into a database, the user might inject SQL statements into the data that the server will execute. With regards to this vulnerability, when character set-unaware escaping is used (for example, `addslashes()` in PHP), it is possible to bypass the escaping in some multi-byte character sets (for example, SJIS, BIG5 and GBK). As a result, a function such as `addslashes()` is not able to prevent SQL-injection attacks. It is impossible to fix this on the server side. The best solution is for applications to use character set-aware escaping offered by a function such `mysql_real_escape_string()`.

However, a bug was detected in how the MySQL server parses the output of `mysql_real_escape_string()`. As a result, even when the character set-aware function `mysql_real_escape_string()` was used, SQL injection was possible. This bug has been fixed.

**Workarounds.** If you are unable to upgrade MySQL to a version that includes the fix for the bug in `mysql_real_escape_string()` parsing, but run MySQL 5.0.1 or higher, you can use the `NO_BACKSLASH_ESCAPES` SQL mode as a workaround. (This mode was introduced in MySQL 5.0.1.) `NO_BACKSLASH_ESCAPES` enables an SQL standard compatibility mode, where backslash is not considered a special character. The result will be that queries will fail.

To set this mode for the current connection, enter the following SQL statement:

```
SET sql_mode='NO_BACKSLASH_ESCAPES';
```

You can also set the mode globally for all clients:

```
SET GLOBAL sql_mode='NO_BACKSLASH_ESCAPES';
```

This SQL mode also can be enabled automatically when the server starts by using the command-line option `--sql-mode=NO_BACKSLASH_ESCAPES` or by setting `sql-mode=NO_BACKSLASH_ESCAPES` in the server option file (for example, `my.cnf` or `my.ini`, depending on your system). ([Bug#8378](#), [CVE-2006-2753](#))

See also [Bug#8303](#).

- **Partitioning: MySQL Cluster:** `SELECT MIN(unique_column)` from a Cluster table with user-defined partitioning crashed the server. ([Bug#18730](#))
- **MySQL Cluster: Replication:** (Replication): Memory was not freed after some `ALTER TABLE` operations, which could cause `mysqld` processes to crash. ([Bug#19885](#))
- **MySQL Cluster:** Running `ALL START` in the `NDB` management client or restarting multiple nodes simultaneously could under some circumstances cause the cluster to crash. ([Bug#19930](#))
- **MySQL Cluster: (NDBAPI):** On big-endian platforms, `NdbOperation::write_attr()` did not update 32-bit fields correctly. ([Bug#19537](#))
- **MySQL Cluster: TRUNCATE TABLE** failed on tables having `BLOB` or `TEXT` columns with the error `LOCK_WAIT_TIMEOUT EXCEEDED`.

### Note

This issue affected both in-memory and Disk Data tables.

([Bug#19201](#))

- **MySQL Cluster: ALTER TABLE ENGINE=...** failed when used to change a MySQL Cluster table having no explicit primary key to use a different storage engine.

### Note

As a consequence of this fix, `SHOW CREATE TABLE` no longer displays auto-partitioning information for `NDB-CLUSTER` tables.

([Bug#19010](#))

- **MySQL Cluster: (NDBAPI):** The `Ndb::dropEventOperation()` method failed to clean up all objects used, which could cause memory leaks to occur. ([Bug#17610](#))
- **MySQL Cluster:** Using “stale” `mysqld.frm` files could cause a newly-restored cluster to fail. This situation could arise when restarting a MySQL Cluster using the `--initial` option while leaving connected `mysqld` processes running. ([Bug#16875](#))

- **MySQL Cluster:** A Cluster whose storage nodes were installed from the `MySQL-ndb-storage-*` RPMs could not perform `CREATE` or `ALTER` operations that made use of nondefault character sets or collations. ([Bug#14918](#))
- **MySQL Cluster:** Data node failures could cause excessive CPU usage by `ndb_mgmd`. ([Bug#13987](#))
- **Replication:** The embedded server crashed with row-based replication enabled. ([Bug#18518](#))
- **Cluster Replication:** `mysqld` processes did not always detect cluster shutdown, leading to issues with Cluster replication and schema distribution. ([Bug#19395](#))
- The `Data_free` column in the output of `SHOW TABLE STATUS` always displayed 0 for partitioned tables. ([Bug#19501](#))
- Altering a `VARCHAR` column in a `MyISAM` table to make it longer could cause corruption of the following column. ([Bug#19386](#))
- It was not possible to invoke a stored routine containing dynamic SQL from a scheduled event. ([Bug#19264](#))
- Adding an index to a table created using partitioning by `KEY` and the `MEMORY` storage engine caused the server to crash. ([Bug#19140](#))
- Use of uninitialized user variables in a subquery in the `FROM` clause resulted in invalid entries in the binary log. ([Bug#19136](#))
- A `CREATE TABLE` statement that created a table from a materialized view did not inherit default values from the underlying table. ([Bug#19089](#))
- Premature optimization of nested subqueries in the `FROM` clause that refer to aggregate functions could lead to incorrect results. ([Bug#19077](#))
- When creating a table using `CREATE TABLE ... PARTITION BY ... SELECT ...`, the partitioning clause was ignored. ([Bug#19062](#))
- For dates with 4-digit year parts less than 200, an implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became `'2050-01-01 00:00:00'`.) Now these operations return `NULL` rather than an incorrect non-`NULL` value. ([Bug#18997](#))
- `BLOB` or `TEXT` arguments to or values returned from stored functions were not copied properly if too long and could become garbled. ([Bug#18587](#))
- The client libraries were not compiled for position-independent code on Solaris-SPARC and AMD x86\_64 platforms. ([Bug#18091](#), [Bug#13159](#), [Bug#14202](#))
- Returning the value of a system variable from a stored function caused a server crash. ([Bug#18037](#))
- Revised memory allocation for local objects within stored functions and triggers to avoid memory leak for repeated function or trigger invocation. ([Bug#17260](#))
- Symlinking `.mysql_history` to `/dev/null` to suppress statement history saving by `mysql` did not work. (`mysql` deleted the symlink and recreated `.mysql_history` as a regular file, and then wrote history to it.) ([Bug#16803](#))
- `IS_USED_LOCK()` could return an incorrect connection identifier. ([Bug#16501](#))
- Simultaneous scheduled events whose actions conflicted with one another could crash the server. ([Bug#16428](#))
- Concurrent reading and writing of privilege structures could crash the server. ([Bug#16372](#))
- The server no longer uses a signal handler for signal 0 because it could cause a crash on some platforms. ([Bug#15869](#))
- `EXPLAIN ... SELECT INTO` caused the client to hang. ([Bug#15463](#))
- `CREATE TABLE ... SELECT ...` statements that used a stored function explicitly or implicitly (through a view) resulted in a `Table not locked` error. ([Bug#15137](#), [Bug#12472](#))
- Display better error message for `ALTER TABLE` operations that will result in duplicate keys due to `AUTO_INCREMENT` resequencing. ([Bug#14573](#))
- The result from `CONV()` is a string, but was not always treated the same way as a string when converted to a real value for an arithmetic operation. ([Bug#13975](#))
- Within a trigger, `SET` used the SQL mode of the invoking statement, not the mode in effect at trigger creation time. ([Bug#6951](#))

- Corrected several problems with the treatment of the `--log-error` option by `mysqld_safe`. These problems were manifest as differences from `mysqld` in error log handling.
  - If a file name was given for `--log-error`, `mysqld_safe` ignored it and did not pass it to `mysqld`, which then wrote error information to `stderr` and resulted in incorrect log rotation when `FLUSH LOGS` was used.
  - `mysql_safe` now adds `.err` to the end of the file name if no extension is present (the same as `mysqld`).
  - `mysqld_safe` treated a relative path name as relative to its own current working directory. Now it treats a relative path name as relative to the data directory (the same as `mysqld`).

In addition, some argument quoting problems were corrected. ([Bug#6061](#))

- The `basedir` and `tmpdir` system variables could not be accessed using `@@var_name` syntax. ([Bug#1039](#))
- `mysqld_safe` treated a relative path name as relative to its own current working directory. Now it treats a relative path name as relative to the data directory (the same as `mysqld`).
- `mysql_safe` now adds `.err` to the end of the file name if no extension is present (the same as `mysqld`).
- If a file name was given for `--log-error`, `mysqld_safe` ignored it and did not pass it to `mysqld`, which then wrote error information to `stderr` and resulted in incorrect log rotation when `FLUSH LOGS` was used.
- The patch for [Bug#8303](#) broke the fix for [Bug#8378](#) and was reverted.

In string literals with an escape character (\) followed by a multi-byte character that had (\) as its second byte, the literal was not interpreted correctly. Now only next byte now is escaped, and not the entire multi-byte character. This means it is a strict reverse of the `mysql_real_escape_string()` function.

## C.1.47. Changes in MySQL 5.1.10 (Not released)

### Note

This was an internal release only, and no binaries were published.

MySQL 5.1.10 includes the patches for recently reported security vulnerabilities in the MySQL client-server protocol. We would like to thank Stefano Di Paola <[stefano.dipaola@wisec.it](mailto:stefano.dipaola@wisec.it)> for finding and reporting these to us.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see [ht tp://www.mysql.com/products/enterprise](http://www.mysql.com/products/enterprise).

Functionality added or changed:

- **Security Enhancement:** Added the global `max_prepared_stmt_count` system variable to limit the total number of prepared statements in the server. This limits the potential for denial-of-service attacks based on running the server out of memory by preparing huge numbers of statements. The current number of prepared statements is available through the `prepared_stmt_count` system variable. ([Bug#16365](#))
- **MySQL Cluster:** It is now possible to restore a MySQL Cluster backup between big-endian and little-endian machines. ([Bug#19255](#))
- **MySQL Cluster:** It is now possible to perform a partial start of a cluster. That is, it is now possible to bring up the cluster without first running `ndbd --initial` on all configured data nodes. ([Bug#18606](#))
- **MySQL Cluster:** It is now possible to install MySQL with Cluster support to a nondefault location and change the search path for font description files using either the `--basedir` or `--character-sets-dir` options. (Previously in MySQL 5.1, `ndbd` searched only the default path for character sets.)
- **Packaging:** The `MySQL-shared-compat-5.1.x-.i386.rpm` shared compatibility RPMs no longer contain libraries for MySQL 5.0. This avoids a conflict because the 5.0 and 5.1 libraries share the same `soname` number. They now contain libraries for MySQL 3.23, 4.0, 4.1, and 5.1. ([Bug#19288](#))
- SQL syntax for prepared statements now supports `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE`. ([Bug#19308](#))
- The `ONLY_FULL_GROUP_BY` SQL mode now also applies to the `HAVING` clause. That is, columns not named in the `GROUP BY` clause cannot be used in the `HAVING` clause if not used in an aggregate function. ([Bug#18739](#))

- XPath expressions passed to the `ExtractValue()` and `UpdateXML()` functions can now include the colon character (“`:`”). This enables use of these functions with XML which employs namespaces. ([Bug#18170](#))
- On Windows, some names such as `nul`, `prn`, and `aux` could not be used as file names because they are reserved as device names. These are now permissible names in MySQL. They are encoded by appending `@@@` to the name when the server creates the corresponding file or directory. This occurs on all platforms for portability of the corresponding database object between platforms. ([Bug#17870](#))
- The bundled yaSSL library was upgraded to version 1.3.5. This improves handling of certain problems with SSL-related command options. ([Bug#17737](#))
- You must now have the `DROP` privilege to drop table partitions. ([Bug#17139](#))
- Server and clients ignored the `--sysconfdir` option that was passed to `configure`. The directory specified by this option, if set, now is used as one of the standard locations in which to look for option files. ([Bug#15069](#))
- In result set metadata, the `MYSQL_FIELD.length` value for `BIT` columns now is reported in number of bits. For example, the value for a `BIT(9)` column is 9. (Formerly, the value was related to number of bytes.) ([Bug#13601](#))
- The following statements now cause an implicit commit: `ANALYZE TABLE`, `CHECK TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE`.
- Added the `KEY_BLOCK_SIZE` table option and index option. This can be used in `CREATE TABLE`, `ALTER TABLE`, and `CREATE INDEX` statements to provide a hint to the storage engine about the size to use for index key blocks. The engine is permitted to change the value if necessary.
- Added the `sql_big_selects` system variable to the output of `SHOW VARIABLES`.
- The `mysql_upgrade` command has been converted from a shell script to a C program, so it is available on non-Unix systems such as Windows. This program should be run for each MySQL upgrade. See [Section 4.4.8, “mysql\\_upgrade — Check Tables for MySQL Upgrade”](#).
- Added the `REFERENTIAL_CONSTRAINTS` table to `INFORMATION_SCHEMA`. It provides information about foreign keys.
- Added the `have_dynamic_loading` system variable that indicates whether the server supports dynamic loading of plugins.
- Added `--debug` option to Instance Manager.
- Binary distributions that include SSL support now are built using yaSSL when possible.

Bugs fixed:

- **Security Fix:** A `\NUL` byte within a comment in a statement string caused the rest of the string not to be written to the query log, permitting logging to be bypassed. ([Bug#17667](#), [CVE-2006-0903](#))
- **Security Fix:** A malicious client, using specially crafted invalid `COM_TABLE_DUMP` packets was able to trigger an exploitable buffer overflow on the server. Thanks to Stefano Di Paola <[stefano.dipaola@wisc.sec.it](mailto:stefano.dipaola@wisc.sec.it)> for finding and reporting this bug. ([CVE-2006-1518](#))
- **Security Fix:** A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (, ) Thanks to Stefano Di Paola <[stefano.dipaola@wisc.sec.it](mailto:stefano.dipaola@wisc.sec.it)> for finding and reporting this bug. ([CVE-2006-1516](#), [CVE-2006-1517](#))
- **MySQL Cluster: Replication:** (Replication): Delete and update of rows in a table without a primary key failed on the slave. ([Bug#17400](#))
- **MySQL Cluster:** A 5.1.6 or newer server did not read local checkpoints recorded by any other 5.1 version, thus preventing a system restart following an upgrade. ([Bug#19333](#))
- **MySQL Cluster:** Concurrent `INSERT` and `ROLLBACK` statements from different connections could cause node failures. ([Bug#19245](#))
- **MySQL Cluster:** (Disk Data): Running an `INSERT` and a `DELETE` on a Disk Data table in the same transaction could cause a deadlock. ([Bug#19244](#))
- **MySQL Cluster:** Starting `mysqld` without `--log-bin` caused DDL statements on `NDB` tables to time out. ([Bug#19214](#))
- **MySQL Cluster:** (NDBAPI): Passing a nonexistent index name to `NdbIndexScanOperation::setBound()` caused a segmentation fault. ([Bug#19088](#))

- **MySQL Cluster:** `mysql-test-run.pl` started NDB even for test cases that did not need it. ([Bug#19083](#))
- **MySQL Cluster:** Stopping multiple nodes could cause node failure handling not to be completed. ([Bug#19039](#))
- **MySQL Cluster:** The Cluster binlog `mysqld` accepted updates even though the binary log was not set up, which could lead to updates missing from the binary log. ([Bug#18932](#))
- **MySQL Cluster:** `mysqld` could crash when attempting an update if the cluster had failed previously. ([Bug#18798](#))
- **MySQL Cluster:** An `INSERT` or `UPDATE` of more than 128 bytes of data in a 4-replica cluster could cause data nodes to crash. ([Bug#18622](#))
- **MySQL Cluster:** (Disk Data): `CREATE LOGFILE GROUP` accepted values other than `NDB` or `NDBCCLUSTER` in the `ENGINE` clause. ([Bug#18604](#))
- **MySQL Cluster:** (Disk Data): Omitting the required `ENGINE` clause from a `CREATE LOGFILE GROUP` or `CREATE TABLESPACE` statement caused the server to crash. An appropriate error message is now returned instead. ([Bug#18603](#))
- **MySQL Cluster:** Queries using `ORDER BY pkn` failed against a `LIST`-partitioned Cluster table having a multi-column primary key, where `pkn` represents one of the columns making up the primary key. ([Bug#18598](#))
- **MySQL Cluster:** A simultaneous `DROP TABLE` and table update operation utilising a table scan could trigger a node failure. ([Bug#18597](#))
- **MySQL Cluster:** Fragment IDs were not logged correctly, causing `ndb_restore_log` to fail. ([Bug#18594](#))
- **MySQL Cluster:** Repeated use of the `SHOW` and `ALL STATUS` commands in the `ndb_mgm` client could cause the `mgmd` process to crash. ([Bug#18591](#))
- **MySQL Cluster:** `ndbd` sometimes failed to start with the error `NODE FAILURE HANDLING NOT COMPLETED` following a graceful restart. ([Bug#18550](#))
- **MySQL Cluster:** `ndb_restore` failed to restore a backup made from a 5.0 cluster to a 5.1 cluster. ([Bug#18210](#))
- **MySQL Cluster:** Adding an index to an unsigned integer column did not work correctly. ([Bug#18133](#))
- **MySQL Cluster:** A `SELECT` from an `NDB` table with `ORDER BY indexed_column` and a `LIMIT` clause would fail following `ALTER TABLE`. ([Bug#18094](#))
- **MySQL Cluster:** `mysqldump` included in its output data from the internal `cluster` database. ([Bug#17840](#))
- **MySQL Cluster:** Backups could fail for large clusters with many tables, where the number of tables approached `MaxNoOfTables`. ([Bug#17607](#))
- **MySQL Cluster:** Some queries having a `WHERE` clause of the form `c1=val1 OR c2 LIKE 'val2'` were not evaluated correctly. ([Bug#17421](#))
- **MySQL Cluster:** An issue with `ndb_mgmd` prevented more than 27 `mysqld` processes from connecting to a single cluster at one time. ([Bug#17150](#))
- **MySQL Cluster:** In a 2-node cluster with a node failure, restarting the node with a low value for `StartPartialTimeout` could cause the cluster to come up partitioned (“split-brain” issue).  
  
A similar issue could occur when the cluster was first started with a sufficiently low value for this parameter. ([Bug#16447](#), [Bug#18612](#))
- **MySQL Cluster:** Performing multiple `ALTER TABLE` operations on the same `NDB` table from different `mysqld` processes in the same cluster led to schema versioning errors when trying to access the table again following the restart of one of the `mysqld` processes. ([Bug#16445](#))
- **MySQL Cluster:** On systems with multiple network interfaces, data nodes would get “stuck” in startup phase 2 if the interface connecting them to the management server was working on node startup while the interface interconnecting the data nodes experienced a temporary outage. ([Bug#15695](#))
- **MySQL Cluster:** On slow networks or CPUs, the management client `SHOW` command could sometimes erroneously show all data nodes as being master nodes belonging to nodegroup 0. ([Bug#15530](#))
- **MySQL Cluster:** Unused open handlers for tables in which the metadata had changed were not properly closed. This could result in stale results from `NDB` tables following an `ALTER TABLE` statement. ([Bug#13228](#))
- **MySQL Cluster:** Uninitialized internal variables could lead to unexpected results. ([Bug#11033](#), [Bug#11034](#))

- **MySQL Cluster:** When attempting to create an index on a `BIT` or `BLOB` column, `ERROR 743: UNSUPPORTED CHARACTER SET IN TABLE OR INDEX` was returned instead of `ERROR 906: UNSUPPORTED ATTRIBUTE TYPE IN INDEX`.
- **Cluster Replication: Partitioning:** Attempting to create an index using multiple columns on an explicitly partitioned table in a replicated Cluster database could cause the master `mysqld` process to crash. ([Bug#18284](#))
- **Cluster Replication: Replication:** An issue with replication caused a `mysqld` connected to a replicated cluster to crash when entering single user mode. ([Bug#18535](#))
- **Replication:** `CREATE VIEW` statements would not be replicated to the slave if the `--replicate-wild-ignore-table` rule was enabled. ([Bug#18715](#))
- **Replication:** Updating a field value when also requesting a lock with `GET_LOCK()` would cause slave servers in a replication environment to terminate. ([Bug#17284](#))
- **Replication:** The binary log would create an incorrect `DROP` query when creating temporary tables during replication. ([Bug#17263](#))
- **Disk Data:** Issuing a `CREATE LOGFILE GROUP` statement during the drop of an `NDB` table would cause database corruption. ([Bug#19141](#))
- **Disk Data:** Concurrent table schema operations and operations on log file groups, tablespaces, data files, or undo files could lead to data node failures. ([Bug#18575](#))
- **Cluster Replication:** Using the `--binlog-do-db` option caused problems with `CREATE TABLE` on the cluster acting as the replication master. ([Bug#19492](#))
- **Cluster Replication:** When taking part in Cluster replication of tables containing `BLOB` columns, `mysqld` falsely reported a large memory leak in the replication buffers when there was none. ([Bug#19247](#))
- **Cluster Replication:** Trying to restore the `apply_status` table from a 5.0 cluster backup failed on a 5.1 server. ([Bug#18935](#))
- A compatibility issue with NPTL (Native POSIX Thread Library) on Linux could result in a deadlock with `FLUSH TABLES WITH READ LOCK` under some conditions. ([Bug#20048](#))
- Some outer joins were incorrectly converted to inner joins. ([Bug#19816](#))

This regression was introduced by [Bug#17146](#).

- A view definition that referred to an alias in the `HAVING` clause could be saved in the `.frm` file with the alias replaced by the expression that it referred to, causing failure of subsequent `SELECT * FROM view_name` statements. ([Bug#19573](#))
- `mysql` displayed `NULL` for strings that are empty or contain only spaces. ([Bug#19564](#))
- Selecting from a view that used `GROUP BY` on a nonconstant temporal interval (such as `DATE(col) + INTERVAL TIME_TO_SEC(col) SECOND`) could cause a server crash. ([Bug#19490](#))
- An outer join of two views that was written using `{ OJ ... }` syntax could cause a server crash. ([Bug#19396](#))
- An issue with file handling in the partitioning code could cause `mysqld` to crash when started and then stopped within a very short period of time. ([Bug#19313](#))
- `myisamchk` and `myisam_ftdump` should permit either table names or `.MYI` file names as arguments, but permitted only table names. ([Bug#19220](#))
- `InnoDB` could read a delete mark from its system tables incorrectly. ([Bug#19217](#))
- Executing a `CREATE EVENT` statement could cause 100% CPU usage. ([Bug#19170](#))
- Eliminated some memory corruption problems that resulted in `double free or corruption` errors and a server crash. ([Bug#19154](#))
- Attempting to set the default value of an `ENUM` or `SET` column to `NULL` caused a server crash. ([Bug#19145](#))
- Index corruption could occur in cases when `key_cache_block_size` was not a multiple of the `myisam-block-size` value (for example, with `--key_cache_block_size=1536` and `--myisam-block-size=1024`). ([Bug#19079](#))
- Instance Manager now finds the version numbers, so that it works properly when the executable name isn't the same as what the Instance Manager launched (such as when wrapping a `libtool`-wrapped executable from the source tree). ([Bug#19059](#))

- Some fast `ALTER TABLE` operations (requiring no temporary table) did not work for all tables. ([Bug#19011](#))
- Successive `ALTER TABLE ... DROP PARTITION` statements on the same subpartitioned table could eventually cause the server to crash. ([Bug#18962](#))
- Creating a table in an `InnoDB` database with a column name that matched the name of an internal `InnoDB` column (including `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR` and `DB_MIX_ID`) would cause a crash. MySQL now returns Error 1005 `CANNOT CREATE TABLE` with `errno` set to -1. ([Bug#18934](#))
- The parser leaked memory when its stack needed to be extended. ([Bug#18930](#))
- MySQL would not compile on Linux distributions that use the `tinfo` library. ([Bug#18912](#))
- The server attempted to flush uninitialized log tables during `SIGHUP` processing, causing a crash. ([Bug#18848](#))
- For a reference to a nonexistent stored function in a stored routine that had a `CONTINUE` handler, the server continued as though a useful result had been returned, possibly resulting in a server crash. ([Bug#18787](#))
- For single-`SELECT` union constructs of the form `(SELECT ... ORDER BY order_list1 [LIMIT n]) ORDER BY order_list2`, the `ORDER BY` lists were concatenated and the `LIMIT` clause was ignored. ([Bug#18767](#))
- Inserts failed with duplicate key errors on a table partitioned using an `AUTO_INCREMENT` column for the partitioning key. ([Bug#18753](#), [Bug#18552](#))
- It was possible to create a `RANGE`-partitioned table with a partition defined using the clause `VALUES LESS THAN (NULL)`, even though such a partition could never contain any values whatsoever. ([Bug#18752](#))
- Delimited identifiers for partitions were not being treated the same as delimited identifiers for other database objects (such as tables and columns) with regard to permitted characters. ([Bug#18750](#))
- Conversion of a number to a `CHAR UNICODE` string returned an invalid result. ([Bug#18691](#))
- If the second or third argument to `BETWEEN` was a constant expression such as `'2005-09-01 - INTERVAL 6 MONTH'` and the other two arguments were columns, `BETWEEN` was evaluated incorrectly. ([Bug#18618](#))
- `LOAD DATA FROM MASTER` would fail when trying to load the `INFORMATION_SCHEMA` database from the master, because the `INFORMATION_SCHEMA` system database would already exist on the slave. ([Bug#18607](#))
- Running an `ALTER TABLE` on a partitioned table simultaneously experiencing a high number of concurrent DML statements could crash the server. ([Bug#18572](#))
- A `LOCK TABLES` statement that failed could cause `MyISAM` not to update table statistics properly, causing a subsequent `CHECK TABLE` to report table corruption. ([Bug#18544](#))
- `mysqltest` incorrectly interpreted some `ER_xxx` error names given in the `error` command. ([Bug#18495](#))
- `InnoDB: ALTER TABLE` to add or drop a foreign key for an `InnoDB` table had no effect. ([Bug#18477](#))
- `InnoDB` did not use a consistent read for `CREATE ... SELECT` when `innodb_locks_unsafe_for_binlog` was set. ([Bug#18350](#))
- `DROP DATABASE` did not drop stored routines associated with the database if the database name was longer than 21 characters. ([Bug#18344](#))
- A query on a table partitioned or subpartitioned by `HASH` did not display all results when using a `WHERE` condition involving a column used in the hashing expression. ([Bug#18329](#), [Bug#18423](#))
- In `mysqltest`, `--sleep=0` had no effect. Now it correctly causes `sleep` commands in test case files to sleep for 0 seconds. ([Bug#18312](#))
- The `ExtractValue()` function did not return character data within `<![CDATA[ ]]>` as expected. ([Bug#18285](#))
- A recent change caused the `mysql` client not to display `NULL` values correctly and to display numeric columns left-justified rather than right-justified. The problems have been corrected. ([Bug#18265](#))
- Updates to a `MEMORY` table caused the size of `BTREE` indexes for the table to increase. ([Bug#18160](#))
- A failed `ALTER TABLE` operation could fail to clean up a temporary `.frm` file. ([Bug#18129](#))
- Event-creation statements enclosed in multi-line comments using `/*!version_number ... */` syntax were not parsed correctly. ([Bug#18078](#))

- `SELECT DISTINCT` queries sometimes returned only the last row. ([Bug#18068](#))
- `InnoDB`: A `DELETE` followed by an `INSERT` and then by an `UPDATE` on a partitioned `InnoDB` table caused subsequent queries to return incorrect results. ([Bug#17992](#))
- It was possible to use trailing spaces in the names of partitions and subpartitions. Attempting to do so now raises the error `INCORRECT PARTITION NAME`. ([Bug#17973](#))
- `LIKE` searches failed on a `CHAR` column used as the partitioning column of a table partitioned by `KEY`. ([Bug#17946](#))
- Executing `SELECT` on a large table that had been compressed within `myisampack` could cause a crash. ([Bug#17917](#))
- The `sql_big_selects` system variable was not displayed by `SHOW VARIABLES`. ([Bug#17849](#))
- `REPAIR TABLE` did not restore the length for packed keys in tables created under MySQL 4.x, which caused them to appear corrupt to `CHECK TABLE` but not to `REPAIR TABLE`. ([Bug#17810](#))
- A range access optimizer heuristic was invalid, causing some queries to be much slower in MySQL 5.0 than in 4.0. ([Bug#17379](#), [Bug#18940](#))
- Logging to the `mysql.general_log` and `mysql.slow_log` tables did not work for Windows builds because the `CSV` storage engine was unavailable. The `CSV` engine now is enabled in Windows builds. ([Bug#17368](#))
- If the `WHERE` condition of a query contained an `OR-ed FALSE` term, the set of tables whose rows cannot serve for null-complements in outer joins was determined incorrectly. This resulted in blocking possible conversions of outer joins into joins by the optimizer for such queries. ([Bug#17164](#))
- Casting a string to `DECIMAL` worked, but casting a trimmed string (using `LTRIM()` or `RTRIM()`) resulted in loss of decimal digits. ([Bug#17043](#))
- `MyISAM` table deadlock was possible if one thread issued a `LOCK TABLES` request for write locks and then an administrative statement such as `OPTIMIZE TABLE`, if between the two statements another client meanwhile issued a multiple-table `SELECT` for some of the locked tables. ([Bug#16986](#))
- `ALTER TABLE ... REBUILD PARTITION` returned an inaccurate error message. ([Bug#16819](#))
- Use of `--default-storage-engine=innodb` resulted in an error with the server reporting that `InnoDB` was an unknown table type. ([Bug#16691](#))
- `MySQL-shared-compat-5.1.9-0.i386.rpm` incorrectly depended on `glibc` 2.3 and could not be installed on a `glibc` 2.2 system. ([Bug#16539](#))
- The presence of multiple equalities in a condition after reading a constant table could cause the optimizer not to use an index. This resulted in certain queries being much slower than in MySQL 4.1. ([Bug#16504](#))
- Within a trigger, `CONNECTION_ID()` did not return the connection ID of the thread that caused the trigger to be activated. ([Bug#16461](#))
- The XPath `string-length()` function was not implemented for use with `ExtractValue()`. ([Bug#16319](#))
- The `ExtractValue()` function failed with a syntax error when the XPath expression used special characters such as `Ñ` (“N-tilde”). ([Bug#16233](#))
- The `sql_notes` and `sql_warnings` system variables were not always displayed correctly by `SHOW VARIABLES` (for example, they were displayed as `ON` after being set to `OFF`). ([Bug#16195](#))
- If the first argument to `BETWEEN` was a `DATE` or `TIME` column of a view and the other arguments were constants, `BETWEEN` did not perform conversion of the constants to the appropriate temporary type, resulting in incorrect evaluation. ([Bug#16069](#))
- After calling `FLUSH STATUS`, the `max_used_connections` variable did not increment for existing connections and connections which use the thread cache. ([Bug#15933](#))
- `DELETE` and `UPDATE` statements that used large `NOT IN (value_list)` clauses could use large amounts of memory. ([Bug#15872](#))
- `InnoDB` failure to release an adaptive hash index latch could cause a server crash if the query cache was enabled. ([Bug#15758](#))
- `LAST_INSERT_ID()` in a stored function or trigger returned zero. . ([Bug#15728](#))
- The `system_time_zone` and `version_*` system variables could not be accessed using `SELECT @@var_name` syntax. ([Bug#15684](#), [Bug#12792](#))

- If the server were built without partition support, it was possible to run partitioning-related statements with no errors or warnings, even though these statements would have no effect. Now such statements are not permitted unless the server has been compiled using the `--with-partition` option. ([Bug#15561](#))
- Use of `CONVERT_TZ()` in a view definition could result in spurious syntax or access errors. ([Bug#15153](#))
- Prevent recursive views caused by using `RENAME TABLE` on a view after creating it. ([Bug#14308](#))
- Some queries were slower in 5.0 than in 4.1 because some 4.1 cost-evaluation code had not been merged into 5.0. ([Bug#14292](#))
- Avoid trying to include `<asm/atomic.h>` when it doesn't work in C++ code. ([Bug#13621](#))
- Running `myisampack` followed by `myisamchk` with the `--unpack` option would corrupt the `AUTO_INCREMENT` key. ([Bug#12633](#))
- Use of `CONVERT_TZ()` in a stored function or trigger (or in a stored procedure called from a stored function or trigger) caused an error. ([Bug#11081](#))
- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. ([Bug#10405](#))

## C.1.48. Changes in MySQL 5.1.9 (12 April 2006)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see [ht tp://www.mysql.com/products/enterprise](http://www.mysql.com/products/enterprise).

Functionality added or changed:

- **MySQL Cluster:** The `NDB` storage engine now supports `CREATE TABLE` statements of arbitrary length. (Previously, `CREATE TABLE` statements for MySQL Cluster tables could contain a maximum of 4096 characters only.) ([Bug#17813](#))
- **MySQL Cluster:** Added the `--nowait-nodes` startup option for `ndbd`, making it possible to skip specified nodes without waiting for them to start when starting the cluster. See [Section 17.4.2, “ndbd — The MySQL Cluster Data Node Daemon”](#).
- `mysqld_safe` no longer checks for a `mysqld-max` binary. Instead, `mysqld_safe` nows checks only for the standard `mysqld` server unless another server binary is specified explicitly using `--mysqld` or `--mysqld-version`. If you previously relied on the implicit invocation of `mysqld-max`, you should use an appropriate option now. ([Bug#17861](#))
- For partitioned tables, the output of `SHOW TABLE STATUS` now shows in the `Engine` column the name of the storage engine used by all partitions for the table; in the `Create_options` column, the output now shows `partitioned` for a partitioned table. This change also affects the values shown in the corresponding columns of the `INFORMATION_SCHEMA.TABLES` table. ([Bug#17631](#))
- `SHOW PLUGIN` was renamed to `SHOW PLUGINS`. `SHOW PLUGIN` now is deprecated and generates a warning. ([Bug#17112](#))
- Large file support was re-enabled for the MySQL server binary for the AIX 5.2 platform. ([Bug#13571](#))
- Binary MySQL distributions now include a `mysqld-max` server, in addition to the usual `mysqld` optimized server and the `mysqld-debug` debugging server.

Bugs fixed:

- **Security Fix:** Invalid arguments to `DATE_FORMAT()` caused a server crash. Thanks to Jean-David Maillefer for discovering and reporting this problem to the Debian project and to Christian Hammers from the Debian Team for notifying us of it. ([Bug#20729](#), [CVE-2006-3469](#))

- **Partitioning: MySQL Cluster:** `BLOB` columns did not work correctly with user-partitioned `NDB` tables. ([Bug#16796](#))
- **MySQL Cluster:** An uninitialized internal variable could lead to unexpected results. ([Bug#18831](#))
- **MySQL Cluster:** `TRUNCATE TABLE` did not reset the `AUTO_INCREMENT` counter for `MyISAM` tables when issued inside a stored procedure.

### Note

This bug did not affect `InnoDB` tables.

In addition, `TRUNCATE TABLE` does not reset the `AUTO_INCREMENT` counter for `NDB` tables regardless of when it is called.

([Bug#14945](#))

See also [Bug#18864](#).

- For full-text searches in boolean mode, and when a full-text parser plugin was used, a `MYSQL_FTPARSER_PARAM::ftparser_state` could have been corrupted by recursive calls to the plugin. ([Bug#18836](#))
- `mysql_reconnect()` sent a `SET NAMES` statement to the server, even for pre-4.1 servers that do not understand the statement. ([Bug#18830](#))
- A query against a partitioned table using `WHERE col IS NULL` could produce incorrect results given the following conditions:
  - The table had partitions and subpartitions
  - The partitioning function depended on a single column `col` of one of the MySQL integer types
  - The partitioning function was not monotonically increasing

The same issue could cause the server to crash when run in debug mode. ([Bug#18659](#))

- Partition pruning did not work properly for some kinds of partitioning and subpartitioning, with certain `WHERE` clauses. (Partitions and subpartitions that should have been marked as used were not so marked.) The error could manifest as incorrect content in `EXPLAIN PARTITIONS` output as well as missing rows in the results of affected queries. ([Bug#18558](#))
- Building the server using `--with-example-storage-engine` failed to enable the `EXAMPLE` storage engine in the server. ([Bug#18464](#))
- If `InnoDB` encountered a `HA_ERR_LOCK_TABLE_FULL` error and rolled back a transaction, the transaction was still written to the binary log. ([Bug#18283](#))
- Complex queries with nested joins could cause a server crash. ([Bug#18279](#))
- `COUNT(*)` on a `MyISAM` table could return different results for the base table and a view on the base table. ([Bug#18237](#))
- `EXTRACT(QUARTER FROM date)` returned unexpected results. ([Bug#18100](#))
- Queries using `WHERE ... IS NULL` returned incorrect results from partitioned tables. ([Bug#18070](#))
- Partition pruning did not perform correctly with partitions on `NULL`, and could potentially crash the server. ([Bug#18053](#))
- `MEDIUMINT` columns were not handled in the same way as other column types by partition pruning.

Partition pruning would sometimes use inappropriate columns in performing queries.

Both of these issues were rectified as part of the same bug fix. ([Bug#18025](#))

- For tables created in a MySQL 4.1 installation upgraded to MySQL 5.0 and up, multiple-table updates could update only the first matching row. ([Bug#16281](#))
- For `mysql.server`, if the `basedir` option was specified after `datadir` in an option file, the setting for `datadir` was ignored and assumed to be located under `basedir`. ([Bug#16240](#))
- Triggers created in one version of the server could not be dropped after upgrading to a newer version. ([Bug#15921](#))
- `CAST(double AS SIGNED INT)` for large `double` values outside the signed integer range truncated the result to be within range, but the result sometimes had the wrong sign, and no warning was generated. ([Bug#15098](#))

- Quoted values could not be used for partition option values. ([Bug#13520](#))
- Delimited identifiers could not be used in defining partitions. ([Bug#13433](#))
- `mysql_config` returned incorrect libraries on `x86_64` systems. ([Bug#13158](#))
- The server was always built as though `--with-extra-charset=complex` had been specified. ([Bug#12076](#))

## C.1.49. Changes in MySQL 5.1.8 (Not released)

### Note

This was an internal release only, and no binaries were published.

Functionality added or changed:

- **Cluster Replication: Incompatible Change:** The `cluster_replication` database has been renamed to `cluster`. This will effect replication between MySQL Clusters where one cluster is running MySQL 5.1.8 or later, and the other is running MySQL 5.1.7 or earlier. See [Section 17.6, “MySQL Cluster Replication”](#), and especially [Section 17.6.4, “MySQL Cluster Replication Schema and Tables”](#).
- **Incompatible Change:** The semantics of `ALTER TABLE t ENGINE=X;` for partitioned tables is changed, and now means that the storage engine used for table `t` is changed to `X`.  
The previous statement formerly (prior to MySQL 5.1.8) meant that all partitioning was removed from the table. To remove the partitioning of a table, the syntax `ALTER TABLE t REMOVE PARTITIONING;` is introduced. The `REMOVE PARTITIONING` option can be used in combination with existing `ALTER TABLE` options such as those employed for adding or dropping columns or indexes. ([Bug#17754](#))
- **Incompatible Change:** For purposes of determining placement, `RANGE` partitioning now treats `NULL` as less than any other value. (Formerly, `NULL` was treated as equal to zero.) See [Section 18.2.6, “How MySQL Partitioning Handles NULL”](#). ([Bug#15447](#))
- **MySQL Cluster:** The stability of `CREATE` and `DROP` operations on `NDB` tables containing `BLOB` columns has been improved. ([Bug#17761](#))
- **MySQL Cluster:** The `NDBCLUSTER` storage engine now supports `INSERT IGNORE` and `REPLACE` statements. Previously, these statements failed with an error. ([Bug#17431](#))
- **Replication:** Triggers from older servers that included no `DEFINER` clause in the trigger definition now execute with the privileges of the invoker (which on the slave is the slave SQL thread). Previously, replication slaves could not replicate such triggers. ([Bug#16266](#))
- **Replication:** The `binlog_format` system variable now can be set to a third format, `MIXED`, as described in [Section 16.1.2, “Replication Formats”](#).
- **Replication:** The `binlog_format` system variable now is dynamic and can be changed at runtime, as described in [Section 16.1.2, “Replication Formats”](#).
- **Replication:** A slave server may now switch the replication format automatically. This happens when the server is running in either `STATEMENT` or `MIXED` format and encounters a row in the binary log that is written in `ROW` logging format. In that case, the slave switches to row-based replication temporarily for that event, and switches back to the previous format afterward.
- **Disk Data:** You can now have only one log file group at any one time. See [Section 12.1.14, “CREATE LOGFILE GROUP Syntax”](#). ([Bug#16386](#))
- Builds for Windows, Linux, and Unix (except AIX) platforms now have SSL support enabled, in the server as well as in the client libraries. Because part of the SSL code is written in C++, this does introduce dependencies on the system's C++ runtime libraries in several cases, depending on compiler specifics. ([Bug#18195](#))
- Partition pruning was made more stable, particularly in cases involving queries using tests for `NULL` values in the `WHERE` clause against subpartitioned tables which were partitioned by `LIST( some_function(col1, ... ,colN) )`. ([Bug#17891](#))
- The output of `SHOW CREATE EVENT` no longer qualifies the event name with the name of the schema to which the event belongs. ([Bug#17714](#))
- The following deprecated constructs now generate warnings, and they are removed as of MySQL 5.5. Where alternatives are

shown, applications should be updated to use them. Existing applications that depend on the deprecated constructs should be converted to make use of the current equivalents as soon as possible. You should not employ them in new applications.

- The `log_bin_trust_routine_creators` system variable (use `log_bin_trust_function_creators`).
- The `table_type` system variable (use `storage_engine`).
- The `TYPE` table option to specify the storage engine for `CREATE TABLE` or `ALTER TABLE` (use `ENGINE`).
- The `SHOW TABLE TYPES` SQL statement (use `SHOW ENGINES`).
- The `SHOW INNODB STATUS` and `SHOW MUTEX STATUS` SQL statements (use `SHOW ENGINE INNODB STATUS` `SHOW ENGINE INNODB MUTEX`).
- The `SHOW PLUGIN` SQL statement (use `SHOW PLUGINS`).
- The `LOAD TABLE ... FROM MASTER` and `LOAD DATA FROM MASTER` SQL statements (use `mysqldump` or `mysqlhotcopy` to dump tables and `mysql` to reload dump files).
- The `BACKUP TABLE` and `RESTORE TABLE` SQL statements (use `mysqldump` or `mysqlhotcopy` to dump tables and `mysql` to reload dump files).
- `TIMESTAMP(N)` data type: The ability to specify a display width of `N` (use without `N`).
- The `--master-xxx` server options to set replication parameters (use the `CHANGE MASTER TO` statement instead): `--master-host`, `--master-user`, `--master-password`, `--master-port`, `--master-connect-retry`, `--master-ssl`, `--master-ssl-ca`, `--master-ssl-capath`, `--master-ssl-cert`, `--master-ssl-cipher`, `--master-ssl-key`.

In addition, `SHOW BDB LOGS` and `SHOW LOGS` are removed as of MySQL 5.1.12.

### Important

**`TYPE` vs `ENGINE`**. In order not to break legacy applications, support for `TYPE = engine_name` —deprecated since MySQL 4.0—has been restored, but now generates a warning.

*Beginning with MySQL 5.5, `TYPE = engine_name` will no longer be available and will produce a syntax error.*

*You should not use `TYPE` in any new applications, and you should immediately begin conversion of existing applications to use the `ENGINE = engine_name` syntax instead.*

(Bug#17501)

- Temporary tables may no longer be partitioned. (Bug#17497)
- More specific error messages are now given when attempting to create an excessive number of partitions or subpartitions. (Previously, no distinction was made between an excessive number of partitions and an excessive number of subpartitions.) (Bug#17393)
- Added the `--events` option to `mysqldump` to enable events to be included in the dump output. (Bug#16853)
- For an event having no `STARTS` time specified when it was created, the `mysql.event` table's `start` column now displays the creation time rather than `NULL`.

In addition, both the `SHOW EVENTS` statement's `Starts` column and the `STARTS` column of the `INFORMATION_SCHEMA.EVENTS` table are now empty rather than `NULL` when `STARTS` was not used in the `CREATE EVENT` statement. (Bug#16537)

- Event names are now case-insensitive. That is (for example), you cannot have events with the names `Myevent` and `MyEvent` belonging to the same database and definer. (Bug#16415)
- Description of the `EVENT` privilege has been changed to `To create, alter, drop, and execute events`. (Bug#16412)
- `MICROSECOND` intervals are no longer permitted for events. (Bug#16411)
- Events no longer support times past the end of the Unix epoch. (Formerly, such dates were interpreted as being at the beginning of the Unix epoch.) (Bug#16396)
- The XPath `last()` function is now implemented for use with `ExtractValue()`. (Bug#16318)

- The `ExtractValue()` function with `contains()` now uses the SQL collation in making comparisons. Previously, comparisons were always binary (that is, case-sensitive). ([Bug#16316](#))
- Names of subpartitions must now be unique for an entire table, and not merely within the same partition. ([Bug#15408](#))
- Added the `--sysdate-is-now` option to `mysqld` to enable `SYSDATE()` to be treated as an alias for `NOW()`. See [Section 11.7, “Date and Time Functions”](#). ([Bug#15101](#))
- `mysqldump` now surrounds the `DEFINER`, `SQL SECURITY DEFINER` and `WITH CHECK OPTION` clauses of a `CREATE VIEW` statement with "not in version" comments to prevent errors in earlier versions of MySQL. ([Bug#14871](#))
- The `mysql_ping()` function will now retry if the `reconnect` flag is set and error `CR_SERVER_LOST` is encountered during the first attempt to ping the server. ([Bug#14057](#))
- The `mysqltest` utility now converts all `CR/LF` combinations to `LF` to enable test cases intended for Windows to work properly on UNIX-like systems. ([Bug#13809](#))
- The output from `SHOW CREATE TABLE` is more consistent about using uppercase for keywords. Data types still are in lowercase. ([Bug#10460](#))
- The client API now attempts to reconnect using TCP/IP if the `reconnect` flag is set, as is the case with sockets. ([Bug#2845](#))
- The syntax for `CREATE PROCEDURE` and `CREATE FUNCTION` statements now includes a `DEFINER` clause. The `DEFINER` value specifies the security context to be used when checking access privileges at routine invocation time if the routine has the `SQL SECURITY DEFINER` characteristic. See [Section 12.1.15, “CREATE PROCEDURE and CREATE FUNCTION Syntax”](#), for more information.

When `mysqldump` is invoked with the `--routines` option, it now dumps the `DEFINER` value for stored routines.

Bugs fixed:

- **Partitioning: MySQL Cluster:** Trying to insert a value into a nonexistent `LIST` partition of an `NDB` table would cause the server to crash.

### Note

Beginning with MySQL 5.1.12, user-defined partitioning types other than `KEY` or `LINEAR KEY` were disabled for `NDB` tables.

([Bug#17763](#))

- **Partitioning: MySQL Cluster:** A repeated `SELECT` on a partitioned table that used the `NDB` storage engine could cause the server to crash. ([Bug#17390](#))
- **MySQL Cluster: Replication:** `AUTO_INCREMENT` values were not propagated correctly in statement-based replication. ([Bug#18208](#))
- **MySQL Cluster: Replication:** Memory was mistakenly freed for `NdbRecAttr` objects during addition of an index while replicating the cluster, which could cause `mysqld` to crash. ([Bug#18106](#))
- **MySQL Cluster: Replication:** Row-based replication could fail with tables using `VARCHAR` columns for primary keys and having `BLOB` columns. ([Bug#18067](#))
- **MySQL Cluster: Replication:** (Replication): The binary log on the secondary master was not being set up correctly following a table rename. ([Bug#17838](#))
- **MySQL Cluster:** Attempting to restart a node with dropped events still pending would fail. ([Bug#18491](#))
- **MySQL Cluster:** Two `mysqld` processes starting at the same time could cause a race condition. ([Bug#18472](#))
- **MySQL Cluster:** A timeout in the handling of an `ABORT` condition with more than 32 operations could yield a node failure. ([Bug#18414](#))
- **MySQL Cluster:** Two `mysqld` processes did not synchronise `DROP TABLE` binary log events correctly. ([Bug#18395](#))
- **MySQL Cluster:** A node restart immediately following a `CREATE TABLE` would fail.

### Important

This fix supports 2-node Clusters only.

(Bug#18385)

- **MySQL Cluster:** In event of a node failure during a rollback, a “false” lock could be established on the backup for that node, which lock could not be removed without restarting the node. (Bug#18352)
- **MySQL Cluster:** When multiple node restarts were attempted without permitting each restart to complete, the error message returned was `ARRAY INDEX OUT OF BOUNDS` rather than `TOO MANY CRASHED REPLICAS`. (Bug#18349)
- **MySQL Cluster:** The cluster created a crashed replica of a table having an ordered index—or when logging was not enabled, of a table having a table or unique index—leading to a crash of the cluster following 8 successive restarts. (Bug#18298)
- **MySQL Cluster:** Issuing a `DROP LOGFILE GROUP` statement would cause `ndbd` processes to crash if MySQL had been compiled with `gcc4`. (Bug#18295)
- **MySQL Cluster:** When replacing a failed master node, the replacement node could cause the cluster to crash from a buffer overflow if it had an excessively large amount of data to write to the cluster log. (Bug#18118)
- **MySQL Cluster:** Insufficient `StringBuffer` memory when attempting to create a trigger caused the server to crash. (Bug#18101)
- **MySQL Cluster:** Variable-length columns used as primary keys were not handled correctly. (Bug#18075)
- **MySQL Cluster:** `CREATE UNIQUE INDEX` on a column containing nonunique data could cause one or more `ndbd` nodes to hang or crash. (Bug#18040)
- **MySQL Cluster:** Node recovery of tables with `VARCHAR` columns using character sets was inconsistent, which could cause a number of issues, including the data nodes failing to restart and `ALTER TABLE` statements to hang. (Bug#18026)
- **MySQL Cluster:** A `SELECT ... ORDER BY` query on an explicitly partitioned Cluster table with no explicit indexes would crash the server. (Bug#17899)
- **MySQL Cluster:** `ALTER TABLE ... ADD INDEX` failed with `ERROR 756: INDEX ON DISK COLUMN IS NOT SUPPORTED` when run against a Disk Data table having a primary key. (Bug#17888)
- **MySQL Cluster:** In some cases, a single `ndbd` node failed following a system restart. (Bug#17854)
- **MySQL Cluster:** A simultaneous `RENAME` of several tables was logged multiple times. (Bug#17827)
- **MySQL Cluster:** Trying to perform a `DELETE` from an `NDB` table following a `LOCK TABLES` caused the `ndbd` processes to hang. (Bug#17812)
- **MySQL Cluster:** Trying to update very large partitioned tables using the `NDB` storage engine sometimes caused the server to crash. (Bug#17806, Bug#16385)
- **MySQL Cluster:** Using `ALTER TABLE ... ADD PARTITION` on a table partitioned by `LIST` would cause the client to hang. (Bug#17701)
- **MySQL Cluster:** With a single replica, transactions waiting in the log synchronisation queue were not being restarted, causing them to be aborted. (Bug#17536)
- **MySQL Cluster:** `ALTER TABLE` on a partitioned `NDB` table could cause the server to crash. (Bug#17499)
- **MySQL Cluster:** `DELETE` operations on `NDB` tables could cause memory leaks. (Bug#16874)
- **MySQL Cluster:** Some query cache statistics were not always correctly reported for Cluster tables. (Bug#16795)
- **MySQL Cluster:** Restarting nodes were permitted to start and join the cluster too early. (Bug#16772)
- **MySQL Cluster:** `UNDO_BUFFER_SIZE` was limited to 17 MB. (Bug#16657, Bug#17890)
- **MySQL Cluster:** Inserting and deleting `BLOB` column values while a backup was in process could cause data nodes to shut down. (Bug#14028)
- **Replication:** Replication of data stored in a partitioned table would cause slave servers to issue a assertion and terminate. (Bug#18436)
- **Replication:** Use of `TRUNCATE TABLE` for a `TEMPORARY` table on a master server was propagated to slaves properly, but slaves did not decrement the `Slave_open_temp_tables` counter properly. (Bug#17137)

- **Replication:** Slave servers would retry the execution of an SQL statement an infinite number of times, ignoring the value `SLAVE_TRANSACTION_RETRIES` when using the NDB engine. ([Bug#16228](#))
- **Replication:** The `DEFINER` value for stored routines was not replicated. ([Bug#15963](#))
- **Disk Data:** `CREATE UNIQUE INDEX` failed with `ERROR 4243: INDEX NOT FOUND.` ([Bug#18039](#))
- **Disk Data:** It was not possible to create more than 9 tablespaces. ([Bug#16913](#))
- A `SELECT ... ORDER BY ...` from a view defined using a function could crash the server. An example of such a view is `CREATE VIEW v1 AS SELECT SQRT(c1) FROM t1.` ([Bug#18386](#))
- The server would crash when `SHOW STATUS` was called on a server linked with `yaSSL`. ([Bug#18310](#))
- The `ExtractValue()` function did not return an error when passed an invalid XPath string. ([Bug#18172](#))
- Using the `position()` function in the XPath argument to `ExtractValue()` crashed the server. ([Bug#18171](#))
- `REPAIR TABLE`, `OPTIMIZE TABLE`, and `ALTER TABLE` operations on transactional tables (or on tables of any type on Windows) could corrupt triggers associated with those tables. ([Bug#18153](#))
- Connecting to a server with a UCS2 default character set with a client using a non-UCS2 character set crashed the server. ([Bug#18004](#))
- Using `ALTER TABLE ... REBUILD PARTITION` without specifying the name of the partition caused the server to crash, rather than reporting a syntax error. ([Bug#17947](#))
- `ALTER TABLE ... REBUILD PARTITION` with no partition name specified would crash the server. ([Bug#17940](#))
- A query with a `WHERE date_column > date_value` condition failed on a table partitioned by `RANGE`. ([Bug#17894](#))
- Renaming and adding a new column to a partitioned table in the same `ALTER TABLE` statement caused the server to crash. ([Bug#17772](#))
- `MyISAM`: Performing a bulk insert on a table referenced by a trigger would crash the table. ([Bug#17764](#))
- Using triggers with partitioned `InnoDB` tables led to incorrect results. ([Bug#17744](#))
- Updating a view that filters certain rows to set a filtered out row to be included in the table caused infinite loop. For example, if the view has a `WHERE` clause of `salary > 100` then issuing an `UPDATE` statement of `SET salary = 200 WHERE id = 10`, caused an infinite loop. ([Bug#17726](#))
- A security enhancement in Visual Studio 8 could cause a MySQL debug server compiled with it to hang when running `SELECT` queries against partitioned tables. ([Bug#17722](#))
- The `EXAMPLE` storage engine did not work on Windows. ([Bug#17721](#))
- `ALTER TABLE ... REORGANIZE PARTITION` failed with `ERROR ON RENAME OF FILENAME ...` on Windows. ([Bug#17720](#))
- The MySQL server could crash with out of memory errors when performing aggregate functions on a `DECIMAL` column. ([Bug#17602](#))
- `NULL` values were written to the `mysql.slow_log` table incorrectly. ([Bug#17600](#))
- `mysql_fix_privilege_tables` did not create the `mysql.plugin` table. ([Bug#17568](#))
- Improper checking of binary log statements could result in a server crash. ([Bug#17457](#))
- Repeated invocations of a stored procedure containing a `SHOW CREATE EVENT` statement would result in the error `PACKETS OUT OF ORDER.` ([Bug#17403](#))
- For `FEDERATED` tables, a `SELECT` statement with an `ORDER BY` clause did not return rows in the proper order. ([Bug#17377](#))
- `SELECT ... WHERE column LIKE 'A%'`, when `column` had a key and used the `latin2_czech_cs` collation, caused the wrong number of rows to be returned. ([Bug#17374](#))
- Calling `CREATE TABLE` or `ALTER TABLE` twice on a partitioned table in a stored procedure or a prepared statement resulted in errors and sometimes server crashes. ([Bug#17290](#))
- Checks for permissions on database operations could be performed in a case-insensitive manner (a user with permissions on database `MYDATABASE` could by accident get permissions on database `myDataBase`), if the privilege data were still cached

from a previous check. ([Bug#17279](#))

- Stored procedures that call UDFs and pass local string variables caused server crashes. ([Bug#17261](#))
- A problem with `NULLs` and interval mapping sometimes caused incorrect results or crashes when trying to use less-than searches on partitioned tables. ([Bug#17173](#))
- Attempting to add a new partition to a table partitioned by a unique key would cause an `OUT OF MEMORY` error. ([Bug#17169](#))
- Creating a table with the same name as the mapped name of another table caused a server crash. For example, if MySQL maps the table name `txu#P#p1` to `txu@0023P@0023p1` on disk, creating another table named `txu@0023P@0023p1` crashed the server. ([Bug#17142](#))
- Trying to add a partition to a table having subpartitions could crash the server. ([Bug#17140](#))
- Attempting to use a conflicting `VALUES` clause in `ALTER TABLE ... ADD PARTITION` caused the server to crash. An example of such a conflicting clause would be that uses `VALUES LESS THAN (constant)` (which indicates a range) with a table that is partitioned by `LIST`. ([Bug#17127](#))
- A failed `ALTER TABLE ... ADD PRIMARY KEY` on a partitioned table would result in bad table metadata and could possibly crash the server. ([Bug#17097](#))
- Stored routine names longer than 64 characters were silently truncated. Now the limit is properly enforced and an error occurs. ([Bug#17015](#))
- Cursors in stored routines could cause a server crash. ([Bug#16887](#))
- Triggers created without `BEGIN` and `END` clauses resulted in “You have an error in your SQL syntax” errors when dumping and replaying a binary log. ([Bug#16878](#))
- Using `ALTER TABLE` to increase the length of a `BINARY(M)` column caused column values to be padded with spaces rather than `0x00` bytes. ([Bug#16857](#))
- `ALTER TABLE ... COALESCE PARTITION` failed with an `OUT OF MEMORY` error. ([Bug#16810](#))
- `ALTER TABLE ... ADD COLUMN ... AFTER ...` failed when used on partitioned tables. ([Bug#16806](#))
- If the server was started with the `--skip-grant-tables` option, it was impossible to create a trigger or a view without explicitly specifying a `DEFINER` clause. ([Bug#16777](#))
- In a highly concurrent environment, a server crash or deadlock could result from execution of a statement that used stored functions or activated triggers coincident with alteration of the tables used by these functions or triggers. ([Bug#16593](#))
- Clients compiled from source with the `--without-readline` did not save command history from session to session. ([Bug#16557](#))
- Using `ORDER BY intvar` within a stored procedure (where `intvar` is an integer variable or expression) would crash the server.

### Note

The use of an integer `i` in an `ORDER BY i` clause for sorting the result by the `ith` column is deprecated (and non-standard). It should *not* be used in new applications. See [Section 12.2.8, “SELECT Syntax”](#).

([Bug#16474](#))

- Slow queries executed by scheduled events were not being written to the slow query log. ([Bug#16426](#))
- `INSERT` statements executed by scheduled events were not written to the general log. ([Bug#16413](#))
- Repeated invocations of a stored procedure containing a `CREATE EVENT` or `ALTER EVENT` statement would crash the server. ([Bug#16408](#))
- Names of subpartitions were not displayed in the output of `SHOW CREATE TABLE`. ([Bug#16370](#))
- The `ExtractValue()` function would not accept expressions which matched element names containing an underscore character. ([Bug#16320](#))
- The `self()` XPath function was not handled correctly by `ExtractValue()`. ([Bug#16315](#))
- The `ExtractValue()` function permitted the use of the `!` character in identifiers by ignoring the illegal character. This is

now correctly reported as a syntax error. ([Bug#16313](#))

- A memory leak caused warnings on slaves for certain statements that executed without warning on the master. ([Bug#16175](#))
- No error was reported when subpartitions were defined for a nonsubpartitioned table. ([Bug#15961](#))
- Character set conversion of string constants for `UNION` of constant and table column was not done when it was safe to do so. ([Bug#15949](#))
- The `mysql_close()` C API function leaked handles for shared-memory connections on Windows. ([Bug#15846](#))
- A `SELECT` using a function against a nested view would crash the server. ([Bug#15683](#))
- Setting up subpartitions on at least one but not all the partitions of a partitioned table caused the server to crash. ([Bug#15407](#))
- During conversion from one character set to `ucs2`, multi-byte characters with no `ucs2` equivalent were converted to multiple characters, rather than to `0x003F QUESTION MARK`. ([Bug#15375](#))
- `CREATE TABLE ... PARTITION ... AS SELECT ...` would cause the server to crash. ([Bug#15336](#))
- When attempting to insert a `0` into a `LIST`-partitioned table that had no value-list containing `0`, no error was reported. ([Bug#15253](#))
- `SELECT COUNT(*)` for a `MyISAM` table could return different results depending on whether an index was used. ([Bug#14980](#))
- Stored routines that contained only a single statement were not written properly to the dumpfile when using `mysqldump`. ([Bug#14857](#))
- Execution of a stored function or trigger which inserted data into a table while running concurrent selects on the same table could result in storing incorrect data in the query cache. ([Bug#14767](#))
- Naming a partition using the characters `Ç` or `ç` (“c-cedilla”; Unicode `00C7` or `00E7`) made unreadable the table containing the partition. ([Bug#14527](#))
- Searches on indexed columns of partitioned tables failed to find all matching rows following updates of the indexed columns. ([Bug#14526](#))
- Creating a partition which depends on an expression containing a column using the `UTF8` character set would cause the server to crash. ([Bug#14367](#))
- On Linux, creation of table partitions failed within a stored procedure. ([Bug#14363](#))
- Invoking more than once a prepared statement that creates a partitioned table would crash the server. ([Bug#14350](#))
- The `RENAME TABLE` statement did not move triggers to the new table. ([Bug#13525](#))
- The server would execute stored routines that had a nonexistent definer. ([Bug#13198](#))
- The length of a `VARCHAR()` column that used the `utf8` character set would increase each time the table was re-created in a stored procedure or prepared statement, eventually causing the `CREATE TABLE` statement to fail. ([Bug#13134](#))
- Loading of UDFs in a statically linked MySQL caused a server crash. UDF loading is now blocked if the MySQL server is statically linked. ([Bug#11835](#))
- Setting the `myisam_repair_threads` system variable to a value larger than 1 could cause corruption of large `MyISAM` tables. ([Bug#11527](#))
- Issuing `GRANT EXECUTE` on a procedure would display any warnings related to the creation of the procedure. ([Bug#7787](#))

## C.1.50. Changes in MySQL 5.1.7 (27 February 2006)

Functionality added or changed:

- **Incompatible Change:** The `mysql_stmt_attr_get()` C API function now returns a boolean rather than an unsigned int for `STMT_ATTR_UPDATE_MAX_LENGTH`. ([Bug#16144](#))
- **Incompatible Change:** Due to a change in the naming scheme for partitioning and subpartitioning files, it is not possible for the server to read partitioned tables created in previous MySQL versions. Attempting to read pre-5.1.6 partitioned tables with a

MySQL 5.1.7 or later server now generates a suitable warning message.

Two possible workarounds are:

- 1. Create a nonpartitioned table with the same table schema using a standard `CREATE TABLE` statement (that is, with no partitioning clauses)
  2. Issue a `SELECT INTO` to copy the data into the nonpartitioned table before the upgrade  
Following the upgrade, you can partition the new table using `ALTER TABLE ... PARTITION BY ...`
- Alternatively, you can dump the table using `mysqldump` prior to upgrading and reload it afterward with `LOAD DATA`. In either case, you should drop the pre-5.1.6 partitioned tables before upgrading to 5.1.6 or later.

### Important

If any partitioned tables that were created prior to MySQL 5.1.6 are present following an upgrade to MySQL 5.1.6 or later, it is also not possible to read from the `INFORMATION_SCHEMA.PARTITIONS` table, nor will you be able to drop those tables or the database or databases in which they are located. In this event, you must:

1. Shut down `mysqld`
2. Manually delete the table, partition, and (if any) subpartition files
3. Restart the MySQL Server

(Bug#13437, Bug#16695)

- **Incompatible Change:** `TYPE = engine_name` is no longer accepted as a synonym for the `ENGINE = engine_name` table option. (`TYPE` has been deprecated since MySQL 4.0.)
- **MySQL Cluster:** Attempting to `SELECT ... FROM INFORMATION_SCHEMA.FILES` now raises a warning in the event that the cluster has crashed. (Bug#17087)
- **Replication:** In row-based replication, when executing a `Rows_log_event`, the associated table was locked, the rows applied and the lock released. This did not work since there are storage engines that count locks and perform an autocommit when the number of locks reach zero. Now we ensure that all table maps come before all `ROWS` events in a statement.
- **Disk Data:** Status messages have been added to `ndb_restore` to enable users to know that data files for Disk Data are being created. (Bug#16873)
- **Cluster Replication:** It is now possible to replicate `NDB` tables having no explicit primary key. See [Section 17.6, “MySQL Cluster Replication”](#).
- Creator privileges are now checked for all events before execution. (Bug#17289)
- `CREATE EVENT`, `DROP EVENT`, and `ALTER EVENT` statements are not permitted in triggers. (Bug#16410)
- The SQL mode in effect at the time an event is created or altered is recorded and used during event execution. (Bug#16407)
- New `charset` command added to `mysql` command-line client. By typing `charset name` or `\C name` (such as `\C UTF8`), the client character set can be changed without reconnecting. (Bug#16217)
- Added the `--wait-timeout` option to `mysqlmanager` to enable configuration of the timeout for dropping an inactive connection, and increased the default timeout from 30 seconds to 28,800 seconds (8 hours). (Bug#15980, Bug#12674)
- All subpartitions within a given partitioned table are now guaranteed to have unique names. (Bug#15408)
- `mysqlimport` now has a `--use-threads=N` option for loading data files in parallel using `N` threads.
- Added the `RENAME DATABASE` statement.
- Added the `PROCESSLIST` table to `INFORMATION_SCHEMA`.
- Several changes were made to make upgrades easier:
  - Added the `mysql_upgrade` program that checks all tables for incompatibilities with the current version of MySQL Server and repairs them if necessary. This program should be run for each MySQL upgrade (rather than `mysql_fix_privilege_tables`). See [Section 4.4.8, “mysql\\_upgrade — Check Tables for MySQL Upgrade”](#).
  - Added the `FOR UPGRADE` option for the `CHECK TABLE` statement. This option checks whether tables are incompatible

with the current version of MySQL Server.

- Added the `--check-upgrade` to `mysqlcheck` that invokes `CHECK TABLE` with the `FOR UPGRADE` option. Added the `--fix-db-names` and `--fix-table-names` options to `mysqlcheck`.
- Removed the `have_isam` and `have_raid` system variables.
- Added the `IN NATURAL LANGUAGE MODE` and `IN NATURAL LANGUAGE MODE WITH QUERY EXPANSION` modifiers for full-text searches. See [Section 11.9, “Full-Text Search Functions”](#).

Bugs fixed:

- **MySQL Cluster:** Creating `NDB` tables containing `BLOB` columns but no primary key caused unpredictable behavior. ([Bug#17559](#))
- **MySQL Cluster:** Inserting the output of `REPEAT( 'some_string' , some_int )` into a `BLOB` column resulted in the error `INVALID BLOB ATTRIBUTES OR INVALID BLOB PARTS TABLE`. ([Bug#17505](#))
- **MySQL Cluster:** `ndbd` restarts could sometimes fail due to incorrect memory access. ([Bug#17417](#))
- **MySQL Cluster:** Sharing of table names containing special characters between multiple SQL nodes was not handled correctly when binary logging was enabled (a timeout error resulted). ([Bug#17415](#))
- **MySQL Cluster:** Table definitions were not shared between multiple SQL nodes in a cluster without binary logging being enabled. ([Bug#17414](#))
- **MySQL Cluster:** Cluster log file paths were truncated to 128 characters. They may now be as long as `MAX_PATH` (the maximum path length permitted by the operating system). ([Bug#17411](#))
- **MySQL Cluster:** `SHOW CREATE TABLE` would fail when run against a table created in a different session. ([Bug#17340](#))
- **MySQL Cluster:** Following multiple forced shutdowns and restarts of data nodes, `DROP DATABASE` could fail. ([Bug#17325](#))
- **MySQL Cluster:** The `REDO` log would become corrupted (and thus unreadable) in some circumstances, due to a failure in the query handler. ([Bug#17295](#))
- **MySQL Cluster:** An `UPDATE` with an inner join failed to match any records if both tables in the join did not have a primary key. ([Bug#17257](#))
- **MySQL Cluster:** A `DELETE` with a join in the `WHERE` clause failed to retrieve any records if both tables in the join did not have a primary key. ([Bug#17249](#))
- **MySQL Cluster:** `CREATE TEMPORARY TABLE` of a Cluster table would fail with an `UNSUPPORTED` error or crash the server. ([Bug#17210](#), [Bug#16552](#))
- **MySQL Cluster:** The storage engine did not permit views to be updated. ([Bug#17206](#))
- **MySQL Cluster:** When attempting to import data into an `NDB` table using `LOAD DATA INFILE`, the server would hang in the event of a duplicate key error. ([Bug#17154](#))
- **MySQL Cluster:** In some cases, `LOAD DATA INFILE` did not load all data into `NDB` tables. ([Bug#17081](#))
- **MySQL Cluster:** `CREATE TABLE new_tbl LIKE old_tbl;` failed when `old_tbl` used the `NDB` storage engine. ([Bug#17005](#))
- **MySQL Cluster:** An unhandled resources issue could cause node failure with a `DELETE FROM TABLE` affecting thousands of rows. ([Bug#16492](#))
- **MySQL Cluster:** `UNIQUE` keys in Cluster tables were limited to 225 bytes in length. ([Bug#15918](#))
- **MySQL Cluster:** `REPLACE` failed when attempting to update a primary key value in a Cluster table. ([Bug#14007](#))
- **MySQL Cluster:** No error message was generated for setting `NoOfFragmentLogFile`s too low. ([Bug#13966](#))
- **MySQL Cluster:** No error message was generated for setting `MaxNoOfAttributes` too low. ([Bug#13965](#))
- **MySQL Cluster:** Performing large numbers of data manipulation statements on cluster tables using Disk Data could lead to a server crash.

- **Cluster Replication: Replication:** Row-based replication of a cluster failed to take `--binlog-ignore-db` settings into account. ([Bug#17188](#))
- **Replication:** An `ALTER DATABASE` statement on a replication master crashed the slaves. ([Bug#17521](#))
- **Replication:** For a transaction that used `MyISAM` and `InnoDB` tables, interruption of the transaction due to a dropped connection on a master server caused slaves to lose synchrony. ([Bug#16559](#))
- **Replication:** Previously, a stored function invocation was written to the binary log as `DO func_name()` if the invocation changes data and occurs within a nonlogged statement, or if the function invokes a stored procedure that produces an error. These invocations now are logged as `SELECT func_name()` instead for better control over error code checking (slave servers could stop due to detecting a different error than occurred on the master). ([Bug#14769](#))
- **Replication:** `BIT` fields were not properly handled when using row-based replication. ([Bug#13418](#))
- **Disk Data:** In some cases, a cluster using Disk Data tables could not be restarted following a normal shutdown. ([Bug#16872](#))
- **Cluster Replication:** Row-based replication was not set up correctly if a backup was already in progress. For example, connecting a `mysqld` instance to a cluster which was being backed up would result in the message `NDB: SKIPPING SETUP TABLE TBL_NAME` being written to the error log. ([Bug#17459](#))
- **Cluster Replication:** Cluster tables not having an explicit primary key could not be replicated. ([Bug#14541](#))
- Column counts were encoded incorrectly in the binary log for row-based logging format. ([Bug#17678](#))
- Data truncations on non-`UNIQUE` indexes could crash `InnoDB` when using multi-byte character sets. ([Bug#17530](#))
- Execution times for scheduled events were not calculated correctly: the last execution time was used as a base rather than the actual start time. ([Bug#17494](#))
- Creating an event and using a whitespace character other than space following the `DO` keyword caused a server crash. ([Bug#17453](#))
- Partitioning with certain `SUBPARTITION BY HASH` clauses caused an error when querying for a partitioned column using an `IS NULL` comparison. ([Bug#17430](#), [Bug#17432](#))
- Race conditions between event creation, dropping, and execution could result in a server crash or hang. ([Bug#17373](#))
- Trying to create a partitioned table with more than 32 attributes failed. ([Bug#17179](#))
- Attempting to add a new partition to a table partitioned by a unique key would cause an `OUT OF MEMORY` error. ([Bug#17169](#))
- `myisam_ftdump` did not work for `FULLTEXT` indexes associated with a parser plugin. ([Bug#17116](#))
- On Windows platforms, some attempts to create partitioned tables from the command line would cause the `mysql` client to hang. ([Bug#17082](#))
- A `SELECT` from the last partition of a subpartitioned table having a `UNIQUE KEY` could crash the MySQL Server. ([Bug#16907](#))
- Statements that contained Unicode characters were not logged to the log tables correctly. ([Bug#16905](#))
- A `SELECT` on a subpartitioned table having a multiple-column `PRIMARY` or `UNIQUE KEY`, and whose partitioning function used only the first column of the key, could cause `mysqld` to crash. ([Bug#16901](#))
- A `RETURN` statement within a trigger caused a server crash. `RETURN` is no longer permitted within triggers. To exit immediately, use `LEAVE`. ([Bug#16829](#))
- Using `REPLACE INTO` on a partitioned table having a primary key would crash the server in the event of a duplicate key error. ([Bug#16782](#))
- `DROP TABLE` would sometimes fail on a table having subpartitions that used the default storage engine. ([Bug#16775](#))
- If the query optimizer transformed a `GROUP BY` clause in a subquery, it did not also transform the `HAVING` clause if there was one, producing incorrect results. ([Bug#16603](#))
- Querying the `INFORMATION_SCHEMA.PARTITIONS` table on a nonmax server caused a server crash. This also happened following the creation of a table with a very large number (hundreds) of partitions. ([Bug#16591](#), [Bug#17141](#))
- `SHOW CREATE EVENT` displayed no output. ([Bug#16423](#))

- `DROP DATABASE` did not drop events for the database. ([Bug#16406](#))
- The `mysql_fix_privilege_tables.sql` script did not properly initialize the `Event_priv` column to '`Y`' for those accounts that should have the `EVENT` privilege. ([Bug#16400](#))
- `SELECT` with `GROUP BY` on a view could cause a server crash. ([Bug#16382](#))
- MySQL server dropped client connection for certain `SELECT` statements against views defined that used `MERGE` algorithm. ([Bug#16260](#))
- Using an XPath expression containing `=` with `ExtractValue()` caused the server to crash. ([Bug#16242](#))
- When used with the `ExtractValue()` function, an XPath expression having no leading `/` character would crash the server. ([Bug#16234](#))
- Using `GROUP BY` on column used in `WHERE` clause could cause empty set to be returned. ([Bug#16203](#))
- `CAST(... AS TIME)` operations returned different results when using versus not using prepared-statement protocol. ([Bug#15805](#))
- The `SELECT` privilege was required for triggers that performed no selects. ([Bug#15196](#))
- The `UPDATE` privilege was required for triggers that performed no updates. ([Bug#15166](#))
- A statement containing `GROUP BY` and `HAVING` clauses could return incorrect results when the `HAVING` clause contained logic that returned `FALSE` for every row. ([Bug#14927](#))
- Killing a long-running query containing a subquery could cause a server crash. ([Bug#14851](#))
- `SUBSTRING_INDEX()` could yield inconsistent results when applied with the same arguments to consecutive rows in a query. ([Bug#14676](#))
- `SET sql_mode = N`, where `N > 31`, did not work properly. ([Bug#13897](#))
- `SHOW CREATE TABLE` produced extraneous spaces following the keywords `PRIMARY KEY`. ([Bug#13883](#))
- `InnoDB` could display an incorrect error message for a cascading update. ([Bug#9680](#))
- `CHECKSUM TABLE` returned different values for `MyISAM` tables depending on whether the `QUICK` or `EXTENDED` option was used. ([Bug#8841](#))
- `SET TRANSACTION ISOLATION LEVEL` acted like `SET SESSION TRANSACTION ISOLATION LEVEL`. That is, it set the isolation level for longer than the next transaction. ([Bug#7955](#))
- Repeated invocation of `my_init()` and `my_end()` caused corruption of character set data and connection failure. ([Bug#6536](#))

## C.1.51. Changes in MySQL 5.1.6 (01 February 2006)

Functionality added or changed:

- **Incompatible Change:** Words with apostrophes are now matched in a FULLTEXT search against nonapostrophe words (for example, a search for `Jerry` will match against the term `Jerry's`). Users upgrading to this version must issue `REPAIR TABLE ... QUICK` statements for tables containing `FULLTEXT` indexes. ([Bug#14194](#))
- **Incompatible Change:** This release introduces the `TRIGGER` privilege. Previously, the `SUPER` privilege was needed to create or drop triggers. Now those operations require the `TRIGGER` privilege. This is a security improvement because you no longer need to grant users the `SUPER` privilege to enable them to create triggers. However, the requirement that the account named in a trigger's `DEFINER` clause must have the `SUPER` privilege has changed to a requirement for the `TRIGGER` privilege. After upgrading, be sure to update your grant tables by running `mysql_upgrade`. This will assign the `TRIGGER` privilege to all accounts that had the `SUPER` privilege. (After updating, you might also consider whether any of those accounts no longer need the `SUPER` privilege.) If you fail to update the grant tables, triggers may fail when activated. ([Bug#9412](#))
- **Incompatible Change:** Before MySQL 5.1.6, the server writes general query log and slow query log entries to log files. As of MySQL 5.1.6, the server's logging capabilities for these logs are more flexible. Log entries can be written to log files (as before) or to the `general_log` and `slow_log` tables in the `mysql` database. If logging is enabled, either or both destinations can be selected. The `--log-output` option controls the destination or destinations of log output. See [Section 5.2.1, "Selecting General Query and Slow Query Log Output Destinations"](#).

If logging is enabled, the default destination now is to log to tables, which differs from earlier versions. If you had the server configured for logging to log files formerly, use `--log-output=FILE` to preserve this behavior after an upgrade to MySQL 5.1.6 or higher.

- **Important Change: MySQL Cluster: Replication:** Replication between MySQL Clusters is now supported. It is now also possible to replicate between a MySQL Cluster and a noncluster database. See [Section 17.6, “MySQL Cluster Replication”](#), for more information.
- **MySQL Cluster:** Added the `ndb_extra_logging` system variable.
- **MySQL Cluster:** The `NDB` storage engine now supports the `CREATE INDEX` and `DROP INDEX` statements.
- **Packaging:** MySQL 5.1.6 introduces some changes to distribution packaging:
  - Distributions include both a `mysqld` optimized server and `mysqld-debug` debugging server. There is no separate debug distribution.
  - There is no longer a `mysqld-max` server. (Note: This changed in MySQL 5.1.9: The `mysqld-max` server also is included in binary distributions.)
  - Server binaries no longer are stripped, except for RPM distributions.
  - Binary distributions for Unix and Unix-like systems no longer include `safe_mysqld` as a link to `mysqld_safe`. `safe_mysqld` has been deprecated since MySQL 4.0 and now is removed.
- The `mysqldump` utility now supports an option for dumping tablespaces. Use `-T` or `--all-tablespaces` to enable this functionality. ([Bug#16753](#))
- Partition support is not an “engine”, but it was included in the output of `SHOW ENGINES`. Now it is not. The `have_partition_engine` variable was renamed to `have_partitioning`. ([Bug#14355](#), [Bug#16718](#))
- `ANALYZE TABLE` is now supported for partitioned tables. ([Bug#13441](#))
- Added the `--use-threads` option for `mysqlslap`.
- Queries against partitioned tables can now take advantage of partition pruning. In some cases, this can result in query execution that is an order of magnitude faster than the same query against a nonpartitioned version of the same table.
- There is no longer a `mysqld-max` server. (Note: This changed in MySQL 5.1.9: The `mysqld-max` server also is included in binary distributions.)
- Added the `FILES` table to `INFORMATION_SCHEMA`.
- Binary distributions for Unix and Unix-like systems no longer include `safe_mysqld` as a link to `mysqld_safe`. `safe_mysqld` has been deprecated since MySQL 4.0 and now is removed.
- Special characters in database and table identifiers now are encoded when creating the corresponding directory names and file names. This relaxes the restrictions on the characters that can appear in identifiers. See [Section 8.2.3, “Mapping of Identifiers to File Names”](#).
- Added the `event_scheduler` system variable.
- MySQL 5.1.6 introduces the *Event Scheduler* which enables statements to be scheduled for execution at predetermined times. Events can be transient (one-time-only) or recurrent at regular intervals, and may execute queries and statements permitted in stored routines, including compound statements.

Events can be altered after creation, and dropped when no longer needed.

Information about scheduled events can be obtained using the statements `SHOW EVENTS` and `SHOW CREATE EVENT`, or by querying the `INFORMATION_SCHEMA.EVENTS` table. All of these are available beginning in MySQL 5.1.6.

Users must have the `EVENT` privilege (also added in 5.1.6) to create events.

For more information, see [Section 19.4, “Using the Event Scheduler”](#).

- Distributions include both a `mysqld` optimized server and `mysqld-debug` debugging server. There is no separate debug distribution.
- Server binaries no longer are stripped, except for RPM distributions.

- The `ARCHIVE` storage engine now supports the `AUTO_INCREMENT` column attribute and the `AUTO_INCREMENT` table option. [Section 13.12, “The ARCHIVE Storage Engine”](#).
- Server plugins can register their own status variables to be displayed by the `SHOW STATUS` statement.
- Added the `PARTITIONS` table to `INFORMATION_SCHEMA`.
- Added the `EVENTS` table to `INFORMATION_SCHEMA`.

Bugs fixed:

- **MySQL Cluster:** `NDB` leaked disk space when performing repeated `INSERT` or `DELETE` statements. ([Bug#16771](#))
- **MySQL Cluster:** `ndb_delete_all` ran out of memory when processing tables containing `BLOB` columns. ([Bug#16693](#))
- **MySQL Cluster:** Trying to import too many dumped tables requiring resources beyond those allocated in the cluster configuration file caused the server to crash instead of reporting an insufficient resources error. ([Bug#16455](#))
- **MySQL Cluster:** A `BIT` column whose offset and length totaled 32 caused the cluster to crash. ([Bug#16125](#))
- **MySQL Cluster:** The `ndb_autodiscover` test failed sporadically due to a node not being permitted to connect to the cluster. ([Bug#15619](#))
- **MySQL Cluster:** `NDB` returned an incorrect `CAN'T FIND FILE` `ERROR` for OS error 24; this has been changed to `TOO MANY OPEN FILES`. ([Bug#15020](#))
- **MySQL Cluster:** `CREATE TABLESPACE` statements were incorrectly parsed on 64-bit platforms. (`INITIAL SIZE size` worked, but `INITIAL SIZE = size` failed.) ([Bug#13556](#))
- **MySQL Cluster:** Using `mysqldump` to obtain a dump of a partitioned table employing the `NDB` storage engine produced a nonfunctional table creation statement. ([Bug#13155](#))
- **Disk Data:** Tablespaces created using parameters with relatively low values (10 MB or less) produced filesizes much smaller than expected. ([Bug#16742](#))
- **Disk Data:** `NDB` returned the wrong error when the tablespace on disk was full. ([Bug#16738](#))
- **Disk Data:** The error message generated by a failed `ADD UNDOFILE` did not provide any reasons for the failure. ([Bug#16267](#))
- **Disk Data:** `DROP LOGFILE GROUP` corrupted the cluster file system and caused `ndbd` to fail when running more than one node on the same system. ([Bug#16193](#))
- **Cluster API:** Upon the completion of a scan where a key request remained outstanding on the primary replica and a starting node died, the scan did not terminate. This caused incomplete error handling for the failed node. ([Bug#15908](#))
- When the full-text search parser plugin returned more words than half of the length (in bytes) of the query string, the server would crash. ([Bug#16722](#))
- An indexing error sometimes caused values to be assigned to the wrong `RANGE` partition. ([Bug#16684](#))
- An `INSERT` statement in a stored procedure corrupted the binary log. ([Bug#16621](#))
- Trying to add more than one partition in a single `ALTER TABLE ... ADD PARTITION` statement caused the server to crash. ([Bug#16534](#))
- Parallel builds occasionally failed on Solaris. ([Bug#16282](#))
- Inserting a negative value into an integer column used as the partitioning key for a table partitioned by `HASH` could cause the server to crash. ([Bug#15968](#))
- Creating a partitioned table using a storage engine other than the session default storage engine caused the server to crash. ([Bug#15966](#))
- The error message for specifying values for which no partition exists returned wrong values on certain platforms. ([Bug#15910](#))
- Specifying a value for `--tmpdir` without a trailing slash had unpredictable results. ([Bug#15904](#))
- `STR_TO_DATE(1, NULL)` caused a server crash. ([Bug#15828, CVE-2006-3081](#))
- `ALTER TABLE ... ADD PARTITIONS` on a table with one partition crashed the server. ([Bug#15820](#))

- The `mysql_real_connect()` C API function incorrectly reset the `MYSQL_OPT_RECONNECT` option to its default value. ([Bug#15719](#))
- In some cases the query optimizer did not properly perform multiple joins where inner joins followed left joins, resulting in corrupted result sets. ([Bug#15633](#))
- Certain permission management statements could create a `NULL` host name for a user, resulting in a server crash. ([Bug#15598](#))
- Improper memory handling for stored routine variables could cause memory overruns and binary log corruption. ([Bug#15588](#))
- The absence of a table in the left part of a left or right join was not checked prior to name resolution, which resulted in a server crash. ([Bug#15538](#))
- An `ALTER TABLE ... PARTITION BY ...` statement did not have any effect. ([Bug#15523](#))
- Using `RANGE` partitioning with a `CASE` expression as the partitioning function would cause records to be placed in the wrong partition. ([Bug#15393](#))
- Certain subqueries where the inner query was the result of a aggregate function would return different results with MySQL 5.1 than with MySQL 4.1.

Subselects could also return wrong results when the query cache and grouping were involved. ([Bug#15347](#))
- Attempting to insert data into a partitioned table that used the `BLACKHOLE` storage engine caused `mysqld` to crash. ([Bug#14524](#))
- A `FULLTEXT` query in a prepared statement could result in unexpected behavior. ([Bug#14496](#))
- With a table partitioned by `LIST`, inserting a value which was smaller than any value shown in the partitioning value-lists could cause the server to crash. ([Bug#14365](#))
- The `DATA DIRECTORY` and `INDEX DIRECTORY` clauses of a `CREATE TABLE` statement involving partitions did not work. ([Bug#14354](#))
- `SHOW CREATE TABLE` did not display the `PARTITIONS` clause for tables partitioned by `HASH` or `KEY`. ([Bug#14327](#))
- `ALTER TABLE ... DROP PARTITION` would truncate all `DATE` column values in the table's remaining partitions to `NULL`. ([Bug#13644](#))
- `ALTER TABLE ... ADD PARTITION` could crash the server or cause an `OUT OF MEMORY` error in some circumstances. ([Bug#13447](#))
- The server would permit foreign keys to be declared in the definition of a partitioned table despite the fact that partitioned tables do not support foreign keys (see [Section 18.5, “Restrictions and Limitations on Partitioning”](#)). ([Bug#13446](#))
- A `SELECT` from a key-partitioned table with a multi-column key could cause the server to crash. ([Bug#13445](#))
- Issuing a `TRUNCATE TABLE` statement twice in succession on the same partitioned table would cause the server to crash. ([Bug#13442](#))
- Using a `REPLACE` statement on a partitioned table caused the server to crash. ([Bug#13440](#))
- Using an identifier rather than a literal integer value in the `LESS THAN` clause of a range-partitioned table could cause the server to crash and corruption of tables. ([Bug#13439](#))
- Using `ENGINE=...` within a `PARTITION` clause could cause the server to crash. ([Bug#13438](#))
- `CREATE TABLE ... LIKE` did not work if the table whose schema was to be copied was a partitioned table. ([Bug#13435](#))
- Multi-byte path names for `LOAD DATA` and `SELECT ... INTO OUTFILE` caused errors. Added the `character_set_filesystem` system variable, which controls the interpretation of string literals that refer to file names. ([Bug#12448](#))
- Temporary table aliasing did not work inside stored functions. ([Bug#12198](#))
- Using the `TRUNCATE()` function with a negative number for the second argument on a `BIGINT` column returned incorrect results. ([Bug#8461](#))
- Certain Japanese table names were not properly saved during a `CREATE TABLE` statement. ([Bug#3906](#))

## C.1.52. Changes in MySQL 5.1.5 (10 January 2006)

Functionality added or changed:

- **Replication:** Added the `binlog_format` system variable that controls whether to use row-based or statement-based binary logging. Added the `--binlog-format` and `--binlog-row-event-max-size` server options for binary logging control. See [Section 16.1.2, “Replication Formats”](#).
- Added the `--port-open-timeout` option to `mysqld` to control how many seconds the server should wait for the TCP/IP port to become free if it cannot be opened. ([Bug#15591](#))
- A new statement, `BINLOG`, is generated by `mysqlbinlog` to represent row-based events in binary log files. The statement argument, a base 64-encoded string, is decoded by the server to determine the data change indicated by the corresponding event.
- Added the `--create-schema`, `--lock-directory`, `--number-of-queries`, `--only-print`, `-p`, `-preserve-schema`, and `--slave` options for `mysqlslap`.
- If `innodb_locks_unsafe_for_binlog` is enabled or if the transaction isolation mode is `READ COMMITTED`, InnoDB can use “semi-consistent” reads. This affects treatment by `UPDATE` statements for rows that are already locked by another transaction. If a row is locked, InnoDB returns the latest committed version to MySQL so that MySQL can determine whether the row matches the `WHERE` condition of the `UPDATE`. If the row matches (must be updated), MySQL reads the row again and this time InnoDB either locks it or waits for a lock on it.

See also [Bug#3300](#).

- Added the `--base64-output` option to `mysqlbinlog` to print all binary log entries using base64 encoding. This is for debugging only. Logs produced using this option should not be applied on production systems.
- Added the `INFORMATION_SCHEMA PLUGINS` table and the `SHOW PLUGIN` statement.
- Two new Hungarian collations are included: `utf8_hungarian_ci` and `ucs2_hungarian_ci`. These support the correct sort order for Hungarian vowels. However, they do not support the correct order for sorting Hungarian consonant contractions; we expect to fix this issue in a future release.
- Plugins now can have status variables that are displayed in the output from `SHOW STATUS`. See [Section 22.2.5, “Writing Plugins”](#).
- Added the `INFORMATION_SCHEMA ENGINES` table.
- Added the XML functions `ExtractValue()` and `UpdateXML()`. `ExtractValue()` returns the content of a fragment of XML matching a given XPath expression. `UpdateXML()` replaces the element selected from a fragment of XML by an XPath expression supplied by the user with a second XML fragment (also user-supplied), and returns the modified XML. See [Section 11.11, “XML Functions”](#).

Bugs fixed:

- `INSERT DELAYED` caused `mysqld` to crash. ([Bug#16095](#))
- The `--plugin_dir` option was not working. Specifying the parser name for full-text also did not work correctly. ([Bug#16068](#))
- Attempting to insert into a table partitioned by `LIST` a value less than any specified in one of the table's partition definitions resulted in a server crash. In such cases, `mysqld` now returns `ERROR 1500 (HY000): TABLE HAS NO PARTITION FOR VALUE v`, where `v` is the out-of-range value. ([Bug#15819](#))
- Issuing a `DROP USER` statement could cause some users to encounter a `hostname is not permitted to connect to this MySQL server` error. ([Bug#15775](#))
- The output of `mysqldump --triggers` did not contain the `DEFINER` clause in dumped trigger definitions. ([Bug#15110](#))
- The output of `SHOW TRIGGERS` contained extraneous whitespace. ([Bug#15103](#))
- Creating a trigger caused a server crash if the table or trigger database was not known because no default database had been selected. ([Bug#14863](#))
- **InnoDB:** Comparison of indexed `VARCHAR CHARACTER SET ucs2 COLLATE ucs2_bin` columns using `LIKE` could fail. ([Bug#14583](#))
- A `COMMIT` statement followed by a `ALTER TABLE` statement on a BDB table caused server crash. ([Bug#14212](#))

- An `INSERT ... SELECT` statement between tables in a `MERGE` set can return errors when statement involves insert into child table from merge table or vice-versa. ([Bug#5390](#))
- `InnoDB`: A semi-consistent read for an `UPDATE` statement with no index column in the `WHERE` condition locked all the rows in the table. ([Bug#3300](#))

## C.1.53. Changes in MySQL 5.1.4 (21 December 2005)

Functionality added or changed:

- Added the `--server-id` option to `mysqlbinlog` to enable only those events created by the server having the given server ID to be extracted. ([Bug#15485](#))
- It is now possible to build the server such that `MyISAM` tables can support up to 128 keys rather than the standard 64. This can be done by configuring the build using the option `--with-max-indexes=N`, where  $N \leq 128$  is the maximum number of indexes to permit per table. ([Bug#10932](#))
- Added the `myisam_use_mmap` system variable.
- Added the `--bdb-data-direct` and `--bdb-log-direct` server options.
- Added the `mysqlslap` program, which is designed to emulate client load for a MySQL server and report the timing of each stage. It works as if multiple clients are accessing the server.
- The bundled `BDB` library was upgraded to version 4.4.16.
- Added the `cp1250_polish_ci` collation for the `cp1250` character set.

Bugs fixed:

- **MySQL Cluster**: The `--ndb` option for `perror` did not function. ([Bug#15486](#))
- **MySQL Cluster**: Using `ORDER BY primary_key_column` when selecting from a table having the primary key on a `VARCHAR` column caused a forced shutdown of the cluster. ([Bug#15240](#), [Bug#15682](#), [Bug#14828](#), [Bug#15517](#))
- Server could not be built on default Debian systems with BDB enabled. ([Bug#15734](#))
- `SHOW ENGINES` output showed the `FEDERATED` engine as `DISABLED` even for builds with `FEDERATED` support. ([Bug#15559](#))
- `BDB`: A `DELETE`, `INSERT`, or `UPDATE` of a `BDB` table could cause the server to crash where the query contained a subquery using an index read. ([Bug#15536](#))
- It was not possible to reorganize a partition reusing a discarded partition name.

Now, for example, you can create a table such as this one:

```
CREATE TABLE t1 (a INT)
 PARTITION BY RANGE (a) (
 PARTITION p0 VALUES LESS THAN (10),
 PARTITION p1 VALUES LESS THAN (20),
 PARTITION p2 VALUES LESS THAN MAXVALUE
);
```

and then repartition it as shown here:

```
ALTER TABLE t1 REORGANIZE PARTITION p2 INTO (
 PARTITION p2 VALUES LESS THAN (30)
);
```

Previously, attempting to do so would produce the error `ALL PARTITIONS MUST HAVE UNIQUE NAMES IN THE TABLE`. ([Bug#15521](#))

- The `BLACKHOLE` storage engine did not handle transactions properly: Rolled-back transactions were written to the binary log. Now they are not. ([Bug#15406](#))
- A left join on a column that has a `NULL` value could cause the server to crash. ([Bug#15268](#))

- Selecting from a view processed with the temptable algorithm caused a server crash if the query cache was enabled. ([Bug#15119](#))
- Creating a view that referenced a stored function that selected from a view caused a crash upon selection from the view. ([Bug#15096](#))
- Multiple-table update operations were counting updates and not updated rows. As a result, if a row had several updates it was counted several times for the “rows matched” value but updated only once. ([Bug#15028](#))
- `ROW_COUNT()` returned an incorrect result after `EXECUTE` of a prepared statement. ([Bug#14956](#))
- `ANALYZE TABLE` did not properly update table statistics for a `MyISAM` table with a `FULLTEXT` index containing stopwords, so a subsequent `ANALYZE TABLE` would not recognize the table as having already been analyzed. ([Bug#14902](#))
- Creating a view within a stored procedure could result in an out of memory error or a server crash. ([Bug#14885](#))
- `SELECT` queries that began with an opening parenthesis were not being placed in the query cache. ([Bug#14652](#))
- Space truncation was being ignored when inserting into `BINARY` or `VARBINARY` columns. Now space truncation results in a warning, or an error in strict mode. ([Bug#14299](#))
- The maximum value of `MAX_ROWS` was handled incorrectly on 64-bit systems. ([Bug#14155](#))
- For binary string data types, `mysqldump --hex-blob` produced an illegal output value of `0x` rather than `' '`. ([Bug#13318](#))
- Some comparisons for the `IN()` operator were inconsistent with equivalent comparisons for the `=` operator. ([Bug#12612](#))
- Attempts to assign `NULL` to a `NOT NULL` column in strict mode now result in a message of `Column 'col_name' cannot be null`, rather than `Column set to default value; NULL supplied to NOT NULL column 'col_name' at row n.` ([Bug#11491](#))
- `SHOW CREATE DATABASE` was sometimes refused when the client had privileges for the database. ([Bug#9785](#))
- Invalid casts to `DATE` values now result in a message of `Incorrect datetime value`, rather than `Truncated incorrect datetime value.` ([Bug#8294](#))
- `mysql` ignored the `MYSQL_TCP_PORT` environment variable. ([Bug#5792](#))

## C.1.54. Changes in MySQL 5.1.3 (29 November 2005)

Functionality added or changed:

- **Plugin API: Incompatible Change:** MySQL 5.1 adds support for a very flexible plugin API that enables loading and unloading of various components at runtime, without restarting the server. Although the work on this is not finished yet, *plugin full-text parsers* are a first step in this direction. This enables users to implement their own input filter on the indexed text, enabling full-text search capability on arbitrary data such as PDF files or other document formats. A pre-parser full-text plugin performs the actual parsing and extraction of the text and hands it over to the built-in MySQL full-text search. (Author: Sergey Vojtovich)

The plugin API requires the `mysql.plugin` table. When upgrading from an older version of MySQL, you should run the `mysql_fix_privilege_tables` command to create this table. See [Section 4.4.4, “mysql\\_fix\\_privilege\\_tables — Upgrade MySQL System Tables”](#).

Plugins are installed in the directory named by the `plugin_dir` system variable. This variable also controls the location from which the server loads user-defined functions (UDFs), which is a change from earlier versions of MySQL. That is, all UDF library files now must be installed in the plugin directory. When upgrading from an older version of MySQL, you must migrate your UDF files to the plugin directory.

- **Incompatible Change:** Renamed the `table_cache` system variable to `table_open_cache`. Any scripts that refer to `table_cache` should be updated to use the new name.
- **MySQL Cluster:** `VARCHAR` columns used in MySQL Cluster tables are now variable-sized; that is, they now only allocate as much space as required to store the data. Previously, a `VARCHAR(n)` column allocated  $n+2$  bytes (aligned to 4 bytes), regardless of whether the actual inserted value required that much space. (In other words, a `VARCHAR` column always required the same, fixed, amount of storage as a `CHAR` column of the same size.)
- **Partitioning:** MySQL Server now supports user-defined table partitioning, which enables distributing portions of individual tables across a file system, according to rules which can be set when the table is created. In effect, different portions of a table are stored as separate tables in different locations, but from the user point of view, the partitioned table is still a single table. See

[Chapter 18, Partitioning](#), for further information on this functionality. (Author: Mikael Ronström)

- `RAND()` no longer permits nonconstant initializers. (Previously, the effect of nonconstant initializers is undefined.) ([Bug#6172](#))
- Added the `table_definition_cache` system variable. If you use a large number of tables, you can create a large table definition cache to speed up opening of tables. The table definition cache takes less space and does not use file descriptors, unlike the normal table cache.
- `SET instance_name. option_name=option_value` sets an option to the specified value and writes it to the config file See [Section 4.6.10, “mysqlmanager — The MySQL Instance Manager”](#), for more details on these new commands. (Author: Petr Chardin)
- `SHOW instance_name LOG FILES` provides a listing of all log files used by the instance. (Author: Petr Chardin)
- Added the `SHOW AUTHORS` statement.
- Fast `ALTER TABLE`: Operations that change only table metadata and not table data do not require a temporary table to be used, which improves performance. For example, renaming a column changes only the `.frm` file and no longer uses a temporary table.
- **The Instance Manager (IM)** now has some additional functionality:
  - `SHOW instance_name LOG FILES` provides a listing of all log files used by the instance. (Author: Petr Chardin)
  - `SHOW instance_name LOG {ERROR | SLOW | GENERAL} size` retrieves a part of the specified log file. (Author: Petr Chardin)
  - `SET instance_name. option_name=option_value` sets an option to the specified value and writes it to the config file See [Section 4.6.10, “mysqlmanager — The MySQL Instance Manager”](#), for more details on these new commands. (Author: Petr Chardin)
  - `SHOW instance_name LOG {ERROR | SLOW | GENERAL} size` retrieves a part of the specified log file. (Author: Petr Chardin)
- Added the `SHOW FUNCTION CODE` and `SHOW PROCEDURE CODE` statements (available only for servers that have been built with debugging support). See [Section 12.4.5.29, “SHOW PROCEDURE CODE Syntax”](#).
- The performance of boolean full-text searches (using the “+” Operator) has been improved. See [Section 11.9, “Full-Text Search Functions”](#), for more details about full-text searching. (Author: Sergey Vojtovich)

Bugs fixed:

- `RESET MASTER` failed to delete log files on Windows. One consequence of this change is that server opens the general query and slow log files in shared mode, so now they can be renamed while the server has them open (something not true in previous versions). ([Bug#13377](#))
- Set functions could not be aggregated in outer subqueries. ([Bug#12762](#))

## C.1.55. Changes in MySQL 5.1.2 (Not released)

Functionality added or changed:

- Added the `bdb_cache_parts` and `bdb_region_size` system variables, and permitted `bdb_cache_size` to be larger than 4GB on systems that support it. ([Bug#14895](#))
- Added `MAXLOCKS`, `MINLOCKS`, `MAXWRITE`, and `MINWRITE` as permissible values of the `--bdb-lock-detect` option. ([Bug#14876](#))
- Added `--replace` to `mysqldump`. This option uses `REPLACE INTO`, rather than `INSERT INTO`, when writing the dump-file.
- Added `Transactions`, `XA`, and `Savepoints` columns to `SHOW ENGINES` output.

Bugs fixed:

- Foreign keys were not properly enforced in `TEMPORARY` tables. Foreign keys are no longer permitted in `TEMPORARY` tables. ([Bug#12084](#))

## C.1.56. Changes in MySQL 5.1.1 (Not released)

Bugs fixed:

- **Partitioning: MySQL Cluster:** Specifying the wrong nodegroup in a `CREATE TABLE` statement using partitioning would lead to the table name being locked after the statement failed (that is, the table name could not be re-used). ([Bug#12114](#))
- Using `ORDER BY` in a query with a partitioned table on a 64-bit operating system could crash the server. ([Bug#12116](#))
- Performing a `CREATE TABLE` statement with a `PARTITION BY` clause in a prepared statement could crash a server running in debug mode. ([Bug#12097](#))
- When two threads competed for the same table, a deadlock could occur if one thread also had a lock on another table through `LOCK TABLES` and the thread was attempting to remove the table in some manner while the other thread tried to place locks on both tables. ([Bug#10600](#))

## C.2. MySQL Enterprise Monitor Change History

This appendix lists the changes to the MySQL Enterprise Monitor, beginning with the most recent release. Each release section covers added or changed functionality, bug fixes, and known issues, if applicable. All bug fixes are referenced by bug number and include a link to the bug database. Bugs are listed in order of resolution. To find a bug quickly, search by bug number.

### C.2.1. Changes in MySQL Enterprise Monitor 2.1.2 (26 May 2010)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.1.1.

Bugs fixed:

- **Security Fix:** A number of cross-site request forging issues have been identified and resolved. ([Bug#52888](#), [Bug#52910](#), [Bug#52905](#), [Bug#52897](#))
- On Windows platforms, the MySQL Enterprise Monitor Agent could show increasing memory usage over time. ([Bug#54313](#))
- MySQL Enterprise Service Manager would crash during initial startup on Solaris SPARC 64-bit. ([Bug#53751](#))
- The dialog box during installation of MySQL Enterprise Service Manager has been updated to make the process of installing MySQL Enterprise Service Manager when using an existing MySQL server. ([Bug#52839](#))
- Scheduling a rule against an instance, and then deleting that instance, would retain the instance within MySQL Enterprise Dashboard, identified as `Unknown`. ([Bug#51095](#))
- Deleting a server within MySQL Enterprise Dashboard could cause a `foreign key constraint` error. ([Bug#50927](#))
- Deleting a server that had purged all its monitoring data, but still have query analyzer information, would fail. ([Bug#50916](#))
- The SSL certificates supplied with MySQL Enterprise Service Manager have been updated.

The certificate shipped with MySQL Enterprise Service Manager is an example certificate that expires after 1 year and that folks should create their own and back it up between MEM service manager updates. For more information on updating the certificate, see [Section 15.12.4, “Creating a new SSL KeyStore”](#). ([Bug#50694](#))

- Clicking a link to a support issue within the dashboard is now configured to open the issue within a new window. ([Bug#50651](#))
- The MySQL Enterprise Monitor Agent could report data using an old timestamp, or report information for a server that the MySQL Enterprise Monitor Agent can no longer connect to due to a permissions change. ([Bug#50449](#))
- Monitoring of a server that had `INFORMATION_SCHEMA`, and a large number of schemas or tables could upset the gathering of monitoring data. ([Bug#47947](#))
- If you specify an invalid backend proxy address to MySQL Enterprise Monitor Agent, the agent would fail silently. ([Bug#46927](#))

- Installation on certain platforms could fail during the generation of a UUID because of a lack of privileges. A separate UUID generation tool, `agent-generate-uuid` is now used to create the UUID. ([Bug#46370](#))
- If a customer was using their own SSL certificate, they entered that information in the `server.xml` file. However, running the upgrade installer caused `server.xml`, and any custom certificates, to be replaced. ([Bug#44525](#))
- Starting the agent could lead to an error regarding the `ssh-keygen` tool and a missing library (`libcrypto`). ([Bug#43125](#))

## C.2.2. Changes in MySQL Enterprise Monitor 2.1.1 (10th February 2010)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.1.0.

Functionality added or changed:

- The smallest purge log time interval that could be set in the Dashboard was one week. MySQL Enterprise Monitor was changed to enable setting the smallest purge log time interval to one day. ([Bug#46822](#))
- Certain heat chart rules cannot be unscheduled or disabled, this is because they are required for correct operation of MySQL Enterprise Monitor. Should an attempt be made to unschedule or disable one of these heat chart rules, a suitable message is now displayed, explaining this requirement. ([Bug#46535](#))
- If you are monitoring one instance of MySQL server `mysqld` and then upgrade that MySQL server, the correct version of the MySQL server is not displayed in the Dashboard. The agent will now perform a re-synchronization of the inventory if it identifies that the server has gone away and that the monitored MySQL has been upgraded. ([Bug#38409](#))

Bugs fixed:

- The MySQL Enterprise Monitor Agent could fail to reconnect to a monitored MySQL instance if the agent was started while the MySQL instance was unavailable. ([Bug#50797](#))
- When installing MySQL Enterprise Monitor Agent on a Linux operating system using the SELinux security environment, the installation would fail if the `allow_execstack` option had been enabled. ([Bug#50515](#))
- When purging old data, the purging process could fail to remove all of the data if the inflow of new information was very high. Purging now removes all outdated information at each execution. ([Bug#50422](#))
- It was possible to update an existing email notification list with two email addresses in the destination without a required comma between the addresses. Addresses are now validated during the editing phase to ensure that this does not occur. ([Bug#50161](#))
- The agent could not be installed on Mac OS X Snow Leopard (10.6) due to an incompatibility in the XML libraries used. ([Bug#50126](#))
- Deleting users within MySQL Enterprise Service Manager could lead to errors in the repository database that would affect further operations involving the deleted user. ([Bug#49896](#))
- When creating a new instance by copying an existing agent configuration, it is possible to create an orphaned agent. The recommended advice is to `TRUNCATE` the `mysql.inventory` table. However, doing this could lead to additional errors and an exception when the scheduled data updates on the now orphaned agent are executed. ([Bug#49882](#))
- Monitoring a MySQL 4.0 server would fail because MySQL 4.0 did not support table-level character set support. ([Bug#49082](#))
- RAM statistics for FreeBSD machines would not be reported correctly by MySQL Enterprise Monitor Agent. ([Bug#48493](#))
- The agent installer for Solaris on x64 would fail due to a library linker issue during the post-installation phase of the installer. ([Bug#48336](#))
- Support has been added for SNMPv2 traps in addition to the existing SNMPv1 traps. You can configure the version to use for SNMP traps, see **SNMP TRAPS**.

In addition, support has also been added to send SNMP notifications to two hosts in place of just one host. Notifications are sent to both hosts simultaneously. ([Bug#47686](#), [Bug#48955](#))

- Support issues can have a Severity from S1 through S4, but can also have a value of “NS” meaning “No Severity Set”. MySQL Enterprise Monitor was not able to parse this, which resulted in errors such as the following:

```
2009-09-23 13:53:51,812 ERROR [em-worker-pool-thread-6:monitor.support.DevSpPoller] error
consuming successful response
java.lang.IllegalArgumentException: No enum const class
com.mysql.etc.tools.monitor.support.SpIssue$Severity.NS
at java.lang.Enum.valueOf(Enum.java:196)
...
```

([Bug#47562](#))

- The pagination of errors within MySQL Enterprise Dashboard for MySQL Enterprise Service Manager logging made it difficult to identify the true source of the error. ([Bug#47464](#))
- An additional link has been added to the **CONFIGURE WHAT'S NEW** page to link to the relevant documentation. ([Bug#47256](#))
- MySQL Enterprise Monitor would fail to install on Miracle Linux4. ([Bug#47209](#))
- Some strings in the **WHAT'S NEW** tab of MySQL Enterprise Dashboard had not been translated from English to Japanese. ([Bug#47203](#))
- The diagnostic report file has been updated so that the filename of the report includes the timestamp when the report was generated. ([Bug#47164](#))
- When the **CONFIGURING AND TROUBLESHOOTING THIS FEED** link was clicked it opened the help screen in the current browser window, rather than in a new window.

The link can be found on the **WHAT'S NEW** tab, at the bottom of the **IMPORTANT PRODUCT-RELATED ANNOUNCEMENTS** section, in the **WELCOME TO THE "WHAT'S NEW?" LIVE FEED!** sub-section. ([Bug#47145](#))

- The links for further information on the **WHAT'S NEW** feed were invalid. ([Bug#47133](#))
- When the Help link was clicked in the Dashboard, the following script error was generated:

```
row: 32
char: 5
error: object expected
code: 0
URL: http://xxx.yyy.com:38080/Help.action
```

This only happened when using Internet Explorer. ([Bug#47065](#))

- The times used for queries in Query Analyzer would not match the time set for the user's timezone and browser setting. ([Bug#47040](#))
- The date format in the **CONFIGURE WHAT'S NEW** pop-up on the **WHAT'S NEW?** tab did not reflect the locale set in the **USER PREFERENCES** page. ([Bug#46901](#))
- Two links in the Agent installer were incorrect.

The link <https://enterprise.mysql.com/docs/monitor/2.0/en/mem-install.html#mem-agent-rights> should have pointed to <https://enterprise.mysql.com/docs/monitor/2.1/en/mem-install.html#mem-agent-rights>. Also, the link <https://enterprise.mysql.com/docs/monitor/2.1/en/mem-query-analysis.html> should have pointed to <https://enterprise.mysql.com/docs/monitor/2.1/en/mem-query-analyzer.html>. ([Bug#46812](#))

- The **REPLACE** and **CALL** statements did not show a rows graph within the statement pop-up graph tab. ([Bug#46796](#))
- When updating your subscription after the subscription has expired, the ability to update your advisor bundle was not available. ([Bug#46700](#))
- The task message for a given server within the agent would be logged at the incorrect level. Messages are now logged at the message level. ([Bug#46681](#))
- Pressing cancel on a pop-up would cause a page reload, instead of just closing the pop-up window. ([Bug#46604](#))
- The cry for help email included a stack trace, however it was displayed on a single line without any line breaks. ([Bug#46458](#))
- If the **LAST** link was clicked on the Infrastructure logs page, the following error was generated:

```
Error Message
fromIndex(400) > toIndex(31)
```

(Bug#46229)

- When using MySQL Enterprise Monitor Agent, if the current configured time went backward (for example, during time correction), the MySQL Enterprise Monitor Agent would stop reporting data and induce a high load on the machine running MySQL Enterprise Monitor Agent (Bug#46052)
- The Windows installers for MySQL Enterprise Service Manager did not include 64-bit versions of the various binary tools. (Bug#45682)
- The agent could get into a state where it loops through the resynchronization of the core data, without reporting information to the service manager, causing gaps in the data. (Bug#45382)
- The IP address of the agent host on FreeBSD 7 systems would not be reported correctly. (Bug#45079)

### C.2.3. Changes in MySQL Enterprise Monitor 2.1.0 (8th September 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.6.

Functionality added or changed:

- **Incompatible Change:** The default proxy port used to relay queries when using the Query Analyzer has been changed from port 4040 to 6446.
- The Agent did not write its version number to the log on startup or shutdown.

The information is now available by setting log level “MESSAGE” in the Dashboard. It is also available when running the Agent from the command line with the command `mysql-monitor-agent --version`. The Agent also now logs its version number on startup if the log level is set to “CRITICAL”. (Bug#45884)

- The Agent did not have a configurable response size.

The response size was hard coded to 65K. However, with large inventories, the customer might need to use a larger response size.

The Agent command line option `--agent-max-response-size` was added which will set the maximum size (in bytes) of the response the agent will send to the Service Manager. The default is 65536. (Bug#45571)

- If the Service Manager lost connection to the repository server, it would shut down after 50 attempts to reconnect or if it was unable to reconnect within 180 seconds. This behavior has now been made configurable through parameters in the `config.properties` file. The parameters are:
  - `mysql.max_connect_retries` - default is 50.
  - `mysql.max_connect_timeout_msec` - default is 180 seconds.

(Bug#45471)

- There was no way to force the Agent to resynch with the Service Manager. A link has now been added. The link can be found on the **SETTINGS, MANAGE SERVERS** page - click the context menu next to a server, the menu now contains a **REFRESH** item. (Bug#45461)
- When the Agent debug log was examined, it was found to contain XML returned by the Service Manager that did not contain carriage returns. This made the data difficult to read by a human. The Service Manager has been changed to return formatted XML. (Bug#45460)
- The version of Enterprise Monitor was not logged on startup.

Enterprise Monitor was changed to log the Monitor and Advisor version number on startup. See also Bug#45884. (Bug#45459)

- The ability to customize the text of the email sent for an event was added. The URL to the event can now be added to the email, so that the administrator does not have to search for the action that triggered the email. (Bug#44383)
- In large installations it can be desirable to locate the repository MySQL Server and the Tomcat server on different computers to reduce load. However, the script `mysqlmonitorctl.sh` assumed these were running on the same server.

The script was therefore changed to accommodate the above requirement.

The `mysqlmonitorctl.sh` script now checks for a new configuration file called `mysqlmonitorctl.conf`. This configuration file is located in a new directory, `etc/defaults`, relative to the install directory. The configuration file contains 2 variables:

- `START_MYSQL=yes`
- `START_TOMCAT=yes`

The script will then start/stop the MySQL Server and Tomcat accordingly. Defaults for both variables in the file are set to “yes”. The update installers will not overwrite this file. ([Bug#44379](#))

- When Replication was configured to use SSL for encrypting the transfer of the binary log, even though replication worked and the dashboard displayed the replication group correctly, the agent still logged the following message (repeatedly):

```
2009-04-06 16:12:00: (critical) job_collect_mysql.c:698: [mysql] (master-uuid)
mysql_real_connect(hostname:port replication:...) to the slave's master
failed: Access denied for user 'replication'@'hostname' (using password: YES) (1045)
```

([Bug#44200](#))

- It was not possible to keep logs for a specific period of more than 52 weeks. The value for purging logs could be set in **SETTINGS**, **GLOBAL SETTINGS** to values ranging from “Never” to “52 Weeks” using the drop down list boxes.

The interface has now been changed to additionally offer periods of 18 months and 24 months. ([Bug#43793](#))

- Events used a GMT timestamp for the event time within email notifications, rather than the local time for the server generating the event.

MySQL Enterprise Monitor has been changed so that it displays the time using the server's locale and GMT. ([Bug#43739](#))

- MySQL Enterprise Monitor did not include a graph to show `max_used_connections` versus `max_connections`.

This has now been included with the Silver level advisor bundle. ([Bug#43583](#))

- A rule has been added named “Server Restarted” to signal a server restart. This has been added as a Heat Chart advisor to the Silver level advisor bundle. The rule has the following options:

```
Expression: (%Uptime% < THRESHOLD)
Critical Alert: 600
Warning Alert: 600
Info Alert: 600
Variable: %Uptime%
Data Item: mysql.status:Uptime
Instance: local
Default frequency: 5 minutes
```

([Bug#43243](#))

- In the Enterprise Dashboard, it was possible to change the last remaining user with a manager role to having an agent role. This led to a problem whereby when attempting to subsequently login to the Dashboard, this caused redirection to the `setup.action` page which presents the Create Administrator facility. However, there was no CONTINUE button on this page, so it was not possible to create the administrative account.

The Dashboard has now been changed so that the currently logged in user is not able to change their role. ([Bug#42436](#))

- Certain alerts were misleadingly labelled as CRITICAL, and caused people to change settings unnecessarily, thereby adversely affecting their system performance and functionality.

MySQL Enterprise Monitor was changed as follows:

#### Heat Chart Advisor

- MyISAM Key Cache Has Sub-Optimal Hit Rate. Critical threshold removed, Warning set to 75 and Info set to 85.
- Query Cache Has Sub-Optimal Hit Rate. Critical threshold removed, Warning set to 40 and Info set to 50.
- Temporary Tables To Disk Ratio Excessive. Critical threshold removed, others left unchanged.

### Memory Usage Advisor

- InnoDB Buffer Cache Has Sub-Optimal Hit Rate. Critical threshold removed, others left unchanged.
- Key Buffer Size May Not Be Optimal For Key Cache. Critical threshold removed, others left unchanged.
- Key Buffer Size May Not Be Optimal For System RAM. Critical threshold removed, others left unchanged.
- Table Cache Not Optimal. Critical threshold removed, Warning set to 60 and Info set to 40.
- Thread Cache Size May Not Be Optimal. Critical threshold removed, Warning set to 75 and Info set to 85.

### Performance Advisor

- Binary Log Usage Exceeding Disk Cache Memory Limits. Critical threshold removed, Warning set to 50 and Info set to 70.
- Excessive Disk Temporary Table Usage Detected. Critical threshold removed, others left unchanged.
- InnoDB Buffer Pool Writes May Be Performance Bottleneck. Critical threshold removed, Warning set to 99 and Info set to 99.5.
- InnoDB Log Waits May Be Performance Bottleneck. Critical threshold removed, Warning set to 1 and Info set to 0.5.

([Bug#42089](#))

- In the Enterprise Dashboard, the **MONITOR** page did not have detailed server meta information. For example, the hostname, datadir, socket and port information were not displayed.

The interface has now been changed to include the following. Hostname, datadir, socket, and port information has been added to the server meta information on the monitor page. The port and datadir information has been added to the **SETTINGS, MANAGE SERVERS** page. Socket and datadir information has been added to the edit server pop-up. ([Bug#40787](#))

- When running multiple instances of the Enterprise Dashboard it could be difficult to determine which instance is currently being logged into.

This was fixed by adding a name for the server on the login page. The name defaults to the hostname but may be changed in the **SETTINGS** page. ([Bug#40642](#))

- The agent should be able to run as a non-`root` user. However, the startup scripts always started it as `root`.

The agent chassis now has a new option `--user` to drop privileges after being started as `root`. Note, this does not work when not started as superuser, nor on Windows.

A new dialog box has also been added to the agent installer. The dialog has the following text: “The agent does not need to run with `root` user privileges. The agent will switch to the user account provided below when started by the `root` user.”

The dialog also has a text field to enable the entry of the user account.

A new parameter was also added to the `mysql-monitor-agent.ini` file. The parameter has the format `user=xxx`, where `xxx` is the user account to be used. ([Bug#33778](#))

- The Advisor rule “InnoDB Redo Logs Not Sized Correctly” has been renamed to “InnoDB Transaction Logs Not Sized Correctly”. The rule’s Problem Description and Advice text have also been updated accordingly. ([Bug#33528](#))
- You can now configure an individual notification group to be used when sending critical email alerts. You can configure this by selecting the administration checkbox when configuring an individual notification group. For more information, see [Section 15.5.5, “Manage Notification Groups”](#). ([Bug#30974](#))
- The Event Log now tracks both the **CURRENT** and **WORST** states for individual events.
- To enable communication by MySQL Enterprise Service Manager with the MySQL Enterprise website, you can now configure an HTTP Proxy to be used when accessing the Internet. For more information, see [Section 15.5.1, “Global Settings”](#).
- The MySQL Enterprise Dashboard now includes a What’s New page that incorporates information automatically from the MySQL Enterprise and MySQL Support websites. For more information, see [Section 15.6, “The What’s New Page”](#).

Bugs fixed:

- The installer for MySQL Enterprise Monitor Agent on Linux 64-bit using glibc-2.3 would fail before the installation had com-

pleted properly. ([Bug#50289](#))

- The alert for “Connection Usage Excessive” recommended raising `max_connections`. However, if the users raised `max_connections` based only on the advice of the alert, they could potentially exhaust all RAM and SWAP.

This alert should have made the proviso that `max_connections` be increased only if sufficient free RAM is available to support the additional connections. The alert should also have recommended checking that all connections are correctly closed, and suggest lowering the `wait_timeout` or `interactive_timeout` settings. ([Bug#46921](#))

- The “Slow Query Log Not Enabled” rule was missing a `<value>` tag in the `<thresholdList>` block. This caused a stack trace to be generated when the Service Manager started. ([Bug#46899](#))
- Table lock contention rules had inconsistent thresholds.

The rule `lock_contention_excessive` (part of the Basic subscription) contained the following expression:

```
(%Uptime% > 10800) && (((%Table_locks_waited% /
(%Table_locks_immediate% + %Table_locks_waited%)) * 100) > THRESHOLD)
```

This used thresholds of 1/3/5 (for Info/Warning/Critical).

However, in the rule `table_lock_contention_excessive` (part of the Platinum subscription), the same expression existed but with different thresholds:

```
(%Uptime% > 10800) && (((%Table_locks_waited% /
(%Table_locks_immediate% + %Table_locks_waited%)) * 100) > THRESHOLD)
```

In this case the thresholds were 30/60/95. ([Bug#46768](#))

- MySQL Enterprise Monitor 2.1 advisors for Windows suggested using `innodb_flush_method=unbuffered`, which is an undocumented value. Only documented values should have been recommended. ([Bug#46709](#))
- When deleting a server within MySQL Enterprise Dashboard where there was a lot of historical data or a large number of instances being monitored, the deletion process could take some time and affect the loading of all pages within MySQL Enterprise Dashboard. The process should no longer affect the performance UI. ([Bug#46632](#))
- The rule names and other content on the **RULES** page could be displayed without the necessary formatting and translation. ([Bug#46608](#))
- You would get a Java `NullPointerException` message if you omitted to select a server before using **ADD SERVER TO GROUP** to add a new server to an existing group. ([Bug#46593](#))
- Initial setup and registration of MySQL Enterprise Monitor could fail on Mac OS X when communicating with the MySQL Enterprise website. ([Bug#46571](#))
- The MySQL Enterprise Service Manager would send one email from each agent when agents were no longer able to write information to the repository. You now get one email containing a list of the affected agents. ([Bug#46460](#))
- The error message shown in the orange dialog when a Rule could not be scheduled showed the Rule's resource key instead of its name. For example:

```
U0146 Unable to schedule rule "binary_logging_is_limited.name" due to
"mysql.MasterStatus.Binlog_Ignore_DB" data not being collected from server
"net-dev2:13306". It may be an unsupported collection for that server.
```

([Bug#46442](#))

- The length of the MySQL Enterprise Monitor related cookie information caused the web browser to fail with errors such as the following (from Safari 4):

```
Bad Request
Your browser sent a request that this server could not understand.
Size of a request header field exceeds server limit.
Cookie: __utma=183337658.3685800196369993700.1241092024.1248080652.1248188601.199;
__utmc=183337658; __utmz=183337658.1247859315.194.26.ut.....
```

([Bug#46348](#))

- The values reported for the `os.mem.swap_page_out` and `os.mem.swap_page_in` could be identified incorrectly as delta, instead of absolute, values. ([Bug#46326](#))
- When upgrading an agent that uses SSL to connect to MySQL Enterprise Service Manager using a non-standard SSL port (i.e. not 18443), the upgrade would change the SSL port back to the default value. ([Bug#46253](#))
- When upgrading MySQL Enterprise Service Manager any custom properties set within `config.properties` would be lost. Changes are now retained during an upgrade. ([Bug#46252](#))
- When installing MySQL Enterprise Service Manager the disk space requirements could be calcualted incorrectly, which would cause the remainder of the installation to fail. ([Bug#46251](#))
- Installation of MySQL Enterprise Monitor Agent on Solaris 8 or Solaris 9 using the SPARC platform could fail if the latest patches of the SUNW UTF-8 and iconv libraries were not available. This prevented the installer from operating correctly, although the agent would work correctly. The installer for the agent has now been updated to avoid this issue. ([Bug#46235](#))
- In the Enterprise Dashboard, the query summary information pop-up on the BrowseQueries page forced a page reload after any hide. This affected both the user pressing the hide button, as well as the links on the `EXAMPLE` and `EXPLAIN` tabs that caused the query summary information pop-up to be hidden, and the Query Analyzer config pop-up to be shown instead. ([Bug#46230](#))
- The Agent had a memory leak. The memory consumption increased by 35MB every five minutes. ([Bug#46222](#))
- The MySQL server embedded with MySQL Enterprise Service Manager has been updated to MySQL 5.1.37. ([Bug#46214](#))
- After a Service Manager upgrade, if there were migration errors, the message “Upgrade Status: there were errors in migration (details)” was displayed on the `SETTINGS`, `MANAGE SERVERS` page. When the details link was clicked the yellow “An Error Occurred” pop-up was briefly displayed before disappearing, making it impossible to determine the details of the error. ([Bug#46181](#))
- When installing a new Advisor JAR, the contents could overwrite localizations in your current installation. ([Bug#46169](#))
- The threshold information in email alerts listed the thresholds in a seemingly random order, for example:

```
Thresholds
Warning : 1024
Info : 512
Critical : 10240

Thresholds
Info : 70
Critical : 5
Warning : 40

Thresholds
Critical : 75
Warning : 85
Info : 95
```

([Bug#46143](#))

- In the Enterprise Dashboard, the check boxes within the `CONFIGURE WHAT'S NEW` panel did not function correctly. When deselecting a check box the accompanying text did not become de-emphasized (“grayed out”) as expected, but only changed when another check box was selected. Further, when the checkbox was subsequently selected, the text did not become emphasized until another check box was selected or deselected. This problem was limited to Internet Explorer 8. ([Bug#46104](#))
- In the Enterprise Dashboard, selecting all three checkboxes in the `CONFIGURE QUERY ANALYZER` panel generated an error:

```
The interval "00:00:00,500" could not be parsed. Intervals must be in hh:mm:ss.msec
format.
```

The error was due to the default value of `AUTO-EXPLAIN THRESHOLD` containing a “,” rather than a “.” character. ([Bug#46102](#))

- The MySQL Enterprise Monitor Agent could return a null value for a valid result set, resulting in incorrect results when using Query Analyzer. ([Bug#46095](#))
- The Rule “Non-Authorized User Has Server Admin Privileges” in the “Security” Advisor checked for the following:

```
Create_user_priv = 'Y'
File_priv = 'Y'
Lock_tables_priv = 'Y'
Reload_priv = 'Y'
Shutdown_priv = 'Y'
Super_priv = 'Y'
```

However, it did not include a check for the condition:

```
Process_priv = 'Y'
```

([Bug#46071](#))

- The Query Analyzer Statement Pop-up history graphs were inconsistent with the other graphs. In particular:
  - The series colors were not consistent with other graphs.
  - The graph image was right aligned, but the title was left aligned. When the pop-up was expanded, unnecessary space was located on the left.
  - The Y axis did not have a Range Label.

([Bug#46066](#))

- In the Enterprise Dashboard, if a Notification Group was created, and also set to be the “MEM Admin” for cry for help emails, the MEM Admin column showed as “false” in the table overview when the group was saved. However, if the group was then edited and the flag added again, the MEM Admin status was saved. ([Bug#46038](#))
- Links in emails generated from the Query Analyzer were not linking to the Query Analyzer tab correctly. ([Bug#46036](#))
- When a query was clicked on the Query Analyzer page, the Explain Query tab displayed a potentially incorrect value for the Auto-Explain Threshold. The Threshold can actually be set to a user configurable value in Configure Query Analyzer, but the pop-up text did not reflect the currently set value, instead displaying a hard-coded default value. ([Bug#46035](#))
- The Rule “Server Includes A Root User Account” in the “Security” Advisor had a Recommended Action:

```
UPDATE user SET user = 'new_name' WHERE user = 'root'; FLUSH PRIVILEGES;
```

However, three other rules triggered in the case where “user” was not “root” but had administrative grants. This caused the following alerts to be generated:

- Non-Authorized User Has DB, Table, Or Index Privileges On All Databases
- Non-Authorized User Has GRANT Privileges On All Databases
- Non-Authorized User Has Server Admin Privileges

([Bug#46023](#))

- In the Enterprise Dashboard, on the **SETTINGS, MANAGE SERVERS** page, the menu item **CONFIGURE QUERY ANALYZER** generated an unhandled error message if clicked when using the Silver level subscription. Query Analyzer is not available at this subscription level, and the menu option to configure the analyzer should not be shown on this page. ([Bug#46016](#))
- If the Agent and monitored server had time settings that were out of sync the Enterprise Dashboard reported the server as “down”. ([Bug#45937](#))
- On the **WHAT'S NEW?** page of the Enterprise Dashboard, multiple messages were generated for the same error. This cluttered the user interface. ([Bug#45927](#))
- In the Enterprise Dashboard, when using the Safari web browser, the graph selection displayed on the **QUERY ANALYZER** tab was sometimes drawn outside the plot area. ([Bug#45926](#))
- The Enterprise Monitor log was flooded with ERROR/WARN messages when the Service Manager was retrying for a `mysqld` connection:

```
2009-07-02 16:52:23,440 WARN [http-18080-4:com.mysql.sql] java.lang.Exception: MySQL
server not running or accepting connections, retrying 30 times or 46 seconds, whichever
expires first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
2009-07-02 16:52:24,455 WARN [Purger:com.mysql.sql] java.lang.Exception: MySQL server not
running or accepting connections, retrying 46 times or 151 seconds, whichever expires
first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
2009-07-02 16:52:25,471 WARN [http-18080-5:com.mysql.sql] java.lang.Exception: MySQL
server not running or accepting connections, retrying 28 times or 34 seconds, whichever
expires first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
2009-07-02 16:52:26,377 WARN [http-18080-9:com.mysql.sql] java.lang.Exception: MySQL
server not running or accepting connections, retrying 33 times or 64 seconds, whichever
expires first. Exception was: Communications link failure
Last packet sent to the server was 0 ms ago.
```

## (Bug#45924)

- In the Enterprise Dashboard the icon file for `event.status.closed` was missing. The problem manifested differently in different browsers. In Internet Explorer 8 the UI cell was empty and no text was displayed. In Firefox 3 the text “`event.status.closed`” was displayed in the cell. ([Bug#45872](#))
- If the system time zone was different from that set in the Enterprise Dashboard, then there was inconsistency in the way times were displayed on the Query Analyzer page. Some times were displayed in the time zone of the system and some were displayed using the Dashboard time zone setting. ([Bug#45858](#))
- In Enterprise Dashboard, when a range on the graph in the **GRAPHS** tab was selected, the following error message was displayed:

```
Error Message

## (Bug#45836)

- If both the **VIEW README** and **LAUNCH MONITOR IN BROWSER** check boxes were selected on the last screen of the Monitor installer, the Dashboard was not brought up in a browser until after the window displaying the “readme” information was closed. ([Bug#45795](#))
- The Agent did not report all the rows from an explain plan where the plan had more than one row. The Dashboard would display information for the first row, but subsequent rows would display NULL. ([Bug#45791](#))
- Custom collections did not override standard collections.

If a custom collection file was defined, and collections specified which were the same as the defaults but with some extensions, the custom collection did not appear to be processed and so did not override the default collection. ([Bug#45755](#))

- When the Service Manager was restarted, or if the Service Manager was turned off for a brief period, and then turned back on, some graphs, such as Database Activity, showed an erroneous spike in traffic. ([Bug#45688](#))
- Cry for help emails were not sent for events such as the monitored server running out of connections or disk space. In the past these had been sent for any error code < 1026. ([Bug#45667](#))
- If custom collection files were created for the Agent, and references added to the `agent-item-files` variable within the `mysql-monitor-agent.ini` file, on upgrade the following problems occurred:
  1. The `agent-item-files` variable was overwritten, thereby removing the custom entry.

2. The custom files were deleted, if they were contained in the `share/` directory.

([Bug#45655](#))

- In the Enterprise Dashboard, when closing single or multiple Events the following exception was generated:

```
Could not execute JDBC batch update
org.hibernate.exception.SQLStateConverter.convert(SQLStateConverter.java:71)
```

([Bug#45627](#))

- In the Enterprise Dashboard, the icon displayed for each server on the `SETTINGS`, `MANAGE SERVERS` page was incorrectly located. This resulted in fewer servers being displayed per page. ([Bug#45564](#))
- In Enterprise Dashboard, when clicking **CONFIGURE WHAT'S NEW** in the **WHAT'S NEW?** tab, an error occurred. This only happened when using Internet Explorer 8. ([Bug#45478](#))
- After the initial server installation a user may select OpenSSL native integration with Tomcat. This will modify the `apache-tomcat/lib` directory. However, subsequently running an upgrade installer overwrote the `apache-tomcat/lib` directory which had been modified during the OpenSSL native integration. ([Bug#45432](#))
- The query `SELECT * FROM 23lk4kj234;` was reported incorrectly in the Query Analyzer. ([Bug#45431](#))
- When an event was closed a “SUCCESS” SNMP trap was sent, rather than a “CLOSED” SNMP trap. ([Bug#45376](#))
- When MySQL Enterprise Monitor 1.3 was upgraded directly to 2.1, and having requested SSL in the upgrade dialog, SSL did not work in the upgraded Monitor. ([Bug#45339](#))
- When an event was closed, the row in the event table where the event entry was located had its checkbox disabled, even though the event now in that row was open. This happened regardless of whether the **CLOSE** button, or the **CLOSE** link were used to close the event. ([Bug#45250](#))
- The Notifications list in the Schedules or Edit Schedules pop-ups listed the Notification Groups targets in the order in which they were created, not alphabetic order. ([Bug#45169](#))
- A small memory leak occurred in the agent when a connection attempt to the dashboard failed. This represented a problem if the agent was unable to connect to the dashboard for a long period of time, as each failure to connect would leak some more memory. ([Bug#45164](#))
- When disabling Query Analyzer while the two sub-options remain enabled for an individual agent, the analyzer, explain and other options would be logged by the agent as critical errors. Now, only the disabling of Query Analyzer is logged as a critical error. The Example Query and Example Explain options are reported as info errors. ([Bug#45041](#))
- The Agent attempted to obtain the Query Analyzer configuration before the Monitor server has created it. This resulted in the Agent generating the following critical error in the log:

```
2009-05-21 15:59:42: (critical) network-io.c:255: successfully reconnected to dashboard at
http://agent:merlin@127.0.0.1:18080/heartbeat
2009-05-21 15:59:47: (critical) agent_mysqld.c:641: successfully connected to database at

```

([Bug#45016](#))

- If a migration from 1.3 to 2.0 was initiated and a new server created during the migration, but then deleted before migration was finished, the new server delete operation failed with a Null Pointer Exception (NPE). ([Bug#44991](#))
- If you have the environment variable `http_proxy` set within your environment, when connections from MySQL Enterprise Monitor Agent could be redirected to an external site, instead of sending them to the configured MySQL Enterprise Service

Manager. You can disable this behavior by adding the contents of the `agent-mgmt-hostname` configuration option for MySQL Enterprise Monitor Agent to the `no_proxy` variable. ([Bug#44893](#))

- The regular expression used to parse the adaptive hash index section of `SHOW INNODB STATUS` for the cell size/used and node size did not function correctly for versions of monitored server greater than 5.1.28. This was because the section of the expression dealing with “cells used” was removed as part of [Bug#36941](#). ([Bug#44853](#))
- The Rule “InnoDB Buffer Cache Hit Rate Not Optimal” in the “Memory Usage” Advisor did not contain an uptime check. This resulted in premature firing of an info event. ([Bug#44770](#))
- Any `JAVA_OPTS` configuration changes made in the `catalina.sh` file, such as `-Xmx`, `-Xms`, were overwritten when the upgrade installer was run. These values were used for customizing larger installations. ([Bug#44740](#))
- In the Advisor “Administration” the Rule “InnoDB Redo Logs Not Sized Correctly” did not fire correctly. The rule contained the expression:

```
(%have_innodb% == "YES") && ((%innodb_log_file_size% * %innodb_log_files_in_group%) <= LEAST(1073741824, (%innodb_buffer_pool_size% / 2)))
```

This was incorrect and needed to be changed to:

```
(%have_innodb% == "YES") && ((%innodb_log_file_size% * %innodb_log_files_in_group%) <= LEAST(1073741824, (%innodb_buffer_pool_size% / 2)))
```

([Bug#44734](#))

- If the Service Manager was set up to use an HTTP proxy, all traffic attempted to go through the proxy, including the connection to the `mysqld` server running the repository. ([Bug#44729](#))
- The recommendation for the rule `Table Cache Not Optimal` says:

```
Recommended Action
SET GLOBAL table_cache = (64 + 16);
```

But an error was generated on executing that query:

```
mysql> SET GLOBAL table_cache = (64 + 16);
ERROR 1193 (HY000): Unknown system variable 'table_cache'

mysql> select version();
+-----+
| version() |
+-----+
| 5.1.31-log |
+-----+
1 row in set (0.01 sec)
```

([Bug#44602](#))

- In Enterprise Dashboard, clicking a query listed on the Query Analyzer page resulted in a delay of around 28 seconds before the pop-up was displayed. ([Bug#44601](#))
- The frequency shown on the **ADVANCED** tab of an **EVENT** pop-up was the default frequency for a rule and not the frequency actually scheduled. ([Bug#44591](#))
- Any changes made to the `config.properties` file, were overwritten by the upgrade installer. ([Bug#44526](#))
- If a customer was using their own SSL certificate, they entered that information in the `server.xml` file. However, running the upgrade installer caused `server.xml`, and any custom certificates, to be replaced. ([Bug#44525](#))
- If you edited the `server.xml` file inside the `tomcat/conf/` folder, and changed the Tomcat port, running the upgrade installer did not show you the new port number, but the one you used at the installation time.

It also did not remember that you had enabled SSL. ([Bug#44444](#))

- Editing an Advisor and selecting the **USE SNMP TRAPS** checkbox led to confusing behavior. Advisors appeared to be incorrectly enabled or disabled. ([Bug#44387](#))
- The Agent failed to correctly determine the state of the monitored server if the `thread-id`, extracted from the client-server protocol, is greater than  $2^{32}$ . In the case with a `thread-id` greater than  $2^{32}$ , the agent incorrectly determined that it was monitoring a remote server. High values of `thread-id` occur when the monitored server has many connections, or if it has been running for an extended period of time. ([Bug#44168](#))

- The Mac OS X version of the Service Manager uses the system JRE. The system JRE loads the libraries located in `/Library/Java/Extensions`. As libraries in the extensions directory take precedence over other libraries, this caused conflicts when user extension libraries were installed there, as these would be used by the JRE when running Service Manager, instead of the shipped libraries. This happened when Java-related products were installed such as Connector/J, Spring, and Hibernate.

This fix stops user-installed extension libraries from being used when the JRE runs the Service Manager, thus giving a “pristine” environment with no library collisions. ([Bug#44157](#))

- The **WHAT'S NEW** tab can no longer be hidden, as it now provides important information and updates about MySQL and MySQL Enterprise Monitor. ([Bug#44107](#))
- In the Enterprise Dashboard, when the frequency for a rule was changed in **ADVISORS**, **MANAGE RULES**, **EDIT**, incorrect thresholds were saved, leading to erroneous alerts. ([Bug#44102](#))
- MySQL Enterprise Monitor installation sometimes failed, generating the following error:

```
Installing
Innitializing User accounts. (4/6)

Error running /opt/mysql/enterprise/monitor/mysql/bin/mysql
--defaults-file=/opt/mysql/enterprise/monitor/mysql/my.cnf -S
/opt/mysql/enterprise/monitor/mysql/tmp/mysql.sock -u root -D mysql -e "update user set
Password = PASSWORD('service_manager') where User = 'root'; update user set User =
'service_manager' where User = 'root'; delete from user where User = ''; flush privileges;"'
: ERROR 2002 (HY000): Can't connect to local MySQL server through socket
'/opt/mysql/enterprise/monitor/mysql/tmp/mysql.sock' (2)
```

After displaying this error, the MySQL Enterprise Monitor installer reported that it had “completed”, but the message displayed contained an error message string:

```
Report2.SetInstallerVariable.errorsOnSQLStatementsText
```

([Bug#44038](#))

- In the Enterprise Dashboard, in the **QUERY ANALYZER** tab, the monitored parameter was not handled correctly during collapse and expansion of the graph. For example, if the graph was monitoring CPU Utilization, and then collapsed and the parameter changed to Database Activity, the monitored parameter reverted to CPU Utilization when the graph was expanded again. ([Bug#44029](#))
- The upgrade installer overwrote any custom settings stored in **WEB-INF/config.properties**. For example it set the database host back to `localhost`. ([Bug#44003](#))
- Accessing the Query Analyzer tab caused a full table scan to take place on the MySQL Enterprise Monitor database. ([Bug#43989](#))
- Some SNMP managers could not detect “Application Error” SNMP notifications.

This happened because some SNMP managers do not follow the protocol correctly. Some use the `DisplayString` length of 255 as the maximum `OctetString`, but this is in fact unlimited in SMIV1 and 64k in SMIV2.

To work around this issue it is possible to override the correct behavior to enable non-conformant SNMP Managers to detect all messages. This is achieved by overriding the `OctetString` maximum size by setting a MySQL Enterprise Monitor server property. This is done by entering SQL such as the following:

```
INSERT INTO map_entries VALUES (1,'2048','snmp.octetstring');
```

In this example the value 2048 will be the maximum SNMP `OctetString` size that would sent in any SNMP traps. After setting this property the server will need to be restarted. Note that the value used may need adjusting depending on the behavior of the SNMP manager. ([Bug#43970](#))

- When updating an Agent from 2.0 to 2.1 the `mysql-monitor-agent.ini` was incorrectly updated.

This happened if the Agent was configured to use SSL to connect to the Enterprise Dashboard, on a port other than 18443. The update installer caused any value specified for the port to be changed to 18443. This did not happen if the Agent was not using SSL. ([Bug#43900](#))

- The Enterprise Dashboard was running abnormally slowly. Clicking on a tab in the Dashboard, or selecting a server from the server tree resulted in a delay of approximately one minute before the results were displayed. ([Bug#43866](#))
- The Agent failed on Linux 32-bit systems with the following error:

```
2009-03-24 16:01:09: (debug) chassis.c:1091: current RLIMIT_NOFILE = 4398046512128 (hard: 577792033385921489)
2009-03-24 16:01:09: (debug) chassis.c:1095: trying to set new RLIMIT_NOFILE = 4398046519296 (hard: 577792033385921489)
2009-03-24 16:01:09: (critical) chassis.c:1097: could not raise RLIMIT_NOFILE to 8192, Invalid argument (22). Current limit still 13811918798715880448.
2009-03-24 16:01:09: (message) MySQL Monitor Agent 2.0.5.7153 started.
```

This happened with the following environment:

```
$./mysql-monitor-agent -V
mysql-proxy 0.7.0
glib2: 2.16.3
libevent: 1.4.6-stable
proxy: 0.7.0
monitor: 0.7.0
MySQL Monitor Agent(agent): 2.0.5.7153
admin: 0.7.0

$ cat /etc/redhat-release
Red Hat Enterprise Linux ES release 3 (Taroon Update 5)

$ uname -a
Linux xxxx 2.4.21-32.0.1.ELsmp #1 SMP Tue May 17 17:52:23 EDT 2005 i686 i686 i386
GNU/Linux
```

The same error also occurred on CentOS 5.2 32-bit systems. ([Bug#43821](#))

- The Replication Group was renamed back to its default name after a new topology was discovered. ([Bug#43816](#))
- A new topology was not discovered after the previous replication group was renamed. ([Bug#43815](#))
- On Unix systems, executing the command:

```
./mysqlmonitorctl.sh stop
```

did not make sure that `mysqld` was shutdown before finishing.

This resulted in a situation such as the following:

```
/opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh stop
Using CATALINA_BASE: /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_HOME: /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_TMPDIR: /opt/mysql/enterprise/monitor/apache-tomcat/temp
Using JRE_HOME: /opt/mysql/enterprise/monitor-2.0.0.7092/java
Stopping tomcat service ... [OK]
/opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh : mysql stopped
```

However, running the following command a few minutes later showed that the MySQL server was still running:

```
/opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh status
MySQL Network MySQL is running
MySQL Network Tomcat is not running
```

([Bug#43803](#))

- The MySQL Enterprise Monitor upgrade installer incorrectly replaced the `AdvisorScript.jar` in `<instDir>/apache-tomcat/webapps/ROOT/WEB-INF/lib/` with the default Advisor JAR. ([Bug#43773](#))
- The SNMP trap source IP was always set to 127.0.0.1. ([Bug#43738](#))
- The advisor “Replication - Slave Has Login Accounts With Inappropriate Privileges” contained inappropriate advice information.

The advice message generated was:

```
Server: slave-01
Time: 2009-03-17 12:00:04 GMT
Advisor: Replication - Slave Has Login Accounts With Inappropriate Privileges

Problem Description
Altering and dropping tables on a slave can break replication. Unless the slave also hosts non-replicated tables, there is no need for accounts with these privileges.

Advice
Revoke the global ALTER and DROP privileges from the following accounts on server slave-01 unless they are absolutely necessary:

user_1@localhost,
```

```

user_2@localhost
Recommended Action
REVOKE ALTER, DROP ON *.* FROM user_name@host_name;
FLUSH PRIVILEGES;

```

However, the problems with this advice were:

1. The server was configured `read_only` so it would not be possible to `DROP` or `ALTER` tables unless the user had `SUPER` privilege.
2. MySQL grants were replicated from the master and therefore appeared on the slave. Also, `read_only` ensured the slave could not be changed.

([Bug#43701](#))

- In Enterprise Dashboard, if on the **MONITOR** page the **CONFIGURE GRAPHS** link was clicked, no changes made, and then the **SAVE** button clicked, then the following error was generated:

```
U0023 You must provide a non-zero interval
```

([Bug#43682](#))

- The installer exited with a return code `0`, even if an error was detected and reported to the user during the installation.

```

.../mysqlmonitor-2.1.0.1015-linux-x86-64bit-installer.bin --mode unattended --installdir
/data0/merlin/monitoring/2.1.0.1015/host/38080 --tomcatport 38080 --tomcatshutdownport

```

([Bug#43676](#))

- The Connections graph did not include information from the Thread Cache graph. Connections and Thread Cache were available as separate graphs but it was difficult to compare them. ([Bug#43584](#))
- If it was desired to look at MySQL Enterprise Monitor graphs for time spans of over 24 hours, you had to change from Interval to From/To mode, and specify a fixed From and To period. This was inconvenient compared to simply specifying a greater interval. ([Bug#43564](#))
- The agent created the `mysql.inventory` table with an engine type of InnoDB, instead of MyISAM, when InnoDB was specified as the default engine type in `my.cnf`. This happened because the agent did not explicitly specify the table engine type to be of MyISAM. ([Bug#43551](#))
- When a trailing space, or tab character, was added at the end of a parameter in the `config.properties` file, MySQL Enterprise Monitor failed to start and generated the following errors in log:

```

ERROR [Thread-1:org.springframework.web.context.ContextLoader] Context initialization
failed
...
Caused by: java.sql.SQLException: Illegal connection port value '13306'
...

```

Resolving the problem required detailed log analysis because the configuration file did not show any apparent problems. ([Bug#43540](#))

- The MySQL Enterprise Monitor installer failed to install correctly due to insufficient disk space, even though the installer calculated there was sufficient disk space for the installation. This was due to the installer having out of date information regarding disk space requirements. ([Bug#43538](#))
- After removing enough servers to bring the host count back down to the number covered in the subscription, the Subscription Warnings reflected the new number. However, the warning message displayed:

```
You are currently monitoring 1 host, however your subscription covers only 1. Your
subscription needs to be updated to cover at least 0 additional hosts.
```

Instead of displaying:

```
Your subscription is up-to-date
You have no warnings at this time.
```

The former message resulted in confusion. ([Bug#43163](#))

- If a host was not a slave during the initial discovery phase, then it would not be displayed in the Replication tab if it subsequently became a slave.

This was because after the initial discovery phase, if a host did not have `slavestatus` present, no subsequent checks were made to check for the host being a slave. It was therefore missed for the purposes of replication discovery and never showed in the Replication tab. ([Bug#42997](#))

- In the Enterprise Dashboard it is only possible to delete monitored servers if they are stopped. Monitored servers can be deleted in **SETTINGS**, **MANAGE SERVERS**. However, if after stopping the Agent, the Dashboard was not refreshed and the agent was started again, an error was generated saying that the agent was running and could therefore not be deleted. Although correct, this was confusing as the Dashboard showed the Agent as stopped but the delete operation error message showed the Agent as running. ([Bug#42983](#))
- Heat Chart rules could not be disabled or unscheduled. ([Bug#42932](#))
- There were four columns added to the `SHOW SLAVE STATUS` query in MySQL Server 5.1: `Last_IO_Errno`, `Last_IO_Error`, `Last_SQL_Errno`, and `Last_SQL_Error`.

However, these were not displayed within the Replication tab. ([Bug#42811](#))

- Agent IP address was not included in SNMP traps. It was also not possible to set these Agent IP addresses through a configuration, which would have been useful for situations where the Agent could not determine the monitored server IP address, such as when virtual IP addresses were used. ([Bug#42703](#))
- The Agent would not reconnect to a monitored database if it was started when the monitored server was down. The agent log contained the following error:

```
Can't connect to MySQL server on '127.0.0.1' (0) (mysql_errno = 2003)
```

The agent only sent OS data to the Dashboard. Further, when the monitored server was later started, no attempts to reconnect were logged.

The problem could be worked around by restarting the agent when the monitored server was running again. ([Bug#42581](#))

- The installer used to upgrade from version 1.3 corrupted passwords containing the “?” character. ([Bug#42452](#))
- Sun multi-core processors caused all cores to be reported on the meta information page.

The larger T-series SPARC processors have 32+ cores. This caused the meta information page in the Dashboard to scroll as it reported each one. ([Bug#42355](#))

- The username field for new users was populated by the last username used.

When creating a new user for the second time in Dashboard, the previously created username appeared in the dialog. ([Bug#42314](#))

- The Agent shut down if the wrong username/password was given in the Service Manager. This happened on a fresh installation, when running the Service Manager through the Proxy. When COMPLETE was clicked to finish the installation the error “Cannot open connection” was displayed. The Agent log also contained the following errors:

```
2009-01-20 15:54:16: (critical) <-- received HTTP-status: 401 (failed) for
'http://agent:mysql@127.0.0.1:8080/Monitor2/heartbeat': password are wrong
2009-01-20 15:54:16: (critical) shutting down normally

2009-01-20 15:54:19: (critical) <-- received HTTP-status: 401 (failed) for
'http://agent:mysql@127.0.0.1:8080/Monitor2/heartbeat': password are wrong
2009-01-20 15:54:19: (critical) shutting down normally
```

([Bug#42228](#))

- The `my.cnf` file for the Enterprise Monitor internal database had the following configuration item:

```
innodb_autoextend_increment = 50M
```

This generated the error:

```
16:36:23 [Warning] option 'innodb_autoextend_increment': unsigned value 52428800
adjusted to 1000
```

This variable is interpreted as being specified in MB, so 50M would be 50 TB. Such a high value results in the variable being adjusted to 1000 MB.

The value in the configuration file should be:

```
innodb_autoextend_increment = 50
```

#### (Bug#42096)

- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. ([Bug#42067](#))
- Using a long interval for the long data collection purging (such as 6 weeks), and a short interval for the query analysis purging (such as 1 week) caused the Query Analyzer purge `EXPLAIN` for the `INSERT ... SELECT` into the `temp_dc_ng_*_now` table to perform a full scan on the `dc_ng_*_now.end_time` index. For example:

```
explain SELECT instance_attribute_id, end_time, end_time FROM dc_ng_long_now JOIN
inventory_instance_attributes USING (instance_attribute_id) JOIN inventory_instances
USING (instance_id) WHERE dc_ng_long_now.end_time <= 1230814870074 AND
dc_ng_long_now.instance_attribute_id AND type_id in (8, 9, 7, 6) ORDER BY
dc_ng_long_now.end_time ASC LIMIT 10000\G

1. row *****
 id: 1
 select_type: SIMPLE
 table: dc_ng_long_now
 type: range
possible_keys: PRIMARY,end_time
 key: end_time
 key_len: 8
 ref: NULL
 rows: 8205369
 Extra: Using where; Using index

2. row *****
 id: 1

```

#### (Bug#41991)

- The MySQL Enterprise Monitor file `my.cnf` specified an initial size of 500M for the central tablespace. However, `in-nodb_file_per_table` was used as well, resulting in approximately 500M of space being potentially wasted. ([Bug#41967](#))
- It was not possible to change any settings related to Query Analyzer unless at least one MySQL server was already being monitored. ([Bug#41875](#))
- The advisor “User Has Rights To Database That Does Not Exist” generated erroneous alerts.

If a database was created with an “\_” character in the name, and then user privileges granted to this database using the escaped character sequence “\\_” to prevent wildcards, then the advisor generates an error stating there is no database for the privilege.

For example, if the following is carried out on the monitored server:

```
CREATE DATABASE test_foo;
GRANT SELECT ON `test_\foo`.* to testuser@'localhost' identified by 'test';
```

then the advisor warns that these users have rights to a database that does not exist:

```
'@\%' on DB test_%,
'test'@'localhost' on DB test_foo,
'testuser'@'localhost' on DB test_foo
```

([Bug#41717](#))

- In the Enterprise Dashboard, when a new server group was clicked in the main tab an error message was generated. On checking the Monitor log there were many error messages related to lock timeouts and having to retry transactions. This problem occurred after enabling purging of the Repository. ([Bug#41461](#))
- Running the Service Manager on Mac OS X and monitoring two servers with two agents for at least 16 hours caused the Java process to use 2.08 GB of memory. ([Bug#41438](#))
- After an error was generated due to an incorrect password while trying to create a new user, the following error was obtained when subsequently attempting to create a valid new user:

```
U0002 You must log in to access the requested resource
```

([Bug#41384](#))

- SNMP trap messages were sending 127.0.0.1 as the IP address, and there was no feature to enable the user to configure the IP address contained in the SNMP message, which would have been useful for troubleshooting. ([Bug#41361](#))
- Allowing the heat chart rules to be set to unscheduled caused the user interface to appear broken. ([Bug#41312](#))
- Data in the agent resource usage graphs (CPU, RAM) stopped after a full install of a new agent monitoring the same database was carried out. Usage history was available across agent versions for all graphs except the agent resource usage graphs. ([Bug#41249](#))
- Graphs were incorrect for data that did not change. The graphs appeared as if no data had been gathered.

The Hit Ratios graph had gaps in it where there had not been any activity on the parameters being monitored. For instance, if MyISAM tables were not used, then no Key Cache hit ratio series was plotted, even though the variables were still being collected. ([Bug#41232](#))

- The generic Linux IA64 glibc2.3 Agent installer was missing from the build. ([Bug#41224](#))
- When creating a new Database Administrator user in FireFox 2 the following error message was generated:

```
U0002 You must log in to access the requested resource.
```

This occurred in a new installation using the default administrator account. No Query Analysis permissions were given. However, the operation worked correctly using the Safari web browser. ([Bug#41032](#))

- The Enterprise Dashboard displayed a blank entry for **DISK SPACE** in the Meta Info area. This happened on Open Solaris 2008.05. This problem only occurred when using the ZFS file system. ([Bug#40907](#))
- The configuration for Query Analyzer that sets the default for all servers (using the **MAKE THIS THE DEFAULT FOR ALL NEW SERVERS** checkbox) could still apply even when the dialog box was canceled. ([Bug#40828](#))
- The **MANAGE SERVERS** page did not refresh in a manner consistent with other pages. This meant that changes to configuration

made by others would not be reflected on the page. Also, changes in the status of the servers were not displayed automatically. ([Bug#40792](#))

- The agent installer for HP-UX 11.11 would fail to execute correctly. ([Bug#40568](#), [Bug#40566](#), [Bug#37508](#))
- The graphs for Thread Cache, Connections and Temporary Tables contained incorrect Japanese translations on their Y axis. The Japanese displayed “total connection time (min)” when it should have displayed something else. For example, the Thread Cache graph should have displayed “total/min”. ([Bug#40413](#))
- If the MySQL Enterprise Monitor Agent was unable to execute an `EXPLAIN` on a query, it would report an empty SQL query. The agent will now report the query hash value, which can be used to identify the original query by examining the repository. ([Bug#40353](#))
- The agent installer for Solaris 8 x86 32-bit was missing. ([Bug#40248](#))
- Even though Query Analysis was disabled through the user interface, the queries that go through the agent were still being collected.

When Query Analysis was turned back on in the user interface, those queries were then displayed. ([Bug#40032](#))

- The Enterprise Dashboard did not display OS data if the Agent was changed from remote to local monitoring. ([Bug#39954](#))
- The agent crashed if `ssh-keygen` was not present and if a wireless card was being used instead of an Ethernet card. This only affected Unix based systems, it did not affect Microsoft Windows. ([Bug#39938](#))
- On Mac OS X when a server had more than 4GB RAM available the memory advisor was still triggered. This appeared to be due to an overflowing value. ([Bug#39757](#))
- The Agent received a critical error but did not terminate as expected. The critical error generated was:

```
2008-09-23 09:35:02: (critical) agent_mysqld.c:139: mysql_real_query() failed: Can't find file: './mysql/inventory.frm' (errno: 13) (errno=1017)
```

([Bug#39603](#))

- Alerts sent from MySQL Enterprise Monitor used the GMT timezone, for example:

```
Time: 2008-09-17 19:41:08 GMT
```

That was not convenient for users, as their timezones may not have been GMT. ([Bug#39504](#))

- The Agent running on AIX 5.3 did not report CPU data or RAM size, causing the Enterprise Dashboard to crash with a Null Pointer Exception. ([Bug#38001](#))
- The MySQL Enterprise Monitor upgrade installer replaced the `my.cnf` file. This resulted in the loss of any changes that had been made to the configuration file. ([Bug#36528](#))
- In the Enterprise Dashboard, on the **GRAPHS** page, the interface for selecting time intervals was not convenient, and it required multiple clicks to select the desired interval.

This was fixed by adding a selection of pre-determined time intervals. ([Bug#34556](#))

- Auto-generated replication group names were not translated into Japanese. ([Bug#32155](#))
- If the “On Save send test trap” checkbox was checked when the SAVE button was clicked and the locale was set to Japanese, an error occurred. The orange error banner was displayed at the top of the page with the error message in Japanese. ([Bug#32069](#))
- The Enterprise Dashboard could communicate with `https://enterprise.mysql.com` using the customer username and password to download the license key and advisor bundle. However, it could not make use of a proxy to do so. This was a problem as many corporate firewalls required the use of a proxy for all HTTP and HTTPS traffic.

The work around of having to manually download license keys and advisor bundles by hand was inconvenient. ([Bug#31507](#))

- The agent log does not include a specific note of when the monitoring by the agent was started. An entry `AgentMonitoringService started` is now added to the log. ([Bug#30609](#))
- When the Agent was started as a service on Windows for the first time, the name in the Task Manager window was `MYSQL-~1.EXE`. This occurred whether the Agent was started from within the installer or from the Start Menu.

If the service was restarted, the Agent's name changed to the correct value, `mysql-service-agent.exe`. ([Bug#30166](#))

- When configuring a graph, setting a to date to a value prior to the from date, or the from date to a value after the to date will not automatically switch the dates when UPDATE is pressed. ([Bug#28473](#))
- In the Enterprise Dashboard, the user interface permitted you to close an already closed event. This happened if multiple instances of the **EVENTS** tab were created. It was possible to close an event with resolution notes in one instance, and then close the same event again with a different set of resolution notes in the other instance. However, on review, the resolution notes and event closure time stamp recorded, were those of the first closure. ([Bug#24107](#))
- When upgrading a monitored server, the information and configuration of the server would not be updated, leading to rules not being executed or applied correctly. Server's are now re-inventoried according to the specified schedule. For more information, see [Remote Server Inventory Schedule](#). ([Bug#24068](#))
- The Dynamic Link Library (DLL) `libxml2.dll` did not contain version resources. This meant version information was not available to be displayed when the file was examined in Windows Explorer. ([Bug#23948](#))
- It was not possible to rename a notification group. ([Bug#22962](#))
- Failures by MySQL Enterprise Service Manager to send warning emails are now reported both in the logs and in the MySQL Enterprise Dashboard within the **PRODUCT INFO** section of the **SETTINGS** page. For more information, see [Section 15.5.7, “The Product Information Screen”](#). ([Bug#20478](#))

## C.3. MySQL Connector/ODBC (MyODBC) Change History

### C.3.1. Changes in MySQL Connector/ODBC 5.1.8 (Not yet released)

Functionality added or changed:

- Documentation in `.CHM` and `.HLP` format has been removed from the distribution. ([Bug#56232](#))

Bugs fixed:

- `SQLDescribeCol` and `SQLColAttribute` could not be called before `SQLExecute`, if the query was parameterized and not all parameters were bound.

Note, MSDN states that “For performance reasons, an application should not call `SQLColAttribute`/`SQLDescribeCol` before executing a statement.” However, it should still be possible to do so if performance reasons are not paramount. ([Bug#56717](#))

- When `SQLNumResultCols()` was called between `SQLPrepare()` and `SQLExecute()` the driver ran `SET @@sql_select_limit=1`, which limited the resultset to just one row. ([Bug#56677](#))

### C.3.2. Changes in MySQL Connector/ODBC 5.1.7 (24 August 2010)

Functionality added or changed:

- MySQL Connector/ODBC has been changed to support the `CLIENT_INTERACTIVE` flag. ([Bug#48603](#))

Bugs fixed:

- `SQLColAttribute(SQL_DESC_PRECISION...)` function returned incorrect results for type identifiers that have a negative value:

```
#define SQL_LONGVARCHAR (-1) returned 4294967295
#define SQL_BINARY (-2) returned 4294967294
#define SQL_VARBINARY (-3) returned 4294967293
#define SQL_LONGVARBINARY (-4) returned 4294967292
#define SQL_BIGINT (-5) returned 4294967291
#define SQL_TINYINT (-6) returned 4294967290
#define SQL_BIT (-7) returned 4294967289
```

They were returned as 32-bit unsigned integer values. This only happened on 64-bit Linux. ([Bug#55024](#))

- `SQLColAttribute` for `SQL_DESC_OCTET_LENGTH` returned length including terminating null byte. It should not have

included the null byte. ([Bug#54206](#))

- The `SQLColumns` function returned the incorrect transfer octet length into the column `BUFFER_LENGTH` for `DECIMAL` type. ([Bug#53235](#))
- `SQLForeignKeys()` did not return the correct information. The list of foreign keys in other tables should not have included foreign keys that point to unique constraints in the specified table. ([Bug#51422](#))
- In contrast to all other ODBC catalog functions `SQLTablePrivileges` required the user to have `SELECT` privilege on MySQL schemata, otherwise the function returned with an error:

```
SQL Error. Native Code: 1142, SQLState: HY000, Return Code: -1
[MySQL][ODBC 5.1 Driver][mysqld-5.0.67-community-nt]SELECT command denied to user
'repadmin'@'localhost' for table 'tables_priv'
[Error] [SQL Error]Error executing SQLTablePrivileges for object cat: myrep, object Name:
xxxxxxxxxx
```

([Bug#50195](#))

- MySQL Connector/ODBC manually added a `LIMIT` clause to the end of certain SQL statements, causing errors for statements that contained code that should be positioned after the `LIMIT` clause. ([Bug#49726](#))
- If `NO_BACKSLASH_ESCAPES` mode was used on a server, escaping binary data led to server query parsing errors. ([Bug#49029](#))
- Bulk upload operations did not work for queries that used parameters. ([Bug#48310](#))
- Retrieval of the current catalog at the moment when a connection was not ready, such as when the connection had been broken or when not all pending results had been processed, resulted in the application crashing. ([Bug#46910](#))
- Describing a view or table caused `SQLPrepare` to prefetch table data. For large tables this created an intolerable performance hit. ([Bug#46411](#))
- If an application was invoked by the root user, `SQLDriverConnect()` was not able to use the username and password in the connection string to connect to the database. ([Bug#45378](#))
- Calling `SQLColAttribute` on a date column did not set `SQL_DESC_DATETIME_INTERVAL_CODE`. `SQLColAttribute` returned `SQL_SUCCESS` but the integer passed in was not set to `SQL_CODE_DATE`. ([Bug#44576](#))
- Conversions for many types were missing from the file `driver/info.c`. ([Bug#43855](#))
- The `SQLTables()` function required approximately two to four minutes to return the list of 400 tables in a database. The `SHOW TABLE STATUS` query used by `SQLTables()` was extremely slow for InnoDB tables with a large number of rows because the query was calculating the approximate number of rows in each table. Further, the results could not be cached due to non-deterministic nature of the result set (the row count was re-calculated every time), impacting performance further. ([Bug#43664](#))
- Executing `SQLForeignKeys` to get imported foreign keys for tables took an excessively long time. For example, getting imported foreign keys for 252 tables to determine parent/child dependencies took about 3 minutes and 14 seconds for the 5.1.5 driver, whereas it took 3 seconds for the 3.5x.x driver. ([Bug#39562](#))
- `SQLDescribeCol` returned incorrect column definitions for `SQLTables` result. ([Bug#37621](#))
- When opening `ADO.Recordset` from Microsoft Access 2003, a run-time error occurred:

```
ErrNo: -2147467259 ErrMessage: Data provider or other service returned an E_FAIL status.
```

([Bug#36996](#))

- `SQLPrimaryKeysW` returned mangled strings for table name, column name and primary key name. ([Bug#36441](#))
- On Windows, the `SOCKET` parameter to the DSN was used as the named pipe name to connect to. This was not exposed in the Windows setup GUI. ([Bug#34477](#))
- MySQL Connector/ODBC returned a value of zero for a column with a non-zero value. This happened when the column had a data type of `BIT`, and any numeric type was used in `SQLBindCol`. ([Bug#32821](#))
- Option for handling bad dates was not available in the GUI. ([Bug#30539](#))

### C.3.3. Changes in MySQL Connector/ODBC 5.1.6 (09 November 2009)

---

Functionality added or changed:

- In the MySQL Data Source Configuration dialog, an excessive number of tabs were required to navigate to selection of a database. MySQL Connector/ODBC has been changed to make the tab order more practical, thereby enabling faster configuration of a Data Source. ([Bug#42905](#))

Bugs fixed:

- An error randomly occurred on Windows 2003 Servers (German language Version) serving classic ASP scripts on IIS6 MDAC version 2.8 SP2 on Windows 2003 SP2. The application connected to MySQL Server 5.0.44-log with a charset of UTF-8 Unicode (utf8). The MySQL server was running on Gentoo Linux.

The script error occurred sporadically on the following line of code:

```
SET my_conn = Server.CreateObject("ADODB.Connection")
my_conn.Open ConnString <- ERROR
```

The connection was either a DSN or the explicit connection string:

```
Driver={MySQL ODBC 5.1 Driver};SERVER=abc.abc.abc.abc;DATABASE=dbname;UID=uidname;PWD=pwdname;PORT=3306;OPTION=6710
```

The error occurred on connections established using either a DNS or a connection string.

When IISState and Debug Diagnostic Tool 1.0.0.152 was used to analyse the code, the following crash analysis was generated:

```
MYODBC5!UTF16TOUTF32+6In 4640-1242788336.dmp the assembly instruction at
myodbc5!utf16toutf32+6 in C:\Programme\MySQL\Connector ODBC 5.1\myodbc5.dll from MySQL AB
has caused an access violation exception (0xC0000005) when trying to read from memory
location 0x194dd000 on thread 33
```

([Bug#44971](#))

- MySQL Connector/ODBC overwrote the query log. MySQL Connector/ODBC was changed to append the log, rather than overwrite it. ([Bug#44965](#))
- MySQL Connector/ODBC failed to build with MySQL 5.1.30 due to incorrect use of the data type `bool`. ([Bug#42120](#))
- Inserting a new record using `SQLSetPos` did not correspond to the database name specified in the `SELECT` statement when querying tables from databases other than the current one.

`SQLSetPos` attempted to do the `INSERT` in the current database, but finished with a `SQL_ERROR` result and “Table does not exist” message from MySQL Server. ([Bug#41946](#))

- Calling `SQLDescribeCol()` with a NULL buffer and nonzero buffer length caused a crash. ([Bug#41942](#))
- MySQL Connector/ODBC updated some fields with random values, rather than with `NULL`. ([Bug#41256](#))
- When a column of type `DECIMAL` containing `NULL` was accessed, MySQL Connector/ODBC returned a 0 rather than a `NULL`. ([Bug#41081](#))
- In Access 97, when linking a table containing a `LONGTEXT` or `TEXT` field to a MySQL Connector/ODBC DSN, the fields were shown as `TEXT (255)` in the table structure. Data was therefore truncated to 255 characters. ([Bug#40932](#))
- Calling `SQLDriverConnect()` with a `NULL` pointer for the output buffer caused a crash if `SQL_DRIVER_NOPROMPT` was also specified:

```
SQLDriverConnect(dbc, NULL, "DSN=myodbc5", SQL_NTS, NULL, 0, NULL, SQL_DRIVER_NOPROMPT)
```

([Bug#40316](#))

- Setting the ADO `Recordset` decimal field value to 44.56 resulted in an incorrect value of 445600.0000 being stored when the record set was updated with the `Update` method. ([Bug#39961](#))
- The `SQLTablesW` API gave incorrect results. For example, table name and table type were returned as `NULL` rather than as the correct values. ([Bug#39957](#))
- MyODBC would crash when a character set was being used on the server that was not supported in the client, for example cp1251:

```
[MySQL][ODBC 5.1 Driver][mysqld-5.0.27-community-nt]Restricted data type attribute violation
```

The fix causes MyODBC to return an error message instead of crashing. ([Bug#39831](#))

- Binding `SQL_C_BIT` to an `INTEGER` column did not work.

The `sql_get_data()` function only worked correctly for `BOOLEAN` columns that corresponded to `SQL_C_BIT` buffers. ([Bug#39644](#))

- When the `SQLTables` method was called with `NULL` passed as the `tablename` parameter, only one row in the `resultset`, with table name of `NULL` was returned, instead of all tables for the given database. ([Bug#39561](#))
- The `SQLGetInfo()` function returned 0 for `SQL_CATALOG_USAGE` information. ([Bug#39560](#))
- MyODBC Driver 5.1.5 was not able to connect if the connection string parameters contained spaces or tab symbols. For example, if the `SERVER` parameter was specified as “`SERVER= localhost`” instead of “`SERVER=localhost`” the following error message will be displayed:

```
[MySQL][ODBC 5.1 Driver] Unknown MySQL server host 'localhost' (11001).
```

([Bug#39085](#))

- The pointer passed to the `SQLDriverConnect` method to retrieve the output connection string length was one greater than it should have been due to the inclusion of the `NULL` terminator. ([Bug#38949](#))
- Data-at-execution parameters were not supported during positioned update. This meant updating a long text field with a cursor update would erroneously set the value to null. This would lead to the error `Column 'column_name' cannot be null` while updating the database, even when `column_name` had been assigned a valid nonnull string. ([Bug#37649](#))
- The `SQLDriverConnect` method truncated the `OutputConnectionString` parameter to 52 characters. ([Bug#37278](#))
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. ([Bug#37179](#))
- Insertion of data into a `LONGTEXT` table field did not work. If such an attempt was made the corresponding field would be found to be empty on examination, or contain random characters. ([Bug#36071](#))
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. ([Bug#30626](#))
- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':
[MySQL][ODBC 3.51 Driver]SSL connection error.
```

([Bug#29955](#))

- When the `recordSet.Update` function was called to update an `adLongVarChar` field, the field was updated but the recordset was immediately lost. This happened with driver cursors, whether the cursor was opened in optimistic or pessimistic mode.

When the next update was called the test code would exit with the following error:

```
-2147467259 : Query-based update failed because the row to update could not be found.
```

([Bug#26950](#))

- Microsoft Access was not able to read `BIGINT` values properly from a table with just two columns of type `BIGINT` and `VARCHAR`. `#DELETE` appeared instead of the correct values. ([Bug#17679](#))

### C.3.4. Changes in MySQL Connector/ODBC 5.1.5 (18 August 2008)

Bugs fixed:

- ODBC `TIMESTAMP` string format is not handled properly by the MyODBC driver. When passing a `TIMESTAMP` or `DATE` to MyODBC, in the ODBC format: {d <date>} or {ts <timestamp>}, the string that represents this is copied once into the SQL

statement, and then added again, as an escaped string. ([Bug#37342](#))

- The connector failed to prompt for additional information required to create a DSN-less connection from an application such as Microsoft Excel. ([Bug#37254](#))
- `SQLDriverConnect` does not return `SQL_NO_DATA` on cancel. The ODBC documentation specifies that this method should return `SQL_NO_DATA` when the user cancels the dialog to connect. The connector, however, returns `SQL_ERROR`. ([Bug#36293](#))
- Assigning a string longer than 67 characters to the `TableType` parameter resulted in a buffer overrun when the `SQLTables()` function was called. ([Bug#36275](#))
- The ODBC connector randomly uses logon information stored in `odbc-profile`, or prompts the user for connection information and ignores any settings stored in `odbc-profile`. ([Bug#36203](#))
- After having successfully established a connection, a crash occurs when calling `SQLProcedures()` followed by `SQLFreeStmt()`, using the ODBC C API. ([Bug#36069](#))

### C.3.5. Changes in MySQL Connector/ODBC 5.1.4 (15 April 2008)

Bugs fixed:

- Wrong result obtained when using `sum()` on a `decimal(8,2)` field type. ([Bug#35920](#))
- The driver installer could not create a new DSN if many other drivers were already installed. ([Bug#35776](#))
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE` (`SQL_COLUMN MONEY`) attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. ([Bug#35581](#))
- On Linux, `SQLGetDiagRec()` returned `SQL_SUCCESS` in cases when it should have returned `SQL_NO_DATA`. ([Bug#33910](#))
- The driver crashes ODBC Administrator on attempting to add a new DSN. ([Bug#32057](#))

### C.3.6. Changes in MySQL Connector/ODBC 5.1.3 (26 March 2008)

Platform specific notes:

- **Important Change:** You must uninstall previous 5.1.x editions of MySQL Connector/ODBC before installing the new version.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.

Bugs fixed:

- **Important Change:** In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the verify of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. ([Bug#29955](#), [Bug#34648](#))
- Inserting characters to a UTF8 table using surrogate pairs would fail and insert invalid data. ([Bug#34672](#))
- Installation of MySQL Connector/ODBC would fail because it was unable to uninstall a previous installed version. The file being requested would match an older release version than any installed version of the connector. ([Bug#34522](#))
- Using `SqlGetData` in combination with `SQL_C_WCHAR` would return overlapping data. ([Bug#34429](#))
- Descriptor records were not cleared correctly when calling `SQLFreeStmt(SQL_UNBIND)`. ([Bug#34271](#))
- The dropdown selection for databases on a server when creating a DSN was too small. The list size now automatically adjusts

up to a maximum size of 20 potential databases. ([Bug#33918](#))

- Microsoft Access would be unable to use `DBEngine.RegisterDatabase` to create a DSN using the MySQL Connector/ODBC driver. ([Bug#33825](#))
- MySQL Connector/ODBC erroneously reported that it supported the `CAST()` and `CONVERT()` ODBC functions for parsing values in SQL statements, which could lead to bad SQL generation during a query. ([Bug#33808](#))
- Using a linked table in Access 2003 where the table has a `BIGINT` column as the first column in the table, and is configured as the primary key, shows `#DELETED` for all rows of the table. ([Bug#24535](#))
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. ([Bug#19065](#))

### C.3.7. Changes in MySQL Connector/ODBC 5.1.2 (13 February 2008)

MySQL Connector/ODBC 5.1.2-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the second beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that un-install any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- Explicit descriptors are implemented. ([Bug#32064](#))
- A full implementation of `SQLForeignKeys` based on the information available from `INFORMATION_SCHEMA` in 5.0 and later versions of the server has been implemented.
- Changed `SQL_ATTR_PARAMSET_SIZE` to return an error until support for it is implemented.
- Disabled `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` when using an SSL connection.
- `SQLForeignKeys` uses `INFORMATION_SCHEMA` when it is available on the server, which enables more complete information to be returned.

Bugs fixed:

- The `SSLCIPHER` option would be incorrectly recorded within the SSL configuration on Windows. ([Bug#33897](#))
- Within the GUI interface, when connecting to a MySQL server on a nonstandard port, the connection test within the GUI would fail. The issue was related to incorrect parsing of numeric values within the DSN when the option was not configured as the last parameter within the DSN. ([Bug#33822](#))
- Specifying a nonexistent database name within the GUI dialog would result in an empty list, not an error. ([Bug#33615](#))
- When deleting rows from a static cursor, the cursor position would be incorrectly reported. ([Bug#33388](#))
- `SQLGetInfo()` reported characters for `SQL_SPECIAL_CHARACTERS` that were not encoded correctly. ([Bug#33130](#))

- Retrieving data from a `BLOB` column would fail within `SQLGetData` when the target data type was `SQL_C_WCHAR` due to incorrect handling of the character buffer. ([Bug#32684](#))
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. ([Bug#31165](#))
- Reading a `TEXT` column that had been used to store UTF8 data would result in the wrong information being returned during a query. ([Bug#28617](#))
- `SQLForeignKeys` would return an empty string for the schema columns instead of `NULL`. ([Bug#19923](#))
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`
- `SQLColAttribute`
- `SQLColAttributes`
- `SQLDescribeCol`
- `SQLSpecialColumns` (theoretically can have the same problem)  
([Bug#12805](#), [Bug#30890](#))
- Dynamic cursors on statements with parameters were not supported. ([Bug#11846](#))
- Evaluating a simple numeric expression when using the OLEDB for ODBC provider and ADO would return an error, instead of the result. ([Bug#10128](#))
- Adding or updating a row using `SQLSetPos( )` on a result set with aliased columns would fail. ([Bug#6157](#))

### C.3.8. Changes in MySQL Connector/ODBC 5.1.1 (13 December 2007)

MySQL Connector/ODBC 5.1.1-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the first beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Includes changes from [Connector/ODBC 3.51.21](#) and [3.51.22](#).

Built using MySQL 5.0.52.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that un-install any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- **Incompatible Change:** Replaced myodbc3i (now myodbc-installer) with MySQL Connector/ODBC 5.0 version.
- **Incompatible Change:** Removed monitor (myodbc3m) and dsn-editor (myodbc3c).

- **Incompatible Change:** Do not permit `SET NAMES` in initial statement and in executed statements.
- A wrapper for the `SQLGetPrivateProfileStringW()` function, which is required for Unicode support, has been created. This function is missing from the unixODBC driver manager. ([Bug#32685](#))
- Added MSI installer for Windows 64-bit. ([Bug#31510](#))
- Implemented support for `SQLCancel()`. ([Bug#15601](#))
- Added support for `SQL_NUMERIC_STRUCT`. ([Bug#3028](#), [Bug#24920](#))
- Removed nonthreadsafe configuration of the driver. The driver is now always built against the threadsafe version of libmysql.
- Implemented native Windows setup library
- Replaced the internal library which handles creation and loading of DSN information. The new library, which was originally a part of MySQL Connector/ODBC 5.0, supports Unicode option values.
- The Windows installer now places files in a subdirectory of the `Program Files` directory instead of the Windows system directory.

Bugs fixed:

- The `SET NAMES` statement has been disabled because it causes problems in the ODBC driver when determining the current client character set. ([Bug#32596](#))
- `SQLDescribeColW` returned UTF-8 column as `SQL_VARCHAR` instead of `SQL_WVARCHAR`. ([Bug#32161](#))
- ADO was unable to open record set using dynamic cursor. ([Bug#32014](#))
- ADO applications would not open a `RecordSet` that contained a `DECIMAL` field. ([Bug#31720](#))
- Memory usage would increase considerably. ([Bug#31115](#))
- SQL statements are limited to 64KB. ([Bug#30983](#), [Bug#30984](#))
- `SQLSetPos` with `SQL_DELETE` advances dynamic cursor incorrectly. ([Bug#29765](#))
- Using an ODBC prepared statement with bound columns would produce an empty result set when called immediately after inserting a row into a table. ([Bug#29239](#))
- ADO Not possible to update a client side cursor. ([Bug#27961](#))
- Recordset `Update()` fails when using `adUseClient` cursor. ([Bug#26985](#))
- MySQL Connector/ODBC would fail to connect to the server if the password contained certain characters, including the semi-colon and other punctuation marks. ([Bug#16178](#))
- Fixed `SQL_ATTR_PARAM_BIND_OFFSET`, and fixed row offsets to work with updatable cursors.
- `SQLSetConnectAttr()` did not clear previous errors, possibly confusing `SQLError()`.
- `SQLError()` incorrectly cleared the error information, making it unavailable from subsequent calls to `SQLGetDiagRec()`.
- NULL pointers passed to `SQLGetInfo()` could result in a crash.
- `SQL_ODBC_SQL_CONFORMANCE` was not handled by `SQLGetInfo()`.
- `SQLCopyDesc()` did not correctly copy all records.
- Diagnostics were not correctly cleared on connection and environment handles.

### C.3.9. Changes in MySQL Connector/ODBC 5.1.0 (10 September 2007)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a alpha release, and as with any other pre-production release, caution should be taken when installing on

production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that un-install any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- Added support for Unicode functions (`SQLConnectW`, etc).
- Added descriptor support (`SQLGetDescField`, `SQLGetDescRec`, etc).
- Added support for `SQL_C_WCHAR`.

### C.3.10. Changes in MySQL Connector/ODBC 5.0.12 (Never released)

#### Note

Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1.

Bugs fixed:

- Inserting `NULL` values into a `DATETIME` column from Access reports an error. ([Bug#27896](#))
- Tables with `TEXT` columns would be incorrectly identified, returning an `Unknown SQL type - 65535` error. ([Bug#20127](#))

### C.3.11. Changes in MySQL Connector/ODBC 5.0.11 (31 January 2007)

Functionality added or changed:

- Added support for ODBC v2 statement options using attributes.
- Driver now builds and is partially tested under Linux with the iODBC driver manager.

Bugs fixed:

- Connection string parsing for DSN-less connections could fail to identify some parameters. ([Bug#25316](#))
- Updates of `MEMO` or `TEXT` columns from within Microsoft Access would fail. ([Bug#25263](#))
- Transaction support has been added and tested. ([Bug#25045](#))
- Internal function, `my_setpos_delete_ignore()` could cause a crash. ([Bug#22796](#))
- Fixed occasional mis-handling of the `SQL_NUMERIC_C` type.
- Fixed the binding of certain integer types.

### C.3.12. Changes in MySQL Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality added or changed:

- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. ([Bug#24876](#))
- Added initial unicode support in data and metadata. ([Bug#24837](#))
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. ([Bug#24485](#))
- Added loose handling of retrieving some diagnostic data. ([Bug#15782](#))
- Added wide-string type info for `SQLGetTypeInfo()`.

Bugs fixed:

- Editing DSN no longer crashes ODBC data source administrator. ([Bug#24675](#))
- String query parameters are now escaped correctly. ([Bug#19078](#))

### C.3.13. Changes in MySQL Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for column binding as `SQL_NUMERIC_STRUCT`.
- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.

Bugs fixed:

- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.
- Added limit of display size when requested using `SQLColAttribute/SQL_DESC_DISPLAY_SIZE`.
- Fixed buffer length return for `SQLDriverConnect`.
- ODBC v2 behavior in driver now supports ODBC v3 date/time types (since `DriverManager` maps them).
- Catch use of `SQL_ATTR_PARAMSET_SIZE` and report error until we fully support.
- Fixed statistics to fail if it couldn't be completed.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed `SQLGetData` to clear the NULL indicator correctly during multiple calls.

### C.3.14. Changes in MySQL Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Also made `SQL_DESC_NAME` only fill in the name if there was a data pointer given, otherwise just the length.

- Fixed display size to be length if max length isn't available.
- Made distinction between `CHAR/BINARY` (and VAR versions).
- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).

Bugs fixed:

- Fixed binding using `SQL_C_LONG`.
- Fixed using wrong pointer for `SQL_MAX_DRIVER_CONNECTIONS` in `SQLGetInfo`.
- Set default return to `SQL_SUCCESS` if nothing is done for `SQLSpecialColumns`.
- Fixed MDiagnostic to use correct v2/v3 error codes.
- Allow `SQLDescribeCol` to be called to retrieve the length of the column name, but not the name itself.
- Length now used when handling bind parameter (needed in particular for `SQL_WCHAR`) - this enables updating char data in MS Access.
- Updated retrieval of descriptor fields to use the right pointer types.
- Fixed hanlding of numeric pointers in `SQLColAttribute`.
- Fixed type returned for `MYSQL_TYPE_LONG` to `SQL_INTEGER` instead of `SQL_TINYINT`.
- Fix size return from `SQLDescribeCol`.
- Fixed string length to chars, not bytes, returned by `SQLGetDiagRec`.

### C.3.15. Changes in MySQL Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for `SQLStatistics` to `MYODBCShell`.
- Improved trace/log.

Bugs fixed:

- `SQLBindParameter` now handles `SQL_C_DEFAULT`.
- Corrected incorrect column index within `SQLStatistics`. Many more tables can now be linked into MS Access.
- Fixed `SQLDescribeCol` returning column name length in bytes rather than chars.

### C.3.16. Changes in MySQL Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations, and notes on this release

- MySQL Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.
- MySQL Connector/ODBC supports both [User](#) and [System](#) DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

### **C.3.17. Changes in MySQL Connector/ODBC 5.0.5 (17 October 2006)**

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

### **C.3.18. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)**

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
  - [SQLBindParameter](#)
  - [SQLBindCol](#)

### **C.3.19. Changes in Connector/ODBC 5.0.2 (Never released)**

Connector/ODBC 5.0.2 was an internal implementation and testing release.

### **C.3.20. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)**

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
  - [SQLAllocHandle](#)
  - [SQLCloseCursor](#)
  - [SQLColAttribute](#)
  - [SQLColumns](#)
  - [SQLConnect](#)

- [SQLCopyDesc](#)
- [SQLDisconnect](#)
- [SQLExecDirect](#)
- [SQLExecute](#)
- [SQLFetch](#)
- [SQLFreeHandle](#)
- [SQLFreeStmt](#)
- [SQLGetConnectAttr](#)
- [SQLGetData](#)
- [SQLGetDescField](#)
- [SQLGetDescRec](#)
- [SQLGetDiagField](#)
- [SQLGetDiagRec](#)
- [SQLGetEnvAttr](#)
- [SQLGetFunctions](#)
- [SQLGetStmtAttr](#)
- [SQLGetTypeInfo](#)
- [SQLNumResultCols](#)
- [SQLPrepare](#)
- [SQLRowcount](#)
- [SQLTables](#)

The following ODBC API function are implemented, but not yet support all the available attributes/options:

- [SQLSetConnectAttr](#)
- [SQLSetDescField](#)
- [SQLSetDescRec](#)
- [SQLSetEnvAttr](#)
- [SQLSetStmtAttr](#)

### C.3.21. Changes in MySQL Connector/ODBC 3.51.28 (Not yet released)

Bugs fixed:

- [SQLColAttribute\(...SQL\\_DESC\\_CASE\\_SENSITIVE...\) returned SQL\\_FALSE for binary types and SQL\\_TRUE for the rest. It should have returned SQL\\_TRUE for binary types, and SQL\\_FALSE for the rest.](#) ([Bug#54212](#))
- [SQLColAttribute for SQL\\_DESC\\_OCTET\\_LENGTH returned length including terminating null byte. It should not have included the null byte.](#) ([Bug#54206](#))
- If NO\_BACKSLASH\_ESCAPES mode was used on a server, escaping binary data led to server query parsing errors. ([Bug#49029](#))
- Inserting a new record using [SQLSetPos](#) did not correspond to the database name specified in the [SELECT](#) statement when querying tables from databases other than the current one.

`SQLSetPos` attempted to do the `INSERT` in the current database, but finished with a `SQL_ERROR` result and “Table does not exist” message from MySQL Server. ([Bug#41946](#))

- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. ([Bug#30626](#))
- Microsoft Access was not able to read `BIGINT` values properly from a table with just two columns of type `BIGINT` and `VARCHAR`. `#DELETE` appeared instead of the correct values. ([Bug#17679](#))

### C.3.22. Changes in MySQL Connector/ODBC 3.51.27 (20 November 2008)

Bugs fixed:

- The client program hung when the network connection to the server was interrupted. ([Bug#40407](#))
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. ([Bug#37179](#))
- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':
[MySQL][ODBC 3.51 Driver]SSL connection error.
```

([Bug#29955](#))

### C.3.23. Changes in MySQL Connector/ODBC 3.51.26 (07 July 2008)

Functionality added or changed:

- There is a new connection option, `FLAG_NO_BINARY_RESULT`. When set this option disables charset 63 for columns with an empty `org_table`. ([Bug#29402](#))

Bugs fixed:

- When an `ADOConnection` is created and attempts to open a schema with `ADOConnection.OpenSchema` an access violation occurs in `myodbc3.dll`. ([Bug#30770](#))
- When `SHOW CREATE TABLE` was invoked and then the field values read, the result was truncated and unusable if the table had many rows and indexes. ([Bug#24131](#))

### C.3.24. Changes in MySQL Connector/ODBC 3.51.25 (11 April 2008)

Bugs fixed:

- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE` (`SQL_COLUMN MONEY`) attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. ([Bug#35581](#))
- The driver crashes ODBC Administrator on attempting to add a new DSN. ([Bug#32057](#))
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`
- `SQLColAttribute`

- [SQLColAttributes](#)
- [SQLDescribeCol](#)
- [SQLSpecialColumns](#) (theoretically can have the same problem)  
(Bug#12805, Bug#30890)

## C.3.25. Changes in MySQL Connector/ODBC 3.51.24 (14 March 2008)

Bugs fixed:

- **Security Enhancement:** Accessing a parameter with the type of `SQL_C_CHAR`, but with a numeric type and a length of zero, the parameter marker would get stripped from the query. In addition, an SQL injection was possible if the parameter value had a nonzero length and was not numeric, the text would be inserted verbatim. (Bug#34575)
- **Important Change:** In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the verification of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug#29955, Bug#34648)
- When using ADO, the count of parameters in a query would always return zero. (Bug#33298)
- Using tables with a single quote or other nonstandard characters in the table or column names through ODBC would fail. (Bug#32989)
- When using Crystal Reports, table and column names would be truncated to 21 characters, and truncated columns in tables where the truncated name was the duplicated would lead to only a single column being displayed. (Bug#32864)
- `SQLExtendedFetch()` and `SQLFetchScroll()` ignored the rowset size if the `Don't cache result` DSN option was set. (Bug#32420)
- When using the ODBC `SQL_TXN_READ_COMMITTED` option, 'dirty' records would be read from tables as if the option had not been applied. (Bug#31959)
- When creating a System DSN using the ODBC Administrator on Mac OS X, a User DSN would be created instead. The root cause is a problem with the iODBC driver manager used on Mac OS X. The fix works around this issue.

### Note

ODBC Administrator may still be unable to register a System DSN unless the `/Library/ODBC/odbc.ini` file has the correct permissions. You should ensure that the file is writable by the `admin` group.

(Bug#31495)

- Calling `SQLFetch` or `SQLFetchScroll` would return negative data lengths when using `SQL_C_WCHAR`. (Bug#31220)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). (Bug#29871)
- Static cursor was unable to be used through ADO when dynamic cursors were enabled. (Bug#27351)
- Using `connection.Execute` to create a record set based on a table without declaring the cmd option as `adCmdTable` will fail when communicating with versions of MySQL 5.0.37 and higher. The issue is related to the way that `SQLSTATE` is returned when ADO tries to confirm the existence of the target object. (Bug#27158)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug#19065)
- With some connections to MySQL databases using MySQL Connector/ODBC, the connection would mistakenly report 'user cancelled' for accesses to the database information. (Bug#16653)

## C.3.26. Changes in MySQL Connector/ODBC 3.51.23 (09 January 2008)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.

Bugs fixed:

- MySQL Connector/ODBC would incorrectly return `SQL_SUCCESS` when checking for distributed transaction support. ([Bug#32727](#))
- When using unixODBC or directly linked applications where the thread level is set to less than 3 (within `odbcinst.ini`), a thread synchronization issue would lead to an application crash. This was because `SQLAllocStmt()` and `SQLFreeStmt()` did not synchronize access to the list of statements associated with a connection. ([Bug#32587](#))
- Cleaning up environment handles in multithread environments could result in a five (or more) second delay. ([Bug#32366](#))
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. ([Bug#31165](#))
- Setting the default database using the `DefaultDatabase` property of an ADO `Connection` object would fail with the error `Provider does not support this property`. The `SQLGetInfo()` returned the wrong value for `SQL_DATABASE_NAME` when no database was selected. ([Bug#3780](#))

### C.3.27. Changes in MySQL Connector/ODBC 3.51.22 (13 November 2007)

Functionality added or changed:

- The workaround for this bug was removed due to the fixes in MySQL Server 5.0.48 and 5.1.21.

This regression was introduced by [Bug#10491](#).

Bugs fixed:

- The `English` locale would be used when formatting floating point values. The `C` locale is now used for these values. ([Bug#32294](#))
- When accessing information about supported operations, the driver would return incorrect information about the support for `UNION`. ([Bug#32253](#))
- Unsigned integer values greater than the maximum value of a signed integer would be handled incorrectly. ([Bug#32171](#))
- The wrong result was returned by `SQLGetData()` when the data was an empty string and a zero-sized buffer was specified. ([Bug#30958](#))
- Added the `FLAG_COLUMN_SIZE_S32` option to limit the reported column size to a signed 32-bit integer. This option is automatically enabled for ADO applications to provide a work around for a bug in ADO. ([Bug#13776](#))

### C.3.28. Changes in MySQL Connector/ODBC 3.51.21 (08 October 2007)

Bugs fixed:

- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. ([Bug#31246](#))
- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. ([Bug#31055](#))
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. ([Bug#31009](#))
- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the TIME columns (`SQL_TYPE_TIME`). ([Bug#30939](#))
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. ([Bug#30568](#))

- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. ([Bug#30499](#))
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). ([Bug#29871](#))
- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column permitted `NULL` values. This was due to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. ([Bug#26108](#))
- MySQL Connector/ODBC would return the wrong error code when the server disconnects the active connection because the configured `wait_timeout` has expired. Previously it would return `HY000`. MySQL Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. ([Bug#3456](#))

### C.3.29. Changes in MySQL Connector/ODBC 3.51.20 (10 September 2007)

Bugs fixed:

- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. ([Bug#30840](#))
- The specified length of the user name and authentication parameters to `SQLConnect()` were not being honored. ([Bug#30774](#))
- The wrong column size was returned for binary data. ([Bug#30547](#))
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0. ([Bug#30520](#))
- `SQLGetConnectAttr()` did not reflect the connection state correctly. ([Bug#14639](#))
- Removed checkbox in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

### C.3.30. Changes in MySQL Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see [Section C.3.31, “Changes in MySQL Connector/ODBC 3.51.18 \(08 August 2007\)“](#).

Functionality added or changed:

- Because of [Bug#10491](#) in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

### C.3.31. Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- **Incompatible Change:** The `FLAG_DEBUG` option was removed.
- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also

available. Previously, tables from the mysql database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. ([Bug#28662](#))

- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the MySQL Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would be installed local to the user, not globally. ([Bug#15326](#), [Bug#10444](#))
- MySQL Connector/ODBC now supports batched statements. To enable cached statement support, you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or `ALLOW MULTIPLE STATEMENTS` within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. ([Bug#7445](#))
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. ([Bug#6741](#))
- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs fixed:

- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be updateable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns. ([Bug#9927](#)) ([Bug#30081](#))
- Fixed an issue where the `myodbc3i` would update the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honoring the `s` and `u` modifiers for the `-d` command-line option. ([Bug#29964](#))
- Getting table metadata (through the `SQLColumns()`) would fail, returning a bad table definition to calling applications. ([Bug#29888](#))
- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. ([Bug#28657](#))
- The `SQL_COLUMN_TYPE`, `SQL_COLUMN_DISPLAY` and `SQL_COLUMN_PRECISION` values would be returned incorrectly by `SQLColumns()`, `SQLDescribeCol()` and `SQLColAttribute()` when accessing character columns, especially those generated through `concat()`. The lengths returned should now conform to the ODBC specification. The `FLAG_FIELD_LENGTH` option no longer has any affect on the results returned. ([Bug#27862](#))
- Obtaining the length of a column when using a character set for the connection of `utf8` would result in the length being returned incorrectly. ([Bug#19345](#))
- The `SQLColumns()` function could return incorrect information about `TIMESTAMP` columns, indicating that the field was not nullable. ([Bug#14414](#))
- The `SQLColumns()` function could return incorrect information about `AUTO_INCREMENT` columns, indicating that the field was not nullable. ([Bug#14407](#))
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- `BIT(n)` columns are now treated as `SQL_BIT` data where `n = 1` and binary data where `n > 1`.
- The wrong value from `SQL_DESC_LITERAL_SUFFIX` was returned for binary fields.
- The `SQL_DATETIME_SUB` column in `SQLColumns()` was not correctly set for date and time types.
- The value for `SQL_DESC_FIXED_PREC_SCALE` was not returned correctly for values in MySQL 5.0 and later.
- The wrong value for `SQL_DESC_TYPE` was returned for date and time types.
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires it.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- Binary packages as disk images with installers are now available for Mac OS X.

- Binary packages for Sun Solaris are now available as [PKG](#) packages.
- The wrong value for `DECIMAL_DIGITS` in `SQLColumns()` was reported for `FLOAT` and `DOUBLE` fields, as well as the wrong value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.
- The `SQL_DATA_TYPE` column in `SQLColumns()` results did not report the correct value for date and time types.

### C.3.32. Changes in MySQL Connector/ODBC 3.51.17 (14 July 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as [PKG](#) packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. ([Bug#9498](#), [Bug#6667](#))
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.
- Dis-allow NULL ptr for null indicator when calling `SQLGetData()` if value is null. Now returns `SQL_ERROR` w/state 22002.
- The setup library has been split into its own RPM package, to enable installing the driver itself with no GUI dependencies.

Bugs fixed:

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. ([Bug#29709](#))
- MySQL Connector/ODBC crashed with Crystal Reports due to a rproblem with `SQLProcedures()`. ([Bug#28316](#))
- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. ([Bug#27315](#))
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. ([Bug#26934](#))
- For a stored procedure that returns multiple result sets, MySQL Connector/ODBC returned only the first result set. ([Bug#16817](#))
- Calling `SQLGetDiagField` with `RecNumber 0, DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. ([Bug#16224](#))
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum permitted ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. ([Bug#13766](#))
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. ([Bug#10563](#))
- When inserting a large `BLOB` field, MySQL Connector/ODBC would crash due to a memory allocation error. ([Bug#10562](#))
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. ([Bug#9498](#))
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argu-

ment was not handled as a pattern value, and most arguments were not escaped correctly when they contained nonalphanumeric characters. ([Bug#8860](#))

- There are no binary packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

### C.3.33. Changes in MySQL Connector/ODBC 3.51.16 (14 June 2007)

Functionality added or changed:

- MySQL Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. ([Bug#12918](#))

Bugs fixed:

- Calls to `SQLNativeSql()` could cause stack corruption due to an incorrect pointer cast. ([Bug#28758](#))
- Using cursors on results sets with multi-column keys could select the wrong value. ([Bug#28255](#))
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. ([Bug#27723](#))
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. ([Bug#27544](#))
- `SQLTables()` did not distinguish tables from views. ([Bug#23031](#))
- Data in `TEXT` columns would fail to be read correctly. ([Bug#16917](#))
- Specifying strings as parameters using the `adBSTR` or `adVarWChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. ([Bug#16235](#))
- `SQL_WVARCHAR` and `SQL_WLONGVARCHAR` parameters were not properly quoted and escaped. ([Bug#16235](#))
- Using `BETWEEN` with date values, the wrong results could be returned. ([Bug#15773](#))
- When using the `Don't Cache Results` (option value [1048576](#)) with Microsoft Access, the connection will fail using DAO/VisualBasic. ([Bug#4657](#))
- Return values from `SQLTables()` may be truncated. ([Bugs #22797](#))

### C.3.34. Changes in MySQL Connector/ODBC 3.51.15 (07 May 2007)

Bugs fixed:

- MySQL Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQLPROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. ([Bug#27591](#))
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. ([Bug#27589](#))
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. ([Bug#27220](#))
- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not update correctly. ([Bug#24306](#))

- Using `SQLProcedures` does not return the database name within the returned resultset. ([Bug#23033](#))
- The `SQLTransact()` function did not support an empty connection handle. ([Bug#21588](#))
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. ([Bug#7912](#))
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. ([Bug#5853](#))
- MySQL Connector/ODBC would return too many foreign key results when accessing tables with similar names. ([Bug#4518](#))

### C.3.35. Changes in MySQL Connector/ODBC 3.51.14 (08 March 2007)

Functionality added or changed:

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. ([Bug#19823](#))
- Added auto is null option to MySQL Connector/ODBC option parameters. ([Bug#10910](#))
- Added auto-reconnect option to MySQL Connector/ODBC option parameters.
- Added support for the `HENV` handlers in `SQLEndTran()`.

Bugs fixed:

- On 64-bit systems, some types would be incorrectly returned. ([Bug#26024](#))
- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. ([Bug#25846](#))
- MySQL Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. ([Bug#22446](#))
- Using MySQL Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. ([Bug#20547](#))
- Using `DataAdapter`, MySQL Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). ([Bug#20459](#))
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. ([Bug#20208](#))
- The ODBC driver name and version number were incorrectly reported by the driver. ([Bug#19740](#))
- A string format exception would be raised when using iODBC, MySQL Connector/ODBC and the embedded MySQL server. ([Bug#16535](#))
- The `SQLDriverConnect()` ODBC method did not work with recent MySQL Connector/ODBC releases. ([Bug#12393](#))

### C.3.36. Changes in MySQL Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

### C.3.37. Changes in MySQL Connector/ODBC 3.51.12 (11 February 2005)

Functionality added or changed:

- N/A

Bugs fixed:

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. ([Bug#15635](#))
- File DSNs could not be saved. ([Bug#12019](#))
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. ([Bug#9539](#))

## C.3.38. Changes in MySQL Connector/ODBC 3.51.11 (28 January 2005)

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. ([Bug#8198](#))
- `SQLGetTypeInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. ([Bug#8138](#))

## C.4. MySQL Connector/.NET Change History

### C.4.1. Changes in MySQL Connector/.NET Version 6.3.x

#### C.4.1.1. Changes in MySQL Connector/.NET 6.3.4 (1st September 2010 GA)

First GA release. Fixes bugs since 6.3.3.

Bugs fixed:

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. ([Bug#55701](#))
- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.
--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

([Bug#55644](#))

- Calling `MySqlDataAdapter.Update(DataTable)` resulted in an unacceptable performance hit when updating large amounts of data. ([Bug#55609](#))
- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

([Bug#55170](#))

- EventLog was not disposed in the SessionState provider. ([Bug#52550](#))
- When attempting to carry out an operation such as:

```
from p in db.Products where p.PostedDate>=DateTime.Now select p;
```

Where `p.PostedDate` is a `DateTimeOffset`, and the underlying column type is a `TIMESTAMP`, the following exception was generated:

```
MySqlException occurred
```

```
Unable to serialize date/time value
```

MySQL Connector/NET has now been changed so that all `TIMESTAMP` columns will be surfaced as `DateTime`. ([Bug#52550](#))

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. ([Bug#50671](#))
- The `INSERT` command was significantly slower with MySQL Connector/NET 6.x compared to 5.x, when compression was enabled. ([Bug#48243](#))
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. ([Bug#44715](#))

#### C.4.1.2. Changes in MySQL Connector/NET 6.3.3 (27th July 2010 beta)

Second Beta release. Fixes bugs since 6.3.2.

Bugs fixed:

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. ([Bug#54895](#))
- Several calls to `datadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. ([Bug#54863](#))
- MySQL Connector/NET generated a null reference exception when `TransactionScope` was used by multiple threads. ([Bug#54681](#))
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. ([Bug#54571](#))
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. ([Bug#54570](#))
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpter.Update` either generated an exception or failed to batch the commands, executing each insert individually. ([Bug#54386](#))
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. ([Bug#54152](#), [Bug#53865](#))
- MySQL Connector/NET did not process `Thread.Abort()` correctly, and failed to cancel queries currently running on the server. ([Bug#54012](#))
- MySQL Connector/NET 6.3.2 failed to install on Windows Vista. ([Bug#53975](#))
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
 MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
 Int32 count)
 MySql.Data.MySqlClient.MySqlStream.LoadPacket()
 Outer Exception Reading from the stream has failed.
 ...
```

([Bug#53457](#))

- MySQL Connector/NET did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. ([Bug#53439](#))
- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
 MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
 MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
 MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
 Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
 Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
```

```
Forecast.Page_Load(Object sender, EventArgs e) in ...:70
 System.Web.UI.Control.OnLoad(EventArgs e) +99
 System.Web.UI.Control.LoadRecursive() +50
 System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

([Bug#53357](#))

- Membership schema creation failed if the default schema collation was not Latin1. ([Bug#53174](#))
- The MySQL Connector/.NET installation failed due to `machine.config` files not being present in configuration folders. MySQL Connector/.NET has been changed to skip over configuration folders that do not contain a `machine.config` file. ([Bug#52352](#))
- `CHAR ( 36 )` columns were not recognized as GUIDs when used in views with entity models. ([Bug#52085](#))
- When an application was subjected to increased concurrent load, MySQL Connector/.NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\' already belongs to this DataSet.
```

([Bug#49118](#))

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. ([Bug#47153](#))
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

MySQL Connector/.NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. ([Bug#38411](#))

- Database name was emitted into typed datasets. This prevented users using the configured default database. ([Bug#33870](#))

#### C.4.1.3. Changes in MySQL Connector/.NET 6.3.2 (24th May 2010 beta)

First Beta release. Fixes bugs since 6.3.1.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated. MySQL Connector/.NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. ([Bug#52562](#))
- MySQL Connector/.NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. ([Bug#47467](#))

Bugs fixed:

- After an exception, the internal datareader, `MySqlCommand.Connection.Reader`, was not properly closed (it was not set to null). If another query was subsequently executed on that command object an exception was generated with the message “There is already an open DataReader associated with this Connection which must be closed first.” ([Bug#55558](#))
- MySQL Connector/.NET generated an exception when used to read a `TEXT` column containing more than 32767 bytes. ([Bug#54040](#))
- In MySQL Connector/.NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. ([Bug#52769](#))

- The procedure cache affected the MySQL Connector/.NET performance, reducing it by around 65%. This was due to unnecessary calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. ([Bug#52475](#))
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. ([Bug#52187](#))
- In MySQL Connector/.NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

This meant that, for example, the Euro sign was not handled correctly.

The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. ([Bug#51927](#))

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. ([Bug#51788](#))
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.
Parameter name: length
```

([Bug#51610](#))

- MySQL Connector/.NET 6.3.1 failed to install. ([Bug#51407](#), [Bug#51604](#))
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. ([Bug#49850](#))

#### C.4.1.4. Changes in MySQL Connector/.NET 6.3.1 (2nd March 2010 alpha)

Fixes bugs since 6.3.0.

Functionality added or changed:

- Connector/.NET was not compatible with Visual Studio wizards that used square brackets to delimit symbols.

Connector/.NET has been changed to include a new connection string option `Sql Server mode` that supports use of square brackets to delimit symbols. ([Bug#35852](#))

Bugs fixed:

- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

([Bug#51209](#))

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. ([Bug#51149](#))
- `MySqlCommand.Parameters.Clear()` did not work. ([Bug#50444](#))
- Binary Columns were not displayed in the Query Builder of Visual Studio. ([Bug#50171](#))
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. ([Bug#50123](#))

- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```

MySql.Data.MySqlClient.MySqlException was unhandled
Message="You have an error in your SQL syntax; check the manual that corresponds to your
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
Source=" MySql.Data"
ErrorCode=-2147467259
Number=1064
StackTrace:
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
lastInsertId)
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
à MySql.Data.MySqlClient.MySqlScript.Execute()

```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. ([Bug#46429](#))

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. ([Bug#41629](#))

#### C.4.1.5. Changes in MySQL Connector/NET 6.3.0 (16th February 2010 alpha)

First alpha release of 6.3.

Functionality added or changed:

- Nested transaction scopes were not supported. MySQL Connector/NET now implements nested transaction scopes. A per-thread stack of scopes is maintained, which is necessary to handle nested scopes with the `RequiresNew` or `Suppress` options. ([Bug#45098](#))
- Support for MySQL Server 4.1 has been removed from MySQL Connector/NET starting with version 6.3.0. The connector will now throw an exception if you try to connect to a server of version less than 5.0.

Bugs fixed:

- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED\_TABLE\_CATALOG' column not being included in the foreign keys collection. ([Bug#48974](#))

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. ([Bug#48944](#))
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. ([Bug#48171](#))

#### C.4.2. Changes in MySQL Connector/NET Version 6.2.x

##### C.4.2.1. Changes in MySQL Connector/NET 6.2.4 (30th August 2010 GA)

This release fixes bugs since 6.2.3.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

MySQL Connector/NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. ([Bug#52562](#))

## Bugs fixed:

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. ([Bug#55701](#))
- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.
--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

([Bug#55644](#))

- After an exception, the internal datareader, `MySqlCommand.Connection.Reader`, was not properly closed (it was not set to null). If another query was subsequently executed on that command object an exception was generated with the message “There is already an open DataReader associated with this Connection which must be closed first.” ([Bug#55558](#))
- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

([Bug#55170](#))

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. ([Bug#54895](#))
- Several calls to `datadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. ([Bug#54863](#))
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. ([Bug#54571](#))
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. ([Bug#54570](#))
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpa-`  
`ter.Update` either generated an exception or failed to batch the commands, executing each insert individually. ([Bug#54386](#))
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOut-`  
`fRangeException`. ([Bug#54152](#), [Bug#53865](#))
- MySQL Connector/.NET did not process `Thread.Abort()` correctly, and failed to cancel queries currently running on the server. ([Bug#54012](#))
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

([Bug#53457](#))

- MySQL Connector/.NET did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. ([Bug#53439](#))
- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
```

```
Connection which must be closed first.]
 MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
 MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
 MySql.Data.MySqlCommand.ExecuteReader() +6
 Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
 Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
 Forecast.Page_Load(Object sender, EventArgs e) in ...:70
 System.Web.UI.Control.OnLoad(EventArgs e) +99
 System.Web.UI.Control.LoadRecursive() +50
 System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

([Bug#53357](#))

- Membership schema creation failed if the default schema collation was not Latin1. ([Bug#53174](#))
- In MySQL Connector/.NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. ([Bug#52769](#))
- EventLog was not disposed in the SessionState provider. ([Bug#52550](#))
- The procedure cache affected the MySQL Connector/.NET performance, reducing it by around 65%. This was due to unnecessary calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. ([Bug#52475](#))
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. ([Bug#52187](#))
- Periodically the session provider threw an `SqlNullValueException` exception. When this happened, the row within the `my_aspnet_sessions` table had `locked` always set to '1'. The locked status never changed back to '0' and the user experienced the exception on every page, until their browser was closed and reopened (recreating a new sessionID), or the `locked` value was manually changed to '0'. ([Bug#52175](#))
- `CHAR ( 36 )` columns were not recognized as GUIDs when used in views with entity models. ([Bug#52085](#))
- In MySQL Connector/.NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

This meant that, for example, the Euro sign was not handled correctly.

The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. ([Bug#51927](#))

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. ([Bug#50671](#))
- When an application was subjected to increased concurrent load, MySQL Connector/.NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

([Bug#49118](#))

- The `INSERT` command was significantly slower with MySQL Connector/.NET 6.x compared to 5.x, when compression was enabled. ([Bug#48243](#))
- When the connection string option "Connection Reset = True" was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. ([Bug#47153](#))
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. ([Bug#44715](#))

- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

MySQL Connector/.NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. ([Bug#38411](#))

- Database name was emitted into typed datasets. This prevented users using the configured default database. ([Bug#33870](#))

### C.4.2.2. Changes in MySQL Connector/.NET 6.2.3 (10th April 2010 GA)

This release fixes bugs since 6.2.2.

Functionality added or changed:

- MySQL Connector/.NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. ([Bug#47467](#))

Bugs fixed:

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. ([Bug#51788](#))
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.
Parameter name: length
```

([Bug#51610](#))

- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

([Bug#51209](#))

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. ([Bug#51149](#))
- `MySqlCommand.Parameters.Clear()` did not work. ([Bug#50444](#))
- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

([Bug#50344](#))

- When using the Compact Framework the following exception occurred when attempting to connect to a MySQL Server:

```
System.InvalidOperationException was unhandled
Message="Timeouts are not supported on this stream."
```

([Bug#50321](#))

- Binary Columns were not displayed in the Query Builder of Visual Studio. ([Bug#50171](#))
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. ([Bug#50123](#))
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. ([Bug#49850](#))
- `MySqlDataReader.GetInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. ([Bug#49794](#))

- A `FormatException` was generated when an empty string was returned from a stored function. ([Bug#49642](#))
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
 MySql.Data.MySqlClient.MySqlException was unhandled
Message="You have an error in your SQL syntax; check the manual that corresponds to your
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
Source=" MySql.Data"
ErrorCode=-2147467259
Number=1064
StackTrace:
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
lastInsertId)
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. ([Bug#46429](#))

- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. ([Bug#45277](#))
- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. ([Bug#41629](#))

#### C.4.2.3. Changes in MySQL Connector/NET 6.2.2 (22nd December 2009 GA)

First GA release of 6.2. This release fixes bugs since 6.2.1.

Bugs fixed:

- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED\_TABLE\_CATALOG' column not being included in the foreign keys collection. ([Bug#48974](#))

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. ([Bug#48944](#))
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. ([Bug#48171](#))
- MySQL Connector/NET generated an invalid operation exception during a transaction rollback:

```
System.InvalidOperationException: Connection must be valid and open to rollback
transaction
at MySql.Data.MySqlClient.MySqlTransaction.Rollback()
at MySql.Data.MySqlClient.MySqlConnection.CloseFully()
at
MySql.Data.MySqlClient.MySqlPromotableTransaction.System.Transactions.IPromotableSinglePhaseNotification.Rollback(S
singlePhaseEnlistment)
...
```

([Bug#35330](#))

- Connection objects were not garbage collected when not in use. ([Bug#31996](#))

#### C.4.2.4. Changes in MySQL Connector/NET 6.2.1 (16th November 2009 beta)

This release fixes bugs since 6.2.0.

Functionality added or changed:

- The `MySqlParameter` class now has a property named `PossibleValues`. This property is NULL unless the parameter is

created by `MySqlCommandBuilder.DeriveParameters`. Further, it will be NULL unless the parameter is of type enum or set - in this case it will be a list of strings that are the possible values for the column. This feature is designed as an aid to the developer. ([Bug#48586](#))

- Prior to MySQL Connector/NET 6.2, `MySqlCommand.CommandTimeout` included user processing time, that is processing time not related to direct use of the connector. Timeout was implemented through a .NET Timer, that triggered after `CommandTimeout` seconds.

MySQL Connector/NET 6.2 introduced timeouts that are aligned with how Microsoft handles `SqlCommand.CommandTimeout`. This property is the cumulative timeout for all network reads and writes during command execution or processing of the results. A timeout can still occur in the `MySqlReader.Read` method after the first row is returned, and does not include user processing time, only IO operations.

Further details on this can be found in the relevant [Microsoft documentation](#).

- Starting with MySQL Connector/NET 6.2, there is a background job that runs every three minutes and removes connections from pool that have been idle (unused) for more than three minutes. The pool cleanup frees resources on both client and server side. This is because on the client side every connection uses a socket, and on the server side every connection uses a socket and a thread.

Prior to this change, connections were never removed from the pool, and the pool always contained the peak number of open connections. For example, a web application that peaked at 1000 concurrent database connections would consume 1000 threads and 1000 open sockets at the server, without ever freeing up those resources from the connection pool.

- MySQL Connector/NET now supports the processing of certificates when connecting to an SSL-enabled MySQL Server. For further information see the connection string option SSL Mode in the section [Section 21.2.6, “Connector/NET Connection String Options Reference”](#) and the tutorial [Section 21.2.4.7, “Tutorial: Using SSL with MySQL Connector/NET”](#).

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

MySQL Connector/NET was changed so that it was possible to do:

```
MySqlCommand clone = comm.Clone();
```

([Bug#48460](#))

- When used, the `Encrypt` connection string option caused a “Keyword not supported” exception to be generated.

This option is in fact obsolete, and the option SSL Mode should be used instead. Although the `Encrypt` option has been fixed so that it does not generate an exception, it will be removed completely in version 6.4. ([Bug#48290](#))

- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. ([Bug#48271](#))

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

MySQL Connector/NET was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. ([Bug#48100](#))

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. ([Bug#47872](#))
- MySQL Connector/NET session support did not work with MySQL Server versions prior to 5.0, as the Session Provider used a call to `TIMESTAMPDIFF`, which was not available on servers prior to 5.0. ([Bug#47219](#))

### C.4.2.5. Changes in MySQL Connector/NET 6.2.0 (21st October 2009 alpha)

The first alpha release of 6.2.

Bugs fixed:

- When using a `BINARY(16)` column to represent a GUID and having specified “old guids = true” in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

```
Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
```

[\(Bug#47928\)](#)

- The Session Provider created invalid “session expires” on a random basis.

This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. [\(Bug#47815\)](#)

- When loading the `MySQLClient-mono.sln` file included with the Connector/NET source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
error CS0115: ` MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory` is marked as an
override but no suitable property found to override
```

[\(Bug#47048\)](#)

### C.4.3. Changes in MySQL Connector/NET Version 6.1.x

#### C.4.3.1. Changes in MySQL Connector/NET 6.1.5 (30th August 2010 GA)

This release fixes bugs since 6.1.4.

Bugs fixed:

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. [\(Bug#55701\)](#)
- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.
--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

[\(Bug#55644\)](#)

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

[\(Bug#55170\)](#)

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. ([Bug#54895](#))
- Several calls to `dataadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. ([Bug#54863](#))
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. ([Bug#54571](#))
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. ([Bug#54570](#))
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpter.Update` either generated an exception or failed to batch the commands, executing each insert individually. ([Bug#54386](#))
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. ([Bug#54152](#), [Bug#53865](#))
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
 MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
 Int32 count)
 MySql.Data.MySqlClient.MySqlStream.LoadPacket()
 Outer Exception Reading from the stream has failed.
 ...

```

([Bug#53457](#))

- MySQL Connector/.NET did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. ([Bug#53439](#))
- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
 MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
 MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
 MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
 Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
 Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
 in ...:13
 Forecast.Page_Load(Object sender, EventArgs e) in ...:70
 System.Web.UI.Control.OnLoad(EventArgs e) +99
 System.Web.UI.Control.LoadRecursive() +50
 System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

([Bug#53357](#))

- Membership schema creation failed if the default schema collation was not Latin1. ([Bug#53174](#))
- EventLog was not disposed in the SessionState provider. ([Bug#52550](#))
- `CHAR ( 36 )` columns were not recognized as GUIDs when used in views with entity models. ([Bug#52085](#))
- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. ([Bug#50671](#))
- When an application was subjected to increased concurrent load, MySQL Connector/.NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

([Bug#49118](#))

- The `INSERT` command was significantly slower with MySQL Connector/.NET 6.x compared to 5.x, when compression was enabled. ([Bug#48243](#))
- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset.

([Bug#47153](#))

- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. ([Bug#44715](#))
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

MySQL Connector/.NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. ([Bug#38411](#))

- Database name was emitted into typed datasets. This prevented users using the configured default database. ([Bug#33870](#))

#### C.4.3.2. Changes in MySQL Connector/.NET 6.1.4 (28th April 2010 GA)

This release fixes bugs since 6.1.3.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

MySQL Connector/.NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. ([Bug#52562](#))

- MySQL Connector/.NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. ([Bug#47467](#))

Bugs fixed:

- In MySQL Connector/.NET, the `SqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. ([Bug#52769](#))
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. ([Bug#52187](#))
- In MySQL Connector/.NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

This meant that, for example, the Euro sign was not handled correctly.

The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. ([Bug#51927](#))

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. ([Bug#51788](#))
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.
Parameter name: length
```

([Bug#51610](#))

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. ([Bug#51149](#))
- `MySqlCommand.Parameters.Clear()` did not work. ([Bug#50444](#))

- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

([Bug#50344](#))

- Binary Columns were not displayed in the Query Builder of Visual Studio. ([Bug#50171](#))
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. ([Bug#50123](#))
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. ([Bug#49850](#))
- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. ([Bug#49794](#))
- A `FormatException` was generated when an empty string was returned from a stored function. ([Bug#49642](#))
- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED\_TABLE\_CATALOG' column not being included in the foreign keys collection. ([Bug#48974](#))

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. ([Bug#48944](#))
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. ([Bug#48171](#))
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
 MySql.Data.MySqlClient.MySqlException was unhandled
Message="You have an error in your SQL syntax; check the manual that corresponds to your
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
Source=" MySql.Data"
ErrorCode=-2147467259
Number=1064
StackTrace:
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
lastInsertId)
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. ([Bug#46429](#))

- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. ([Bug#45277](#))
- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. ([Bug#41629](#))

#### C.4.3.3. Changes in MySQL Connector/NET 6.1.3 (16th November 2009 GA)

This release fixes bugs since 6.1.2.

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
 MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

MySQL Connector/NET was changed so that it was possible to do:

```
MySqlCommand clone = comm.Clone();
```

#### (Bug#48460)

- When building the `MySQL.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of
MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. (Bug#48271)

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named "b`a`d" as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
 "Indexes",
 new string[] { null, schemaName, "b`a`d" });
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d' at line 1
```

#### (Bug#48101)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

MySQL Connector/.NET was changed to expose the  `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug#48100)

- For some character sets such as UTF-8, a `CHAR` column would sometimes be incorrectly interpreted as a `GUID` by MySQL Connector/.NET.

MySQL Connector/.NET was changed so that a column would only be interpreted as a `GUID` if it had a character length of 36, as opposed to a byte length of 36. (Bug#47985)

- When using a `BINARY(16)` column to represent a GUID and having specified "old guids = true" in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

```
Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
```

#### (Bug#47928)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug#47872)

- The Session Provider created invalid "session expires" on a random basis.

This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. (Bug#47815)

- Attempting to build MySQL Connector/.NET 6.1 `MySQL.Data` from source code on Windows failed with the following error:

```
...\\clones\\6.1\\MySQL.Data\\Provider\\Source\\NativeDriver.cs(519,29): error CS0122:
'MySql.Data.MySqlClient.MySqlPacket.MySqlPacket()' is inaccessible due to its protection level
```

#### (Bug#47354)

- When tables were auto created for the Session State Provider they were set to use the MySQL Server's default collation, rather than the default collation set for the containing database. (Bug#47332)
- When loading the `MySQLClient-mono.sln` file included with the Connector/.NET source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySQL.Data.Provider/Source/Connection.cs(280,46):
error CS0115: ` MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

([Bug#47048](#))

#### C.4.3.4. Changes in MySQL Connector/NET 6.1.2 (8th September 2009 GA)

This is the first GA release of 6.1.

Bugs fixed:

- The MySQL Connector/NET Session State Provider truncated session data to 64KB, due to its column types being set to `BLOB`. ([Bug#47339](#))
- MySQL Connector/NET generated the following exception when using the Session State provider:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL
server version for the right syntax to use near 'MINUTEWHERE SessionId =
'dtmgga55x35oi255nrfrxe45' AND ApplicationId = 1 AND Loc' at line 1
Description: An unhandled exception occurred during the execution of the current web
request. Please review the stack trace for more information about the error and where it
originated in the code.
```

```
Exception Details: MySql.Data.MySqlClient.MySqlException: You have an error in your SQL
syntax; check the manual that corresponds to your MySQL server version for the right
syntax to use near 'MINUTEWHERE SessionId = 'dtmgga55x35oi255nrfrxe45' AND ApplicationId =
1 AND Loc' at line 1
```

([Bug#46939](#))

- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

This was due to the fact that the encoding field had not been initialized correctly. ([Bug#46844](#))

- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. ([Bug#44985](#))
- MySQL Connector/NET did not time out correctly. The command timeout was set to 30 secs, but MySQL Connector/NET hung for several hours. ([Bug#43761](#))

#### C.4.3.5. Changes in MySQL Connector/NET 6.1.1 (20 August 2009 beta)

This is the first Beta release of 6.1.

Bugs fixed:

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. ([Bug#46620](#))
- The MySQL Connector/NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
Server Error in '/mono' Application

The requested feature is not implemented.
Description: HTTP 500. Error processing request.
Stack Trace:
System.NotImplementedException: The requested feature is not implemented.
```

```

at MySql.Data.MySqlClient.MySqlConnection.EnlistTransaction
(System.Transactions.Transaction transaction) [0x00000]
at MySql.Data.MySqlClient.MySqlConnection.Open () [0x00000]
at MySql.Web.Profile.MySQLProfileProvider SetPropertyValues
(System.Configuration.SettingsContext context,
System.Configuration.SettingsPropertyValueCollection collection) [0x00000]

```

-----  
Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433

#### (Bug#46375)

- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. ([Bug#46311](#))
- MySQL Connector/.NET sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. ([Bug#46308](#))
- When using MySQL Connector/.NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException' System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column. Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

#### (Bug#46270)

- The MySQL Connector/.NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message "Parameter 'foo' not found in the collection." and the following stack trace:

```

MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(string
parameterName = "pStart", bool throwOnNotFound = true) Line 459C#
MySql.Data.dll!MySql.Data.MySqlClient.StoredProcedure.Resolve() Line 157 + 0x25
bytesC#

System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) +
0x5f bytes

```

#### (Bug#46213)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. ([Bug#46205](#), [Bug#46359](#), [Bug#41953](#))
- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
SystemArgumentException: DataGridViewComboBoxCell value is not valid.
To replace this default dialog please handle the DataError Event.
```

#### (Bug#46100)

- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

This resulted in the data being unsorted. ([Bug#45723](#))

- The MySQL Connector/NET 6.0.4 installer failed with an error. The error message generated was:

```
There is a problem with this Windows Installer package. A DLL required for this
install to complete could not be run. Contact your support personnel or package vendor.
```

When OK was clicked to acknowledge the error the installer exited. ([Bug#45474](#))

- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

([Bug#45457](#))

- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
The value given is not an instance of type 'Edm.Int32'
```

([Bug#45077](#))

- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. ([Bug#44455](#))
- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/NET, an `IndexOutOfRangeException` exception was generated on trying to open the connection. ([Bug#43736](#))
- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. ([Bug#43678](#))
- An error occurred when building MySQL Connector/NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

When an attempt was made to build (for example) the MySQL Connector/NET 5.2 branch using the command:

```
$ nant -buildfile:Client.build
```

The following error occurred:

```
BUILD FAILED
Error loading buildfile.
Encoding name 'Windows-1252' not supported.
Parameter name: name
```

([Bug#42411](#))

- MySQL Connector/NET CHM documentation stated that MySQL Server 3.23 was supported. ([Bug#42110](#))
- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. ([Bug#40684](#))

- Calling a Stored Procedure with an output parameter through MySQL Connector/NET resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. ([Bug#36027](#))

#### C.4.3.6. Changes in MySQL Connector/NET 6.1.0 (15 July 2009 alpha)

This is the first Alpha release of 6.1.

Functionality added or changed:

- Changed GUID type - The backend representation of a guid type has been changed to be CHAR(36). This is so you can use the server UUID() function to populate a GUID table. UUID generates a 36 character string. Developers of older applications can add `old_guids=true` to the connection string and the old BINARY(16) type will be used instead.
- Support for native output parameters - This is supported when connected to a server that supports native output parameters. This includes servers as of 5.5.3 and 6.0.8.
- Session State Provider - This enables you to store the state of your website in a MySQL server.
- Website Configuration Dialog - This is a new wizard that is activated by clicking a button on the toolbar at the top of the Visual Studio Solution Explorer. It works in conjunction with the ASP.NET administration pages, making it easier to activate and set advanced options for the different MySQL web providers included.

## C.4.4. Changes in MySQL Connector/.NET Version 6.0.x

### C.4.4.1. Changes in MySQL Connector/.NET 6.0.7 (30 August 2010)

Fixes bugs since 6.0.6.

Bugs fixed:

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.
--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMyValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMyValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

([Bug#55644](#))

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. ([Bug#54895](#))
- Several calls to `datadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. ([Bug#54863](#))
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. ([Bug#54570](#))
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpter.Update` either generated an exception or failed to batch the commands, executing each insert individually. ([Bug#54386](#))
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. ([Bug#54152](#), [Bug#53865](#))
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

([Bug#53457](#))

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
```

```

```

([Bug#53357](#))

- Membership schema creation failed if the default schema collation was not Latin1. ([Bug#53174](#))
- EventLog was not disposed in the SessionState provider. ([Bug#52550](#))
- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. ([Bug#50671](#))
- When an application was subjected to increased concurrent load, MySQL Connector/.NET generated the following error when calling stored procedures:

```
A DataTable named '\Procedure Parameters\'
already belongs to this DataSet.
```

([Bug#49118](#))

- The `INSERT` command was significantly slower with MySQL Connector/.NET 6.x compared to 5.x, when compression was enabled. ([Bug#48243](#))
- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. ([Bug#47153](#))
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. ([Bug#44715](#))
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

MySQL Connector/.NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. ([Bug#38411](#))

- Database name was emitted into typed datasets. This prevented users using the configured default database. ([Bug#33870](#))

#### C.4.4.2. Changes in MySQL Connector/.NET 6.0.6 (28 April 2010)

Fixes bugs since 6.0.5.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.  
MySQL Connector/.NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. ([Bug#52562](#))
- MySQL Connector/.NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. ([Bug#47467](#))

Bugs fixed:

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and

the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

([Bug#55170](#))

- In MySQL Connector/NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. ([Bug#52769](#))
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. ([Bug#52187](#))
- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

This meant that, for example, the Euro sign was not handled correctly.

The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. ([Bug#51927](#))

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. ([Bug#51788](#))
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.
Parameter name: length
```

([Bug#51610](#))

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. ([Bug#51149](#))
- `MySqlCommand.Parameters.Clear()` did not work. ([Bug#50444](#))
- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

([Bug#50344](#))

- Binary Columns were not displayed in the Query Builder of Visual Studio. ([Bug#50171](#))
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. ([Bug#50123](#))
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. ([Bug#49850](#))
- `MySqlDataReader.GetInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. ([Bug#49794](#))
- A `FormatException` was generated when an empty string was returned from a stored function. ([Bug#49642](#))
- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED\_TABLE\_CATALOG' column not being included in the foreign keys collection. ([Bug#48974](#))

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an

editor gave an access denied error. ([Bug#48944](#))

- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. ([Bug#48171](#))
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
 MySql.Data.MySqlClient.MySqlException was unhandled
 Message="You have an error in your SQL syntax; check the manual that corresponds to your
 MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
 Source="MySql.Data"
 ErrorCode=-2147467259
 Number=1064
 StackTrace:
 à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
 à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
 lastInsertId)
 à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
 à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
 à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
 à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
 à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
 à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. ([Bug#46429](#))

- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. ([Bug#45277](#))
- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. ([Bug#41629](#))

#### C.4.4.3. Changes in MySQL Connector/NET 6.0.5 (12 November 2009)

This is a new release, fixing recently discovered bugs.

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
 MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

MySQL Connector/NET was changed so that it was possible to do:

```
 MySqlCommand clone = comm.Clone();
```

([Bug#48460](#))

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named "b`a`d" as follows:

```
 DataTable schemaPrimaryKeys = connection.GetSchema(
 "Indexes",
 new string[] { null, schemaName, "b`a`d" });
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d' at line 1
```

([Bug#48101](#))

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

MySQL Connector/NET was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. ([Bug#48100](#))

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BI-`

`GINT` was displayed as `BIGINT`. ([Bug#47872](#))

- When loading the `MySQLClient-mono.sln` file included with the Connector/NET source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySQL.Data.Provider/Source/Connection.cs(280,46):
error CS0115: ` MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

([Bug#47048](#))

- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

This was due to the fact that the encoding field had not been initialized correctly. ([Bug#46844](#))

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. ([Bug#46620](#))
- The MySQL Connector/NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
Server Error in '/mono' Application

The requested feature is not implemented.
Description: HTTP 500. Error processing request.

Stack Trace:
System.NotImplementedException: The requested feature is not implemented.
at MySql.Data.MySqlClient.MySqlConnection.EnlistTransaction
(System.Transactions.Transaction transaction) [0x00000]

(System.Configuration.SettingsContext context,
System.Configuration.SettingsPropertyValueCollection collection) [0x00000]

Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433
```

([Bug#46375](#))

- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. ([Bug#46311](#))
- MySQL Connector/NET sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. ([Bug#46308](#))
- When using MySQL Connector/NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException' System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column. Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

([Bug#46270](#))

- The MySQL Connector/NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message "Parameter 'foo' not found in the collection." and the following stack trace:

```

 MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(string parameterName = "pStart", bool throwOnNotFound = true) Line 459C#
 MySql.Data.dll!MySql.Data.MySqlClient.StoredProcedure.Resolve() Line 157 + 0x25 bytesC#
 MySql.Data.dll!MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(System.Data.CommandBehavior behavior = SequentialAccess) Line 405 + 0xb bytesC#

 System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet, int startRecord, int maxRecords, string srcTable, System.Data.IDbCommand command, System.Data.CommandBehavior behavior) + 0x120 bytes
 System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) + 0x5f bytes

```

#### (Bug#46213)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. ([Bug#46205](#), [Bug#46359](#), [Bug#41953](#))
- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```

System.ArgumentException: DataGridViewComboBoxCell value is not valid.
To replace this default dialog please handle the DataError Event.

```

#### (Bug#46100)

- In MySQL Connector/NET 6.0.4 using `GetProcData` generated an error because the `parameters` data table was only created if MySQL Server was at least version 6.0.6, or if the `UseProcedureBodies` connection string option was set to true. Also the `DeriveParameters` command generated a null reference exception. This was because the `parameters` data table, which was null, was used in a `for each` loop. ([Bug#45952](#))
- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```

TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();

```

This resulted in the data being unsorted. ([Bug#45723](#))

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. ([Bug#45699](#))
- Adding the `Allow Batch=False` option to the connection string caused MySQL Connector/NET to generate the error:

```

You have an error in your SQL syntax; check the manual that corresponds to your MySQL
server version for the right syntax to use near 'SET character_set_results=NULL' at line 1

```

#### (Bug#45502)

- The MySQL Connector/NET 6.0.4 installer failed with an error. The error message generated was:

```

There is a problem with this Windows Installer package. A DLL required for this
install to complete could not be run. Contact your support personnel or package vendor.

```

When OK was clicked to acknowledge the error the installer exited. ([Bug#45474](#))

- A MySQL Connector/NET test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

This was due to a bug in Mono. MySQL Connector/NET was modified to avoid using `WeakReferences` in the `Com-`

`pressed` stream class, which was causing the crash. ([Bug#45463](#))

- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

([Bug#45457](#))

- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
The value given is not an instance of type 'Edm.Int32'
```

([Bug#45077](#))

- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. ([Bug#44985](#))
- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. ([Bug#44455](#))
- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector.NET, an `IndexOutOfRangeException` exception was generated on trying to open the connection. ([Bug#43736](#))
- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector.NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. ([Bug#43678](#))
- An error occurred when building MySQL Connector.NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

When an attempt was made to build (for example) the MySQL Connector.NET 5.2 branch using the command:

```
$ nant -buildfile:Client.build
```

The following error occurred:

```
BUILD FAILED
Error loading buildfile.
Encoding name 'Windows-1252' not supported.
Parameter name: name
```

([Bug#42411](#))

- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework\MySQL.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

The error generated was:

```
Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
has no constructors defined MysqlTest
Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
likely culprit is 'COMPILE'.
```

([Bug#42261](#))

- MySQL Connector.NET CHM documentation stated that MySQL Server 3.23 was supported. ([Bug#42110](#))
- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. ([Bug#40684](#))

- MySQL Connector.NET generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
 bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
 bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
 bei System.Threading.ExecutionContext.runTryCode(Object userData)
 bei System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
```

```

 code, CleanupCode backoutCode, Object userData)
bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
ContextCallback callback, Object state)
bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
ContextCallback callback, Object state)
bei System.Threading._TimerCallback.PerformTimerCallback(Object state)

```

([Bug#40005](#))

- Calling a Stored Procedure with an output parameter through MySQL Connector/.NET resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. ([Bug#36027](#))
- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

```
Connection must be valid and open
```

([Bug#34657](#))

#### C.4.4.4. Changes in MySQL Connector/.NET 6.0.4 (16 June 2009)

This is the first post-GA release, fixing recently discovered bugs.

Bugs fixed:

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/.NET displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

For example, if, when establishing a database connection using TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

```
Only one usage of each socket address (protocol/network address/port) is normally
permitted IP ADDRESS/PORT.
```

However, MySQL Connector/.NET masked this socket exception and displayed an exception with the following text:

```
Unable to connect to any of the specified MySQL hosts.
```

([Bug#45021](#))

- A SQL query string containing an escaped backslash caused an exception to be generated:

```

Index and length must refer to a location within the string.
Parameter name: length
at System.String.InternalSubStringWithChecks(Int32 startIndex, Int32 length, Boolean
fAlwaysCopy)
at MySql.Data.MySqlClient.MySqlTokenizer.NextParameter()
at MySql.Data.MySqlClient.Statement.InternalBindParameters(String sql,
MySqlParameterCollection parameters, MySqlPacket packet)
at MySql.Data.MySqlClient.Statement.BindParameters()
at MySql.Data.MySqlClient.PreparableStatement.Execute()
at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()

```

([Bug#44960](#))

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/.NET from source. ([Bug#44822](#))
- The Data Set editor generated an error when attempts were made to modify insert, update or delete commands:

```
Error in WHERE clause near '@'.
Unable to parse query text.
```

([Bug#44512](#))

- The DataReader in MySQL Connector/.NET 6.0.3 considered a BINARY(16) field as a GUID with a length of 16. ([Bug#44507](#))

- When creating a new DataSet the following error was generated:

```
Failed to open a connection to database.
Cannot load type with name 'MySQL.Data.VisualStudio.StoredProcedureColumnEnumerator'
```

(Bug#44460)

- The MySQL Connector/NET MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug#44414)
- MySQL Connector/NET was missing the capability to validate the server's certificate when using encryption. This made it possible to conduct a man-in-the-middle attack against the connection, which defeated the security provided by SSL. (Bug#38700)

#### C.4.4.5. Changes in MySQL Connector/NET 6.0.3 (28 April 2009)

First GA release.

Functionality added or changed:

- The `MySqlTokenizer` failed to split fieldnames from values if they were not separated by a space. This also happened if the string contained certain characters. As a result `MySqlCommand.ExecuteNonQuery` raised an index out of range exception.

The resulting errors are illustrated by the following examples. Note, the example statements do not have delimiting spaces around the `=` operator.

```
INSERT INTO anytable SET Text='test--test';
```

The tokenizer incorrectly interpreted the value as containing a comment.

```
UPDATE anytable SET Project='123-456',Text='Can you explain this ?',Duration=15 WHERE
ID=4711;'
```

A `MySQLException` was generated, as the `?` in the value was interpreted by the tokenizer as a parameter sign. The error message generated was:

```
Fatal error encountered during command execution.
EXCEPTION: MySqlException - Parameter '?' must be defined.
```

(Bug#44318)

Bugs fixed:

- `MySQL.Data` was not displayed as a Reference inside Microsoft Visual Studio 2008 Professional.

When a new C# project was created in Microsoft Visual Studio 2008 Professional, `MySQL.Data` was not displayed when REFERENCES, ADD REFERENCE was selected. (Bug#44141)

- Column types for `SchemaProvider` and `ISSchemaProvider` did not match.

When the source code in `SchemaProvider.cs` and `ISSchemaProvider.cs` were compared it was apparent that they were not using the same column types. The base provider used SQL such as `SHOW CREATE TABLE`, while `ISSchemaProvider` used the schema information tables. Column types used by the base class were `INT64` and the column types used by `ISSchemaProvider` were `UNSIGNED`. (Bug#44123)

#### C.4.4.6. Changes in MySQL Connector/NET 6.0.2 (07 April 2009 beta)

This is a new development release, fixing recently discovered bugs.

Bugs fixed:

- MySQL Connector/NET 6.0.1 did not load in Microsoft Visual Studio 2008 and Visual Studio 2005 Pro.

The following error message was generated:

```
.NET Framework Data Provider for MySQL: The data provider object factory service was not
found.
```

(Bug#44064)

#### C.4.4.7. Changes in MySQL Connector/NET 6.0.1 (02 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An insert and update error was generated by the decimal data type in the Entity Framework, when a German collation was used. ([Bug#43574](#))
- Generating an Entity Data Model (EDM) schema with a table containing columns with data types `MEDIUMTEXT` and `LONGTEXT` generated a runtime error message “Max value too long or too short for Int32”. ([Bug#43480](#))

#### C.4.4.8. Changes in MySQL Connector/NET 6.0.0 (02 March 2009 alpha)

This is a new Alpha development release.

Bugs fixed:

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. ([Bug#42801](#))

### C.4.5. Changes in MySQL Connector/NET Version 5.3.x

#### C.4.5.1. Changes in MySQL Connector/NET 5.3.0 (Not yet released)

Bugs fixed:

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema="true"`. ([Bug#39072](#))
- The MySQL Connector/NET installer program ended prematurely without reporting the specific error. ([Bug#39019](#))
- When called with an incorrect password the `MembershipProvider.GetPassword()` method threw a `MySQLException` instead of a `MembershipPasswordException`. ([Bug#38939](#))
- Possible overflow in `MySqlPacket.ReadLong()`. ([Bug#36997](#))
- The `TokenizeSql` method was adding query overhead and causing high CPU utilization for larger queries. ([Bug#36836](#))

### C.4.6. Changes in MySQL Connector/NET Version 5.2.x

#### C.4.6.1. Changes in MySQL Connector/NET 5.2.8 (Not yet released)

Bugs fixed:

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named "b`a`d" as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
 "Indexes",
 new string[] { null, schemaName, "b`a`d" });
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

([Bug#48101](#))

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. ([Bug#47153](#))
- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. ([Bug#46620](#))
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
MySql.Data.MySqlClient.MySqlException was unhandled
Message="You have an error in your SQL syntax; check the manual that corresponds to your
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
Source=" MySql.Data"
ErrorCodes=-2147467259
Number=1064
StackTrace:
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
lastInsertId)
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. ([Bug#46429](#))

- The MySQL Connector/.NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
Server Error in '/mono' Application

The requested feature is not implemented.
Description: HTTP 500. Error processing request.

Stack Trace:

System.NotImplementedException: The requested feature is not implemented.

```

([Bug#46375](#))

- When using MySQL Connector/.NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException' System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column. Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

([Bug#46270](#))

- The MySQL Connector/.NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter ‘foo’ not found in the collection.” and the following stack trace:

```
MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(string
parameterName = "pStart", bool throwOnNotFound = true) Line 459C#
MySql.Data.dll!MySql.Data.MySqlClient.StoredProcedure.Resolve() Line 157 + 0x25
```

([Bug#46213](#))

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. ([Bug#46205](#), [Bug#46359](#), [Bug#41953](#))
- If the application slept for longer than the specified `net_write_timeout`, and then resumed `Read` operations on a connection, then the application failed silently. ([Bug#45978](#))
- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/.NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. ([Bug#43678](#))
- An error occurred when building MySQL Connector/.NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

When an attempt was made to build (for example) the MySQL Connector/.NET 5.2 branch using the command:

```
$ nant -buildfile:Client.build
```

The following error occurred:

```

BUILD FAILED

Error loading buildfile.
Encoding name 'Windows-1252' not supported.
Parameter name: name

```

([Bug#42411](#))

- MySQL Connector/.NET CHM documentation stated that MySQL Server 3.23 was supported. ([Bug#42110](#))
- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

```
Connection must be valid and open
```

([Bug#34657](#))

## C.4.6.2. Changes in MySQL Connector/.NET 5.2.7 (15 July 2009)

Bugs fixed:

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. ([Bug#45699](#))
- A MySQL Connector/.NET test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

This was due to a bug in Mono. MySQL Connector/.NET was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. ([Bug#45463](#))

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/.NET dis-

played an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

For example, if, when establishing a database connection using TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

```
Only one usage of each socket address (protocol/network address/port) is normally
permitted IP ADDRESS/PORT.
```

However, MySQL Connector/.NET masked this socket exception and displayed an exception with the following text:

```
Unable to connect to any of the specified MySQL hosts.
```

([Bug#45021](#))

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/.NET from source. ([Bug#44822](#))
- The MySQL Connector/.NET MySQLRoleProvider reported that there were no roles, even when roles existed. ([Bug#44414](#))
- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework\MySql.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

The error generated was:

```
Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
has no constructors defined MysqlTest
Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
likely culprit is 'COMPILE'.
```

([Bug#42261](#))

- MySQL Connector/.NET generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
bei System.Threading.ExecutionContext.runTryCode(Object userData)
bei System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
code, CleanupCode backoutCode, Object userData)
bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
ContextCallback callback, Object state)
bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
ContextCallback callback, Object state)
bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

([Bug#40005](#))

- When a TableAdapter was created on a DataSet, it was not possible to use a stored procedure with variables. The following error was generated:

```
The method or operation is not implemented
```

([Bug#39409](#))

#### C.4.6.3. Changes in MySQL Connector/.NET 5.2.6 (28 April 2009)

Functionality added or changed:

- A new connection string option has been added: `use affected rows`. When `true` the connection will report changed rows instead of found rows. ([Bug#44194](#))

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to

`GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. ([Bug#43991](#))

- `GetSchema( "MetaDataCollections" )` should have returned a table with a column named “`NumberOfRestrictions`” not “`NumberOfRestriction`”.

This can be confirmed by referencing the [Microsoft Documentation](#). ([Bug#43990](#))

- Requests sent to the MySQL Connector/.NET role provider to remove a user from a role failed. The query log showed the query was correctly executed within a transaction which was immediately rolled back. The rollback was caused by a missing call to the `Complete` method of the transaction. ([Bug#43553](#))
- When using `MySqlBulkLoader.Load()`, the text file is opened by `NativeDriver.SendFileToServer`. If it encountered a problem opening the file as a stream, an exception was generated and caught. An attempt to clean up resources was then made in the `finally{}` clause by calling `fs.Close()`, but since the stream was never successfully opened, this was an attempt to execute a method of a null reference. ([Bug#43332](#))
- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. ([Bug#42801](#))
- `MySQLMembershipProvider.ValidateUser` only used the `userId` to validate. However, it should also use the `applicationId` to perform the validation correctly.

The generated query was, for example:

```
SELECT Password, PasswordKey, PasswordFormat, IsApproved, Islockedout
FROM my_aspnet_Membership WHERE userId=13
```

Note that `applicationId` is not used. ([Bug#42574](#))

- There was an error in the `ProfileProvider` class in the `private ProfileInfoCollection GetProfiles()` function. The column of the final table was named “`lastUpdatdDate`” ('e' is missing) instead of the correct “`lastUpdatedDate`”. ([Bug#41654](#))
- The `GetGuid()` method of `MySqlDataReader` did not treat `BINARY(16)` column data as a GUID. When operating on such a column a `FormatException` exception was generated. ([Bug#41452](#))
- When ASP.NET membership was configured to not require password question and answer using `requiresQuestionAndAnswer="false"`, a `SqlNullValueException` was generated when using `MembershipUser.ResetPassword()` to reset the user password. ([Bug#41408](#))
- If a `Stored Procedure` contained spaces in its parameter list, and was then called from MySQL Connector/.NET, an exception was generated. However, the same `Stored Procedure` called from the MySQL Query Analyzer or the MySQL Client worked correctly.

The exception generated was:

```
Parameter '0' not found in the collection.
```

([Bug#41034](#))

- The `DATETIME` format contained an erroneous space. ([Bug#41021](#))
- When `MySql.Web.Profile.MySQLProfileProvider` was configured, it was not possible to assign a name other than the default name `MySQLProfileProvider`.

If the name `SCC_MySQLProfileProvider` was assigned, an exception was generated when attempting to use `Page.Context.Profile['custom prop']`.

The exception generated was:

```
The profile default provider was not found.
```

Note that the exception stated: ‘the profile **default provider**...’, even though a different name was explicitly requested. ([Bug#40871](#))

- When `ExecuteNonQuery` was called with a command type of `Stored Procedure` it worked for one user but resulted in

a hang for another user with the same database permissions.

However, if `CALL` was used in the command text and `ExecuteNonQuery` was used with a command type of `Text`, the call worked for both users. ([Bug#40139](#))

#### C.4.6.4. Changes in MySQL Connector/NET 5.2.5 (19 November 2008)

Bugs fixed:

- Visual Studio 2008 displayed the following error three times on start-up:

```
"Package Load Failure

Package 'MySql.Data.VisualStudio.MySqlDataProviderPackage, MySql.VisualStudio,
Version=5.2.4, Culture=neutral, PublicKeyToken=null' has failed to load properly (GUID =
{79A115C9-B133-4891-9E7B-242509DAD272}). Please contact the package vendor for
assistance. Application restart is recommended, due to possible environment corruption.
Would you like to disable loading the package in the future? You may use
'devenve/resetskipkpgs' to re-enable package loading."
```

([Bug#40726](#))

#### C.4.6.5. Changes in MySQL Connector/NET 5.2.4 (13 November 2008)

Bugs fixed:

- `MySqlDataReader` did not feature a `GetSByte` method. ([Bug#40571](#))
- When working with stored procedures MySQL Connector/NET generated an exception `Unknown "table parameters" in information_schema.` ([Bug#40382](#))
- `GetDefaultCollation` and `GetMaxLength` were not thread safe. These functions called the database to get a set of parameters and cached them in two static dictionaries in the function `InitCollections`. However, if many threads called them they would try to insert the same keys in the collections resulting in duplicate key exceptions. ([Bug#40231](#))
- If connection pooling was not set explicitly in the connection string, MySQL Connector/NET added “;Pooling=False” to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted “Pooling=True” to “pooling=True”.

If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated “;Pooling=False” to the end of the connection string. The resulting connection string was thus terminated with “pooling=True;Pooling=False”. This disabled connection pooling completely. ([Bug#40091](#))

- The connection string option `Functions Return String` did not set the correct encoding for the result string. Even though the connection string option `Functions Return String=true;` is set, the result of `SELECT DES_DECRYPT()` contained “??” instead of the correct national character symbols. ([Bug#40076](#))
- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. ([Bug#39817](#))
- After the `ConnectionString` property was initialized using the public setter of `DbConnectionStringBuilder`, the `GetConnectionString` method of `MySqlConnectionStringBuilder` incorrectly returned `null` when `true` was assigned to the `includePass` parameter. ([Bug#39728](#))
- When using `ProfileProvider`, attempting to update a previously saved property failed. ([Bug#39330](#))
- Reading a negative time value greater than -01:00:00 returned the absolute value of the original time value. ([Bug#39294](#))
- Inserting a negative time value (negative `TimeSpan`) into a `Time` column through the use of `MySqlParameter` caused `MySqlException` to be thrown. ([Bug#39275](#))
- When a data connection was created in the server explorer of Visual Studio 2008 Team, an error was generated when trying to expand stored procedures that had parameters.

Also, if `TABLEADAPTER` was right-clicked and then Add, Query, Use Existing Stored Procedures selected, if you then

attempted to select a stored procedure, the window would close and no error message would be displayed. ([Bug#39252](#))

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerates-schema="true"`. ([Bug#39072](#))
- MySQL Connector/.NET called hashed password methods not supported in Mono 2.0 Preview 2. ([Bug#38895](#))

#### C.4.6.6. Changes in MySQL Connector/.NET 5.2.3 (19 August 2008)

Functionality added or changed:

- Error string was returned after a 28000 second `wait_timeout`. This has been changed to generate a `Connection-State.Closed` event. ([Bug#38119](#))
- Changed how the procedure schema collection is retrieved. If the connection string contains “`use procedure bodies=true`” then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains “`use procedure bodies=false`”, then the Information Schema collection is queried. ([Bug#36694](#))
- Changed how the procedure schema collection is retrieved. If `use procedure bodies=true` then the `mysql.proc` table is selected directly as this is up to 50 times faster than the current `information_schema` implementation. If `use procedure bodies=false`, then the `information_schema` collection is queried. ([Bug#36694](#))
- String escaping functionality has been moved from the `MySqlString` class to the `MySqlHelper` class, where it can be accessed by the `EscapeString` method. ([Bug#36205](#))

Bugs fixed:

- The `GetOrdinal()` method failed to return the ordinal if the column name string contained an accent. ([Bug#38721](#))
- MySQL Connector/.NET uninstaller did not clean up all installed files. ([Bug#38534](#))
- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. ([Bug#38276](#))
- The provider did not silently create the user if the user did not exist. ([Bug#38243](#))
- Executing a command that resulted in a fatal exception did not close the connection. ([Bug#37991](#))
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. ([Bug#37968](#))
- In a .NET application MySQL Connector/.NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

([Bug#37955](#))

- Unnecessary network traffic was generated for the normal case where the web provider schema was up to date. ([Bug#37469](#))
- `MySqlReader.GetOrdinal()` performance enhancements break existing functionality. ([Bug#37239](#))
- The `autogenerateschema` option produced tables with incorrect collations. ([Bug#36444](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))

- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types ([ENUM](#)) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. ([Bug#30603](#))

#### C.4.6.7. Changes in MySQL Connector/NET 5.2.2 (12 May 2008)

Bugs fixed:

- Product documentation incorrectly stated "?" is the preferred parameter marker. ([Bug#37349](#))
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned [NULL](#). ([Bug#36313](#))
- Tables with [GEOMETRY](#) field types would return an unknown data type exception. ([Bug#36081](#))
- When using the [MySQLProfileProvider](#), setting profile details and then reading back saved data would result in the default values being returned instead of the updated values. ([Bug#36000](#))
- When creating a connection, setting the [ConnectionString](#) property of [MySqlConnection](#) to [NULL](#) would throw an exception. ([Bug#35619](#))
- The [DbCommandBuilder.QuoteIdentifier](#) method was not implemented. ([Bug#35492](#))
- When using encrypted passwords, the [GetPassword\(\)](#) function would return the wrong string. ([Bug#35336](#))
- An error would be raised when calling [GetPassword\(\)](#) with a [NULL](#) value. ([Bug#35332](#))
- When retrieving data where a field has been identified as containing a GUID value, the incorrect value would be returned when a previous row contained a [NULL](#) value for that field. ([Bug#35041](#))
- Using the [TableAdapter Wizard](#) would fail when generating commands that used stored procedures due to the change in supported parameter characters. ([Bug#34941](#))
- When creating a new stored procedures, the new parameter code which permits the use of the @ symbol would interfere with the specification of a [DEFINER](#). ([Bug#34940](#))
- When using [SqlDataSource](#) to open a connection, the connection would not automatically be closed when access had completed. ([Bug#34460](#))
- There was a high level of contention in the connection pooling code that could lead to delays when opening connections and submitting queries. The connection pooling code has been modified to try and limit the effects of the contention issue. ([Bug#34001](#))
- Using the [TableAdaptor](#) wizard in combination with a suitable [SELECT](#) statement, only the associated [INSERT](#) statement would also be created, rather than the required [DELETE](#) and [UPDATE](#) statements. ([Bug#31338](#))
- Fixed problem in datagrid code related to creating a new table. This problem may have been introduced with .NET 2.0 SP1.
- Fixed profile provider that would throw an exception if you were updating a profile that already existed.

#### C.4.6.8. Changes in MySQL Connector/NET 5.2.1 (27 February 2008)

Bugs fixed:

- When using the provider to generate or update users and passwords, the password checking algorithm would not validate the password strength or requirements correctly. ([Bug#34792](#))
- When executing statements that used stored procedures and functions, the new parameter code could fail to identify the correct parameter format. ([Bug#34699](#))
- The installer would fail to the DDEX provider binary if the Visual Studio 2005 component was not selected. The result would lead to MySQL Connector/NET not loading properly when using the interface to a MySQL server within Visual Studio. ([Bug#34674](#))

- A number issues were identified in the case, connection and schema areas of the code for `MembershipProvider`, `RoleProvider`, `ProfileProvider`. ([Bug#34495](#))
- When using web providers, the MySQL Connector/.NET would check the schema and cache the application id, even when the connection string had been set. The effect would be to break the membership provider list. ([Bug#34451](#))
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. ([Bug#34448](#))
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. ([Bug#34359](#))
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. ([Bug#34338](#))
- Fixed problem with Visual Studio 2008 integration that caused pop-up menus on server explorer nodes to not function
- The provider code has been updated to fix a number of outstanding issues.

#### C.4.6.9. Changes in MySQL Connector/.NET 5.2.0 (11 February 2008)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. ([Bug#34052](#))
- Added support for `DbDataAdapter UpdateBatchSize`. Batching is fully supported including collapsing inserts down into the multi-value form if possible.
- DDEX provider now works under Visual Studio 2008 beta 2.
- Added ClearPool and ClearAllPools features.

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. ([Bug#34220](#))
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. MySQL Connector/.NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. ([Bug#34204](#))
- The status of connections reported through the state change handler was not being updated correctly. ([Bug#34082](#))
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. ([Bug#34000](#))
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. ([Bug#33909](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- Using compression in the MySQL connection with MySQL Connector/.NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted.

[Bug#26344](#)

## C.4.7. Changes in MySQL Connector/NET Version 5.1.x

### C.4.7.1. Changes in MySQL Connector/NET 5.1.8 (Not yet released)

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted. In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. ([Bug#43991](#))
- The `DATETIME` format contained an erroneous space. ([Bug#41021](#))
- If connection pooling was not set explicitly in the connection string, MySQL Connector/NET added “;Pooling=False” to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted “Pooling=True” to “pooling=True”.

If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated “;Pooling=False” to the end of the connection string. The resulting connection string was thus terminated with “pooling=True;Pooling=False”. This disabled connection pooling completely. ([Bug#40091](#))

- MySQL Connector/NET generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
bei System.Threading.ExecutionContext.runTryCode(Object userData)
bei System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
code, CleanupCode backoutCode, Object userData)
bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
ContextCallback callback, Object state)
bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
ContextCallback callback, Object state)
bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

([Bug#40005](#))

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. ([Bug#39817](#))
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. ([Bug#37968](#))
- Calling `MySqlDataAdapter.FillSchema` on a `SELECT` statement that referred to a table that did not exist left the connection in a bad state. After this call, all `SELECT` statements returned an empty result set. If the `SELECT` statement referred to a table that did exist then everything worked as expected. ([Bug#30518](#))

### C.4.7.2. Changes in MySQL Connector/NET 5.1.7 (21 August 2008)

Bugs fixed:

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. ([Bug#38276](#))
- Executing a command that resulted in a fatal exception did not close the connection. ([Bug#37991](#))
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

([Bug#37955](#))

- As `MySqlDbType.DateTime` is not available in `VB.NET` the warning `THE DATETIME ENUM VALUE IS OBSOLETE` was always shown during compilation. ([Bug#37406](#))
- An unknown `MySqlErrorCode` was encountered when opening a connection with an incorrect password. ([Bug#37398](#))
- Documentation incorrectly stated that “the `DataTable` class in .NET 1.0 and 1.1 does not permit columns with type of `UInt16`, `UInt32`, or `UInt64` to be autoincrement columns”. ([Bug#37350](#))
- `SemaphoreFullException` is generated when application is closed. ([Bug#36688](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. ([Bug#30603](#))

#### C.4.7.3. Changes in MySQL Connector/.NET 5.1.6 (12 May 2008)

Bugs fixed:

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. ([Bug#36432](#))
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. ([Bug#36313](#))
- The `MembershipProvider` will raise an exception when the connection string is configured with `enablePasswordRetrieval = true` and `RequireQuestionAndAnswer = false`. ([Bug#36159](#))
- When calling `GetNumberOfUsersOnline` an exception is raised on the submitted query due to a missing parameter. ([Bug#36157](#))
- Tables with `GEOMETRY` field types would return an unknown data type exception. ([Bug#36081](#))
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. ([Bug#35619](#))
- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. ([Bug#34460](#))
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. ([Bug#34448](#))
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. ([Bug#34359](#))
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. ([Bug#34338](#))
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. ([Bug#31338](#))

#### C.4.7.4. Changes in MySQL Connector/NET 5.1.5 (Not yet released)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. ([Bug#34052](#))

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. ([Bug#34220](#))
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. MySQL Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. ([Bug#34204](#))
- The status of connections reported through the state change handler was not being updated correctly. ([Bug#34082](#))
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. ([Bug#34000](#))
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. ([Bug#33909](#))
- MySQL Connector/NET would fail to compile properly with `nant`. ([Bug#33508](#))
- Problem with membership provider would mean that `FindUserByEmail` would fail with a `MySqlException` because it was trying to add a second parameter with the same name as the first. ([Bug#33347](#))
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))

#### C.4.7.5. Changes in MySQL Connector/NET 5.1.4 (20 November 2007)

Bugs fixed:

- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with noninput direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. ([Bug#32010](#))
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. ([Bug#31930](#))
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. ([Bug#31731](#))
- MySQL Connector/NET would incorrectly report success when enlisting in a distributed transaction, although distributed transactions are not supported. ([Bug#31703](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Trying to use a connection that was not open could return an ambiguous and misleading error message. ([Bug#31262](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/.NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- Column types with only 1-bit (such as `BOOLEAN` and `TINYINT(1)`) were not returned as boolean fields. ([Bug#27959](#))
- When accessing certain statements, the command would timeout before the command completed. Because this cannot always be controlled through the individual command timeout options, a `default command timeout` has been added to the connection string options. ([Bug#27958](#))
- The server error code was not updated in the `Data[ ]` hash, which prevented `DbProviderFactory` users from accessing the server error code. ([Bug#27436](#))
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. ([Bug#26344](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

#### C.4.7.6. Changes in MySQL Connector/.NET 5.1.3 (21 September 2007 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. ([Bug#30077](#))
- The Saudi Hijri calendar was not supported. ([Bug#29931](#))
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. ([Bug#29526](#))
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. ([Bug#29476](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server became available while the application was still running. ([Bug#29409](#))
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. ([Bug#29312](#))
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. ([Bug#29236](#))
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. ([Bug#29235](#))
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. ([Bug#29124](#))
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. ([Bug#29123](#))
- *Visual Studio Plugin:* Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. ([Bug#29098](#))
- Using `TransactionScope` would cause an `InvalidOperationException`. ([Bug#28709](#))

#### C.4.7.7. Changes in MySQL Connector/.NET 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Log messages would be truncated to 300 bytes. ([Bug#28706](#))
- Creating a user would fail due to the application name being set incorrectly. ([Bug#28648](#))
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. ([Bug#28536](#))
- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. ([Bug#28437](#))
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. ([Bug#28204](#))
- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. ([Bug#26347](#))

#### C.4.7.8. Changes in MySQL Connector/.NET 5.1.1 (23 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. ([Bug#28448](#))
- Installation of the MySQL Connector/.NET on Windows would fail if VisualStudio had not already been installed. ([Bug#28260](#))
- MySQL Connector/.NET would look for the wrong table when executing `User.IsRole()`. ([Bug#28251](#))
- Building a connection string within a tight loop would show slow performance. ([Bug#28167](#))
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. ([Bug#27679](#))
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. ([Bug#27668](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))
- Fixed password property on `MySqlConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

#### C.4.7.9. Changes in MySQL Connector/.NET 5.1.0 (01 May 2007)

Functionality added or changed:

- Now compiles for .NET CF 2.0.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- GetSchema will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Added Membership and Role provider contributed by Sean Wright (thanks!).

### C.4.8. Changes in MySQL Connector/.NET Version 5.0.x

#### C.4.8.1. Changes in MySQL Connector/.NET 5.0.10 (Not yet released)

Bugs fixed:

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. ([Bug#39817](#))
- Executing a command that resulted in a fatal exception did not close the connection. ([Bug#37991](#))
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data

that should be inserted is corrupted and no error is thrown. ([Bug#37968](#))

- In a .NET application MySQL Connector/.NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

([Bug#37955](#))

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. ([Bug#36432](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))

#### C.4.8.2. Changes in MySQL Connector/.NET 5.0.9 (Not yet released)

Bugs fixed:

- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with noninput direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. ([Bug#32010](#))
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. ([Bug#31930](#))
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. ([Bug#31731](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- The server error code was not updated in the `Data[ ]` hash, which prevented `DbProviderFactory` users from accessing the server error code. ([Bug#27436](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

#### C.4.8.3. Changes in MySQL Connector/.NET 5.0.8 (21 August 2007)

---

**Note**

This version introduces a new installer technology.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. ([Bug#30077](#))
- Fixed bug where MySQL Connector/NET was hand building some date time patterns rather than using the patterns provided under `CultureInfo`. This caused problems with some calendars that do not support the same ranges as Gregorian.. ([Bug#29931](#))
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. ([Bug#29526](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server became available while the application was still running. ([Bug#29409](#))
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. ([Bug#29312](#))
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. ([Bug#29124](#))
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. ([Bug#29123](#))
- Log messages would be truncated to 300 bytes. ([Bug#28706](#))
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. ([Bug#28204](#))
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. `ExecuteReader` had to be changed to check for this.

#### C.4.8.4. Changes in MySQL Connector/NET 5.0.7 (18 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. ([Bug#28448](#))
- Building a connection string within a tight loop would show slow performance. ([Bug#28167](#))
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. ([Bug#27765](#))
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain

the parameter information. ([Bug#27679](#))

- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. ([Bug#27668](#))
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. ([Bug#27289](#))
- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. ([Bug#27269](#))
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. ([Bug#26754](#))
- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. ([Bug#26472](#))
- The `charset` property would not be identified during a connection (also affected Visual Studio Plugin). ([Bug#26147](#), [Bug#27240](#))
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. ([Bug#25947](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))

#### C.4.8.5. Changes in MySQL Connector/NET 5.0.6 (22 March 2007)

Bugs fixed:

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `DESCRIBE ....` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. ([Bug#27221](#))
- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. ([Bug#27187](#))
- `SqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- Exception thrown when using large values in `UInt64` parameters. ([Bug#27093](#))
- MySQL Visual Studio Plugin 1.1.2 does not work with MySQL Connector/NET 5.0.5. ([Bug#26960](#))

#### C.4.8.6. Changes in MySQL Connector/NET 5.0.5 (07 March 2007)

Functionality added or changed:

- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Added `SqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Fixed problem with calling stored functions when a return parameter was not given.
- Added `Use Procedure Bodies` connection string option to enable calling procedures without using procedure metadata.

Bugs fixed:

- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. ([Bug#26660](#))
- MySQL Connector/.NET would fail to install under Windows Vista. ([Bug#26430](#))
- Opening a connection would be slow due to host name lookup. ([Bug#26152](#))
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. ([Bug#25950](#))
- Registry would be incorrectly populated with installation locations. ([Bug#25928](#))
- Times with negative values would be returned incorrectly. ([Bug#25912](#))
- Returned data types of a `DataTypes` collection do not contain the right correct CLR data type. ([Bug#25907](#))
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. ([Bug#25906](#))
- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. ([Bug#25726](#))
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. ([Bug#25651](#))
- When closing and then re-opening a connection to a database, the character set specification is lost. ([Bug#25614](#))
- Filling a table schema through a stored procedure triggers a runtime error. ([Bug#25609](#))
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. ([Bug#25605](#))
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. ([Bug#25603](#))
- The `UpdateRowSource.FirstReturnedRecord` method does not work. ([Bug#25569](#))
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. ([Bug#25458](#))
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. ([Bug#25443](#))
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. ([Bug#24957](#))
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. ([Bug#24802](#))
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. ([Bug#24373](#))
- MySQL Connector/.NET would not compile properly when used with Mono 1.2. ([Bug#24263](#))
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

#### C.4.8.7. Changes in MySQL Connector/.NET 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

#### C.4.8.8. Changes in MySQL Connector/.NET 5.0.3 (05 January 2007)

Functionality added or changed:

- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- The `MySqlCommand` object now supports asynchronous query methods. This is implemented using the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from stored procedures and stored function execution are cached.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.

- The `ViewColumns GetSchema` collection has been updated.
- Improved speed and performance by re-architecting certain sections of the code.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- The SharpZipLib library has been replaced with the deflate support provided within .NET 2.0.
- SSL support has been updated.

Bugs fixed:

- Additional text added to error message ([Bug#25178](#))
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. ([Bug#25033](#))
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))
- Stored procedure executions are not thread safe. ([Bug#23905](#))
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. ([Bug#23687](#))
- Nested transactions (which are unsupported) do not raise an error or warning. ([Bug#22400](#))

#### C.4.8.9. Changes in MySQL Connector/.NET 5.0.2 (06 November 2006)

Functionality added or changed:

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/.NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

Bugs fixed:

- One system where IPv6 was enabled, MySQL Connector/.NET would incorrectly resolve host names. ([Bug#23758](#))
- Column names with accented characters were not parsed properly causing malformed column names in result sets. ([Bug#23657](#))
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. ([Bug#23538](#))
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. ([Bug#23268](#))

- During installation, an antivirus error message would be raised (indicating a malicious script problem). ([Bug#23245](#))
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that MySQL Connector/.NET 5.0.2 must be installed. ([Bug#23071](#))
- Using Windows Vista (RC2) as a nonprivileged user would raise a `Registry key 'Global' access denied.` ([Bug#22882](#))
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. ([Bug#18186](#))
- MySQL Connector/.NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. ([Bug#16126](#))

#### C.4.8.10. Changes in MySQL Connector/.NET 5.0.1 (01 October 2006)

Bugs fixed:

- MySQL Connector/.NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#))
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. ([Bug#22042](#))
- The `MySQlexception` class is now derived from the `DbException` class. ([Bug#21874](#))
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](#))
- You can now install the MySQL Connector/.NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](#))
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/.NET exception. ([Bug#18391](#))
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. ([Bug#11991](#))
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). ([Bug#9619](#))
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first.` ([Bug#7248](#))
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

#### C.4.8.11. Changes in MySQL Connector/.NET 5.0.0 (08 August 2006)

Functionality added or changed:

- Replaced use of ICSharpCode with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reimplemented PacketReader/PacketWriter support into `MySqlStream` class.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added internal implementation of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Implemented `MySqlClientFactory` class.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented classes and interfaces for ADO.Net 2.0 support.

- Added Async query methods.
- Implemented Usage Advisor.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented `MySqlConnectionBuilder` class.

Bugs fixed:

- CommandText: Question mark in comment line is being parsed as a parameter. ([Bug#6214](#))

## C.4.9. Changes in MySQL Connector/NET Version 1.0.x

### C.4.9.1. Changes in MySQL Connector/NET 1.0.11 (Not yet released)

Bugs fixed:

- Attempting to utilize MySQL Connector .Net version 1.0.10 throws a fatal exception under Mono when pooling is enabled. ([Bug#33682](#))
- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with noninput direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

### C.4.9.2. Changes in MySQL Connector/NET 1.0.10 (24 August 2007)

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server became available while the application was still running. ([Bug#29409](#))
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `SqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. ([Bug#25605](#))
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. ([Bug#25603](#))
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. ([Bug#24957](#))
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. ([Bug#24373](#))

### C.4.9.3. Changes in MySQL Connector/NET 1.0.9 (02 February 2007)

Functionality added or changed:

- The ICSharpCode ZipLib is no longer used by the Connector, and is no longer distributed with it.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

Bugs fixed:

- Times with negative values would be returned incorrectly. ([Bug#25912](#))
- `MySqlConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. ([Bug#25726](#))
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. ([Bug#25651](#))
- When closing and then re-opening a connection to a database, the character set specification is lost. ([Bug#25614](#))
- Trying to fill a table schema through a stored procedure triggers a runtime error. ([Bug#25609](#))
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. ([Bug#25443](#))
- Additional text added to error message. ([Bug#25178](#))
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. ([Bug#24802](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))
- Stored procedure executions are not thread safe. ([Bug#23905](#))
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. ([Bug#23862](#))
- One system where IPv6 was enabled, MySQL Connector/NET would incorrectly resolve host names. ([Bug#23758](#))
- Nested transactions do not raise an error or warning. ([Bug#22400](#))
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)

- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug#18186)

#### C.4.9.4. Changes in MySQL Connector/NET 1.0.8 (20 October 2006)

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedure metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

Bugs fixed:

- MySQL Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#))
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](#))
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. ([Bug#20581](#))
- You can now install the MySQL Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](#))
- The `DiscoverParameters` function would fail when a stored procedure used a `NUMERIC` parameter type. ([Bug#19515](#))
- When running a query that included a date comparison, a `DateReader` error would be raised. ([Bug#19481](#))
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. ([Bug#19294](#))
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. ([Bug#19261](#))
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/NET exception. ([Bug#18391](#))
- An exception would be raised when using an output parameter to a `System.String` value. ([Bug#17814](#))
- CHAR type added to `MySqlDbType`. ([Bug#17749](#))
- A `SELECT` query on a table with a date with a value of '`0000-00-00`' would hang the application. ([Bug#17736](#))
- The `CommandBuilder` ignored Unsigned flag at Parameter creation. ([Bug#17375](#))
- When working with multiple threads, character set initialization would generate errors. ([Bug#17106](#))
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. ([Bug#16934](#))
- `DataReader` would show the value of the previous row (or last row with nonnull data) if the current row contained a `date-time` field with a null value. ([Bug#16884](#))
- Unsigned data types were not properly supported. ([Bug#16788](#))
- The connection string parser did not permit single or double quotation marks in the password. ([Bug#16659](#))
- The `MySqlDateTime` class did not contain constructors. ([Bug#15112](#))
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no parameters would cause an application crash. ([Bug#15077](#))
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. ([Bug#11991](#))
- An  `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). ([Bug#9619](#))
- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. ([Bug#8131](#))

- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first.` ([Bug#7248](#))
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

#### C.4.9.5. Changes in MySQL Connector/NET 1.0.7 (21 November 2005)

Bugs fixed:

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. ([Bug#18570](#))
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. ([Bug#14631](#))
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. ([Bug#13927](#))
- Added support for the `cp932` character set. ([Bug#13806](#))
- Calling a stored procedure where a parameter contained special characters (such as '@') would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. ([Bug#13753](#))
- The `Ping()` method did not update the `State` property of the `Connection` object. ([Bug#13658](#))
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. ([Bug#13632](#))
- A statement that contained multiple references to the same parameter could not be prepared. ([Bug#13541](#))

#### C.4.9.6. Changes in MySQL Connector/NET 1.0.6 (03 October 2005)

Bugs fixed:

- MySQL Connector/NET 1.0.5 could not connect on Mono. ([Bug#13345](#))
- Serializing a parameter failed if the first value passed in was `NULL`. ([Bug#13276](#))
- Field names that contained the following characters caused errors: `( )%<>/` ([Bug#13036](#))
- The `nant` build sequence had problems. ([Bug#12978](#))
- The MySQL Connector/NET 1.0.5 installer would not install alongside MySQL Connector/NET 1.0.4. ([Bug#12835](#))

#### C.4.9.7. Changes in MySQL Connector/NET 1.0.5 (29 August 2005)

Bugs fixed:

- MySQL Connector/NET could not connect to MySQL 4.1.14. ([Bug#12771](#))
- With multiple hosts in the connection string, MySQL Connector/NET would not connect to the last host in the list. ([Bug#12628](#))
- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. ([Bug#12551](#), [Bug#8724](#))
- The `cp1250` character set was not supported. ([Bug#11621](#))
- A call to a stored procedure caused an exception if the stored procedure had no parameters. ([Bug#11542](#))
- Certain malformed queries would trigger a `Connection must be valid and open` error message. ([Bug#11490](#))
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. ([Bug#11450](#))
- MySQL Connector/NET interpreted the new decimal data type as a byte array. ([Bug#11294](#))

- Added support to call a stored function from MySQL Connector/NET. ([Bug#10644](#))
- Connection could fail when .NET thread pool had no available worker threads. ([Bug#10637](#))
- Calling `MySqlConnection.Clone` when a connection string had not yet been set on the original connection would generate an error. ([Bug#10281](#))
- Decimal parameters caused syntax errors. ([Bug#10152](#), [Bug#11550](#), [Bug#10486](#))
- Parameters were not recognized when they were separated by linefeeds. ([Bug#9722](#))
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. ([Bug#8382](#))
- Trying to read a `TIMESTAMP` column generated an exception. ([Bug#7951](#))
- MySQL Connector/NET could not work properly with certain regional settings. (WL#8228)

#### C.4.9.8. Changes in MySQL Connector/NET 1.0.4 (20 January 2005)

Bugs fixed:

- `MySqlReader.GetInt32` throws exception if column is unsigned. ([Bug#7755](#))
- Quote character \222 not quoted in `EscapeString`. ([Bug#7724](#))
- `GetBytes` is working no more. ([Bug#7704](#))
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. ([Bug#7612](#))
- Clone method bug in `MySqlCommand`. ([Bug#7478](#))
- Problem with Multiple resultsets. ([Bug#7436](#))
- `MySqlAdapter.Fill` method throws error message `Non-negative number required.` ([Bug#7345](#))
- `MySqlCommand.Connection` returns an `IDbConnection`. ([Bug#7258](#))
- Calling prepare causing exception. ([Bug#7243](#))
- Fixed problem with shared memory connections.
- Added or filled out several more topics in the API reference documentation.
- Fixed another small problem with prepared statements.
- Fixed problem that causes named pipes to not work with some blob functionality.

#### C.4.9.9. Changes in MySQL Connector/NET 1.0.3 (12 October 2004 gamma)

Bugs fixed:

- Invalid query string when using inout parameters ([Bug#7133](#))
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. ([Bug#7132](#))
- `MySqlDateTime` in Datatables sorting by Text, not Date. ([Bug#7032](#))
- Exception stack trace lost when re-throwing exceptions. ([Bug#6983](#))
- Errors in parsing stored procedure parameters. ([Bug#6902](#))
- InvalidCast when using `DATE_ADD`-function. ([Bug#6879](#))
- Int64 Support in `MySqlCommand` Parameters. ([Bug#6863](#))
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. ([Bug#6831](#))

- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRangeException` exception. ([Bug#6770](#))
- Integer "out" parameter from stored procedure returned as string. ([Bug#6668](#))
- An Open Connection has been Closed by the Host System. ([Bug#6634](#))
- Fixed Invalid character set index: 200. ([Bug#6547](#))
- Connections now do not have to give a database on the connection string.
- Installer now includes options to install into GAC and create START MENU items.
- Fixed major problem with detecting null values when using prepared statements.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added Ping method to `MySqlConnection`.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Made MySQL the default named pipe name.

#### C.4.9.10. Changes in MySQL Connector/NET 1.0.2 (15 November 2004 gamma)

Bugs fixed:

- Fixed Objects not being disposed ([Bug#6649](#))
- Fixed Charset-map for UCS-2 ([Bug#6541](#))
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset ([Bug#6429](#))
- Fixed double type handling in `MySqlParameter(string parameterName, object value)`. ([Bug#6428](#))
- Fixed Installation directory ignored using custom installation ([Bug#6329](#))
- Fixed #HY000 Illegal mix of collations (latin1\_swedish\_ci,IMPLICIT) and (utf8\_general\_ ([Bug#6322](#))
- Added the TableEditor CS and VB sample
- Added charset connection string option
- Fixed problem with `MySqlBinary` where string values could not be used to update extended text columns
- Provider is now using character set specified by server as default
- Updated the installer to include the new samples
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

#### C.4.9.11. Changes in MySQL Connector/NET 1.0.1 (27 October 2004 beta)

Bugs fixed:

- Fixed IndexOutOfBoundsException when reading BLOB with DataReader with `GetString(index)` ([Bug#6230](#))
- Fixed `GetBoolean` returns wrong values ([Bug#6227](#))
- Fixed Method `TokenizeSql()` uses only a limited set of valid characters for parameters ([Bug#6217](#))

- Fixed NET Connector source missing resx files ([Bug#6216](#))
- Fixed System.OverflowException when using YEAR data type. ([Bug#6036](#))
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found ([Bug#6006](#))
- Fixed serializing of floating point parameters (double, numeric, single, decimal) ([Bug#5900](#))
- Fixed missing Reference in DbType setter ([Bug#5897](#))
- Fixed Parsing the ';' char ([Bug#5876](#))
- Fixed DBNull Values causing problems with retrieving/updating queries. ([Bug#5798](#))
- IsNullable error ([Bug#5796](#))
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value ([Bug#5621](#))
- Fixed construtor initialize problems in MySqlCommand() ([Bug#5613](#))
- Fixed Yet Another "object reference not set to an instance of an object" ([Bug#5496](#))
- Fixed Can't display Chinese correctly ([Bug#5288](#))
- Fixed MySqlDataReader and 'show tables from ...' behavior ([Bug#5256](#))
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed [Bug#5458](#) Calling GetChars on a longtext column throws an exception
- Added test case for resetting the command text on a prepared command
- Fixed [Bug#5388](#) DataReader reports all rows as NULL if one row is NULL
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed [Bug#5602](#) Possible bug in MySqlParameter(string, object) constructor
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed [Bug#5392](#) MySqlCommand sees "?" as parameters in string literals
- Added Aggregate function test (wasn't really a bug)
- Using PacketWriter instead of Packet for writing to streams
- Implemented SequentialAccess
- Fixed problem with ConnectionInternal where a key might be added more than once
- Fixed Russian character support as well
- Fixed [Bug#5474](#) cannot run a stored procedure populating mysqlcommand.parameters
- Fixed problem where connector was not issuing a CMD\_QUIT before closing the socket
- Fixed problem where Min Pool Size was not being respected
- Refactored compression code into CompressedStream to clean up NativeDriver
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed [Bug#5469](#) Setting DbType throws NullReferenceException
- Virtualized driver subsystem so future releases could easily support client or embedded server support

#### C.4.9.12. Changes in MySQL Connector/.NET 1.0.0 (01 September 2004)

Bugs fixed:

- Thai encoding not correctly supported. ([Bug#3889](#))
- Bumped version number to 1.0.0 for beta 1 release.
- Removed all of the XML comment warnings.
- Added `COPYING.rtf` file for use in installer.
- Updated many of the test cases.
- Fixed problem with using compression.
- Removed some last references to ByteFX.

## C.4.10. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a `SerializeBinary` method for sending their data to a `PacketWriter`.
- Added `PacketWriter` class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- `SingleRow` behavior now working right even with limit.
- `GetBytes` now only works on binary columns.
- Logger now truncates long SQL commands so blob columns do not blow out our log.
- Host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. ([Bug#5214](#))
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where `GetSchema` would return false for `IsUnique` when the column is key.
- `MySqlDataReader` `GetXXX` methods now using the field level `MySqlValue` object and not performing conversions.
- `DataReader` returning `NULL` for time column. ([Bug#5097](#))
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added replacetext custom nant task.
- Added `CommandBuilderTest` fixture.
- Added Last One Wins feature to `CommandBuilder`.
- Fixed persist security info case problem.
- Fixed `GetBool` so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to enable use of @ parameter marker.
- `MySqlCommandBuilder`. ([Bug#4658](#))
- `ByteFX.MySqlClient` caches passwords if `Persist Security Info` is false. ([Bug#4864](#))
- Updated license banner in all source files to include FLOSS exception.
- Added new .Types namespace and implementations for most current MySql types.
- Added `MySqlField41` as a subclass of `MySqlField`.

- Changed many classes to now use the new `.Types` types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using bytefx .net mysql driver ([Bug#4520](#))
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. ([Bug#4505](#))
- Added code to Parameter test case `TestQuoting` to test for backslashes.
- `MySqlCommandBuilder` fails with multi-word column names. ([Bug#4486](#))
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySqlDataReader.GetBytes` do not work correctly. ([Bug#4324](#))
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added CRInSQL test case for carriage returns in SQL.
- Setting `maxPacketSize` to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. ([Bug#4442](#))
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. ([Bug#4071](#))
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Enable reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.
- Error processing show create table. ([Bug#4074](#))
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.
- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. ([Bug#4149](#))
- Moved all test suite files into `TestSuite` folder.

- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. ([Bug#3917](#))
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. ([Bug#3915](#))
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- `RowUpdating` event not set when setting the `DataAdapter` property. ([Bug#3888](#))
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.
- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdatper` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySqlHelper.cs` (thanks Patrick Kristiansen).

## C.4.11. Changes in MySQL Connector/NET Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to `MySqlClient.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySqlConnectionstring`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.
- Changed `ConnectionString` and added attributes to permit it to be used in `MySqlClient.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnectionstring`.
- `ConnectionInternal` is now using PING to see whether the server is available.
- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to permit values to come directly from row buffer.
- Changed to use the new driver.Send syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

## C.4.12. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year data type now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.

- A `MySqlException` is now thrown if a user name is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

### C.4.13. Changes in MySQL Connector/NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to `Thread.Sleep(0)` in `MySqlDataStream` to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where `CreateNewPooledConnection` was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).

- Enclosed queries for `max_allowed_packet` and `characterset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed SQL parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the MySqlPool (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perkens-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perkens-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to permit `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in MySQL 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammil)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match `SqlClient` (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split SQL code (thanks everyone!).

## C.4.14. Changes in MySQL Connector/.NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
-

- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

## C.4.15. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` data type handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perkens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command SQL processing so quotation marks are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded SQL, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out.
- Added `MySqlStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more SqlClient compliant so that DataReaders have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.
- Improved driver coding
- Fixed bug where NextResult was returning false on the last resultset.
- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to Int64 and unsigned 16bit values to Int32, and so forth.
- Added new constructor for `MySqlParameter` for (name, type, size, srccol)
- Fixed bug in `MySqlDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySqlClient` unit tests (added `MySqlClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySqlPool`. I may move it again, this is in preparation of the conference.

- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of Command worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now MySql in all files. PgSQL is now PgSql.
- Added attribute to PgSql code to prevent designer from trying to show.
- Added `MySQldbType` property to Parameter object and added proper conversion code to convert from `DbType` to `MySQldbType`.
- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(...)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without @.
- Fixed `Command.ConvertSQLToBytes` so it only permits characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing @ in their names.
- Removed `MySQLFieldType` enum from `Field.cs`. Now using `MySQldbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading @ (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

## C.4.16. Changes in MySQL Connector/.NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using `DBNull.Value` instead of null.
- `CommandBuilder` using `DBNull.Value`.

- `CommandBuilder` now builds insert command correctly when an auto\_insert field is not present.
- Field now uses typeof keyword to return `System.Types` (performance).

## C.4.17. Changes in MySQL Connector/NET Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use xsd (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

## C.4.18. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using SharpZipLib ([www.icsharpcode.net](http://www.icsharpcode.net)).
- Named pipes on Windows now working properly.
- Work done to improve `Timestamp` data type handling.
- Implemented `IEnumerable` on `DataReader` so `DataGridView` would work.

## C.4.19. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to `TIMESTAMP` and `DATETIME` fields fixed.

## C.5. MySQL Visual Studio Plugin Change History

### Note

As of Connector/NET 5.1.2 (14 June 2007), the Visual Studio Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see [Section C.4, “MySQL Connector/NET Change History”](#).

### C.5.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs fixed:

- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

### C.5.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs fixed:

- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. ([Bug#24875](#))

- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. ([Bug#23071](#))

### C.5.3. Changes in MySQL Visual Studio Plugin 1.0.1 (4 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft .Net\Framework\v2.0.50727\CONFIG\machine.config` (%win% should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant=" MySql.Data.MySqlClient "
description=".Net Framework Data Provider for MySQL"
type=" MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data" />
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant=" MySql.Data.MySqlClient "
description=".Net Framework Data Provider for MySQL"
type=" MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d" />
```

### C.5.4. Changes in MySQL Visual Studio Plugin 1.0.0 (4 October 2006)

Bugs fixed:

- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.
- DDEX (Data Designer Extensibility) compatibility.

## C.6. MySQL Connector/J Change History

### C.6.1. Changes in MySQL Connector/J 5.1.x

#### C.6.1.1. Changes in MySQL Connector/J 5.1.14 (Not yet released)

Fixes bugs found since release 5.1.13.

Functionality added or changed:

- Connector/J's load-balancing functionality only allowed the following events to trigger failover:
  - Transaction commit/rollback
  - CommunicationExceptions
  - Matches to user-defined Exceptions using the `loadBalanceSQLStateFailover`, `loadBalanceSQLEceptionSubclassFailover` or `loadBalanceExceptionChecker` property.

This meant that connections where auto-commit was enabled were not balanced, except for Exceptions, and this was problematic in the case of distribution of read-only work across slaves in a replication deployment.

The ability to load-balance while auto-commit is enabled has now been added to Connector/J. This introduces two new properties:

1. `loadBalanceAutoCommitStatementThreshold` - defines the number of matching statements which will trigger the driver to (potentially) swap physical server connections. The default value (0) retains the previously-established behavior that connections with auto-commit enabled are never balanced.
2. `loadBalanceAutoCommitStatementRegex` - the regular expression against which statements must match. The default value (blank) matches all statements.

Load-balancing will be done after the statement is executed, before control is returned to the application. If rebalancing fails,

the driver will silently swallow the resulting Exception (as the statement itself completed successfully). ([Bug#55723](#))

### C.6.1.2. Changes in MySQL Connector/J 5.1.13 (24 June 2010)

Fixes bugs found since release 5.1.12.

Functionality added or changed:

- Connector/J did not support `utf8mb4` for servers 5.5.2 and newer.

Connector/J now auto-detects servers configured with `character_set_server=utf8mb4` or treats the Java encoding `utf-8` passed using `characterEncoding=...` as `utf8mb4` in the `SET NAMES=` calls it makes when establishing the connection. ([Bug#54175](#))

Bugs fixed:

- The method `unSafeStatementInterceptors()` contained an erroneous line of code, which resulted in the interceptor being called, but the result being thrown away. ([Bug#53041](#))
- There was a performance regression of roughly 25% between r906 and r907, which appeared to be caused by pushing the Proxy down to the I/O layer. ([Bug#52534](#))
- Logic in implementations of `LoadBalancingConnectionProxy` and `LoadBalanceStrategy` behaved differently as to which `SQLExceptions` trigger failover to a new host. The former looked at the first two characters of the SQLState:

```
if (sqlState.startsWith("08"))
...

```

The latter used a different test:

```
if (sqlEx instanceof CommunicationsException
 || "08S01".equals(sqlEx.getSQLState())) {
...

```

This meant it was possible for a new `Connection` object to throw an `Exception` when the first selected host was unavailable. This happened because `MySqlIO.createNewIO()` could throw an `SQLException` with a `SQLState` of “08001”, which did not trigger the “try another host” logic in the `LoadBalanceStrategy` implementations, so an `Exception` was thrown after having only attempted connecting to a single host. ([Bug#52231](#))

- In the file `DatabaseMetadata.java`, the function `private void getCallStmtParameterTypes` failed if the parameter was defined over more than one line by using the '`\n`' character. ([Bug#52167](#))
- The catalog parameter, `PARAM_CAT`, was not correctly processed when calling for metadata with `getMetaData()` on stored procedures. This was because `PARAM_CAT` was hardcoded in the code to `NULL`. In the case where `nullCatalogMeansCurrent` was `true`, which is its default value, a crash did not occur, but the metadata returned was for the stored procedures from the catalog currently attached to. If, however, `nullCatalogMeansCurrent` was set to `false` then a crash resulted.

Connector/J has been changed so that when `NULL` is passed as `PARAM_CAT` it will not crash when `nullCatalogMeansCurrent` is `false`, but rather iterate all catalogs in search of stored procedures. This means that `PARAM_CAT` is no longer hardcoded to `NULL` (see [Bug#51904](#)). ([Bug#51912](#))

- A load balanced `Connection` object with multiple open underlying physical connections rebalanced on `commit()`, `rollback()`, or on a communication exception, without validating the existing connection. This caused a problem when there was no pinging of the physical connections, using queries starting with “`/* ping */`”, to ensure they remained active. This meant that calls to `Connection.commit()` could throw a `SQLException`. This did not occur when the transaction was actually committed; it occurred when the new connection was chosen and the driver attempted to set the auto-commit or transaction isolation state on the newly chosen physical connection. ([Bug#51783](#))
- The `rollback()` method could fail to rethrow a `SQLException` if the server became unavailable during a rollback. The errant code only rethrew when `ignoreNonTxTables` was true and the exception did not have the error code 1196, `SQLERROR_ER_WARNING_NOT_COMPLETE_ROLLBACK`. ([Bug#51776](#))
- When the `allowMultiQueries` connection string option was set to `true`, a call to `Statement.executeBatch()` scanned the query for escape codes, even though `setEscapeProcessing(false)` had been called previously. ([Bug#51704](#))

- When a `StatementInterceptor` was used and an alternate `ResultSet` was returned from `preProcess()`, the original statement was still executed. ([Bug#51666](#))
- Objects created by `ConnectionImpl`, such as prepared statements, hold a reference to the `ConnectionImpl` that created them. However, when the load balancer picked a new connection, it did not update the reference contained in, for example, the `PreparedStatement`. This resulted in inserts and updates being directed to invalid connections, while commits were directed to the new connection. This resulted in silent data loss. ([Bug#51643](#))
- `jdbc:mysql:loadbalance://` would connect to the same host, even though `loadBalanceStrategy` was set to a value of `random`, and multiple hosts were specified. ([Bug#51266](#))
- An unexpected exception when trying to register `OUT` parameters in `CallableStatement`.  
Sometimes Connector/J was not able to register `OUT` parameters for `CallableStatements`. ([Bug#43576](#))

### C.6.1.3. Changes in MySQL Connector/J 5.1.12 (18 February 2010)

Fixes bugs found since release 5.1.11.

Bugs fixed:

- The catalog parameter was ignored in the `DatabaseMetaData.getProcedure()` method. It returned all procedures in all databases. ([Bug#51022](#))
- A call to `DatabaseMetaData.getDriverVersion()` returned the revision as `mysql-connector-java-5.1.11 ( Revision: ${svn.Revision} )`. The variable `${svn.Revision}` was not replaced by the SVN revision number. ([Bug#50288](#))

### C.6.1.4. Changes in MySQL Connector/J 5.1.11 (21 January 2010)

Fixes bugs found since release 5.1.10.

Functionality added or changed:

- Replication connections, those with URLs that start with `jdbc:mysql:replication`, now use a `jdbc:mysql:loadbalance` connection for the slave pool. This means that it is possible to set load balancing properties such as `loadBalanceBlacklist-Timeout` and `loadBalanceStrategy` to choose a mechanism for balancing the load, and failover or fault tolerance strategy for the slave pool. ([Bug#49537](#))

Bugs fixed:

- `NullPointerException` sometimes occurred in `invalidateCurrentConnection()` for load-balanced connections. ([Bug#50288](#))
- The `deleteRow` method caused a full table scan, when using an updatable cursor and a multibyte character set. ([Bug#49745](#))
- For pooled connections, Connector/J did not process the session variable `time_zone` when set using the URL, resulting in incorrect timestamp values being stored. ([Bug#49700](#))
- The `ExceptionInterceptor` class did not provide a `Connection` context. ([Bug#49607](#))
- Ping left closed connections in the liveConnections map, causing subsequent Exceptions when that connection was used. ([Bug#48605](#))
- Using `MysqlConnectionPoolDataSource` with a load-balanced URL generated exceptions of type `ClassCastException`:

```
ClassCastException in MysqlConnectionPoolDataSource
Caused by: java.lang.ClassCastException: $Proxy0
 at
com.mysql.jdbc.optional.MysqlConnectionPoolDataSource.getPooledConnection(MysqlConne
ctionPoolDataSource.java:80)
```

```
java.lang.ClassCastException: $Proxy2
 at com.mysql.jdbc.optional.StatementWrapper.executeQuery(StatementWrapper.java:744)
```

(Bug#48486)

- The implementation for load-balanced `Connection` used a proxy, which delegated method calls, including `equals()` and `hashCode()`, to underlying `Connection` objects. This meant that successive calls to `hashCode()` on the same object potentially returned different values, if the proxy state had changed such that it was utilizing a different underlying connection. (Bug#48442)
- The batch rewrite functionality attempted to identify the start of the `VALUES` list by looking for “VALUES ” (with trailing space). However, valid MySQL syntax permits `VALUES` to be followed by whitespace or an opening parenthesis:

```
INSERT INTO tbl VALUES
(1);

INSERT INTO tbl VALUES(1);
```

Queries written with the above formats did not therefore gain the performance benefits of the batch rewrite. (Bug#48172)

- A PermGen memory leak was caused by the Connector/J statement cancellation timer (`java.util.Timer`). When the application was unloaded the cancellation timer did not terminate, preventing the ClassLoader from being garbage collected. (Bug#36565)
- With the connection string option `noDatetimeStringSync` set to `true`, and server-side prepared statements enabled, the following exception was generated if an attempt was made to obtain, using `ResultSet.getString()`, a datetime value containing all zero components:

```
java.sql.SQLException: Value '0000-00-00' can not be represented as java.sql.Date
```

(Bug#32525)

### C.6.1.5. Changes in MySQL Connector/J 5.1.10 (23 September 2009)

Fixes bugs found since release 5.1.9.

Bugs fixed:

- The `DriverManager.getConnection()` method ignored a non-standard port if it was specified in the JDBC connection string. Connector/J always used the standard port 3306 for connection creation. For example, if the string was `jdbc:mysql://localhost:6777`, Connector/J would attempt to connect to port 3306, rather than 6777. (Bug#47494)

### C.6.1.6. Changes in MySQL Connector/J 5.1.9 (21 September 2009)

Bugs fixed:

- In the class `com.mysql.jdbc.jdbc2.optional.SuspendableXAConnection`, which is used when `pinGlobalAltXToPhysicalConnection=true`, there is a static map (`XIDS_TO_PHYSICAL_CONNECTIONS`) that tracks the Xid with the XAConnection, however this map was not populated. The effect was that the `SuspendableXAConnection` was never pinned to the real XA connection. Instead it created new connections on calls to `start`, `end`, `resume`, and `prepare`. (Bug#46925)
- When using the ON DUPLICATE KEY UPDATE functionality together with the rewriteBatchedStatements option set to true, an exception was generated when trying to execute the prepared statement:

```
INSERT INTO config_table (modified,id_) VALUES (?,?) ON DUPLICATE KEY UPDATE modified=?
```

The exception generated was:

```
java.sql.SQLException: Parameter index out of range (3 > number of parameters, which is 2).
 at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:135)
.....
Caused by: java.sql.SQLException: Parameter index out of range (3 > number of parameters, which is 2).
 at com.mysql.jdbc.SQLException.createSQLException(SQLException.java:1055)
 at com.mysql.jdbc.SQLException.createSQLException(SQLException.java:956)

at com.mysql.jdbc.PreparedStatement.executeBatchedInserts(PreparedStatement.java:1759)
at com.mysql.jdbc.PreparedStatement.executeBatch(PreparedStatement.java:1441)
at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:131)
... 16 more

```

([Bug#46788](#))

- When Connector/J encountered an error condition that caused it to create a `CommunicationsException`, it tried to build a friendly error message that helped diagnose what was wrong. However, if there had been no network packets received from the server, the error message contained the following incorrect text:

```
The last packet successfully received from the server was 1,249,932,468,916 milliseconds ago. The last packet sent successfully to the server was 0 milliseconds ago.
```

([Bug#46637](#))

- The `getSuperTypes` method returned a result set with incorrect names for the first two columns. The name of the first column in the result set was expected to be `TYPE_CAT` and that of the second column `TYPE_SCHEMA`. The method however returned the names as `TABLE_CAT` and `TABLE_SCHEMA` for first and second column respectively. ([Bug#44508](#))
- SQLException for data truncation error gave the error code as 0 instead of 1265. ([Bug#44324](#))
- Calling `ResultSet.deleteRow()` on a table with a primary key of type `BINARY(8)` silently failed to delete the row, but only in some repeatable cases. The generated `DELETE` statement generated corrupted part of the primary key data. Specifically, one of the bytes was changed from 0x90 to 0x9D, although the corruption appeared to be different depending on whether the application was run on Windows or Linux. ([Bug#43759](#))
- Accessing result set columns by name after the result set had been closed resulted in a `NullPointerException` instead of a `SQLException`. ([Bug#41484](#))
- `QueryTimeout` did not work for batch statements waiting on a locked table.

When a batch statement was issued to the server and was forced to wait because of a locked table, Connector/J only terminated the first statement in the batch when the timeout was exceeded, leaving the rest hanging. ([Bug#34555](#))

- The `parseURL` method in class `com.mysql.jdbc.Driver` did not work as expected. When given a URL such as “`jdbc:mysql://www.mysql.com:12345/my_database`” to parse, the property `PORT_PROPERTY_KEY` was found to be `null` and the `HOST_PROPERTY_KEY` property was found to be “`www.mysql.com:12345`”.

### Note

Connector/J has been fixed so that it will now always fill in the `PORT` property (using 3306 if not specified), and the `HOST` property (using `localhost` if not specified) when `parseURL()` is called. The driver also parses a list of hosts into `HOST.n` and `PORT.n` properties as well as adding a property `NUM_HOSTS` for the number of hosts it has found. If a list of hosts is passed to the driver, `HOST` and `PORT` will be set to the values given by `HOST.1` and `PORT.1` respectively. This change has centralized and cleaned up a large section of code used to generate lists of hosts, both for load-balanced and fault tolerant connections and their tests.

([Bug#32216](#))

- Attempting to delete rows using `ResultSet.deleteRow()` did not delete rows correctly. ([Bug#27431](#))
- The `setDate` method silently ignored the Calendar parameter. The code was implemented as follows:

```

public void setDate(int parameterIndex, java.sql.Date x, Calendar cal) throws SQLException {
 setDate(parameterIndex, x);
}

```

From reviewing the code it was apparent that the Calendar parameter `cal` was ignored. ([Bug#23584](#))

## C.6.1.7. Changes in MySQL Connector/J 5.1.8 (16 July 2009)

Bugs fixed:

- The reported milliseconds since the last server packets were received/sent was incorrect by a factor of 1000. For example, the following method call:

```
SQLError.createLinkFailureMessageBasedOnHeuristics(
 (ConnectionImpl) this.conn,
 System.currentTimeMillis() - 1000,
 System.currentTimeMillis() - 2000,
 e,
 false);
```

returned the following string:

```
The last packet successfully received from the server
was 2 milliseconds ago. The last packet sent successfully to the
server was 1 milliseconds ago.
```

(Bug#45419)

- Calling `Connection.serverPrepareStatement()` variants that do not take result set type or concurrency arguments returned statements that produced result sets with incorrect defaults, namely `TYPE_SCROLL_SENSITIVE`. (Bug#45171)
- The result set returned by `getIndexInfo()` did not have the format defined in the JDBC API specifications. The fourth column, `DATA_TYPE`, of the result set should be of type `BOOLEAN`. Connector/J however returns `CHAR`. (Bug#44869)
- The result set returned by `getTypeInfo()` did not have the format defined in the JDBC API specifications. The second column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44868)
- The `DEFERRABILITY` column in database metadata result sets was expected to be of type `SHORT`. However, Connector/J returned it as `INTEGER`.

This affected the following methods: `getImportedKeys()`, `getExportedKeys()`, `getCrossReference()`. (Bug#44867)

- The result set returned by `getColumns()` did not have the format defined in the JDBC API specifications. The fifth column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44865)
- The result set returned by `getVersionColumns()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44863)
- The result set returned by `getBestRowIdentifier()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44862)
- Connector/J contains logic to generate a message text specifically for streaming result sets when there are `CommunicationException` exceptions generated. However, this code was never reached.

In the `CommunicationException` code:

```
private boolean streamingResultSetInPlay = false;
public CommunicationException(ConnectionImpl conn, long lastPacketSentTimeMs,
 long lastPacketReceivedTimeMs, Exception underlyingException) {
 this.exceptionMessage = SQLError.createLinkFailureMessageBasedOnHeuristics(conn,
 lastPacketSentTimeMs, lastPacketReceivedTimeMs, underlyingException,
 this.streamingResultSetInPlay);
```

`streamingResultSetInPlay` was always false, which in the following code in `SQLERror.createLinkFailureMessageBasedOnHeuristics()` never being executed:

```
if (streamingResultSetInPlay) {
 exceptionMessageBuf.append(
 Messages.getString("CommunicationException.ClientWasStreaming")); // $NON-NLS-1$
} else {
 ...
}
```

(Bug#44588)

- The `SQLERror.createLinkFailureMessageBasedOnHeuristics()` method created a message text for communication link failures. When certain conditions were met, this message included both “last packet sent” and “last packet received” information, but when those conditions were not met, only “last packet sent” information was provided.

Information about when the last packet was successfully received should be provided in all cases. (Bug#44587)

- `Statement.getGeneratedKeys()` retained result set instances until the statement was closed. This caused memory

leaks for long-lived statements, or statements used in tight loops. ([Bug#44056](#))

- Using `useInformationSchema` with `DatabaseMetaData.getExportedKeys()` generated the following exception:

```
com.mysql.jdbc.exceptions.MySQLIntegrityConstraintViolationException: Column
'REFERENCED_TABLE_NAME' in where clause is ambiguous
...
at com.mysql.jdbc.PreparedStatement.executeInternal(PreparedStatement.java:1772)
at com.mysql.jdbc.PreparedStatement.executeQuery(PreparedStatement.java:1923)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.executeMetadataQuery(
DatabaseMetaDataUsingInfoSchema.java:50)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.getExportedKeys(
DatabaseMetaDataUsingInfoSchema.java:603)
```

([Bug#43714](#))

- `LoadBalancingConnectionProxy.doPing()` did not have blacklist awareness.

`LoadBalancingConnectionProxy` implemented `doPing()` to ping all underlying connections, but it threw any exceptions it encountered during this process.

With the global blacklist enabled, it catches these exceptions, adds the host to the global blacklist, and only throws an exception if all hosts are down. ([Bug#43421](#))

- The method `Statement.getGeneratedKeys()` did not return values for `UNSIGNED BIGINTS` with values greater than `Long.MAX_VALUE`.

Unfortunately, because the server does not tell clients what TYPE the auto increment value is, the driver cannot consistently return `BigIntegers` for the result set returned from `getGeneratedKeys()`, it will only return them if the value is greater than `Long.MAX_VALUE`. If your application needs this consistency, it will need to check the class of the return value from `.getObject()` on the `ResultSet` returned by `Statement.getGeneratedKeys()` and if it is not a `BigInteger`, create one based on the `java.lang.Long` that is returned. ([Bug#43196](#))

- When the MySQL Server was upgraded from 4.0 to 5.0, the Connector/J application then failed to connect to the server. This was because authentication failed when the application ran from EBCDIC platforms such as z/OS. ([Bug#43071](#))
- When connecting with `traceProtocol=true`, no trace data was generated for the server greeting or login request. ([Bug#43070](#))
- Connector/J generated an unhandled `StringIndexOutOfBoundsException`:

```
java.lang.StringIndexOutOfBoundsException: String index out of range: -1
at java.lang.String.substring(String.java:1938)
at com.mysql.jdbc.EscapeProcessor.processTimeToken(EscapeProcessor.java:353)
at com.mysql.jdbc.EscapeProcessor.escapeSQL(EscapeProcessor.java:257)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1546)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1524)
```

([Bug#42253](#))

- A `ConcurrentModificationException` was generated in `LoadBalancingConnectionProxy`:

```
java.util.ConcurrentModificationException
at java.util.HashMap$HashIterator.nextEntry(Unknown Source)
at java.util.HashMap$KeyIterator.next(Unknown Source)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.getGlobalBlacklist(LoadBalancingConnectionProxy.java:520)
at com.mysql.jdbc.RandomBalanceStrategy.pickConnection(RandomBalanceStrategy.java:55)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.pickNewConnection(LoadBalancingConnectionProxy.java:414)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:390)
```

([Bug#42055](#))

- SQL injection was possible when using a string containing U+00A5 in a client-side prepared statement, and the character set being used was SJIS/Windows-31J. ([Bug#41730](#))
- If there was an apostrophe in a comment in a statement that was being sent through Connector/J, the apostrophe was still recognized as a quote and put the state machine in `EscapeTokenizer` into the `inQuotes` state. This led to further parse errors.

For example, consider the following statement:

```
String sql = "-- Customer's zip code will be fixed\n" +
```

```
"update address set zip_code = 99999\n" +
"where not regexp '^[0-9]{5}([[-.])?([0-9]{4})?$'"
```

When passed through Connector/J, the `EscapeTokenizer` did not recognize that the first apostrophe was in a comment and thus set `inQuotes` to true. When that happened, the quote count was incorrect and thus the regular expression did not appear to be in quotation marks. With the parser not detecting that the regular expression was in quotation marks, the curly braces were recognized as escape sequences and were removed from the regular expression, breaking it. The server thus received SQL such as:

```
-- Customer's zip code will be fixed
update address set zip_code = '99999'
where not regexp '^[0-9]([[-.])?([0-9])?$'
```

(Bug#41566)

- MySQL Connector/J 5.1.7 was slower than previous versions when the `rewriteBatchedStatements` option was set to `true`.

### Note

The performance regression in `indexOfIgnoreCaseRespectMarker()` has been fixed. It has also been made possible for the driver to rewrite `INSERT` statements with `ON DUPLICATE KEY UPDATE` clauses in them, as long as the `UPDATE` clause contains no reference to `LAST_INSERT_ID()`, as that would cause the driver to return bogus values for `getGeneratedKeys()` invocations. This has resulted in improved performance over version 5.1.7.

(Bug#41532)

- When accessing a result set column by name using `ResultSetImpl.findColumn()` an exception was generated:

```
java.lang.NullPointerException
at com.mysql.jdbc.ResultSetImpl.findColumn(ResultSetImpl.java:1103)
at com.mysql.jdbc.ResultSetImpl.getShort(ResultSetImpl.java:5415)
at org.apache.commons.dbcp.DelegatingResultSet.getShort(DelegatingResultSet.java:219)
at com.zimbra.cs.db.DbVolume.constructVolume(DbVolume.java:297)
at com.zimbra.cs.db.DbVolume.get(DbVolume.java:197)
at com.zimbra.cs.db.DbVolume.create(DbVolume.java:95)
at com.zimbra.cs.store.Volume.create(Volume.java:227)
at com.zimbra.cs.store.Volume.create(Volume.java:189)
at com.zimbra.cs.service.admin.CreateVolume.handle(CreateVolume.java:48)
at com.zimbra.soap.SoapEngine.dispatchRequest(SoapEngine.java:428)
at com.zimbra.soap.SoapEngine.dispatch(SoapEngine.java:285)
```

(Bug#41484)

- The `RETURN_GENERATED_KEYS` flag was being ignored. For example, in the following code the `RETURN_GENERATED_KEYS` flag was ignored:

```
PreparedStatement ps = connection.prepareStatement("INSERT INTO table
values(?,?)",PreparedStatement.RETURN_GENERATED_KEYS);
```

(Bug#41448)

- When using Connector/J 5.1.7 to connect to MySQL Server 4.1.18 the following error message was generated:

```
Thu Dec 11 17:38:21 PST 2008 WARN: Invalid value {1} for server variable named {0},
falling back to sane default of {2}
```

This occurred with MySQL Server version that did not support `auto_increment_increment`. The error message should not have been generated. (Bug#41416)

- When `DatabaseMetaData.getProcedureColumns()` was called, the value for `LENGTH` was always returned as 65535, regardless of the column type (fixed or variable) or the actual length of the column.

However, if you obtained the `PRECISION` value, this was correct for both fixed and variable length columns. (Bug#41269)

- `PreparedStatement.addBatch()` did not check for all parameters being set, which led to inconsistent behavior in `executeBatch()`, especially when rewriting batched statements into multi-value `INSERT`s. (Bug#41161)
- Error message strings contained variable values that were not expanded. For example:

```
Mon Nov 17 11:43:18 JST 2008 WARN: Invalid value {1} for server variable named {0},
falling back to sane default of {2}
```

(Bug#40772)

- When using `rewriteBatchedStatements=true` with:

```
INSERT INTO table_name_values (...) VALUES (...)
```

Query rewriting failed because “values” at the end of the table name was mistaken for the reserved keyword. The error generated was as follows:

```
testBug40439(testsuite.simple.TestBug40439)java.sql.BatchUpdateException: You have an
error in your SQL syntax; check the manual that corresponds to your MySQL server version
for the right syntax to use near 'values (2,'toto',2),(id,data, ordr) values
(3,'toto',3),(id,data, ordr) values (' at line 1
at com.mysql.jdbc.PreparedStatement.executeBatchedInserts(PreparedStatement.java:1495)
at com.mysql.jdbc.PreparedStatement.executeBatch(PreparedStatement.java:1097)
at testsuite.simple.TestBug40439.testBug40439(TestBug40439.java:42)
at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)

at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25)
at testsuite.simple.TestBug40439.main(TestBug40439.java:57)
```

(Bug#40439)

- A statement interceptor received the incorrect parameters when used with a batched statement. (Bug#39426)
- Using Connector/J 5.1.6 the method `ResultSet.getObject` returned a `BYTE[ ]` for following:

```
SELECT TRIM(rowid) FROM tbl
```

Where `rowid` had a type of `INT(11) PRIMARY KEY AUTO_INCREMENT`.

The expected return type was one of `CHAR`, `VARCHAR`, `CLOB`, however, a `BYTE[ ]` was returned.

Further, adding `functionsNeverReturnBlobs=true` to the connection string did not have any effect on the return type. (Bug#38387)

### C.6.1.8. Changes in MySQL Connector/J 5.1.7 (21 October 2008)

Functionality added or changed:

- When statements include `ON DUPLICATE UPDATE`, and `rewriteBatchedStatements` is set to true, batched statements are not rewritten into the form `INSERT INTO table VALUES (), (), ()`, instead the statements are executed sequentially.

Bugs fixed:

- `Statement.getGeneratedKeys()` returned two keys when using `ON DUPLICATE KEY UPDATE` and the row was updated, not inserted. (Bug#42309)
- When using the replication driver with `autoReconnect=true`, Connector/J checks in `PreparedStatement.execute` (also called by `CallableStatement.execute`) to determine if the first character of the statement is an “S”, in an attempt to block all statements that are not read-only-safe, for example non-`SELECT` statements. However, this also blocked `CALL`s to stored procedures, even if the stored procedures were defined as `SQL READ DATA` or `NO SQL`. (Bug#40031)
- With large result sets `ResultSet.findColumn` became a performance bottleneck. (Bug#39962)
- Connector/J ignored the value of the MySQL Server variable `auto_increment_increment`. (Bug#39956)
- Connector/J failed to parse `TIMESTAMP` strings for nanos correctly. (Bug#39911)
- When the `LoadBalancingConnectionProxy` handles a `SQLException` with SQL state starting with “08”, it calls `invalidateCurrentConnection`, which in turn removes that `Connection` from `liveConnections` and the `connectionsToHostsMap`, but it did not add the host to the new global blacklist, if the global blacklist was enabled.

There was also the possibility of a `NullPointerException` when trying to update stats, where `connectionsToHostsMap.get(this.currentConn)` was called:

```
int hostIndex = ((Integer) this.hostsToListIndexMap.get(this.connectionsToHostsMap.get(this.currentConn))).intValue
```

This could happen if a client tried to issue a rollback after catching a `SQLException` caused by a connection failure. ([Bug#39784](#))

- When configuring the Java Replication Driver the last slave specified was never used. ([Bug#39611](#))
- When an `INSERT ON DUPLICATE KEY UPDATE` was performed, and the key already existed, the `affected-rows` value was returned as 1 instead of 0. ([Bug#39352](#))
- When using the random load balancing strategy and starting with two servers that were both unavailable, an `IndexOutOfBoundsException` was generated when removing a server from the `whiteList`. ([Bug#38782](#))
- Connector/J threw the following exception when using a read-only connection:

```
java.sql.SQLException: Connection is read-only. Queries leading to data
modification are not allowed.
```

([Bug#38747](#))

- Connector/J was unable to connect when using a non-`latin1` password. ([Bug#37570](#))
- The `useOldAliasMetadataBehavior` connection property was ignored. ([Bug#35753](#))
- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. ([Bug#35170](#))
- When `getGeneratedKeys()` was called on a statement that had not been created with `RETURN_GENERATED_KEYS`, no exception was thrown, and batched executions then returned erroneous values. ([Bug#34185](#))
- The `loadBalance bestResponseTime` blacklists did not have a global state. ([Bug#33861](#))

### C.6.1.9. Changes in MySQL Connector/J 5.1.6 (07 March 2008)

Functionality added or changed:

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the result sets from stored procedures now return multiple results sets, with the exception of result sets using registered `OUTPUT` parameters. ([Bug#33678](#))
- XAConnections and datasources have been updated to the JDBC-4.0 standard.
- The profiler event handling has been made extensible using the `profilerEventHandler` connection property.
- Add the `verifyServerCertificate` property. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a nonverifying trust store and the "default" key store.

Bugs fixed:

- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. ([Bug#36830](#))
- When trying to read `Time` values like "00:00:00" with `ResultSet.getTime(int)` an exception is thrown. ([Bug#36051](#))
- JDBC connection URL parameters are ignored when using `MysqlConnectionPoolDataSource`. ([Bug#35810](#))
- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. ([Bug#35666](#))
- When using the keyword "loadbalance" in the connection string and trying to perform load balancing between two databases, the driver appears to hang. ([Bug#35660](#))
- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. ([Bug#35610](#))

- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. ([Bug#35489](#))
- In calling a stored function returning a `bigint`, an exception is encountered beginning:

```
java.sql.SQLException: java.lang.NumberFormatException: For input string:
```

followed by the text of the stored function starting after the argument list. ([Bug#35199](#))
- The JDBC driver uses a different method for evaluating column names in `resultSet.getColumnName()` and when looking for a column in `resultSet.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:

```
SELECT column AS aliasName from table
```

([Bug#35150](#))
- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented `com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from `ConnectionProperties` are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. ([Bug#34937](#))
- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMP`s when using server-side prepared statements (not enabled by default). ([Bug#34913](#))
- `RowDataStatic` doesn't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. ([Bug#34762](#))
- When calling `isValid()` on an active connection, if the timeout is nonzero then the `Connection` is invalidated even if the `Connection` is valid. ([Bug#34703](#))
- It was not possible to truncate a `BLOB` using `Blog.truncate()` when using 0 as an argument. ([Bug#34677](#))
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. ([Bug#34518](#))
- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. ([Bug#34194](#))
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. ([Bug#34093](#))
- The internal class `ResultSetInternalMethods` referenced the nonpublic class `com.mysql.jdbc.CachedResultSetMetaData`. ([Bug#33823](#))
- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. ([Bug#33734](#))
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. ([Bug#33594](#))
- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. ([Bug#33162](#))
- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the `retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name using the `loadBalanceStrategy` configuration property. ([Bug#32877](#))

- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values , as the hours end up being the same when sent as the literal that MySQL requires.

Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your

server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

This bug fix also fixes [Bug#15604](#), by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (that is, the old date/time handling code will be deprecated) ([Bug#32577](#), [Bug#15604](#))

- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly, so no exception is raised, and the driver than hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal SELECTs won't have an error in this spot in the protocol unless an I/O error occurs. ([Bug#32246](#))
- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. ([Bug#32101](#))
- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBoundsException` exception when setting the last parameter to null. ([Bug#31823](#))
- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. ([Bug#31790](#))
- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. ([Bug#31192](#))
- Further fixes have been made to this bug in the event that a node is nonresponsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. ([Bug#31053](#))
- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. ([Bug#30508](#))
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. ([Bug#20491](#))
- Fixed `ResultSetMetadata.getColumnName()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED\_KEY" as in 5.0.x.

### C.6.1.10. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than  $5 * \text{stddev}$  of the mean query time (outside the 96% percentile).

Bugs fixed:

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. ([Bug#28256](#))
- When calling `setTimestamp` on a prepared statement, the timezone information stored in the calendar object was ignored. This resulted in the incorrect `DATETIME` information being stored. The following example illustrates this:

```
Timestamp t = new Timestamp(cal.getTimeInMillis());
ps.setTimestamp(N, t, cal);
```

(Bug#15604)

### C.6.1.11. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

### C.6.1.12. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Connector/J now connects using an initial character set of `utf-8` solely for the purpose of authentication to permit user names or database names in any character set to be used in the JDBC connection URL. (Bug#29853)
- Added two configuration parameters:
  - `blobsAreStrings`: Should the driver always treat BLOBS as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBS` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client-server round trips as possible.
- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Added experimental support for statement "interceptors" through the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`. Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).
- The driver will automatically adjust the server session variable `net_write_timeout` when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).
- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` through the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and class of the underlying error.
- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.
- Errors encountered during `Statement/PreparedStatement/CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to

`EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT/REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on com.mysql.jdbc.Statement: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:
  - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set using `setLocalInfileInputStream()`.

- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBS`. The regex must follow the patterns used for the `java.util.regex` package. The default is to exclude no columns, and include all columns.

Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to `utf8OutsideBmpExcludedColumnNamePattern`. The regex must follow the patterns used for the `java.util.regex` package.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. ([Bug#30892](#))
- NPE with null column values when `padCharsWithSpace` is set to true. ([Bug#30851](#))
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. ([Bug#30664](#))
- An `ArithmaticException` or `NullPointerException` would be raised when the batch had zero members and `re-writeBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. ([Bug#30550](#))
- Closing a load-balanced connection would cause a `ClassCastException`. ([Bug#29852](#))
- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". ([Bug#29106](#))
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. ([Bug#28972](#))
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as `IN` parameters but permit callers to call `registerOutParameter()` on them without throwing an exception. ([Bug#28689](#))

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. ([Bug#27915](#))

- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. ([Bug#27867](#))
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. ([Bug#27182](#))
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. ([Bug#21116](#))
- Specifying a "validation query" in your connection pool that starts with "/\* ping \*/" \_exactly\_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a Load-BalancedConnection, will send the ping across all active connections.

### C.6.1.13. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

### C.6.1.14. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality added or changed:

- **Incompatible Change:** Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

For those looking further into the driver implementation, it is not an API that is used for plugability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

`Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Externalized the descriptions of connection properties.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.
- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- Added experimental support for statement "interceptors" through the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`.

Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

`StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.

- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.
- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be re-written in the form `CALL (...); CALL (...); ...` to send the batch in as few client-server round trips as possible.

### C.6.1.15. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

**Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

#### Note

The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCompatibleTimezoneShift=true`.

Functionality added or changed:

- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

#### Note

This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the `SQLState` class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR/NVARCHAR` types.
- `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's `SQLXML` interfaces.
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

- `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
- `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file
- New feature—driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).
- Added support for JDBC-4.0's client information. The backend storage of information provided using `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that imple-

ments the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

This functionality is only available when using Java-6 or newer.

- `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's `Wrapper` interface.

## C.6.2. Changes in MySQL Connector/J 5.0.x

### C.6.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

Functionality added or changed:

- `blobsAreStrings`: Should the driver always treat BLOBS as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
  - `blobsAreStrings`: Should the driver always treat BLOBS as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBS` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBS` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it is actually an error condition).

Bugs fixed:

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.

If the driver gives up, it will throw the last-received `SQLException`. ([Bug#31053](#))

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. ([Bug#30892](#))
- NPE with null column values when `padCharsWithSpace` is set to true. ([Bug#30851](#))
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. ([Bug#30664](#))
- An `ArithmaticException` or `NullPointerException` would be raised when the batch had zero members and `re-writeBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. ([Bug#30550](#))
- Closing a load-balanced connection would cause a `ClassCastException`. ([Bug#29852](#))
- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". ([Bug#29106](#))
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. ([Bug#28972](#))

- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as `IN` parameters but permit callers to call `registerOutParameter()` on them without throwing an exception. ([Bug#28689](#))

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. ([Bug#28256](#))
- `UNSIGNED` types not reported using `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly using `DBMD.getColumns()`. ([Bug#27916](#))

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. ([Bug#27915](#))
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. ([Bug#27867](#))
- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. ([Bug#27412](#))
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. ([Bug#27182](#))
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. ([Bug#21116](#))
- Specifying a "validation query" in your connection pool that starts with `/* ping */` \_exactly\_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a Load-BalancedConnection, will send the ping across all active connections.

### C.6.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality added or changed:

- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements to function.
- `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
- Give more information in EOFExceptions thrown out of MysqlIO (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and `autoReconnect` to `true`.
- `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a nonzero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.
- `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes `ResultSetMetadata.isCaseSensitive()` much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- Added configuration properties to enable tuning of TCP/IP socket parameters:
  - `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
  - `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
  - `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.

- `tcpSndBuf` - Should the driver set SO\_SND\_BUF to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that enable Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling `setFetchSize()` on a Statement or ResultSet) by using fully-materialized cursors on the server.
- `tcpSndBuf` - Should the driver set SO\_SND\_BUF to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires JDK >= 1.5)?

#### Note

If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

Bugs fixed:

- Don't send any file data in response to LOAD DATA LOCAL INFILE if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. ([Bug#29605](#))
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '--' single-line comments. ([Bug#28956](#))
- Parser in client-side prepared statements eats character following '/' if it is not a multi-line comment. ([Bug#28851](#))
- `PreparedStatement.getMetaData()` for statements containing leading one-line comments is not returned correctly.

As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECTs` for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. ([Bug#28469](#))

### C.6.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality added or changed:

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at `ReplicationConnection` or `lbpool`).

If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

Therefore, for this to work (at all), you must use transactions, even if only reading data.

Physical connections to the given hosts will not be created until needed.

The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL

configuration property:

- **random**: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- **bestResponseTime**: The driver will route the request to the host that had the best response time for the previous transaction.
- **bestResponseTime**: The driver will route the request to the host that had the best response time for the previous transaction.
- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).
- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

### Note

This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- New configuration property, `enableQueryTimeouts` (default `true`).

When enabled, query timeouts set with `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.
- **random**: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jd-bc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a `ReplicationConnection` (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc[NonRegistering]Driver` with the new URL prefix.

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.
- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()` (which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). ([Bug#28085](#))
- `Connection.getTransactionIsolation()` uses "SHOW VARIABLES LIKE" which is very inefficient on MySQL-5.0+ servers. ([Bug#27655](#))
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). ([Bug#27655](#))
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

If the comments happen to contain parameter markers (?), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

#### Note

The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

([Bug#27400](#))

- `ResultSet.get*( )` with a column index < 1 returns misleading error message. ([Bug#27317](#))
- Using `ResultSet.get*( )` with a column index less than 1 returns a misleading error message. ([Bug#27317](#))
- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. ([Bug#26959](#))
- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. ([Bug#26789](#))
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes( )`. ([Bug#26592](#))
- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. ([Bug#26173](#))
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB, BIT, (VAR)BINARY, JAVA_OBJECT`) have extra 7 bytes. ([Bug#25715](#))
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. ([Bug#25624](#))
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. ([Bug#25545](#))
- `Statement.setMaxRows( )` is not effective on result sets materialized from cursors. ([Bug#25517](#))
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject( )` rather than `byte[ ]`. ([Bug#25328](#))

### C.6.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality added or changed:

- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

- Improved speed of `datetime` parsing for ResultSets that come from plain or nonserver-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Fixed logging of XA commands sent to server, it is now configurable using `logXaCommands` property (defaults to `false`).
- Added configuration property `localSocketAddress`, which is the host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat `java.util.Date` as a `java.sql.Timestamp` because it is useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.

Bugs fixed:

- Connection property `socketFactory` wasn't exposed using correctly named mutator/Accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). ([Bug#26326](#))
- A query execution which timed out did not always throw a `MySQLTimeoutException`. ([Bug#25836](#))
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. ([Bug#25787](#))
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. ([Bug#25514](#))
- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. ([Bug#25399](#))
- `INOUT` parameters in `CallableStatements` get doubly-escaped. ([Bug#25379](#))
- When using the `rewriteBatchedStatements` connection option with `PreparedStatement.executeBatch()` an internal memory leak would occur. ([Bug#25073](#))
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them using `ResultSetMetaData`. ([Bug#25073](#))
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. ([Bug#25047](#))
- Client-side prepared statement parser gets confused by in-line comments `/* ... */` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. ([Bug#25025](#))
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". ([Bug#25009](#))
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. ([Bug#24840](#))
- Using `DatabaseMetaData.getSQLKeywords()` does not return all of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. ([Bug#24794](#))
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). ([Bug#24721](#))
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. ([Bug#24360](#))
- Calendars and timezones are now lazily instantiated when required. ([Bug#24351](#))
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. The reason was due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-

side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. ([Bug#24344](#))

- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. ([Bug#24065](#))
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. ([Bug#23645](#))
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. ([Bug#23304](#))
- `DatabaseMetaData.getschemas()` doesn't return a `TABLE_CATALOG` column. ([Bug#23303](#))
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). ([Bug#22628](#))
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. ([Bug#21480](#))
- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. ([Bug#21438](#))
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). ([Bug#21438](#))
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). ([Bug#21267](#))
- Fixed an issue where `XADatasources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.

Other changes:

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underlying exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed cases where `ServerPreparedStatements` weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a `HashMap`. This enables us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many

transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, TreeMaps are about half as fast wall-clock time as a `HashMap`, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).

- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.

### C.6.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs fixed:

- `DBMD.getColumns()` does not return expected `COLUMN_SIZE` for the `SET` type, now returns length of largest possible set disregarding whitespace or the `,` delimiters to be consistent with the ODBC driver. ([Bug#22613](#))
- Added new `_ci` collations to `CharsetMapping` - `utf8_unicode_ci` not working. ([Bug#22456](#))
- Driver was using milliseconds for `Statement.setQueryTimeout()` when specification says argument is to be in seconds. ([Bug#22359](#))
- Workaround for server crash when calling stored procedures using a server-side prepared statement (driver now detects pre-prepare(stored procedure) and substitutes client-side prepared statement). ([Bug#22297](#))
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. ([Bug#22024](#))
- When using `information_schema` for metadata, `COLUMN_SIZE` for `getColumns()` is not clamped to range of `java.lang.Integer` as is the case when not using `information_schema`, thus leading to a truncation exception that isn't present when not using `information_schema`. ([Bug#21544](#))
- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-to-1 mappings between `findColumn()` and `rsmd.getColumnName()`, usually manifests itself as "Can't find column ()" exceptions. ([Bug#21379](#))
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- DatabaseMetaData correctly reports `true` for `supportsCatalog*()` methods.
- Driver now supports `{call sp}` (without "() if procedure has no arguments).

### C.6.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006 beta)

Functionality added or changed:

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies using `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs fixed:

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. ([Bug#20650](#))
- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. ([Bug#20650](#))

### C.6.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

Bugs fixed:

- `MysqlXaConnection.recover(int flags)` now permits combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the “scanning” nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere’s transaction manager. ([Bug#20242](#))
- Fixed `MysqlValidConnectionChecker` for JBoss doesn’t work with `MySQLXADataSources`. ([Bug#20242](#))
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This enables the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don’t maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). ([Bug#20242](#))
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. ([Bug#20242](#))
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. ([Bug#19169](#))
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL’s `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. ([Bug#18086](#))
- Fixed can’t use `XAConnection` for local transactions when no global transaction is in progress. ([Bug#17401](#))

### C.6.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

### C.6.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

Bugs fixed:

- Added support for Connector/MXJ integration using url subprotocol `jdbc:mysql:mxj://...`. ([Bug#14729](#))
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. ([Bug#14729](#))
- When fix for [Bug#14562](#) was merged from 3.1.12, added functionality for `CallableStatement`’s parameter metadata to return correct information for `.getParameterClassName()`. ([Bug#14729](#))
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. ([Bug#14729](#))
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec permits it anyways), part of fix to [Bug#14972](#). ([Bug#14729](#))
- Moved all `SQLException` constructor usage to a factory in `SQLError` (ground-work for JDBC-4.0 `SQLState`-based exception classes). ([Bug#14729](#))
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is ‘’, `(int)0` was being used as an argument indirectly using method return value. This signature doesn’t exist prior to Java5.) ([Bug#14729](#))
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. ([Bug#14729](#))

- Return “[VAR]BINARY” for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). ([Bug#14729](#))
- Attempt detection of the MySQL type `BINARY` (it is an alias, so this isn’t always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the “stock” `XAEception` (which has no messages).
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals

(for example, "`{ts ...}`" and "`{t ...}`").

- Do not permit `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- `XADatasource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Return original column name for `RSMD.getColumnName()` if the column was aliased, alias name for `.getColumnName()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Setting `useJDBCCompliantTimezoneShift=true` (it is not the default) causes the driver to use GMT for all `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

## C.6.3. Changes in MySQL Connector/J 3.1.x

### C.6.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

**Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs fixed:

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. ([Bug#24840](#))

### C.6.3.2. Changes in MySQL Connector/J 3.1.14 (10-19-2006)

Bugs fixed:

- Check and store value for `continueBatchOnError` property in constructor of Statements, rather than when executing batches, so that Connections closed out from underneath statements don't cause `NullPointerExceptions` when it is required to check this property. ([Bug#22290](#))
- Fixed [Bug#18258](#) - `DatabaseMetaData.getTables()`, `columns()` with bad catalog parameter threw exception rather than return empty result set (as required by spec). ([Bug#22290](#))
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'. ([Bug#22290](#))
- Fixed bug where driver would not advance to next host if `roundRobinLoadBalance=true` and the last host in the list is down. ([Bug#22290](#))
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). ([Bug#22290](#))
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that

logs to STDERR. ([Bug#21207](#))

- DDriver throws NPE when tracing prepared statements that have been closed (in asSQL()). ([Bug#21207](#))
- ResultSet.getSomeInteger() doesn't work for BIT(>1). ([Bug#21062](#))
- Escape of quotation marks in client-side prepared statements parsing not respected. Patch covers more than bug report, including NO\_BACKSLASH\_ESCAPES being set, and stacked quote characters forms of escaping (that is, " or ""). ([Bug#20888](#))
- Fixed can't pool server-side prepared statements, exception raised when re-using them. ([Bug#20687](#))
- Fixed Updatable result set that contains a BIT column fails when server-side prepared statements are used. ([Bug#20485](#))
- Fixed updatable result set throws ClassCastException when there is row data and moveToInsertRow() is called. ([Bug#20479](#))
- Fixed ResultSet.getShort() for UNSIGNED TINYINT returns incorrect values when using server-side prepared statements. ([Bug#20306](#))
- ReplicationDriver does not always round-robin load balance depending on URL used for slaves list. ([Bug#19993](#))
- Fixed calling toString() on ResultSetMetaData for driver-generated (that is, from DatabaseMetaData method calls, or from getGeneratedKeys()) result sets would raise a NullPointerException. ([Bug#19993](#))
- Connection fails to localhost when using timeout and IPv6 is configured. ([Bug#19726](#))
- ResultSet.getFloatFromString() can't retrieve values near Float.MIN/MAX\_VALUE. ([Bug#18880](#))
- Fixed memory leak with profileSQL=true. ([Bug#16987](#))
- Fixed NullPointerException in MysqlDataSourceFactory due to Reference containing RefAddrs with null content. ([Bug#16791](#))

### C.6.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

Bugs fixed:

- Fixed PreparedStatement.setObject(int, Object, int) doesn't respect scale of BigDecimals. ([Bug#19615](#))
- Fixed ResultSet.wasNull() returns incorrect value when extracting native string from server-side prepared statement generated result set. ([Bug#19282](#))
- Fixed invalid classname returned for ResultSetMetaData.getColumnClassName() for BIGINT type. ([Bug#19282](#))
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. ([Bug#19282](#))
- Fixed data truncation and getWarnings() only returns last warning in set. ([Bug#18740](#))
- Fixed aliased column names where length of name > 251 are corrupted. ([Bug#18554](#))
- Improved performance of retrieving BigDecimal, Time, Timestamp and Date values from server-side prepared statements by creating fewer short-lived instances of Strings when the native type is not an exact match for the requested type. ([Bug#18496](#))
- Added performance feature, re-writing of batched executes for Statement.executeBatch() (for all DML statements) and PreparedStatement.executeBatch() (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL. ([Bug#18041](#))
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. ([Bug#18041](#))
- Fixed CallableStatement.registerOutParameter() not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from getMetaData() should be, however. ([Bug#17898](#))
- Fixed calling clearParameters() on a closed prepared statement causes NPE. ([Bug#17587](#))
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. ([Bug#17587](#))

- Added additional accessor and mutator methods on ConnectionProperties so that DataSource users can use same naming as regular URL properties. ([Bug#17587](#))
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done using conversion for server-side prepared statements. ([Bug#17450](#))
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. ([Bug#17099](#))
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). ([Bug#16841](#))
- `DBMD.getColumns()` returns wrong type for `BIT`. ([Bug#15854](#))
- `lib-nodist` directory missing from package breaks out-of-box build. ([Bug#15676](#))
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. ([Bug#15570](#))
- No "dos" character set in MySQL > 4.1.0. ([Bug#15544](#))
- `INOUT` parameter does not store `IN` value. ([Bug#15464](#))
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an `UNSIGNED LONG` type). ([Bug#15383](#))
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. ([Bug#14938](#))
- Exception thrown for new decimal type when using updatable result sets. ([Bug#14609](#))
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently . ([Bug#13601](#))
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property. ([Bug#13469](#))
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.

If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this. ([Bug#13469](#))

- LogFactory now prepends `com.mysql.jdbc.log` to the log class name if it cannot be found as specified. This enables you to use "short names" for the built-in log factories, for example, `logger=CommonsLogger` instead of `log-ger=com.mysql.jdbc.log.CommonsLogger`. ([Bug#13469](#))
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. ([Bug#11874](#))

#### C.6.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

Bugs fixed:

- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. ([Bug#15141](#))
- Usage advisor complains about unreferenced columns, even though they've been referenced. ([Bug#15065](#))
- Driver incorrectly closes streams passed as arguments to `PreparedStatements`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePstmtStreams` to `true` (also included in the 3-0-Compat configuration "bundle"). ([Bug#15024](#))
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. ([Bug#14972](#))
- Unable to initialize character set mapping tables (due to J2EE classloader differences). ([Bug#14938](#))
- Escape processor replaces quote character in quoted string with string delimiter. ([Bug#14909](#))

- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. ([Bug#14815](#))
- `storesMixedCaseIdentifiers()` returns `false` ([Bug#14562](#))
- `storesLowerCaseIdentifiers()` returns `true` ([Bug#14562](#))
- `storesMixedCaseQuotedIdentifiers()` returns `false` ([Bug#14562](#))
- `storesMixedCaseQuotedIdentifiers()` returns `true` ([Bug#14562](#))
- If `lower_case_table_names=0` (on server):
  - `storesLowerCaseIdentifiers()` returns `false`
  - `storesLowerCaseQuotedIdentifiers()` returns `false`
  - `storesMixedCaseIdentifiers()` returns `true`
  - `storesMixedCaseQuotedIdentifiers()` returns `true`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`
- ([Bug#14562](#))
- `storesUpperCaseIdentifiers()` returns `false` ([Bug#14562](#))
- `storesUpperCaseQuotedIdentifiers()` returns `true` ([Bug#14562](#))
- If `lower_case_table_names=1` (on server):
  - `storesLowerCaseIdentifiers()` returns `true`
  - `storesLowerCaseQuotedIdentifiers()` returns `true`
  - `storesMixedCaseIdentifiers()` returns `false`
  - `storesMixedCaseQuotedIdentifiers()` returns `false`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`
- ([Bug#14562](#))
- `storesLowerCaseQuotedIdentifiers()` returns `true` ([Bug#14562](#))
- Fixed `DatabaseMetaData.stores*Identifiers()`:
  - If `lower_case_table_names=0` (on server):
    - `storesLowerCaseIdentifiers()` returns `false`
    - `storesLowerCaseQuotedIdentifiers()` returns `false`
    - `storesMixedCaseIdentifiers()` returns `true`
    - `storesMixedCaseQuotedIdentifiers()` returns `true`
    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`
  - If `lower_case_table_names=1` (on server):
    - `storesLowerCaseIdentifiers()` returns `true`
    - `storesLowerCaseQuotedIdentifiers()` returns `true`
    - `storesMixedCaseIdentifiers()` returns `false`

- `storesMixedCaseQuotedIdentifiers()` returns `false`
- `storesUpperCaseIdentifiers()` returns `false`
- `storesUpperCaseQuotedIdentifiers()` returns `true`

(Bug#14562)

- `storesMixedCaseIdentifiers()` returns `true` (Bug#14562)
- `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug#14562)
- Java type conversion may be incorrect for `MEDIUMINT`. (Bug#14562)
- `storesLowerCaseIdentifiers()` returns `false` (Bug#14562)
- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `.getTimestamp()` to return correct millis-since GMT when `.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug#14562)
- Extraneous sleep on `autoReconnect`. (Bug#13775)
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255)
- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048)
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug#12975)
- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug#12975)
- `logSlowQueries` should give better info. (Bug#12230)
- Don't increase timeout for failover/reconnect. (Bug#6577)
- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
- Do not permit `executeBatch()` for `CallableStatements` with registered `OUT/INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.

### C.6.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

Bugs fixed:

- The configuration property `sessionVariables` now permits you to specify variables that start with the “@” sign. (Bug#13453)
- URL configuration parameters do not permit “&” or “=” in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (<http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html>).  
If the “%” character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of “%” when using application/x-www-form-urlencoded encoding. (Bug#13453)
- Workaround for Bug#13374: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed using `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug#13277)

- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. ([Bug#13277](#))
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. ([Bug#13277](#))
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` is not technically permitted by the JDBC specification, but we have historically permitted it). ([Bug#13277](#))
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY/VARBINARY` and related types. ([Bug#13277](#))
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it is reading the response to the empty `LOAD DATA INFILE` packet sent to the server. ([Bug#13277](#))
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. ([Bug#13043](#))
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. ([Bug#12970](#))
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. ([Bug#12970](#))
- Tokenizer for `=` in URL properties was causing `sessionVariables=....` to be parameterized incorrectly. ([Bug#12753](#))
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. ([Bug#12752](#))
- `getExportedKeys()` ([Bug#12541](#))
- Specifying a catalog works as stated in the API docs. ([Bug#12541](#))
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. ([Bug#12541](#))
- `getIndexInfo()` ([Bug#12541](#))
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) ([Bug#12541](#))
- `getImportedKeys()` ([Bug#12541](#))
- Specifying `" "` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users. ([Bug#12541](#))
- `getCrossReference()` ([Bug#12541](#))
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. ([Bug#12541](#))
- `getColumns()` ([Bug#12541](#))
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
  - `getBestRowIdentifier()`
  - `getColumns()`
  - `getCrossReference()`
  - `getExportedKeys()`
  - `getImportedKeys()`
  - `getIndexInfo()`
  - `getPrimaryKeys()`
  - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
  - `getTables()`

The `catalog` argument in all of these methods now behaves in the following way:

- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
- Specifying `" "` means "current" catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users.
- Specifying a catalog works as stated in the API docs.
- Made `Connection.clientPrepare()` available from "wrapped" connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).

([Bug#12541](#))

- `getBestRowIdentifier()` ([Bug#12541](#))
- Made `Connection.clientPrepare()` available from "wrapped" connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). ([Bug#12541](#))
- `getTables()` ([Bug#12541](#))
- `getPrimaryKeys()` ([Bug#12541](#))
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). ([Bug#12417](#))
- `explainSlowQueries` hangs with server-side prepared statements. ([Bug#12229](#))
- Properties shared between master and slave with replication connection. ([Bug#12218](#))
- Geometry types not handled with server-side prepared statements. ([Bug#12104](#))
- `maxPerformance.properties` mis-spells "elideSetAutoCommits". ([Bug#11976](#))
- `ReplicationConnection` won't switch to slave, throws "Catalog can't be null" exception. ([Bug#11879](#))
- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. ([Bug#11798](#))
- Escape tokenizer doesn't respect stacked single quotation marks for escapes. ([Bug#11797](#))
- `GEOMETRY` type not recognized when using server-side prepared statements. ([Bug#11797](#))
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. ([Bug#11781](#))
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M. ([Bug#11781](#))
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT/OUTPUT` parameters as well as `INPUT` parameters. ([Bug#11781](#))
- Fixed regression caused by fix for [Bug#11552](#) that caused driver to return incorrect values for unsigned integers when those integers were within the range of the positive signed type. ([Bug#11663](#))
- Moved source code to Subversion repository. ([Bug#11663](#))
- Incorrect generation of testcase scripts for server-side prepared statements. ([Bug#11663](#))
- Fixed statements generated for testcases missing `:` for "plain" statements. ([Bug#11629](#))
- Spurious `!` on console when character encoding is `utf8`. ([Bug#11629](#))
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in `characters` is specified. ([Bug#11614](#))
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. ([Bug#11575](#))
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`. ([Bug#11498](#))
- Escape processor didn't honor strings demarcated with double quotation marks. ([Bug#11498](#))

- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. ([Bug#11498](#))
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). ([Bug#11498](#))
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. ([Bug#11190](#))
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. ([Bug#11115](#))
- `Statement.getWarnings()` fails with NPE if statement has been closed. ([Bug#10630](#))
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. ([Bug#10630](#))

### C.6.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

Bugs fixed:

- Initial implementation of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.
- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.

### C.6.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

Bugs fixed:

- Production package doesn't include JBoss integration classes. ([Bug#11411](#))
- Removed nonsensical "costly type conversion" warnings when using usage advisor. ([Bug#11411](#))
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. ([Bug#11360](#))
- Connector/J dumping query into `SQLException` twice. ([Bug#11360](#))
- `autoReconnect` ping causes exception on connection startup. ([Bug#11259](#))
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. ([Bug#11115](#))
- `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality ([Bug#11115](#))
- `maxPerformance`: Maximum performance without being reckless ([Bug#11115](#))
- `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can ([Bug#11115](#))
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. ([Bug#11115](#))
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. ([Bug#11115](#))
- Added the following configuration bundles, use one or many using the `useConfigs` configuration property:
  - `maxPerformance`: Maximum performance without being reckless
  - `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can
  - `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality

([Bug#11115](#))
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the con-

nection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a "Connection closed" exception that will also list the OOM exception as the reason for the implicit connection close event. ([Bug#10850](#))

- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. ([Bug#10850](#))
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. ([Bug#10850](#))
- 0-length streams not sent to server when using server-side prepared statements. ([Bug#10850](#))
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[ ,?]` in statements being prepared, as the server supports those types of queries now. ([Bug#10850](#))
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. ([Bug#10496](#))
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestCaseScript` is set to `true`. ([Bug#10496](#))
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucjpms`. ([Bug#10496](#))
- The data type returned for `TINYINT(1)` columns when `tinyIntIsBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyIntIsBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. ([Bug#10485](#))
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Dates` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORTS`. ([Bug#10485](#))
- Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. ([Bug#10310](#))
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. ([Bug#10156](#))
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. ([Bug#10155](#))
- Double quotation marks not recognized when parsing client-side prepared statements. ([Bug#10155](#))
- Made JDBC2-compliant wrappers public to enable access to vendor extensions. ([Bug#10155](#))
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. ([Bug#10155](#))
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. ([Bug#10155](#))
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. ([Bug#10155](#))
- Actually write manifest file to correct place so it ends up in the binary jar file. ([Bug#10144](#))
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. ([Bug#10144](#))
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. ([Bug#10144](#))
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. ([Bug#9064](#))
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.

- Overhaul of character set configuration, everything now lives in a properties file.

### C.6.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

Bugs fixed:

- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it is not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). ([Bug#9917](#))
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. ([Bug#9778](#))
- Added a `Manifest.MF` file with implementation information to the `.jar` file. ([Bug#9778](#))
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. ([Bug#9778](#))
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. ([Bug#9778](#))
- Should accept `null` for name patterns in DBMD (meaning "%"), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). ([Bug#9769](#))
- The performance metrics feature now gathers information about number of tables referenced in a SELECT. ([Bug#9704](#))
- The logging system is now automatically configured. If the value has been set by the user, using the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
  1. Log4j, if it is available,
  2. Then JDK1.4 logging,
  3. Then fallback to our `STDERR` logging.

([Bug#9704](#))
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. ([Bug#9704](#))
- Stored procedures with `DECIMAL` parameters with storage specifications that contained “,” in them would fail. ([Bug#9682](#))
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. ([Bug#9682](#))
- Added support for the c3p0 connection pool's (<http://c3p0.sf.net/>) validation/connection checker interface which uses the light-weight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MySqlConnectionTester`. ([Bug#9320](#))
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. ([Bug#9320](#))
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. ([Bug#9320](#))
- `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish `LIMIT` clauses with placeholders in them from ones without to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. ([Bug#9320](#))
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. ([Bug#9320](#))
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. ([Bug#9319](#))
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. ([Bug#9319](#))
- A continuation of [Bug#8868](#), where functions used in queries that should return nonstring types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n)`

- CHARACTER SET BINARY to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. ([Bug#9236](#))
- Cannot use `UTF-8` for characterSetResults configuration property. ([Bug#9206](#))
  - `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. ([Bug#9040](#))
  - `ServerPreparedStatements` now correctly "stream" `BLOB/CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). ([Bug#8868](#))
  - `DATE_FORMAT()` queries returned as `BLOBS` from `getObject()`. ([Bug#8868](#))
  - Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. ([Bug#8868](#))
  - `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. ([Bug#8868](#))
  - Fixed regression in `ping()` for users using `autoReconnect=true`. ([Bug#8868](#))
  - Check for empty strings (' ') when converting `CHAR/VARCHAR` column data to numbers, throw exception if `emptyStringIsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). ([Bug#8803](#))
  - `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). ([Bug#8803](#))
  - `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive file systems. ([Bug#8800](#))
  - `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). ([Bug#8792](#))
  - Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.
  - Made `Connection.ping()` a public method.
  - Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
  - Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.

### C.6.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

Bugs fixed:

- `PreparedStatement` not creating streaming result sets. ([Bug#8487](#))
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. ([Bug#8487](#))
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. ([Bug#8428](#))
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). ([Bug#8428](#))
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when < 9 bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. ([Bug#8424](#))
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. ([Bug#8424](#))
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize(>=0)` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. ([Bug#8424](#))

- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if nonrounding `BigDecimal.setScale()` fails. ([Bug#8424](#))
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. ([Bug#8096](#))
- Emulated locators corrupt binary data when using server-side prepared statements. ([Bug#8096](#))
- Infinite recursion when “falling back” to master in failover configuration. ([Bug#7952](#))
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. ([Bug#7952](#))
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. ([Bug#7952](#))
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. ([Bug#7952](#))
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over `statement.close()` or new execution on same statement (suggested by Kevin Burton). ([Bug#7715](#))
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. ([Bug#7715](#))
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. ([Bug#7715](#))
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. ([Bug#7686](#))
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(..., cal)`. ([Bug#4718](#))
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. ([Bug#4718](#))
- Always return `byte[ ]`s for output parameters registered as `*BINARY`. ([Bug#4718](#))
- By default, the driver now scans SQL you are preparing using all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. ([Bug#4718](#))
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for nonwell-behaved apps (that is, applications that don't close `Statement` objects when they should). ([Bug#4718](#))
- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. ([Bug#4718](#))
- Fixed bug with Connection not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. ([Bug#4718](#))

### C.6.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

Bugs fixed:

- `DBMD.getProcedures()` doesn't respect catalog parameter. ([Bug#7026](#))
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

### C.6.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

Bugs fixed:

- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is < `max_allowed_packet` on server. ([Bug#6537](#))
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to

conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all “padding” zeros. ([Bug#6537](#))

- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. ([Bug#6537](#))
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. ([Bug#6399](#))
- Make auto-deserialization of `java.lang.Object`s stored in `BLOB` columns configurable using `autoDeserialize` property (defaults to `false`). ([Bug#6399](#))
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. ([Bug#6399](#))
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. ([Bug#6399](#))
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. ([Bug#6348](#))
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for [Bug#6359](#). ([Bug#6225](#))
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. ([Bug#6225](#))
- Use null-safe-equals for key comparisons in updatable result sets. ([Bug#6225](#))
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for [Bug#6359](#). ([Bug#6225](#))
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. ([Bug#5729](#))
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for nonnumeric values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector. ([Bug#5706](#))
- Don't throw exceptions for `Connection.releaseSavepoint()`. ([Bug#5706](#))
- Inefficient detection of pre-existing string instances in `ResultSet.getString()`. ([Bug#5706](#))
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). ([Bug#5706](#))
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error “Wrong arguments to mysql\_stmt\_execute()”. ([Bug#5235](#))
- Handle case when string representation of timestamp contains trailing “.” with no numbers following it. ([Bug#5235](#))
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. ([Bug#5235](#))
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales “override” case rules for English. Also use `StringUtil.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

### C.6.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

Bugs fixed:

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it is currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundsException`. ([Bug#5032](#))
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet:exception` (the default), which throws an `SQLException` with an SQLState of `S1009;convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is '0001-01-01'. ([Bug#5032](#))

- The driver is more strict about truncation of numerics on `ResultSet.get*`( ), and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). ([Bug#5032](#))
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. ([Bug#5032](#))
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for "pseudo" bit type). ([Bug#5032](#))
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. ([Bug#5032](#))
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. ([Bug#5012](#))
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. ([Bug#4689](#))
- `ResultSet.wasNull()` does not work for primitives if a previous `null` was returned. ([Bug#4689](#))
- Optimized integer number parsing, enable "old" slower integer parsing using JDK classes using `useFastIntParsing=false` property. ([Bug#4642](#))
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the SQLState's "standard" description, followed by the server's error message). This property is set to `true` by default. ([Bug#4642](#))
- `ServerPreparedStatement.execute*`( ) sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. ([Bug#4642](#))
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` -> `Buffer.readShort()`). ([Bug#4510](#))
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. ([Bug#4510](#))
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. ([Bug#4482](#))
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. ([Bug#4482](#))

### C.6.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

Bugs fixed:

- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. ([Bug#4311](#))
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. ([Bug#4311](#))
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. ([Bug#4311](#))
- Externalized more messages (on-going effort). ([Bug#4119](#))
- Null bitmask sent for server-side prepared statements was incorrect. ([Bug#4119](#))
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to SQLStates that the driver uses (for documentation purposes). ([Bug#4119](#))
- Added packet debugging code (see the `enablePacketDebug` property documentation). ([Bug#4119](#))
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. ([Bug#4119](#))
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.

### C.6.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

Bugs fixed:

- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). ([Bug#3804](#))
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. ([Bug#3804](#))
- `getProcedureColumns()` doesn't work with wildcards for procedure name. ([Bug#3540](#))
- `getProcedures()` does not return any procedures in result set. ([Bug#3539](#))
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1). ([Bug#3520](#))
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. ([Bug#3520](#))
- `DBMD.getSQLStateType()` returns incorrect value. ([Bug#3520](#))
- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParameter()`. ([Bug#3146](#))
- Cleaned up detection of server properties. ([Bug#3146](#))
- Correctly detect initial character set for servers >= 4.1.0. ([Bug#3146](#))
- Support placeholder for parameter metadata for server >= 4.1.2. ([Bug#3146](#))
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Enabled callable statement caching using `cacheCallableStmts` property.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.

### C.6.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004 alpha)

Bugs fixed:

- Use DocBook version of docs for shipped versions of drivers. ([Bug#2671](#))
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. ([Bug#2671](#))
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. ([Bug#2671](#))
- Fixed `ConnectionProperties` that weren't properly exposed through accessors, cleaned up `ConnectionProperties` code. ([Bug#2623](#))

- Class-cast exception when using scrolling result sets and server-side prepared statements. ([Bug#2623](#))
- Merged unbuffered input code from 3.0. ([Bug#2623](#))
- Enabled streaming of result sets from server-side prepared statements. ([Bug#2606](#))
- Server-side prepared statements were not returning data type `YEAR` correctly. ([Bug#2606](#))
- Fixed charset conversion issue in `getTables()`. ([Bug#2502](#))
- Implemented multiple result sets returned from a statement or stored procedure. ([Bug#2502](#))
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`. ([Bug#2359](#))
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. ([Bug#2359](#))
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements. ([Bug#2359](#))
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. ([Bug#2359](#))
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. ([Bug#2359](#))
- Display where/why a connection was implicitly closed (to aid debugging). ([Bug#1673](#))
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-'%' column name patterns. ([Bug#1673](#))
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month discrepancies in `ServerPreparedStatement.setTimestamp(), setDate()`. ([Bug#1673](#))
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. ([Bug#1673](#))
- Fixed sending of queries larger than 16M. ([Bug#1673](#))
- Merged fix of data type mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. ([Bug#1673](#))
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. ([Bug#1673](#))
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. ([Bug#1673](#))
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. ([Bug#1673](#))
- Detect collation of column for `RSMD.isCaseSensitive()`. ([Bug#1673](#))
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions  $\geq 5.0.0$
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Removed `useFastDates` connection property.

- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for transaction savepoints (MySQL >= 4.0.14 or 4.1.1).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn’t provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Centralized setting of result set type and concurrency.
- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `Data-Source` properties.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.

### C.6.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003 alpha)

Bugs fixed:

- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Added `requireSSL` property.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

## C.6.4. Changes in MySQL Connector/J 3.0.x

### C.6.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

Bugs fixed:

- Workaround for server Bug#9098: Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can’t be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. (Bug#8812)
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. (Bug#8812)
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn’t understand. (Bug#8629)
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `euc_jpms` (backported from 3.1 branch). This only works on servers that support `euc_jpms`, namely 5.0.3 or later. (Bug#8629)
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including “aliases” `Windows-31J`, `CP934`, `MS932`. (Bug#8629)
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. (Bug#8629)

- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. ([Bug#8064](#))
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. ([Bug#7952](#))
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). ([Bug#7686](#))
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. ([Bug#7686](#))
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. ([Bug#7607](#))
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. ([Bug#7601](#))
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. ([Bug#7601](#))
- Escape sequence `{fn convert(..., type)}` now supports ODBC-style types that are prepended by `SQL_`. ([Bug#7601](#))
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. ([Bug#7316](#))
- Support new protocol type `MYSQL_TYPE_VARCHAR`. ([Bug#7081](#))
- Added `useOldUTF8Behavior`' configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. ([Bug#7081](#))
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. ([Bug#7081](#))
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. ([Bug#7061](#))
- `PreparedStatement`s don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. ([Bug#7033](#))
- Connections starting up failed-over (due to down master) never retry master. ([Bug#6966](#))
- Adding `CP943` to aliases for `sjis`. ([Bug#6549](#), [Bug#7607](#))
- `Timestamp/Time` conversion goes in the wrong "direction" when `useTimeZone=true` and server time zone differs from client time zone. ([Bug#5874](#))

#### C.6.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

Bugs fixed:

- Made `TINYINT(1) -> BIT/Boolean` conversion configurable using `tinyIntIsBit` property (default `true` to be JDBC compliant out of the box). ([Bug#5664](#))
- Off-by-one bug in `Buffer.readString(string)`. ([Bug#5664](#))
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. ([Bug#5664](#))
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. ([Bug#5664](#))
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. ([Bug#5664](#))
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, nonnegative) scale for the `NUMERIC` type. ([Bug#5664](#))
- Only set `character_set_results` during connection establishment if server version  $\geq 4.1.1$ . ([Bug#5664](#))
- Fixed `ResultSetMetaData.isReadOnly()` to detect nonwritable columns when connected to MySQL-4.1 or newer, based on existence of "original" table and column names.
- Re-issue character set configuration commands when re-using pooled connections or `Connection.changeUser()` when connected to MySQL-4.1 or newer.

### C.6.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

Bugs fixed:

- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. ([Bug#5069](#))
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. ([Bug#5069](#))
- Parse new time zone variables from 4.1.x servers. ([Bug#5069](#))
- `ResultSet` should release `Field[]` instance in `.close()`. ([Bug#5022](#))
- `RSMD.getPrecision()` returning 0 for nonnumeric types (should return max length in chars for nonbinary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). ([Bug#4880](#))
- “Production” is now “GA” (General Availability) in naming scheme of distributions. ([Bug#4860](#), [Bug#4138](#))
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. ([Bug#4860](#), [Bug#4138](#))
- Calling `.close()` twice on a `PooledConnection` causes NPE. ([Bug#4808](#))
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. ([Bug#4742](#))
- Added FLOSS license exemption. ([Bug#4742](#))
- Removed redundant calls to `checkRowPos()` in `ResultSet`. ([Bug#4334](#))
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

#### **Warning**

This required a change to the `SocketFactory.connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

([Bug#4334](#))

- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. ([Bug#4334](#))
- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. ([Bug#4010](#))

### C.6.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

Bugs fixed:

- Fixed URL parsing error.

### C.6.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

Bugs fixed:

- `No Database Selected` when using `MysqlConnectionPoolDataSource`. ([Bug#3920](#))
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. ([Bug#3873](#))
- Using a `MySQLDatasource` without server name fails. ([Bug#3848](#))

### C.6.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

Bugs fixed:

- Inconsistent reporting of data type. The server still doesn't return all types for \*BLOBS \*TEXT correctly, so the driver won't return those correctly. ([Bug#3570](#))
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. ([Bug#3557](#))
- Not specifying database in URL caused `MalformedURLException` exception. ([Bug#3554](#))
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. ([Bug#3554](#))
- Use `junit.textui.TestRunner` for all unit tests (to enable them to be run from the command line outside of Ant or Eclipse). ([Bug#3554](#))
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. ([Bug#3554](#))
- Made `StringRegressionTest` 4.1-unicode aware. ([Bug#3520](#))
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. ([Bug#3520](#))
- `DBMD.getSQLStateType()` returns incorrect value. ([Bug#3520](#))
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. ([Bug#3511](#))
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. ([Bug#3511](#))
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. ([Bug#2957](#))
- Use `SET character_set_results` during initialization to enable any charset to be returned to the driver for result sets. ([Bug#2670](#))
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and `setBinary/CharacterStream()`. ([Bug#2670](#))
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. ([Bug#2670](#))
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers >= 4.1.2. ([Bug#2670](#))
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL >= 4.1.0. ([Bug#2670](#))
- Add helper methods to `ResultSetMetaData.getColumnCharacterEncoding()` and `getColumnCharacterSet()` to permit end users to see what charset the driver thinks it should be using for the column. ([Bug#2670](#))
- Only set `character_set_results` for MySQL >= 4.1.0. ([Bug#2670](#))
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPoolDataSource` so that passing of other properties is possible from inside appservers.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Backport documentation tooling from 3.1 branch.
- Added `failOverReadOnly` property, to enable the user to configure the state of the connection (read-only/writable) when failed over.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. . ([Bug#103](#))
- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Map duplicate key and foreign key errors to SQLState of `23000`.
- Backported "change user" and "reset server state" functionality from 3.1 branch, to enable clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.

### C.6.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

Bugs fixed:

- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. ([Bug#2855](#))
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance). ([Bug#2855](#))
- Issue connection events on all instances created from a `ConnectionPoolDataSource`. ([Bug#2855](#))
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. ([Bug#2852](#))
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue <http://developer.java.sun.com/developer/bugParade/bugs/4401235.html>) ([Bug#2578](#))
- Fixed failover always going to last host in list. ([Bug#2578](#))
- Detect `on/off` or `1, 2, 3` form of `lower_case_table_names` value on server. ([Bug#2578](#))
- `AutoReconnect` time was growing faster than exponentially. ([Bug#2447](#))
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` or `utf-8` using the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

### C.6.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

Bugs fixed:

- Enable caching of the parsing stage of prepared statements using the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). ([Bug#2006](#))
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). ([Bug#2006](#))
- Speed up parsing of `PreparedStatement`s, try to use one-pass whenever possible. ([Bug#2006](#))
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 ([Bug#2006](#))
- Fixed mappings in SQLError to report deadlocks with SQLStates of `41000`. ([Bug#2006](#))
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. ([Bug#2006](#))
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. ([Bug#2006](#))
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). ([Bug#2006](#))
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. ([Bug#2006](#))
- Use constants for SQLStates. ([Bug#2006](#))
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. ([Bug#2006](#))
- Ensure that `Buffer.writeString()` saves room for the `\0`. ([Bug#2006](#))
- `ArrayIndexOutOfBoundsException` when parameter number == number of parameters + 1. ([Bug#1958](#))
- Connection property `maxRows` not honored. ([Bug#1933](#))
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. ([Bug#1925](#))
- Support escape sequence {fn convert ...}. ([Bug#1914](#))
- Implement `ResultSet.updateClob()`. ([Bug#1913](#))

- Autoreconnect code didn't set catalog upon reconnect if it had been changed. ([Bug#1913](#))
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. ([Bug#1913](#))
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. ([Bug#1913](#))
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR/VARCHAR` columns. ([Bug#1913](#))
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. ([Bug#1913](#))
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. ([Bug#1775](#))
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. ([Bug#1731](#))
- Fix for `ArrayIndexOutOfBoundsException` exception when using `Statement.setMaxRows()`. ([Bug#1695](#))
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. ([Bug#1630](#))
- Fix for 4.1.1-style authentication with no password. ([Bug#1630](#))
- Cross-database updatable result sets are not checked for updatability correctly. ([Bug#1592](#))
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. ([Bug#1592](#))
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. ([Bug#1576](#))
- Barge blobs and split packets not being read correctly. ([Bug#1576](#))
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. ([Bug#1534](#))
- “Friendlier” exception message for `PacketTooLargeException`. ([Bug#1534](#))
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. ([Bug#1511](#))

#### C.6.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

Bugs fixed:

- `ResultSet.get/setString` mashing char 127. ([Bug#1247](#))
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. ([Bug#1247](#))
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. ([Bug#1247](#))
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. ([Bug#1247](#))
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. ([Bug#1246](#))
- Optimized `CLOB.setCharacterStream()`. ([Bug#1131](#))
- Fixed `CLOBtruncate()`. ([Bug#1130](#))
- Fixed deadlock issue with `Statement.setMaxRows()`. ([Bug#1099](#))
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. ([Bug#1099](#))
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble/setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. ([Bug#884](#))
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. ([Bug#884](#))
- Double-escaping of '\\' when charset is SJIS or GBK and '\\' appears in nonescaped input. ([Bug#879](#))

- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows to not monopolize CPU time. ([Bug#879](#))
- Issue exception on `ResultSet.getXXX()` on empty result set (wasn't caught in some cases). ([Bug#848](#))
- Don't hide messages from exceptions thrown in I/O layers. ([Bug#848](#))
- Fixed regression in large split-packet handling. ([Bug#848](#))
- Better diagnostic error messages in exceptions for “streaming” result sets. ([Bug#848](#))
- Don't change timestamp TZ twice if `useTimezone==true`. ([Bug#774](#))
- Don't wrap `SQLExceptions` in `RowDataDynamic`. ([Bug#688](#))
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. ([Bug#688](#))
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. ([Bug#688](#))
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. ([Bug#688](#))
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). ([Bug#688](#))
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. ([Bug#675](#))
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). ([Bug#664](#), [Bug#517](#))
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). ([Bug#664](#), [Bug#517](#))
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). ([Bug#661](#))
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. ([Bug#496](#))
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. ([Bug#496](#))
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.

#### C.6.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

Bugs fixed:

- Fixed SJIS encoding bug, thanks to Naoto Sato. ([Bug#378](#))
- Fix problem detecting server character set in some cases. ([Bug#378](#))
- Allow multiple calls to `Statement.close()`. ([Bug#378](#))
- Return correct number of generated keys when using `REPLACE` statements. ([Bug#378](#))
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. ([Bug#378](#))
- Fix row data decoding error when using *very* large packets. ([Bug#378](#))
- Optimized row data decoding. ([Bug#378](#))
- Issue exception when operating on an already closed prepared statement. ([Bug#378](#))
- Optimized usage of `EscapeProcessor`. ([Bug#378](#))
- Use JVM charset with file names and `LOAD DATA [LOCAL] INFILE`.

- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Allow bogus URLs in `Driver.getPropertyInfo()`.

### C.6.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

Bugs fixed:

- Fixed charset issues with database metadata (charset was not getting set correctly).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- 4.1 Column Metadata fixes.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Fixed escaping of 0x5c ('\') character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).

### C.6.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

Bugs fixed:

- Backported 4.1 charset field info changes from Connector/J 3.1.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `ResultSetMetaData` to return " " when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.

- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not permitted with `.executeQuery()`).
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).

#### C.6.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

Bugs fixed:

- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added update options for foreign key metadata.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBoundsException` exceptions with some queries when unpacking fields.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatement`s.

#### C.6.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

Bugs fixed:

- Streamlined character conversion and `byte[]` handling in `PreparedStatement`s for `setByte()`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for 4.0.8-style large packets.
- Reduce memory footprint of `PreparedStatement`s by sharing outbound packet with `MysqlIO`.
- Added `strictUpdates` property to enable control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for quoted identifiers in `PreparedStatement` parser.

#### C.6.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

Bugs fixed:

- Allow user to alter behavior of `Statement/PreparedStatement.executeBatch()` using `continueBatchOnError` property (defaults to `true`).
- More robust escape tokenizer: Recognize `--` comments, and permit nested escape sequences (see `test-suite.EscapeProcessingTest`).

- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- `NamedPipeSocketFactory` now works (only intended for Windows), see [README](#) for instructions.
- Changed `charsToByte` in `SingleByteCharConverter` to be nonstatic.
- Use nonaliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to permit it. Can be turned off with the `allowLoadLocalInfile` property (see the [README](#)).
- Implemented `Connection.nativeSQL()`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed charset handling in `Fields.java`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- Some MySQL-4.1 protocol support (extended field info from selects).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.

#### C.6.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

Bugs fixed:

- Implemented `Clob.setString()`.
- Added `com.mysql.jdbc.MiniAdmin` class, which enables you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added SSL support. See [README](#) for information on how to use it.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also enables cascade options for `DELETE` information to be returned.
- Implemented `Clob.setCharacterStream()`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, to stay transaction-safe.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Implemented `Clob.setAsciiStream()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).

- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding using properties.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Escape `0x5c` character in strings for the SJIS charset.
- `PreparedStatement` now honors stream lengths in `setBinary/Ascii/Character Stream()` unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Fixed issue with updatable result sets and `PreparedStatements` not working.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Added `connectTimeout` parameter that enables users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed various non-ASCII character encoding issues.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Properly restore connection properties when autoReconnecting or failing-over, including `autoCommit` state, and isolation level.
- Implemented `Clobtruncate()`.

#### C.6.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

Bugs fixed:

- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Fixed `RowDataStatic.getValueAt()` off-by-one bug.
- Fixed `ResultSet.getRow()` off-by-one bug.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Implemented `ResultSet.getCharacterStream()`.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`).
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `socketTimeout` parameter to URL.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as host names, ports, or user names), as well as clearing “sensitive” data structures when possible.

### C.6.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

Bugs fixed:

- General source-code cleanup.
- The driver now only works with JDK-1.2 or newer.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- Support for streaming (row-by-row) result sets (see [README](#)) Thanks to Doron.
- Testsuite now uses Junit (which you can get from <http://www.junit.org>).
- JDBC Compliance: Passes all tests besides stored procedure tests.
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Added multi-host failover support (see [README](#)).
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Support for large packets (new addition to MySQL-4.0 protocol), see [README](#) for more information.
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Overall speed improvements using controlling transient object creation in `MysqlIO` class when reading packets.
- !!! LICENSE CHANGE !!! The driver is now GPL. If you need non-GPL licenses, please contact me <[mark@mysql.com](mailto:mark@mysql.com)>.
- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.

## C.6.5. Changes in MySQL Connector/J 2.0.x

### C.6.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

Bugs fixed:

- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- Fixed typo for `relaxAutoCommit` parameter.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See [README](#) for more information.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- More code cleanup.
- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `-sql-mode=ANSI_QUOTES`, “`”` will be used as an identifier quote character, otherwise “`‘`” will be used.

### C.6.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

---

Bugs fixed:

- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PreparedStatement`.
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- More code cleanup.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- `ResultSetMetaData.getColumnClassName()` now implemented.

### C.6.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

Bugs fixed:

- Fixed `testsuite.Traversal.afterLast()` bug, thanks to Igor Lastric.
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `BIT` types (51870) to `PreparedStatement`.
- `ResultSet.insertRow()` should now detect auto\_increment fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added support for `YEAR` type (533556).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Added `getTable/ColumnPrivileges()` to DBMD (fixes 484502).
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- `ResultSet.refreshRow()` implemented.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- General code cleanup.

### C.6.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

Bugs fixed:

- Full synchronization of `Statement.java`.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.

- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

### C.6.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

Bugs fixed:

- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).
- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).

### C.6.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

Bugs fixed:

- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed casting bug in `PreparedStatement` (bug 488663).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADatasource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed quoting error with escape processor (bug 486265).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).

### C.6.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

Bugs fixed:

- `XADatasource/ConnectionPoolDataSource` code (experimental)
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).

### C.6.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

Bugs fixed:

- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)

- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- `PreparedStatement.setCharacterStream()` now implemented
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- `PreparedStatement.setDouble()` now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Updatable result sets now correctly handle `NULL` values in fields.
- `PreparedStatement.setBoolean()` will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Fixed `ResultSet.isAfterLast()` always returning `false`.

### C.6.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

Bugs fixed:

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

### C.6.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

Bugs fixed:

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- Added `Byte` to `PreparedStatement.setObject()`.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- `DataBaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has +/-Inf/inf support.
- `getObject()` on `ResultSet` correctly does `TINYINT->Byte` and `SMALLINT->Short`.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT/BLOB`.
- Fixed `ArrayIndexOutOfBoundsException` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.

### C.6.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

Bugs fixed:

- Fixed composite key problem with updatable result sets.
- Faster ASCII string operations.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Added detection of -/+INF for doubles.
- Added `ultraDevHack` URL parameter, set to `true` to enable (broken) Macromedia UltraDev to use the driver.
- Implemented `getBigDecimal()` without scale component for JDBC2.

### C.6.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

Bugs fixed:

- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- Cleaned up exception handling when driver connects.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cesar Garcia and Carlos Martinez.
- No escape processing is done on `PreparedStatements` anymore per JDBC spec.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

### C.6.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

### C.6.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to `ResultSet` for `insertRow()` - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed `ResultSet` to return correct row numbers
- `Statement.getUpdateCount()` now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- `Statement/PreparedStatement.getMoreResults()` bug fixed. Thanks to Noel J. Bergman.
- Added `Short` as a type to `PreparedStatement.setObject()`. Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

### C.6.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

---

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLEception in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to be specified to connect. (Thanks to Christian Motschke)

## C.6.6. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now permits null for a column name pattern (not in spec), which it changes to '%'.
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotation marks correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859\_1", but they do not.
- Fixed Connection to use the platform character encoding instead of "ISO8859\_1" if one isn't explicitly set. This fixes problems people were having loading the character-converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MysqlIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to {} inside quotation marks.

## C.6.7. Changes in MySQL Connector/J 1.2.x and lower

### C.6.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

### C.6.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements

- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

### C.6.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MySqlDefs to allow all \*text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

### C.6.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidirectionally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

### C.6.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values using setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

### C.6.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

### C.6.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set using properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value using "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

### C.6.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LGPL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.stringToStream to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

### C.6.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to getTypeInfo() for parameters, and so forth.
- DatabaseMetaData is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

### C.6.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented `getTypeInfo()`. `Connection.rollback()` now throws an `SQLException` per the JDBC spec.
- Added `PreparedStatement` that supports all JDBC API methods for `PreparedStatement` including `InputStreams`. Please check this out and let me know if anything is broken.
- Fixed a bug in `ResultSet` that would break some queries that only returned 1 row.
- Fixed bugs in `DatabaseMetaData.getTables()`, `DatabaseMetaData.getColumns()` and `DatabaseMetaData.getCatalogs()`.
- Added functionality to `Statement` that enables `executeUpdate()` to store values for IDs that are automatically generated for `AUTO_INCREMENT` fields. Basically, after an `executeUpdate()`, look at the `SQLWarnings` for warnings like "`"LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'"`. If you are using `AUTO_INCREMENT` fields in your tables and are executing a lot of `executeUpdate()`s on one `Statement`, be sure to `clearWarnings()` every so often to save memory.

### C.6.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split `MysqlIO` and `Buffer` to separate classes. Some `ClassLoaders` gave an `IllegalAccessException` error for some fields in those two classes. Now `mm.mysql` works in applets and all classloaders. Thanks to Joe Ennis <[jce@mail.boone.com](mailto:jce@mail.boone.com)> for pointing out the problem and working on a fix with me.

### C.6.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed `DatabaseMetadata` problems in `getColumns()` and bug in switch statement in the `Field` constructor. Thanks to Costin Manolache <[costin@tdiinc.com](mailto:costin@tdiinc.com)> for pointing these out.

### C.6.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <[Richard.Swift@kanatek.ca](mailto:Richard.Swift@kanatek.ca)> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
  - `getTables()`
  - `getTableTypes()`
  - `getColumns()`
  - `getCatalogs()`

## C.7. MySQL Connector/MXJ Change History

### C.7.1. Changes in MySQL Connector/MXJ 5.0.11 (24th November 2009)

Functionality added or changed:

- The embedded MySQL binaries have been updated to MySQL 5.1.40 for GPL releases and MySQL 5.1.40 for Commercial releases.
- The contents of the directory used for bootstrapping the MySQL databases is now configurable by using the `windows-share-dir-jar` property. You should supply the name of a jar containing the files you want to use.
- The embedded Aspect/J class has been removed.

- The default timeout for the kill delay within the embedded test suite has been increased from 10 to 30 seconds.

Bugs fixed:

- On startup Connector/MXJ generated an exception on Windows 7:

```
Exception in thread "Thread-3" java.util.MissingResourceException?: Resource
`5-0-51a/Windows_7-x86/mysqld-nt.exe' not found
at com.mysql.management.util.Streams.getResourceAsStream(Streams.java:133)
at com.mysql.management.util.Streams.getResourceAsStream(Streams.java:107)
at com.mysql.management.util.Streams$1.inner(Streams.java:149) at
com.mysql.management.util.Exceptions$VoidBlock?.exec(Exceptions.java:128)
at com.mysql.management.util.Streams.createFileFromResource(Streams.java:162)
at com.mysql.management.MysqldResource?.makeMysqld(MysqldResource?.java:533)
at com.mysql.management.MysqldResource?.deployFiles(MysqldResource?.java:518)
at com.mysql.management.MysqldResource?.exec(MysqldResource?.java:495)
at com.mysql.management.MysqldResource?.start(MysqldResource?.java:216)
at com.mysql.management.MysqldResource?.start(MysqldResource?.java:166)
```

The default [platform-map.properties](#) file, which maps platforms to the supplied binary bundles, has been updated with additional platforms, including Windows 7, Windows Server 2008, [amd64](#) and [sparcv9](#) for Solaris, and Mac OS X 64-bit. ([Bug#48298](#))

## C.7.2. Changes in MySQL Connector/MXJ 5.0.10 (Never released)

This was an internal only release.

Functionality added or changed:

- The embedded MySQL has been updated to the MySQL 5.1 series. The embedded MySQL binaries have been updated to MySQL 5.1.33 for GPL releases and MySQL 5.1.34 for Commercial releases.
- The MySQL binary for Windows targets has been updated to be configurable through the [windows-mysqld-command](#) property. This is to handle the move in MySQL 5.1.33 from [mysqld-nt.exe](#) to [mysqld.exe](#). The default value is [mysqld.exe](#).

## C.7.3. Changes in MySQL Connector/MXJ 5.0.9 (19 August 2008)

Functionality added or changed:

- The port used in the [ConnectorMXJUrlTestExample](#) and [ConnectorMXJObjectTestExample](#) port is no longer hard coded. Instead, the code uses the [x-mxj\\_test\\_port](#) property a default value of 3336
- The utility used to kill MySQL on Windows ([kill.exe](#)) has been configured to be loaded from the [kill.exe](#) property, instead of being hard-coded. The corresponding timeout, [KILL\\_DELAY](#) has also been moved to the properties file and defaults to 5 minutes.
- The embedded MySQL binaries have been updated to MySQL 5.0.51a for GPL releases and MySQL 5.0.54 for Commercial releases.
- The timeout for kill operations in the embedded test suite has been set to a default of 10 seconds.

## C.7.4. Changes in MySQL Connector/MXJ 5.0.8 (06 August 2007)

Functionality added or changed:

- The embedded documentation has been updated so that it now points to the main MySQL documentation pages in the MySQL reference manual.
- The embedded MySQL binaries have been updated to MySQL 5.0.45 for GPL releases and MySQL 5.0.46 for Commercial releases.

## C.7.5. Changes in MySQL Connector/MXJ 5.0.7 (27 May 2007)

---

Functionality added or changed:

- Updated the jar filename to be consistent with the Connector/J jar filename. Files are now formatted as `mysql-connector-mxj-mxj-version`.
- The `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExampple` have been updated to include an example of initializing the user/password and creating an initial database. The `InitializePasswordExample` example class has now been removed.
- The `PatchedStandardSocketFactory` class has been removed, because it fixed an issue in Connector/J that was corrected in Connector/J 5.0.6.
- The embedded MySQL binaries have been updated to MySQL 5.0.41 for GPL releases and MySQL 5.0.42 for Commercial releases.

Bugs fixed:

- Added a null-check to deal with class loaders where `getClassLoader()` returns null.

## C.7.6. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

Functionality added or changed:

- Updated internal jar file names to include version information and be more consistent with Connector/J jar naming. For example, `connector-mxj.jar` is now `mysql-connector-mxj-${mxj-version}.jar`.
- Updated commercial license files.
- Added copyright notices to some classes which were missing them.
- Added `InitializeUser` and `QueryUtil` classes to support new feature.
- Added new tests for initial-user & expanded some existing tests.
- `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` now demonstrate the initialization of user/password and creating the initial database (rather than using "test").
- Added new connection property `initialize-user` which, if set to `true` will remove the default, un-passworded anonymous and root users, and create the user/password from the connection url.
- Removed obsolete field `SimpleMysqldDynamicMBean.lastInvocation`.
- Clarified code in `DefaultsMap.entrySet()`.
- Removed obsolete `PatchedStandardSocketFactory` java file.
- Added `main(String[])` to `com/mysql/management/AllTestsSuite.java`.
- Errors reading `portFile` are now reported using `stacktrace(err)`, previously `System.err` was used.
- `portFile` now contains a new-line to be consistent with `pidFile`.
- Fixed where `versionString.trim()` was ignored.
- Removed references to `File.deleteOnExit`, a warning is printed instead.

Bugs fixed:

- Changed tests to shutdown mysqld prior to deleting files.
- Fixed port file to always be written to datadir.
- Added os.name-os.arch to resource directory mapping properties file.
- Swapped out commercial binaries for v5.0.40.

- Delete `portFile` on shutdown.
- Moved `platform-map.properties` into `db-files.jar`.
- Clarified the startup max wait numbers.
- Updated `build.xml` in preparation for next beta build.
- Removed `use-default-architecture` property replaced.
- Added null-check to deal with C/MXJ being loaded by the bootstrap classloaders with JVMs for which `getClassLoader()` returns null.
- Added robustness around reading portfile.
- Removed `PatchedStandardSocketFactory` (fixed in Connector/J 5.0.6).
- Refactored duplication from tests and examples to `QueryUtil`.
- Removed obsolete `InitializePasswordExample`

## C.7.7. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Bugs fixed:

- Moved `MysqldFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Swapped out commercial binaries for v5.0.36.
- Found and removed dynamic linking in `mysql_kill`; updated solution.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: [MySQL Forums](#) (Actual testing with JBoss, and filing a bug, is still required.)
- `build.xml: usage` now slightly more verbose; some reformatting.
- Now incorporates Reggie Bennett's `SafeTerminateProcess` and only calls the unsafe `TerminateProcess` as a final last resort.
- New windows `kill.exe` fixes a bug where mysqld was being force terminated. Issue reported by bruno halebian and others, see: [MySQL Forums](#).
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- Changed `connector-mxj.properties` default mysql version to 5.0.37.
- In testing so far mysqld reliably shuts down cleanly much faster.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrates that `dataDir` is a mutable MBean property.
- Updated `build.xml` in prep for next release.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand to enable setting of `datadir`. (Rubinger bug groundwork).
- Clarified the synchronization of `MysqldResource` methods.
- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Clarified the immutability of `baseDir, dataDir, pidFile, portFile`.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.

- Added `getDataDir()` to interface `MysqldResourceI`.
- Added 5.1.14 binaries to repository.
- Replaced windows `kill.exe` resource with re-written version specific to mysqld.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- Ensured 5.1.14 compatibility.
- Swapped out gpl binaries for v5.0.37.
- Removed 5.0.22 binaries from the repository.

## C.7.8. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

Bugs fixed:

- Allow multiple calls to start server from URL connection on non-3306 port. ([Bug#24004](#))
- Updated `build.xml` to build to handle with different gpl and commercial mysld version numbers.
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Swapped out gpl binaries for v5.0.27.
- Swapped out commercial binaries for v5.0.32.
- Moved mysqld binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-mxj-db-files.jar`.
- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.
- Fixed test to be tollerant of `/tmp` being a symlink to `/foo/tmp`.

## C.7.9. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

Bugs fixed:

- Removed unused imports, formatted code, made minor edits to tests.
- Removed "TeeOutputStream" - no longer needed.
- Swapped out the mysqld binaries for MySQL v5.0.22.

## C.7.10. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Bugs fixed:

- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.
- "platform" directories replace spaces with underscores
- extracted array and list printing to `ListToString` utility class
- Swapped out the mysqld binaries for MySQL v5.0.21
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`

- reformatted code
- altered to be "basedir" rather than "port" oriented.
- help parsing test reflects current help options
- insulated users from problems with "." in basedir
- swapped out the mysqld binaries for MySQL v5.0.18
- Made tests more robust by deleting the /tmp/test-c.mxj directory before running tests.
- ServerLauncherSocketFactory.shutdown API change: now takes File parameter (basedir) instead of port.
- socket is now "mysql.sock" in datadir
- added ability to specify "mysql-version" as an url parameter
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.
- swapped out the mysqld binaries for MySQL v5.0.19
- MysqldResource now tied to dataDir as well as basedir (API CHANGE)
- moved PID file into datadir
- ServerLauncherSocketFactory.shutdown now works across JVMs.
- extracted splitLines(String) to Str utility class
- ServerLauncherSocketFactory.shutdown(port) no longer throws, only reports to System.err
- ServerLauncherSocketFactory now treats URL parameters in the form of `&server.foo=null` as `serverOptionsMap.put("foo", null)`
- ServerLauncherSocketFactory.shutdown API change: now takes 2 File parameters (basedir, datadir)

## C.7.11. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

## C.7.12. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Bugs fixed:

- Removed HelpOptionsParser's need to reference a MysqldResource.
- Reorganized utils into a single "Utils" collaborator.
- Minor test tweaks
- Altered examples and tests to use new Connector/J 5.0 URL syntax for launching Connector/MXJ ("jdbc:mysql:mxj://")
- Swapped out the mysqld binaries for MySQL v5.0.16.
- Ditched "ClassUtil" (merged with Str).
- Minor refactorings for type casting and exception handling.

# C.8. MySQL Connector/C++ Change History

## C.8.1. Changes in MySQL Connector/C++ 1.1.x

### C.8.1.1. Changes in MySQL Connector/CPP 1.1.0 (Note yet released GA)

This fixes bugs since the first GA release 1.0.5 and introduces new features.

Functionality added or changed:

- **Incompatible Change:** API incompatible change: `ConnectPropertyVal` is no longer a `struct` by a typedef that uses `boost::variant`. Code such as:

```
sql::ConnectPropertyVal tmp;
tmp.str.val=passwd.c_str();
tmp.str.len=passwd.length();
connection_properties["password"] = tmp;
```

Should be changed to:

```
connection_properties["password"] = sql::ConnectPropertyVal(passwd);
```

- Instances of `std::auto_ptr` have been changed to `boost::scoped_ptr`. Scoped array instances now use `boost::scoped_array`. Further, `boost::shared_ptr` and `boost::weak_ptr` are now used for guarding access around result sets.
- `LDFLAGS`, `CXXFLAGS` and `CPPFLAGS` are now checked from the environment for every binary generated.
- Connection map property `OPT_RECONNECT` was changed to be of type `boolean` from `long long`.
- `get_driver_instance()` is now only available in dynamic library builds - static builds do not have this symbol. This was done to accommodate loading the DLL with `LoadLibrary` or `dlopen`. If you do not use CMake for building the source code you will need to define `mysqlcppconn_EXPORTS` if you are loading dynamically and want to use the `get_driver_instance()` entry point.
- `Connection::getClientOption(const sql::SQLString & optionName, void * optionValue)` now accepts the `optionName` values `metadataUseInfoSchema`, `defaultStatementResultType`, `defaultPreparedStatementResultType`, and `characterSetResults`. In the previous version only `metadataUseInfoSchema` was permitted. The same options are available for `Connection::setClientOption()`.

Bugs fixed:

- Certain header files were incorrectly present in the source distribution. The fix excludes dynamically generated and platform specific header files from source packages generated using CPack. ([Bug#45846](#))
- CMake generated an error if configuring an out of source build, that is when CMake not called from the source root directory. ([Bug#45843](#))
- Using Prepared Statements caused corruption of the heap. ([Bug#45048](#))
- Missing includes when using GCC 4.4. Note that GCC 4.4 is not yet in use for any official MySQL Connector/C++ builds. ([Bug#44931](#))
- A bug was fixed in Prepared Statements. The bug occurred when a stored procedure was prepared without any parameters. This led to an exception. ([Bug#44931](#))
- Fixed a Prepared Statements performance issue. Reading large result sets was slow.
- Fixed bug in `ResultSetMetaData` for statements and prepared statements, `getScale` and `getPrecision` returned incorrect results.

## C.8.2. Changes in MySQL Connector/C++ 1.0.x

### C.8.2.1. Changes in MySQL Connector/CPP 1.0.5 (21 April 2009)

This is the first Generally Available (GA) release.

Functionality added or changed:

- The interface of `sql::ConnectionMetaData`, `sql::ResultSetMetaData` and `sql::ParameterMetaData` was modified to have a protected destructor. As a result the client code has no need to destruct the metadata objects returned by the connector. MySQL Connector/C++ handles the required destruction. This enables statements such as:

```
connection->getMetaData->getSchema();
```

This avoids potential memory leaks that could occur as a result of losing the pointer returned by `getMetaData()`.

- Improved memory management. Potential memory leak situations are handled more robustly.
- Changed the interface of `sql::Driver` and `sql::Connection` so they accept the options map by alias instead of by value.
- Changed the return type of `sql::SQLException::getSQLState()` from `std::string` to `const char *` to be consistent with `std::exception::what()`.
- Implemented `getResultSetType()` and `setResultSetType()` for `Statement`. Uses `TYPE_FORWARD_ONLY`, which means unbuffered result set and `TYPE_SCROLL_INSENSITIVE`, which means buffered result set.
- Implemented `getResultSetType()` for `PreparedStatement`. The setter is not implemented because currently `PreparedStatement` cannot do refetching. Storing the result means the bind buffers will be correct.
- Added the option `defaultStatementResultType` to `MySQL_Connection::setClientOption()`. Also, the method now returns `sql::Connection *`.
- Added `Result::getType()`. Implemented for the three result set classes.
- Enabled tracing functionality when building with Microsoft Visual C++ 8 and later, which corresponds to Microsoft Visual Studio 2005 and later.
- Added better support for named pipes, on Windows. Use `pipe://` and add the path to the pipe. Shared memory connections are currently not supported.

Bugs fixed:

- A bug was fixed in `MySQL_Connection::setSessionVariable()`, which had been causing exceptions to be thrown.

### C.8.2.2. Changes in MySQL Connector/CPP 1.0.4 (31 March 2009 beta)

Functionality added or changed:

- An installer was added for the Windows operating system.
- Minimum CMake version required was changed from 2.4.2 to 2.6.2. The latest version is required for building on Windows.
- `metadataUseInfoSchema` was added to the connection property map, which enables control of the `INFORMATION_SCHEMA` for metadata.
- Implemented `MySQL_ConnectionMetaDataTable::supportsConvert(from, to)`.
- Added support for MySQL Connector/C.
- Introduced `ResultSetMetaData::isZeroFill()`, which is not in the JDBC specification.

Bugs fixed:

- A bug was fixed in all implementations of `ResultSet::relative()` which was giving a wrong return value although positioning was working correctly.
- A leak was fixed in `MySQL_PreparedResultSet`, which occurred when the result contained a `BLOB` column.

### C.8.2.3. Changes in MySQL Connector/CPP 1.0.3 (02 March 2009 alpha)

Functionality added or changed:

- Added new tests in `test/unit/classes`. Those tests are mostly about code coverage. Most of the actual functionality of

the driver is tested by the tests found in `test/CJUnitPort`.

- New data types added to the list returned by `DatabaseMetaData::getTypeInfo()` are `FLOAT UNSIGNED, DECIMAL UNSIGNED, DOUBLE UNSIGNED`. Those tests may not be in the JDBC specification. However, due to the change you should be able to look up every type and type name returned by, for example, `ResultSetMetaData::getColumnTypeName()`.
- `MySQL_Driver::getPatchVersion` introduced.
- Major performance improvements due to new buffered `ResultSet` implementation.
- Addition of `test/unit/README` with instructions for writing bug and regression tests.
- Experimental support for STLPort. This feature may be removed again at any time later without prior warning! Type `cmake -L` for configuration instructions.
- Added properties enabled methods for connecting, which add many connect options. This uses a dictionary (map) of key value pairs. Methods added are `Driver::connect(map)`, and `Connection::Connection(map)`.
- New BLOB implementation. `sql::Blob` was removed in favor of `std::istream`. C++'s `iostream` library is very powerful, similar to PHP's streams. It makes no sense to reinvent the wheel. For example, you can pass a `std::istringstream` object to `setBlob()` if the data is in memory, or just open a file `std::fstream` and let it stream to the DB, or write its own stream. This is also true for `getBlob()` where you can just copy data (if a buffered result set), or stream data (if implemented).
- Implemented `ResultSet::getBlob()` which returns `std::stream`.
- Fixed `MySQL_DatabaseMetaData::getTablePrivileges()`. Test cases were added in the first unit testing framework.
- Implemented `MySQL_Connection::setSessionVariable()` for setting variables like `sql_mode`.
- Implemented `MySQL_DatabaseMetaData::getColumnPrivileges()`.
- `cppconn/datatype.h` has changed and is now used again. Reimplemented the type subsystem to be more usable - more types for binary and nonbinary strings.
- Implementation for `MySQL_DatabaseMetaData::getImportedKeys()` for MySQL versions before 5.1.16 using `SHOW`, and above using `INFORMATION_SCHEMA`.
- Implemented `MySQL_ConnectionMetaData::getProcedureColumns()`.
- `make package_source` now packs with bzip2.
- Re-added `getTypeInfo()` with information about all types supported by MySQL and the `sql::DataType`.
- Changed the implementation of `MySQL_ConstructedResultSet` to use the more efficient O(1) access method. This should improve the speed with which the metadata result sets are used. Also, there is less copying during the construction of the result set, which means that all result sets returned from the metadata functions will be faster.
- Introduced, internally, `sql::mysql::MyVal` which has implicit constructors. Used in `mysql_metadata.cpp` to create result sets with native data instead of always string (varchar).
- Renamed `ResultSet::getLong()` to `ResultSet::getInt64()`. `resultset.h` includes typdefs for Windows to be able to use `int64_t`.
- Introduced `ResultSet::getUInt()` and `ResultSet::getUInt64()`.
- Improved the implementation for `ResultSetMetaData::isReadOnly()`. Values generated from views are read only. These generated values don't have `db` in `MYSQL_FIELD` set, while all normal columns do have.
- Implemented `MySQL_DatabaseMetaData::getExportedKeys()`.
- Implemented `MySQL_DatabaseMetaData::getCrossReference()`.

Bugs fixed:

- Bug fixed in `MySQL_PreparedResultSet::getString()`. Returned string that had real data but the length was random. Now, the string is initialized with the correct length and thus is binary safe.

- Corrected handling of unsigned server types. Now returning correct values.
- Fixed handling of numeric columns in `ResultSetMetaData::isCaseSensitive` to return `false`.

#### C.8.2.4. Changes in MySQL Connector/CPP 1.0.2 (19 December 2008 alpha)

Functionality added or changed:

- Implemented `getScale()`, `getPrecision()` and `getColumnDisplaySize()` for `MySQL_ResultSetMetaData` and `MySQL_Prepared_ResultSetMetaData`.
- Changed `ResultSetMetaData` methods `getColumnDisplaySize()`, `getPrecision()`, `getScale()` to return `unsigned int` instead of `signed int`.
- `DATE`, `DATETIME` and `TIME` are now being handled when calling the `MySQL_PreparedResultSet` methods `getString()`, `getDouble()`, `getInt()`, `getLong()`, `getBoolean()`.
- Reverted implementation of `MySQL_DatabaseMetaData::getTypeInfo()`. Now unimplemented. In addition, removed `cppconn/datatype.h` for now, until a more robust implementation of the types can be developed.
- Implemented `MySQL_PreparedStatement::setNull()`.
- Implemented `MySQL_PreparedStatement::clearParameters()`.
- Added PHP script `examples/cpp_trace_analyzer.php` to filter the output of the debug trace. Please see the inline comments for documentation. This script is unsupported.
- Implemented `MySQL_ResultSetMetaData::getPrecision()` and `MySQL_Prepared_ResultSetMetaData::getPrecision()`, updating example.
- Added new unit test framework for JDBC compliance and regression testing.
- Added `test/unit` as a basis for general unit tests using the new test framework, see `test/unit/example` for basic usage examples.

Bugs fixed:

- Fixed `MySQL_PreparedStatementResultSet::getDouble()` to return the correct value when the underlying type is `MYSQL_TYPE_FLOAT`.
- Fixed bug in `MySQL_ConnectionMetaData::getIndexInfo()`. The method did not work because the schema name wasn't included in the query sent to the server.
- Fixed a bug in `MySQL_ConnectionMetaData::getColumns()` which was performing a cartesian product of the columns in the table times the columns matching `columnNamePattern`. The example `example/connection_meta_schemaobj.cpp` was extended to cover the function.
- Fixed bugs in `MySQL_DatabaseMetaData`. All `supportsCatalogXXXX` methods were incorrectly returning `true` and all `supportsSchemaXXXX` methods were incorrectly returning `false`. Now `supportsCatalogXXXX` returns `false` and `supportsSchemaXXXX` returns `true`.
- Fixed bugs in the `MySQL_PreparedStatements` methods `setBigInt()` and `setDatetime()`. They decremented the internal column index before forwarding the request. This resulted in a double-decrement and therefore the wrong internal column index. The error message generated was:

```
setString() ... invalid "parameterIndex"
```

- Fixed a bug in `getString().getString()` is now binary safe. A new example was also added.
- Fixed bug in `FLOAT` handling.
- Fixed `MySQL_PreparedStatement::setBlob()`. In the tests there is a simple example of a class implementing `sql::Blob`.

#### C.8.2.5. Changes in MySQL Connector/CPP 1.0.1 (01 December 2008 alpha)

---

Functionality added or changed:

- `sql::mysql::MySQL_SQLException` was removed. The distinction between server and client (connector) errors, based on the type of the exception, has been removed. However, the error code can still be checked to evaluate the error type.
- Support for (n)make install was added. You can change the default installation path. Carefully read the messages displayed after executing cmake. The following are installed:
  - Static and the dynamic version of the library, `libmysqlcppconn`.
  - Generic interface, `cppconn`.
  - Two MySQL specific headers:

`mysql_driver.h`, use this if you want to get your connections from the driver instead of instantiating a `MySQL_Connection` object. This makes your code portable when using the common interface.

`mysql_connection.h`, use this if you intend to link directly to the `MySQL_Connection` class and use its specifics not found in `sql::Connection`.

However, you can make your application fully abstract by using the generic interface rather than these two headers.

- Driver Manager was removed.
- Added `ConnectionMetaData::getSchemas()` and `Connection::setSchema()`.
- `ConnectionMetaData::getCatalogTerm()` returns not applicable, there is no counterpart to catalog in MySQL Connector/C++.
- Added experimental GCov support, `cmake -DMYSQLCPPCONN_GCOV_ENABLE:BOOL=1`
- All examples can be given optional connection parameters on the command line, for example:

```
examples/connect tcp://host:port user pass database
```

or

```
examples/connect unix:///path/to/mysql.sock user pass database
```

- Renamed `ConnectionMetaData::getTables: TABLE_COMMENT` to `REMARKS`.
- Renamed `ConnectionMetaData::getProcedures: PROCEDURE_SCHEMA` to `PROCEDURE_SCHEM`.
- Renamed `ConnectionMetaData::getPrimaryKeys(): COLUMN` to `COLUMN_NAME`, `SEQUENCE` to `KEY_SEQ`, and `INDEX_NAME` to `PK_NAME`.
- Renamed `ConnectionMetaData::getImportedKeys(): PKTABLE_CATALOG` to `PKTABLE_CAT`, `PKTABLE_SCHEMA` to `PKTABLE_SCHEM`, `FKTABLE_CATALOG` to `FKTABLE_CAT`, `FKTABLE_SCHEMA` to `FKTABLE_SCHEM`.
- Changed metadata column name `TABLE_CATALOG` to `TABLE_CAT` and `TABLE_SCHEMA` to `TABLE_SCHEM` to ensure JDBC compliance.
- Introduced experimental CPack support, see make help.
- All tests changed to create TAP compliant output.
- Renamed `sql::DbcMethodNotImplemented` to `sql::MethodNotImplementedException`
- Renamed `sql::DbcInvalidArgumentException` to `sql::InvalidArgumentException`
- Changed `sql::DbcException` to implement the interface of JDBC's `SQLException`. Renamed to `sql::SQLException`.
- Converted Connector/J tests added.
- MySQL Workbench 5.1 changed to use MySQL Connector/C++ for its database connectivity.
- New directory layout.

## C.9. MySQL Proxy Change History

### C.9.1. Changes in MySQL Proxy 0.8.1 (Not yet released)

Functionality added or changed:

- `network_address_set_address()`–>`network_address_set_address_ip()` called `gethostbyname()` which was not reentrant. This meant that an mt-plugin needed to guard all calls to `network_address_set_address()` with a mutex. `network_address_set_address()` has been modified to be thread safe. ([Bug#49099](#))
- The hard-limit was fixed for the case where the fdlimit was set. ([Bug#48120](#))
- Allow interception of LOAD DATA and SHOW ERROR commands.
- An unused `network_mysqld_com_query_result_track_state()` state was deprecated.
- `chassis_set_fdlimit()` was deprecated in favor of `chassis_fdlimit_set()`.
- Shutdown hooks were added to free the global memory of third party libraries such as `openssl`.
- `con->in_load_data_local` has been removed.

Bugs fixed:

- The admin plugin had an undocumented default value for `--admin-password`. ([Bug#53429](#))
- Use of LOAD DATA LOCAL INFILE caused the connection between the client and MySQL Proxy to abort. ([Bug#51864](#))
- When using the MySQL Proxy, if the backend MySQL server went down, and then the clock on the MySQL Proxy host went back in time (for example, during daylight savings time adjustments), the MySQL Proxy would stop sending queries to the configured backend. ([Bug#50806](#))
- Proxy returned an error message with a non-standard SQLState when all backends were down:

```
"#07000(proxy) all backends are down"
```

This caused issues for clients with "retry" logic, as they did not have the facility to handle these "custom" SQL States. ([Bug#45417](#))

- When using `mysql-proxy` with a UNIX socket, the socket would not be deleted when `mysql-proxy` terminated. ([Bug#38415](#))
- When running `configure` to build, the error message relating to the `lua` libraries could be misleading. The wording and build advice have now been updated.

### C.9.2. Changes in MySQL Proxy 0.8.0 (21 Jan 2010)

Bugs fixed:

- A memory leak could occur in MySQL Proxy if MySQL v4.0 or earlier clients connected to the proxy. ([Bug#50993](#))
- `mysql-proxy` would cause a segmentation fault if a connection was made from a client using the MySQL protocol 4.0 or earlier. ([Bug#48641](#))
- MySQL Proxy would load a configuration file with unsafe permissions, which could permit password information to be exposed through the configuration file. MySQL Proxy now refuses to load a file with unsafe permissions. ([Bug#47589](#))
- The supplied script `ro-balance.lua` had not been updated to use the `resultset_is_needed` and updated `proxy.connection.dst.name` structure. ([Bug#47349](#), [Bug#45408](#))
- The line numbers provided in stack traces would be out by one line. ([Bug#47348](#))
- The supplied script `active-transactions.lua` had not been updated to use the new `resultset_is_needed` flag. ([Bug#47345](#))

- When submitting an address on the command line using `--proxy-backend-addresses`, the option would accept more than one address as an argument to the option. You should specify one `--proxy-backend-addresses` for each backend address. ([Bug#47273](#))
- MySQL Proxy would return the wrong version string internally from the `proxy.PROXY_VERSION` constant. ([Bug#45996](#))
- MySQL Proxy could stop accepting network packets if a large number of packets were sent to the proxy. The listen queue has been extended to permit a larger backlog. ([Bug#45878](#), [Bug#43278](#))
- Due to a memory leak, memory usage for each unique connection to the proxy would increase, leading to very high consumption. ([Bug#45272](#))
- MySQL Proxy would fail to work with certain versions of MySQL, including MySQL 5.1.15, where a change in the MySQL protocol existed. ([Bug#45167](#))

See also [Bug#25371](#).

- The supplied script `rw-splitting.lua` had not been updated to use the new `resultset_is_needed` flag or updated `proxy.connections` structure. ([Bug#43424](#), [Bug#42841](#), [Bug#46141](#))
- Logging to `syslog` with the `use-log-syslog` option did not work. ([Bug#36431](#))
- It was possible for the MySQL Proxy to incorrectly insert null values into the returned result set, even though non-null values were returned in the original query. ([Bug#35729](#))
- MySQL Proxy would raise an error when processing query packets larger than 16MB in size. ([Bug#35202](#))

### C.9.3. Changes in MySQL Proxy 0.7.2 (30 June 2009)

Bugs fixed:

- When using MySQL Proxy on Windows, the required modules may not be found properly during initialization. The core code has now been updated to find the components correctly, and the Lua-based C modules are prefixed with `lua-` and Lua plugins with `plugin-`. ([Bug#45833](#))

### C.9.4. Changes in MySQL Proxy 0.7.1 (15 May 2009)

Bugs fixed:

- Due to a memory leak, memory usage for each unique connection to the proxy would increase, leading to very high consumption. ([Bug#45272](#))
- The port number reported in `proxy.connection.client.address` would be reported incorrectly. ([Bug#43313](#))
- Result sets with more than 250 fields could cause MySQL Proxy to crash. ([Bug#43078](#))
- MySQL Proxy would be unable to increase its own maximum number of open files according to the applied limit, if the limit was less than 8192. When set to debug level, MySQL Proxy will now report the open files limits and when the limits have been updated. ([Bug#42783](#))
- When connecting to a MySQL 4.0 server, the proxy would crash. You are now provided with an error message. ([Bug#38601](#))
- When using the `rw-splitting.lua` script you could get an error when talking to the backend server:

```
2008-07-28 18:00:30: (critical) (read_query) [string
"/usr/local/share/mysql-proxy/rw-splitting.l..."]:218: bad argument #1 to 'ipairs' (table
expected, got userdata)
```

This would lead to the proxy closing the connection to the configured MySQL backend. ([Bug#38419](#))

- When using MySQL Proxy with multiple backends, the failure of one backend would cause proxy to disconnect all backends and stop routing requests. ([Bug#34793](#))

### C.9.5. Changes in MySQL Proxy 0.7.0 (Never Released)

Functionality added or changed:

- Support for using a configuration file, in addition to the command-line options, has been added. You can specify the file to use by using the `--defaults-file` command line option. See [Section 14.6.3, “MySQL Proxy Configuration Options”](#). ([Bug#30206](#))
- A number of the internal structures used during developing Lua scripts for work with MySQL proxy have been updated and harmonised to make their meaning and contents easier to use and consistent across multiple locations.
- The address information has been updated so that instead of a combined `ip:port` structure that you had to parse to extract the individual information, you can now access that information directly. For example, instead of structures providing a single item `.address`, you now have items, `name` (the combined `ip:port`) and `address` (the IP address) and `port` (port number). In addition, all addresses now supply both the `src` (source) and `dst` (destination) socket information for both ends of the connections.

Some familiar structures have been updated to accommodate this information:

- `proxy.connection.client.address` is `proxy.connection.client.src.name`
- `proxy.connection.server.address` is `proxy.connection.server.dst.name`
- `proxy.backends` is now in `proxy.global.backends`. The `.address` field of each backend is a address-object as described above. For example, `proxy.backends[1].address` is `proxy.global.backends[1].dst.name`.
- The `read_auth()` and `read_handshake()` functions no longer receive an `auth` parameter. Instead, all the data is available in the connection tables.

In `read_handshake()` you access the information through the global `proxy.connection` table:

0.6	0.7
<code>auth.thread_id</code>	<code>proxy.connection.server.thread_id</code>
<code>auth.mysql_version</code>	<code>proxy.connection.server.mysql_version</code>
<code>auth.server_addr</code>	<code>proxy.connection.server.dst.name</code>
<code>auth.client_addr</code>	<code>proxy.connection.client.src.name</code>
<code>auth.scramble</code>	<code>proxy.connection.server.scramble_buffer</code>

In `read_auth()` you can use the following:

0.6	0.7
<code>auth.username</code>	<code>proxy.connection.client.username</code>
<code>auth.password</code>	<code>proxy.connection.client.scrambled_password</code>
<code>auth.default_db</code>	<code>proxy.connection.client.default_db</code>
<code>auth.server_addr</code>	<code>proxy.connection.server.dst.name</code>
<code>auth.client_addr</code>	<code>proxy.connection.client.src.name</code>

- In the function `proxy.queries:append()` a 3rd parameter is an (optional) table with options specific to the this packet. Specifically, if you want to have access to the resultset in the `read_query_result()` hook, you have to set the `resultset_is_needed` flag:

```
proxy.queries:append(1, ..., { resultset_is_needed = true })
```

For more information, see [proxy.queries \[1291\]](#).

- `proxy.backends` is now in `proxy.global.backends`.

Bugs fixed:

- Security Enhancement:** Accessing `mysql-proxy` using a client or backend with a MySQL protocol less than MySQL 5.0 would result in `mysql-proxy` aborting with an assertion. This is because `mysql-proxy` only supports MySQL Protocol 5.0 or higher. The proxy will now report a fault. ([Bug#31419](#))

- MySQL Proxy would be configured with the `LUA_PATH` and `LUA_CPATH` directory locations according to the build, not execution, host. In addition, during installation, certain Lua source files could be installed into the incorrect locations. ([Bug#44877](#), [Bug#44497](#))
- Using `mysql-proxy` with very large return datasets from queries, with or without manipulation of the dataset within the Lua engine could cause a crash. ([Bug#39332](#))
- If a submitted packet was smaller than expected by the protocol, MySQL Proxy would terminate. ([Bug#36743](#))
- When using `mysql-proxy` in a master-master replication scenario, a failure in one of the replication masters would fail to be identified by the proxy and connections would not be redirected to the other master. ([Bug#35295](#))

## C.9.6. Changes in MySQL Proxy 0.6.1 (06 February 2008)

Functionality added or changed:

- Fixed assertions on write-errors
- Fixed sending fake server-greetings in `connect_server()`.
- Fixed error handling for socket functions on Windows.
- Added new features to `run-tests.lua`.

## C.9.7. Changes in MySQL Proxy 0.6.0 (11 September 2007)

Functionality added or changed:

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. ([Bug#30867](#))
- Added support in `read_query_result()` to overwrite the result-set.
- Added `--no-daemon` and `--pid-file`.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added support for `proxy.response.packets`.
- Added testcases.
- Added `--no-proxy` to disable the proxy.
- Added support for listening UNIX sockets.
- Added a global lua-scope `proxy.global.*`.
- Added connection pooling.

Bugs fixed:

- Fixed assertion on `COM_BINLOG_DUMP`. ([Bug#29764](#))
- Fixed assertion on result-packets like [ `field-len` | `fields` | `EOF` | `ERR` ]. ([Bug#29732](#))
- Fixed assertion at login with empty password + empty default db. ([Bug#29719](#))
- Fixed assertion at `COM_SHUTDOWN`. ([Bug#29719](#))
- Fixed crash if `proxy.connection` is used in `connect_server()`.
- Fixed check for `glib2` to require at least 2.6.0.

- Fixed assertion when all backends are down and we try to connect.
- Fixed connection-stalling if `read_query_result()` throws an `assert()`ion.
- Fixed len-encoding on `proxy.resultsets`.
- Fixed compilation on win32.
- Fixed assertion when connecting to the MySQL 6.0.1.
- Fixed decoding of len-encoded ints for 3-byte notation.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed handling of (SQL) `NULL` in result-sets.
- Fixed mem-leak with `proxy.response.*` is used.

## C.9.8. Changes in MySQL Proxy 0.5.1 (30 June 2007)

Functionality added or changed:

- Added `resultset.affected_rows` and `resultset.insert_id`.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.
- Added missing dependency to `libmysqlclient-dev` to the INSTALL file.
- Added `inj.query_time` and `inj.response_time` into the lua scripts.
- Added support for pre-4.1 passwords in a 4.1 connection.
- Added script examples for rewriting and injection.
- Added `proxy.VERSION`.
- Added support for UNIX sockets.
- Added protection against duplicate resultsets from a script.

Bugs fixed:

- Fixed mysql check in configure to die when mysql.h isn't detected.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed crash on fields > 250 bytes when the resultset is inspected.
- Fixed warning if `connect_server()` is not provided.
- Fixed assertion when a error occurs at initial script exec time.
- Fixed assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.

## C.9.9. Changes in MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Bugs fixed:

- Added `automake/autoconf` support.
- Added `cmake` support.

---

## Appendix D. Restrictions and Limits

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

### D.1. Restrictions on Stored Routines, Triggers, and Events

These restrictions apply to the features described in [Chapter 19, \*Stored Programs and Views\*](#).

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some [restrictions specific to stored functions](#) but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some [restrictions specific to triggers](#).

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some [restrictions specific to events](#).

### SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`. (Before MySQL 5.1.21, this restriction is enforced only for stored functions.)
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See [Section 12.6, “SQL Syntax for Prepared Statements”](#), for a list of statements supported as prepared statements. Only the statements listed there are supported for stored routines, unless noted otherwise in [Section 19.2, “Using Stored Routines \(Procedures and Functions\)”](#).
- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted, but the statement is handled as a normal `INSERT`.
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. To begin a transaction in this context, use `START TRANSACTION` instead.

### Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 12.7.3.3, “`SELECT ... INTO Statement`”](#).
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.

### Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers currently are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. The triggers on the slave are activated when using statement-based replication. For more information, see [Section 16.4.1.29, “Replication and Triggers”](#).
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

## Restrictions on Calling Stored Procedures

Before MySQL 5.1.4, `CALL` statements cannot be prepared, meaning that stored procedures cannot be called from dynamic SQL. This is true both for server-side prepared statements and for SQL prepared statements.

## Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
 DECLARE i INT DEFAULT 0;
 SELECT i FROM t;
 BEGIN
 DECLARE i INT DEFAULT 1;
 SELECT i FROM t;
 END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

## Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in [Section 19.7, “Binary Logging of Stored Programs”](#).

The `--replicate-wild-do-table=db_name.tbl_name` option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*--db` options.

## Introspection Considerations

`INFORMATION_SCHEMA` does not have a `PARAMETERS` table until MySQL 5.5; this table enables stored routines or client applications to determine the names, types, and default values of parameters for stored routines. For releases without this `INFORMATION_SCHEMA.PARAMETERS` table, to examine these types of metadata, you must use workarounds such as parsing the output of `SHOW CREATE` statements or the `param_list` column of the `mysql.proc` table. `param_list` contents can be processed from within a stored routine, unlike the output from `SHOW`.

## Debugging Considerations

There are no stored routine debugging facilities.

## Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- `UNDO` handlers are not supported.
- `FOR` loops are not supported.

## Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See [Section 19.7, “Binary Logging of Stored Programs”](#).

## Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- In MySQL 5.1.6 only, any table referenced in an event's action statement must be fully qualified with the name of the schema in which it occurs (that is, as `schema_name.table_name`).
- Beginning with MySQL 5.1.8, event names are handled in case-insensitive fashion. For example, this means that you cannot have two events in the same database (and—prior to MySQL 5.1.12—with the same definer) with the names `anEvent` and `AnEvent`.

### Important

If you have events created in MySQL 5.1.7 or earlier which are assigned to the same database and have the same definer, and whose names differ only with respect to lettercase, then you must rename these events to respect case-sensitive handling before upgrading to MySQL 5.1.8 or later.

- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. ([Bug#16409](#), [Bug#18896](#))
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also [Bug#16522](#).)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts *are* updated in the global scope. ([Bug#16422](#))
- Prior to MySQL 5.1.12, you could not view another user's events in the `INFORMATION_SCHEMA.EVENTS` table. In other words, any query made against this table was treated as though it contained the condition `DEFINER = CURRENT_USER()` in the `WHERE` clause.
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Prior to MySQL 5.1.8, handling in scheduled events of dates later than this was buggy; starting with MySQL 5.1.8, such dates are specifically not permitted by the Event Scheduler. ([Bug#16396](#))
- In MySQL 5.1.6, `INFORMATION_SCHEMA.EVENTS` shows `NULL` in the `SQL_MODE` column. Beginning with MySQL 5.1.7, the `SQL_MODE` displayed is that in effect when the event was created.
- In MySQL 5.1.6, the only way to drop or alter an event created by a user who was not the definer of that event was by manipu-

lation of the `mysql.event` system table by the MySQL `root` user or by another user with privileges on this table. Beginning with MySQL 5.1.7, `DROP USER` drops all events for which that user was the definer; also beginning with MySQL 5.1.7 `DROP SCHEMA` drops all events associated with the dropped schema.

- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. Beginning with MySQL 5.1.13, these sorts of references are not permitted. (See [Bug#22830](#) for more information.)
- Generally speaking, statements that are not permitted in stored routines or in SQL prepared statements are also not permitted in the body of an event. For more information, see [Section 12.6, “SQL Syntax for Prepared Statements”](#).
- When upgrading to MySQL 5.1.18 or 5.1.19 from a previous MySQL version where scheduled events were in use, the upgrade utilities `mysql_upgrade` and `mysql_fix_privilege_tables` do not accomodate changes in system tables relating to the Event Scheduler. This issue was fixed in MySQL 5.1.20 (see [Bug#28521](#)).

**Stored routines and triggers in MySQL Cluster.** Stored procedures, stored functions, and triggers are all supported by tables using the `NDB` storage engine; however, it is important to keep in mind that they do *not* propagate automatically between MySQL Servers acting as Cluster SQL nodes. This is because of the following:

- Stored routine definitions are kept in tables in the `mysql` system database using the `MyISAM` storage engine, and so do not participate in clustering.
- The `.TRN` and `.TRG` files containing trigger definitions are not read by the `NDB` storage engine, and are not copied between Cluster nodes.

Any stored routine or trigger that interacts with MySQL Cluster tables must be re-created by running the appropriate `CREATE PROCEDURE`, `CREATE FUNCTION`, or `CREATE TRIGGER` statements on each MySQL Server that participates in the cluster where you wish to use the stored routine or trigger. Similarly, any changes to existing stored routines or triggers must be carried out explicitly on all Cluster SQL nodes, using the appropriate `ALTER` or `DROP` statements on each MySQL Server accessing the cluster.

### Warning

*Do not attempt to work around the issue described in the first item mentioned previously by converting any `mysql` database tables to use the `NDB` storage engine. Altering the system tables in the `mysql` database is not supported and is very likely to produce undesirable results.*

## D.2. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API using the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor enables a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are nonholdable (not held open after a commit).

Cursors are asensitive.

Cursors are nonscrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

## D.3. Restrictions on Subqueries

- In MySQL 5.1 before 5.1.16, if you compare a `NULL` value to a subquery using `ALL`, `ANY`, or `SOME`, and the subquery returns an empty result, the comparison might evaluate to the nonstandard result of `NULL` rather than to `TRUE` or `FALSE`. As of 5.1.16, the comparison evaluates to `TRUE` or `FALSE` except for subqueries inside `IS NULL`, such as this:

```
SELECT ... WHERE NULL IN (SELECT ...) IS NULL
```

As of 5.1.32, the `IS NULL` limitation is removed and the comparison evaluates to `TRUE` or `FALSE`.

- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` operator.

A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return  $M$  and  $N$  rows, respectively, the execution time becomes on the order of  $O(M \times N)$ , rather than  $O(M+N)$  as it would be for an uncorrelated subquery.

An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
```

Here the result from the subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
  - For `expr IN (subquery)`, `expr` can be an  $n$ -tuple (specified using row constructor syntax) and the subquery can return rows of  $n$ -tuples.
  - For `expr op {ALL|ANY|SOME} (subquery)`, `expr` must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of  $n$ -tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Prior to MySQL 5.1.12, row constructors were not well optimized; of the following two equivalent expressions, only the second could be optimized:

```
(col1, col2, ...) = (val1, val2, ...)
col1 = val1 AND col2 = val2 AND ...
```

In MySQL 5.1.12 and later, all row equalities are converted into conjunctions of equalities between row elements, and handled by the optimizer in the same way. ([Bug#16081](#))

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- MySQL does not support `LIMIT` in subqueries for certain subquery operators:

```
mysql> SELECT * FROM t1
 -> WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
ERROR 1235 (42000): This version of MySQL doesn't yet support
'LIMIT & IN/ALL/ANY/SOME subquery'
```

- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the subquery.

- MySQL permits a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if `f()` inserts rows, the following query can modify data:

```
SELECT ... WHERE x IN (SELECT f() ...);
```

This behavior is nonstandard (not permitted by the SQL standard). In MySQL, it can produce indeterminate results because `f()` might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

For statement-based or mixed-format replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a, ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied,

rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.
- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join enables the optimizer to use `t1` or `t2` first.
- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

## D.4. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section D.3, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);
UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is

prepared and before it is executed. Example:

```
CREATE VIEW v AS SELECT RAND();
PREPARE s FROM 'SELECT * FROM v';
ALTER VIEW v AS SELECT NOW();
EXECUTE s;
```

The result returned by the `EXECUTE` statement is a random number, not the current date and time.

- If a statement in a stored routine refers to a view, the view definition seen by the statement are its definition the first time that statement is executed. For example, this means that if the statement is executed in a loop, further iterations of the statement see the same view definition, even if the definition is changed later in the loop. Example:

```
CREATE VIEW v AS SELECT 1;
delimiter //
CREATE PROCEDURE p ()
BEGIN
 DECLARE i INT DEFAULT 0;
 WHILE i < 5 DO
 SELECT * FROM v;
 SET i = i + 1;
 ALTER VIEW v AS SELECT 2;
 END WHILE;
END;
//
delimiter ;
CALL p();
```

When the procedure `p()` is called, the `SELECT` returns 1 each time through the loop, even though the view definition is changed within the loop.

As of MySQL 5.1.21, `ALTER VIEW` is prohibited within stored routines, so this restriction does not apply.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.
- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in [Bug#22062](#).

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

`SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. As of MySQL 5.1.23, aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is to modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

## D.5. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA”, storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

## D.6. Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not permitted in identifiers.
- The `ucs2` character sets has the following restrictions:
  - It cannot be used as a client character set, which means that it does not work for `SET NAMES` or `SET CHARACTER SET`. (See Section 9.1.4, “Connection Character Sets and Collations”.)
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use this character set.
  - `FULLTEXT` indexes cannot be created on a column that this character set. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
  - The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

## D.7. Limits in MySQL

This section lists current limits in MySQL 5.1.

### D.7.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

### D.7.2. The Maximum Number of Columns Per Table

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors, listed in the following discussion.

- Every table has a maximum row size of 65,535 bytes. This maximum applies to all storage engines, but a given engine might have additional constraints that result in a lower effective maximum row size.

The maximum row size constrains the number of columns because the total width of all columns cannot exceed this size. For example, `utf8` characters require up to three bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate  $255 \times 3 = 765$  bytes per value. Consequently, a table cannot contain more than  $65,535 / 765 = 85$  such columns.

Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

`BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately.

Declaring columns `NULL` can reduce the maximum number of columns permitted. `NULL` columns require additional space in the row to record whether their values are `NULL`.

For `MyISAM` tables, each `NULL` column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row_length = 1
 + (sum of column lengths)
 + (number of NULL columns + delete_flag + 7)/8
 + (number of variable-length columns)
```

`delete_flag` is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. `delete_flag` is 0 for dynamic tables because the flag is stored in the dynamic row header.

These calculations do not apply for `InnoDB` tables, for which storage size is no different for `NULL` columns than for `NOT NULL` columns.

The following statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
-> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL);
Query OK, 0 rows affected (0.01 sec)
```

The following statement to create table `t2` fails because the columns are `NULL` and require additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
-> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL);
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBS, is 65535. You have to change some
columns to TEXT or BLOBS
```

- Each table has an `.frm` file that contains the table definition. The server uses the following expression to check some of the table information stored in the file against an upper limit of 64KB:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
n_length+int_length+com_length > 65535L || int_count > 255)
```

The portion of the information stored in the `.frm` file that is checked against the expression cannot grow beyond the 64KB limit, so if the table definition reaches this size, no more columns can be added.

The relevant factors in the expression are:

- `info_length` is space needed for “screens.” This is related to MySQL’s Unireg heritage.
- `create_fields.elements` is the number of columns.
- `FCOMP` is 17.
- `n_length` is the total length of all column names, including one byte per name as a separator.
- `int_length` is related to the list of values for `ENUM` and `SET` columns.
- `com_length` is the total length of column and table comments.

Thus, using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or

use of column or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:
  - `InnoDB` permits no more than 1000 columns.
  - `InnoDB` restricts row size to something less than half a database page (approximately 8000 bytes), not including `VARBINARY`, `VARCHAR`, `BLOB`, or `TEXT` columns.
  - Different `InnoDB` storage formats (`COMPRESSED`, `REDUNDANT`) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

## D.7.3. Windows Platform Limitations

The following limitations apply to use of MySQL on the Windows platform:

- **Number of file descriptors**

The number of open file descriptors on Windows is limited to a maximum of 2048, which may limit the ability to open a large number of tables simultaneously. This limit is due not to Windows but to C runtime library compatibility functions used to open files on Windows that use the POSIX compatibility layer.

This limitation will also cause problems if you try to set `open_files_limit` to a value greater than the 2048 file limit.

- **Process memory**

On Windows 32-bit platforms it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**

When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.frm` files in the default data directory configured with the `datadir` option.

- **Limited number of ports**

Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Note that ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

For more information about this problem, see <http://support.microsoft.com/default.aspx?scid=kb;en-us;196271>.

- **Concurrent reads**

MySQL depends on the `pread()` and `pwrite()` system calls to be able to mix `INSERT` and `SELECT`. Currently, we use mutexes to emulate `pread()` and `pwrite()`. We intend to replace the file level interface with a virtual interface in the future so that we can use the `readfile()/writefile()` interface to get more speed. The current implementation limits the number of open files that MySQL 5.1 can use to 2,048, which means that you cannot run as many concurrent threads on Windows as on Unix.

This problem is fixed in MySQL 5.5.

- **Blocking read**

Before MySQL 5.1.41, MySQL uses a blocking read for each connection. That has the following implications if named-pipe connections are enabled:

- A connection is not disconnected automatically after eight hours, as happens with the Unix version of MySQL.
- If a connection hangs, it is not possible to break it without killing MySQL.

- `mysqladmin kill` does not work on a sleeping connection.
- `mysqladmin shutdown` cannot abort as long as there are sleeping connections.

- **DROP DATABASE**

You cannot drop a database that is in use by another session.

- **Case-insensitive names**

File names are not case sensitive on Windows, so MySQL database and table names are also not case sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See [Section 8.2.2, “Identifier Case Sensitivity”](#).

- **Directory and file names**

On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

```
datadir="C:/私たちのプロジェクトのデータ"
```

The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in `LOAD DATA INFILE`.

- **The “\” path name separator character**

Path name components in Windows are separated by the “\” character, which is also the escape character in MySQL. If you are using `LOAD DATA INFILE` or `SELECT ... INTO OUTFILE`, use Unix-style file names with “/” characters:

```
mysql> LOAD DATA INFILE 'C:/tmp/skr.txt' INTO TABLE skr;
mysql> SELECT * INTO OUTFILE 'C:/tmp/skr.txt' FROM skr;
```

Alternatively, you must double the “\” character:

```
mysql> LOAD DATA INFILE 'C:\\tmp\\\\skr.txt' INTO TABLE skr;
mysql> SELECT * INTO OUTFILE 'C:\\tmp\\\\skr.txt' FROM skr;
```

- **Problems with pipes**

Pipes do not work reliably from the Windows command-line prompt. If the pipe includes the character `^Z / CHAR( 24 )`, Windows thinks that it has encountered end-of-file and aborts the program.

This is mainly a problem when you try to apply a binary log as follows:

```
C:\> mysqlbinlog binary_log_file | mysql --user=root
```

If you have a problem applying the log and suspect that it is because of a `^Z / CHAR( 24 )` character, you can use the following workaround:

```
C:\> mysqlbinlog binary_log_file --result-file=/tmp/bin.sql
C:\> mysql --user=root --execute "source /tmp/bin.sql"
```

The latter command also can be used to reliably read in any SQL file that may contain binary data.

# Function Index

## **my\_init()**

Section 21.9.8.1, “`my_init()`”  
Section 21.9.8.3, “`mysql_thread_init()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_affected\_rows()**

Section 12.2.1, “`CALL` Syntax”  
Section 12.2.5, “`INSERT` Syntax”  
Section 12.2.7, “`REPLACE` Syntax”  
Section 21.9.3.1, “`mysql_affected_rows()`”  
Section 21.9.3.44, “`mysql_list_tables()`”  
Section 21.9.3.46, “`mysql_next_result()`”  
Section 21.9.3.48, “`mysql_num_rows()`”  
Section 21.9.7.1, “`mysql_stmt_affected_rows()`”  
Section 21.9.3.71, “`mysql_use_result()`”  
Section 21.9.1, “C API Data Structures”  
Section 21.9.2, “C API Function Overview”  
Section 11.14, “Information Functions”  
Section 21.9.10.2, “What Results You Can Get from a Query”

## **mysql\_autocommit()**

Section 21.9.3.2, “`mysql_autocommit()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_change\_user()**

Section 21.9.3.3, “`mysql_change_user()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_character\_set\_name()**

Section 21.9.3.4, “`mysql_character_set_name()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_close()**

Section 21.9.3.5, “`mysql_close()`”  
Section 21.9.3.6, “`mysql_commit()`”  
Section 21.9.3.7, “`mysql_connect()`”  
Section 21.9.3.36, “`mysql_init()`”  
Section 21.9.3.57, “`mysql_rollback()`”  
Section 21.9.2, “C API Function Overview”  
Section B.5.2.11, “Communication Errors and Aborted Connections”

## **mysql\_commit()**

Section 21.9.3.6, “`mysql_commit()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_connect()**

Section 21.9.8.1, “`my_init()`”  
Section 21.9.3.5, “`mysql_close()`”  
Section 21.9.3.7, “`mysql_connect()`”  
Section 21.9.3.49, “`mysql_options()`”  
Section 21.9.8.3, “`mysql_thread_init()`”  
Section 21.9.2, “C API Function Overview”  
Section 21.9.16.2, “How to Make a Threaded Client”

## **mysql\_create\_db()**

Section 21.9.3.8, “`mysql_create_db()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_data\_seek()**

Section 21.9.3.9, “`mysql_data_seek()`”

Section 21.9.3.58, “`mysql_row_seek()`”  
Section 21.9.3.71, “`mysql_use_result()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_debug()**

Section 21.9.3.10, “`mysql_debug()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_drop\_db()**

Section 21.9.3.11, “`mysql_drop_db()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_dump\_debug\_info()**

Section 21.9.3.12, “`mysql_dump_debug_info()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_eof()**

Section 21.9.3.13, “`mysql_eof()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_errno(&mysql)**

Section 21.9.3.22, “`mysql_field_count()`”  
Section 21.9.3.47, “`mysql_num_fields()`”

## **mysql\_errno()**

Section 21.9.3.7, “`mysql_connect()`”  
Section 21.9.3.13, “`mysql_eof()`”  
Section 21.9.3.14, “`mysql_errno()`”  
Section 21.9.3.66, “`mysql_sqlstate()`”  
Section 21.9.3.69, “`mysql_store_result()`”  
Section 21.9.3.71, “`mysql_use_result()`”  
Section 21.9.3, “C API Function Descriptions”  
Section 21.9.2, “C API Function Overview”  
Section B.2, “Types of Error Values”  
Section 21.9.10.1, “Why `mysql_store_result()` Sometimes Returns NULL After `mysql_query()` Returns Success”

## **mysql\_error()**

Section 21.9.3.7, “`mysql_connect()`”  
Section 21.9.3.13, “`mysql_eof()`”  
Section 21.9.3.15, “`mysql_error()`”  
Section 21.9.3.69, “`mysql_store_result()`”  
Section 21.9.3.71, “`mysql_use_result()`”  
Section 21.9.3, “C API Function Descriptions”  
Section 21.9.2, “C API Function Overview”  
Section B.2, “Types of Error Values”  
Section 21.9.10.1, “Why `mysql_store_result()` Sometimes Returns NULL After `mysql_query()` Returns Success”

## **mysql\_escape\_string()**

Section 21.9.3.16, “`mysql_escape_string()`”  
Section 21.9.2, “C API Function Overview”

## **mysql\_fetch\_field()**

Section 21.9.3.17, “`mysql_fetch_field()`”  
Section 21.9.3.23, “`mysql_field_seek()`”  
Section 21.9.3.24, “`mysql_field_tell()`”  
Section 21.9.7.22, “`mysql_stmt_result_metadata()`”  
Section 21.9.1, “C API Data Structures”  
Section 21.9.2, “C API Function Overview”

## **mysql\_fetch\_field\_direct()**

Section 21.9.3.18, “`mysql_fetch_field_direct()`”  
Section 21.9.7.22, “`mysql_stmt_result_metadata()`”

Section 21.9.2, “C API Function Overview”

### **mysql\_fetch\_fields()**

Section 21.9.3.19, “mysql\_fetch\_fields()”

Section 21.9.7.22, “mysql\_stmt\_result\_metadata()”

Section 21.9.2, “C API Function Overview”

### **mysql\_fetch\_lengths()**

Section 21.9.3.20, “mysql\_fetch\_lengths()”

Section 21.9.3.21, “mysql\_fetch\_row()”

Section 21.9.2, “C API Function Overview”

Section 9.1.7.9, “Collation and *INFORMATION\_SCHEMA* Searches”  
Section 9.1.9.1, “Result Strings”  
Section 11.5, “String Functions”  
Section 9.1.13.1, “Unicode Character Sets”

**UPPER(x)**

Section 9.1.9.1, “Result Strings”

**UPPER(\_utf8'abc')**

Section 9.1.8, “String Repertoire”

**UPPER(str)**

Section 11.5, “String Functions”

**USER( )**

Section 5.5.8, “Auditing MySQL Account Activity”  
Section 5.4.7, “Causes of Access-Denied Errors”  
Section 9.1.7.5, “Collation of Expressions”  
Section 9.1.7.4, “Collations Must Be for the Right Character Set”  
Section 16.1.2.1, “Comparison of Statement-Based and Row-Based Replication”  
Section 7.6.3.1, “How the Query Cache Operates”  
Section 11.14, “Information Functions”  
Section 5.2.4.3, “Mixed Binary Logging Format”  
Section 16.4.1.12, “Replication and System Functions”  
Section 16.1.2.3, “Safe and Unsafe Statements in Logging and Replication”  
Section 9.1.11, “UTF-8 for Metadata”

**UTC\_DATE**

Section 11.7, “Date and Time Functions”

**UTC\_DATE()**

Section 11.7, “Date and Time Functions”  
Section 16.1.2.3, “Safe and Unsafe Statements in Logging and Replication”

**UTC\_TIME**

Section 11.7, “Date and Time Functions”

**UTC\_TIME()**

Section 11.7, “Date and Time Functions”  
Section 16.1.2.3, “Safe and Unsafe Statements in Logging and Replication”

**UTC\_TIMESTAMP**

Section 10.3.1.1, “*TIMESTAMP* Properties”  
Section 11.7, “Date and Time Functions”

**UTC\_TIMESTAMP()**

Section 11.7, “Date and Time Functions”  
Section 9.6, “MySQL Server Time Zone Support”  
Section 16.1.2.3, “Safe and Unsafe Statements in Logging and Replication”

**UUID( )**

Section 16.1.3.4, “Binary Log Options and Variables”  
Section 19.7, “Binary Logging of Stored Programs”  
Section 16.1.2.1, “Comparison of Statement-Based and Row-Based Replication”  
Section 7.6.3.1, “How the Query Cache Operates”  
Section 11.15, “Miscellaneous Functions”  
Section 5.2.4.3, “Mixed Binary Logging Format”  
Section 16.4.1.12, “Replication and System Functions”  
Section 16.1.2.3, “Safe and Unsafe Statements in Logging and Replication”  
Section 5.2.4.2, “Setting The Binary Log Format”

**UUID\_SHORT( )**

Section 16.1.2.1, “Comparison of Statement-Based and Row-Based Replication”

Section 7.6.3.1, “How the Query Cache Operates”

Section 11.15, “Miscellaneous Functions”

Section 16.1.2.3, “Safe and Unsafe Statements in Logging and Replication”

## **Union(g1,g2)**

Section 11.17.5.3.2, “Spatial Operators”

## **UpdateXML()**

Section 1.5, “What Is New in MySQL 5.1”

Section 11.11, “XML Functions”

## **UpdateXML(xml\_target, xpath\_expr, new\_xml)**

Section 11.11, “XML Functions”

## **VALUES()**

Section 12.2.5.3, “`INSERT ... ON DUPLICATE KEY UPDATE` Syntax”

Section 11.15, “Miscellaneous Functions”

## **VALUES(col\_name)**

Section 12.2.5.3, “`INSERT ... ON DUPLICATE KEY UPDATE` Syntax”

Section 11.15, “Miscellaneous Functions”

## **VARIANCE()**

Section 11.16.1, “`GROUP BY` (Aggregate) Functions”

## **VARIANCE(expr)**

Section 11.16.1, “`GROUP BY` (Aggregate) Functions”

## **VAR\_POP()**

Section 11.16.1, “`GROUP BY` (Aggregate) Functions”

## **VAR\_POP(expr)**

Section 11.16.1, “`GROUP BY` (Aggregate) Functions”

## **VAR\_SAMP()**

Section 11.16.1, “`GROUP BY` (Aggregate) Functions”

## **VAR\_SAMP(expr)**

Section 11.16.1, “`GROUP BY` (Aggregate) Functions”

## **VERSION()**

Section 9.1.7.5, “Collation of Expressions”

Section 16.1.2.1, “Comparison of Statement-Based and Row-Based Replication”

Determining your current MySQL version

Section 11.14, “Information Functions”

Section 16.4.1.12, “Replication and System Functions”

Section 9.1.11, “UTF-8 for Metadata”

## **WEEK()**

Section 11.7, “Date and Time Functions”

Section 5.1.4, “Server System Variables”

## **WEEK(date)**

Section 11.7, “Date and Time Functions”

## **WEEK(date,0)**

Section 11.7, “Date and Time Functions”

## **WEEK(date,3)**

Section 11.7, “Date and Time Functions”

## **WEEK(date[,mode])**

Section 11.7, “Date and Time Functions”

## **WEEKDAY()**

Section 1.8.4, “MySQL Extensions to Standard SQL”

Section 18.2, “Partition Types”

Section 18.5.3, “Partitioning Limitations Relating to Functions”

## **WEEKDAY(date)**

Section 11.7, “Date and Time Functions”

## **WEEKOFYEAR()**

Section 11.7, “Date and Time Functions”

## **WEEKOFYEAR(date)**

Section 11.7, “Date and Time Functions”

## **WEIGHT\_STRING()**

Section 9.4, “How to Add a New Collation to a Character Set”

Section 11.5, “String Functions”

Section 9.1.13.1, “Unicode Character Sets”

## **WEIGHT\_STRING(str [AS {CHAR|BINARY}(N)] [LEVEL levels] [flags])**

Section 11.5, “String Functions”

## **WEIGHT\_STRING(str1)**

Section 11.5, “String Functions”

## **WEIGHT\_STRING(str2)**

Section 11.5, “String Functions”

## **Within()**

Section 11.17.5.6, “Functions That Test Spatial Relationships Between Geometries”

## **Within(g1,g2)**

Section 11.17.5.6, “Functions That Test Spatial Relationships Between Geometries”

## **X(p)**

Section 11.17.5.2.2, “Point Functions”

## **Y(p)**

Section 11.17.5.2.2, “Point Functions”

## **YEAR('1984-06-21')**

Section 18.4, “Partition Pruning”

## **YEAR('1999-06-21')**

Section 18.4, “Partition Pruning”

## **YEAR()**

Section 3.3.4.5, “Date Calculations”  
Section 18.4, “Partition Pruning”  
Section 18.2, “Partition Types”  
Section 18.5.3, “Partitioning Limitations Relating to Functions”

**YEAR(NULL)**

Section 18.2.6, “How MySQL Partitioning Handles NULL”

**YEAR(date)**

Section 11.7, “Date and Time Functions”

**YEAR(date\_col)**

Section 18.2.3, “HASH Partitioning”

# INFORMATION\_SCHEMA Index

## CHARACTER\_SETS

Section 9.1.9.3, “SHOW Statements and INFORMATION\_SCHEMA”  
Section 20.9, “The INFORMATION\_SCHEMA CHARACTER\_SETS Table”

## COLLATIONS

Section 9.1.9.3, “SHOW Statements and INFORMATION\_SCHEMA”  
Section 21.9.1, “C API Data Structures”  
Section 7.3.3, “INFORMATION\_SCHEMA Optimization”  
Section 20.10, “The INFORMATION\_SCHEMA COLLATIONS Table”

## COLLA-

## TION\_CHARACTER\_SET\_APPLICABILITY

Section 20.11, “The INFORMATION\_SCHEMA COLLATION\_CHARACTER\_SET\_APPLICABILITY Table”

## COLUMNS

Section 7.3.3, “INFORMATION\_SCHEMA Optimization”  
Section 20.3, “The INFORMATION\_SCHEMA COLUMNS Table”  
Section 20.14, “The INFORMATION\_SCHEMA ROUTINES Table”

## COLUMN\_PRIVILEGES

Section 20.8, “The INFORMATION\_SCHEMA COLUMN\_PRIVILEGES Table”

## ENGINES

Section 17.5.7, “Quick Reference: MySQL Cluster SQL Statements”  
Section 20.18, “The INFORMATION\_SCHEMA ENGINES Table”  
Section 1.5, “What Is New in MySQL 5.1”

## EVENTS

Section 16.4.1.9, “Replication of Invoked Features”  
Section 20.20, “The INFORMATION\_SCHEMA EVENTS Table”  
Section 1.5, “What Is New in MySQL 5.1”

## FILES

Section 17.5.10.1, “MySQL Cluster Disk Data Objects”  
Section 20.21, “The INFORMATION\_SCHEMA FILES Table”  
Section 1.5, “What Is New in MySQL 5.1”

## GLOBAL\_STATUS

Section 20.24, “The INFORMATION\_SCHEMA GLOBAL\_STATUS and SESSION\_STATUS Tables”  
Section 20.25, “The INFORMATION\_SCHEMA GLOBAL\_VARIABLES and SESSION\_VARIABLES Tables”

## GLOBAL\_VARIABLES

Section 20.25, “The INFORMATION\_SCHEMA GLOBAL\_VARIABLES and SESSION\_VARIABLES Tables”

## INFORMATION\_SCHEMA.COLLATIONS

Section 9.4.2, “Choosing a Collation ID”

## INFORMATION\_SCHEMA.ENGINES

Section 17.5.7, “Quick Reference: MySQL Cluster SQL Statements”

## INFORMATION\_SCHEMA.EVENTS

Section 12.4.5.19, “SHOW EVENTS Syntax”  
Section 16.4.1.9, “Replication of Invoked Features”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”

## INFORMATION\_SCHEMA.FILES

Section 12.1.3, “ALTER LOGFILE GROUP Syntax”  
Section 12.1.8, “ALTER TABLESPACE Syntax”  
Section 12.1.14, “CREATE LOGFILE GROUP Syntax”  
Section 12.1.18, “CREATE TABLESPACE Syntax”  
Section 17.1.4.3, “MySQL Cluster Development in MySQL Cluster NDB 6.3”  
Section 17.1.4.2, “MySQL Cluster Development in MySQL Cluster NDB 7.0”  
Section 17.5.10.3, “MySQL Cluster Disk Data Storage Requirements”

## INFORMATION\_SCHEMA.PARAMETERS

Section 1.5, “What Is New in MySQL 5.1”

## INFORMATION\_SCHEMA.PARTITIONS

Section 18.2.4, “KEY Partitioning”  
Section 18.2.6, “How MySQL Partitioning Handles NULL”  
Section 18.3.4, “Obtaining Information About Partitions”  
Section 20.19, “The INFORMATION\_SCHEMA PARTITIONS Table”

## INFORMATION\_SCHEMA.PLUGINS

Section 12.4.3.4, “INSTALL PLUGIN Syntax”  
Section 22.2.4.1, “General Plugin Data Structures and Functions”  
Section 12.4.3.1, “Installing and Uninstalling Plugins”  
Section 22.2.1, “Plugin API Characteristics”  
Section 22.2.2, “Plugin API Components”

## INFORMA-TION\_SCHEMA.PROCESSLIST

Section 20.22, “The INFORMATION\_SCHEMA PROCESSLIST Table”

## INFORMATION\_SCHEMA.ROUTINES

Chapter 20, *INFORMATION\_SCHEMA Tables*  
Section 20.14, “The INFORMATION\_SCHEMA ROUTINES Table”  
Section 1.5, “What Is New in MySQL 5.1”

## INFORMATION\_SCHEMA.TABLES

Chapter 20, *INFORMATION\_SCHEMA Tables*  
Chapter 18, *Partitioning*

## INFORMA-TION\_SCHEMA.TABLE\_CONSTRAINTS

Section 20.23, “The INFORMATION\_SCHEMA REFERENTIAL\_CONSTRAINTS Table”

## INFORMATION\_SCHEMA.TRIGGERS

Section 12.4.5.40, “SHOW TRIGGERS Syntax”  
Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”

## INFORMATION\_SCHEMA.VIEWS

Section 19.5.3, “Updatable and Insertable Views”

## KEY\_COLUMN\_USAGE

Section 7.3.3, “INFORMATION\_SCHEMA Optimization”

Section 20.13, “The INFORMATION\_SCHEMA KEY\_COLUMN\_USAGE Table”

## PARAMETERS

Section 19.2.3, “Stored Routine Metadata”

Section 20.14, “The INFORMATION\_SCHEMA ROUTINES Table”

## PARTITIONS

Section 18.2.6, “How MySQL Partitioning Handles NULL”

Section 18.3.4, “Obtaining Information About Partitions”

Section 7.3.3, “INFORMATION\_SCHEMA Optimization”

Chapter 18, *Partitioning*

Section 20.19, “The INFORMATION\_SCHEMA PARTITIONS Table”

Section 1.5, “What Is New in MySQL 5.1”

## PLUGINS

Section 20.18, “The INFORMATION\_SCHEMA ENGINES Table”

Section 20.17, “The INFORMATION\_SCHEMA PLUGINS Table”

Section 1.5, “What Is New in MySQL 5.1”

## PROCESSLIST

Section 12.4.5.31, “SHOW PROCESSLIST Syntax”

Section 7.10, “Examining Thread Information”

Section 20.22, “The INFORMATION\_SCHEMA PROCESSLIST Table”

Section 1.5, “What Is New in MySQL 5.1”

## PROFILING

Section 12.4.5.33, “SHOW PROFILES Syntax”

Section 20.26, “The INFORMATION\_SCHEMA PROFILING Table”

## REFERENTIAL\_CONSTRAINTS

Section 7.3.3, “INFORMATION\_SCHEMA Optimization”

Section 20.23, “The INFORMATION\_SCHEMA REFERENTIAL\_CONSTRAINTS Table”

## ROUTINES

Section 12.4.5.30, “SHOW PROCEDURE STATUS Syntax”

Section 19.2.3, “Stored Routine Metadata”

Section 20.14, “The INFORMATION\_SCHEMA ROUTINES Table”

## SCHEMATA

Section 5.4.2, “Privilege System Grant Tables”

Section 20.1, “The INFORMATION\_SCHEMA SCHEMATA Table”

## SCHEMA\_PRIVILEGES

Section 20.6, “The INFORMATION\_SCHEMA SCHEMA\_PRIVILEGES Table”

## SESSION\_STATUS

Section 20.24, “The INFORMATION\_SCHEMA GLOBAL\_STATUS and SESSION\_STATUS Tables”

Section 20.25, “The INFORMATION\_SCHEMA GLOBAL\_VARIABLES and SESSION\_VARIABLES Tables”

## SESSION\_VARIABLES

Section 20.25, “The INFORMATION\_SCHEMA GLOBAL\_VARIABLES and SESSION\_VARIABLES Tables”

## STATISTICS

Section 13.6.3, “InnoDB Startup Options and System Variables”

Section 7.3.3, “INFORMATION\_SCHEMA Optimization”

Section 20.4, “The INFORMATION\_SCHEMA STATISTICS Table”

## TABLES

Chapter 20, *INFORMATION\_SCHEMA Tables*

Section 13.6.3, “InnoDB Startup Options and System Variables”

Section 7.3.3, “INFORMATION\_SCHEMA Optimization”

Section 20.2, “The INFORMATION\_SCHEMA TABLES Table”

## TABLE\_CONSTRAINTS

Section 7.3.3, “INFORMATION\_SCHEMA Optimization”

Section 20.12, “The INFORMATION\_SCHEMA TABLE\_CONSTRAINTS Table”

## TABLE\_PRIVILEGES

Section 20.7, “The INFORMATION\_SCHEMA TABLE\_PRIVILEGES Table”

## TRIGGERS

Section 12.4.5.13, “SHOW CREATE TRIGGER Syntax”

Section 7.3.3, “INFORMATION\_SCHEMA Optimization”

Section 20.16, “The INFORMATION\_SCHEMA TRIGGERS Table”

Section 19.3.2, “Trigger Metadata”

## USER\_PRIVILEGES

Section 20.5, “The INFORMATION\_SCHEMA USER\_PRIVILEGES Table”

## VIEWS

Section 12.4.5.14, “SHOW CREATE VIEW Syntax”

Section 7.3.3, “INFORMATION\_SCHEMA Optimization”

Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 20.20, “The INFORMATION\_SCHEMA EVENTS Table”

## **CREATE EVENT IF NOT EXISTS**

Section 16.4.1.3, “Replication of CREATE ... IF NOT EXISTS Statements”

## **CREATE FUNCTION**

Section 12.1.4, “ALTER FUNCTION Syntax”  
Section 12.1.12, “CREATE FUNCTION Syntax”  
Section 12.4.3.2, “CREATE FUNCTION Syntax”  
Section 12.1.15, “CREATE PROCEDURE and CREATE FUNCTION Syntax”  
Section 12.4.3.3, “DROP FUNCTION Syntax”  
Section 22.3, “Adding New Functions to MySQL”  
Section 19.7, “Binary Logging of Stored Programs”  
Section 22.3.2.5, “Compiling and Installing User-Defined Functions”  
Description  
Section 8.2.4, “Function Name Parsing and Resolution”  
Section 11.14, “Information Functions”  
Section 16.4.1.5, “Replication of CURRENT\_USER()”  
Section 16.4.1.9, “Replication of Invoked Features”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 19.2.1, “Stored Routine Syntax”  
Section 22.3.2.1, “UDF Calling Sequences for Simple Functions”  
Section 2.12.1, “Upgrading MySQL”  
Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”  
Section 22.3.2.6, “User-Defined Function Security Precautions”

## **CREATE INDEX**

Section 12.1.7, “ALTER TABLE Syntax”  
Section 12.1.13, “CREATE INDEX Syntax”  
Section 13.6.4.4, “FOREIGN KEY Constraints”  
Section 11.17.6.1, “Creating Spatial Indexes”  
Section 11.9, “Full-Text Search Functions”  
Section 17.1.5.8, “Issues Exclusive to MySQL Cluster”  
Section 17.1.4.4, “MySQL Cluster Development in MySQL Cluster NDB 6.2”  
Section 17.1.5.11, “Previous MySQL Cluster Issues Resolved in MySQL 5.1, MySQL Cluster NDB 6.x, and MySQL Cluster NDB 7.x”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.4, “Server System Variables”

Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 17.1.5.6, “Unsupported or Missing Features in MySQL Cluster”

## **CREATE LOGFILE GROUP**

Section 17.3.2.6, “Defining MySQL Cluster Data Nodes”  
Description  
Section 17.1.5.8, “Issues Exclusive to MySQL Cluster”

## **CREATE OR REPLACE VIEW**

Section 12.1.9, “ALTER VIEW Syntax”  
Section 12.1.20, “CREATE VIEW Syntax”  
Section D.4, “Restrictions on Views”

## **CREATE PROCEDURE**

Section 12.1.5, “ALTER PROCEDURE Syntax”  
Section 12.2.1, “CALL Syntax”  
Section 12.1.15, “CREATE PROCEDURE and CREATE FUNCTION Syntax”  
Section 19.7, “Binary Logging of Stored Programs”  
Description  
Section 11.14, “Information Functions”  
Section 16.4.1.5, “Replication of CURRENT\_USER()”  
Section 16.4.1.9, “Replication of Invoked Features”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 19.2.1, “Stored Routine Syntax”

## **CREATE SCHEMA**

Section 12.1.10, “CREATE DATABASE Syntax”  
Section 17.1.4.6, “Development History of MySQL Cluster in MySQL 5.1”  
Section 17.1.5.8, “Issues Exclusive to MySQL Cluster”  
Section 17.6.9, “MySQL Cluster Backups With MySQL Cluster Replication”  
Section 17.1.4.4, “MySQL Cluster Development in MySQL Cluster NDB 6.2”  
Section 17.1.4.3, “MySQL Cluster Development in MySQL Cluster NDB 6.3”

## **CREATE SERVER**

Section 12.1.6, “ALTER SERVER Syntax”  
Section 12.1.16, “CREATE SERVER Syntax”  
Section 13.11.3, “FEDERATED Storage Engine Notes and Tips”  
Section 12.4.6.3, “FLUSH Syntax”  
Section 13.11.2.2, “Creating a FEDERATED Table Using CREATE SERVER”  
Section 7.9.5, “How MySQL Uses Memory”  
Section 13.11.2, “How to Create FEDERATED Tables”

## **CREATE TABLE**

Section 4.5.1.1, “mysql Options”  
Section 12.1.7, “ALTER TABLE Syntax”  
Section 13.6.4.3, “AUTO\_INCREMENT Handling in InnoDB”  
Section 12.1.11, “CREATE EVENT Syntax”  
Section 12.1.13, “CREATE INDEX Syntax”  
Section 12.1.16, “CREATE SERVER Syntax”  
Section 12.1.17.1, “CREATE TABLE ... SELECT Syntax”  
Section 12.1.17, “CREATE TABLE Syntax”  
Section 12.8.1, “DESCRIBE Syntax”  
Section 13.6.4.4, “FOREIGN KEY Constraints”  
Section 18.2.3, “HASH Partitioning”

## CREATE TABLE ... SELECT

- Section 12.1.17.1, “`CREATE TABLE ... SELECT` Syntax”  
Section 1.8.5.1, “`SELECT INTO TABLE`”  
Section B.5.8.2, “Additional Known Issues”  
Section 19.7, “Binary Logging of Stored Programs”  
Section 11.10, “Cast Functions and Operators”  
Section 16.1.2.1, “Comparison of Statement-Based and Row-Based Replication”  
Section 13.6.8.2, “Consistent Nonlocking Reads”  
Section 5.2.4.4, “Logging Format for Changes to `mysql` Database Tables”  
Section B.5.8.1, “Open Issues in MySQL”  
Section 16.4.1.4, “Replication of `CREATE TABLE ... SELECT` Statements”  
Section 5.1.4, “Server System Variables”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”

## **CREATE TABLE ... SELECT ...**

Section 13.6.8.6, “Locks Set by Different SQL Statements in InnoDB”

Section 18.3.1, “Management of RANGE and LIST Partitions”

## **CREATE TABLE IF NOT EXISTS**

Section 12.1.17.1, “CREATE TABLE ... SELECT Syntax”

Section 16.4.1.3, “Replication of CREATE ... IF NOT EXISTS Statements”

Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”

## **CREATE TABLE IF NOT EXISTS ... LIKE**

Section 16.4.1.3, “Replication of CREATE ... IF NOT EXISTS Statements”

## **CREATE TABLE IF NOT EXISTS ... SELECT**

Section 12.1.17.1, “CREATE TABLE ... SELECT Syntax”

Section 16.4.1.3, “Replication of CREATE ... IF NOT EXISTS Statements”

Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”

## **CREATE TABLESPACE**

Section 12.1.8, “ALTER TABLESPACE Syntax”

Section 17.3.2.6, “Defining MySQL Cluster Data Nodes”

Description

Section 17.1.5.8, “Issues Exclusive to MySQL Cluster”

## **CREATE TEMPORARY TABLE**

Section 12.4.1.3, “GRANT Syntax”

Description

Section 6.5, “Point-in-Time (Incremental) Recovery Using the Binary Log”

Section 12.3.3, “Statements That Cause an Implicit Commit”

## **CREATE TRIGGER**

Section 12.1.19, “CREATE TRIGGER Syntax”

Section 12.4.5.13, “SHOW CREATE TRIGGER Syntax”

Section 19.7, “Binary Logging of Stored Programs”

Description

Section 11.14, “Information Functions”

Section 17.1.4.3, “MySQL Cluster Development in MySQL Cluster NDB 6.3”

Section 17.1.4.2, “MySQL Cluster Development in MySQL Cluster NDB 7.0”

Section 17.1.4.1, “MySQL Cluster Development in MySQL Cluster NDB 7.1”

Section 7.3.1.14, “Optimizing IN/ANY Subqueries”

Section 16.4.1.29, “Replication and Triggers”

Section 16.4.1.5, “Replication of CURRENT\_USER()”

Section 16.4.1.9, “Replication of Invoked Features”

Section D.1, “Restrictions on Stored Routines, Triggers, and Events”

Section 12.3.3, “Statements That Cause an Implicit Commit”

Section 19.3.1, “Trigger Syntax”

## **CREATE USER**

Section 12.4.1.1, “CREATE USER Syntax”

Section 12.4.6.3, “FLUSH Syntax”

Section 12.4.1.3, “GRANT Syntax”

Section 5.5.2, “Adding User Accounts”

Section 5.3.2.1, “Administrator Guidelines for Password Security”

Section 5.5.5, “Assigning Account Passwords”

Section 5.4.7, “Causes of Access-Denied Errors”

Section 16.1.1.3, “Creating a User for Replication”

Section 5.3.2.2, “End-User Guidelines for Password Security”

Section 7.9.5, “How MySQL Uses Memory”

Section 5.2.4.4, “Logging Format for Changes to mysql Database Tables”

Section 17.5.9.2, “MySQL Cluster and MySQL Privileges”

Section 5.4.1, “Privileges Provided by MySQL”

Section 16.4.1.21, “Replication of the mysql System Database”

Section 5.4.3, “Specifying Account Names”

Section 12.3.3, “Statements That Cause an Implicit Commit”

Section 5.4, “The MySQL Access Privilege System”

## **CREATE VIEW**

Section 12.1.9, “ALTER VIEW Syntax”

Section 12.1.20, “CREATE VIEW Syntax”

Section 12.4.5.14, “SHOW CREATE VIEW Syntax”

Section 7.10.2, “General Thread States”

Section 11.14, “Information Functions”

Section 5.4.1, “Privileges Provided by MySQL”

Section 16.4.1.5, “Replication of CURRENT\_USER()”

Section D.4, “Restrictions on Views”

Section 8.2, “Schema Object Names”

Section 12.3.3, “Statements That Cause an Implicit Commit”

Section 20.15, “The INFORMATION\_SCHEMA VIEWS Table”

Section 19.5.3, “Updatable and Insertable Views”

Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”

Section 19.5.2, “View Processing Algorithms”

Section 19.5.1, “View Syntax”

## **DEALLOCATE PREPARE**

Section 12.6.3, “DEALLOCATE PREPARE Syntax”

Section 12.6.1, “PREPARE Syntax”

Section D.1, “Restrictions on Stored Routines, Triggers, and Events”

Section 12.6, “SQL Syntax for Prepared Statements”

Section 5.1.6, “Server Status Variables”

## **DECLARE**

Section 12.1.15, “CREATE PROCEDURE and CREATE FUNCTION Syntax”

Section 12.7.2, “DECLARE Syntax”

Section 12.7.4.1, “DECLARE for Conditions”

Section 12.7.5.1, “DECLARE for Cursors”

Section 12.7.4.2, “DECLARE for Handlers”

Section 12.7.3.1, “DECLARE for Local Variables”

## **DELETE**

Section 4.5.1.1, “mysql Options”

Section 12.1.7, “ALTER TABLE Syntax”

Section 12.1.15, “CREATE PROCEDURE and CREATE FUNCTION Syntax”

Section 12.1.19, “CREATE\_TRIGGER Syntax”

Section 12.1.20, “CREATE VIEW Syntax”

Section 12.2.2, “DELETE Syntax”

Section 13.11.3, “FEDERATED Storage Engine Notes and Tips”

Section 13.6.4.4, “FOREIGN KEY Constraints”

Section 12.4.1.3, “GRANT Syntax”

Section 13.6.3, “InnoDB Startup Options and System Variables”

Section 13.6.4.5, “InnoDB and MySQL Replication”

Section 12.2.8.1, “JOIN Syntax”

Section 12.4.6.4, “KILL Syntax”

Section 18.2.2, “LIST Partitioning”

Section 13.8.2, “MERGE Table Problems”

Section 18.2.1, “RANGE Partitioning”

Section 12.4.1.5, “REVOKE Syntax”

Section 12.3.6, “SET TRANSACTION Syntax”

Section 12.2.10, “TRUNCATE TABLE Syntax”

Section 7.3.1.2, “WHERE Clause Optimization”  
Section 21.9.3.1, “mysql\_affected\_rows()”  
Section 21.9.3.44, “mysql\_list\_tables()”

Section 11.15, “Miscellaneous Functions”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section D.3, “Restrictions on Subqueries”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 12.2.9, “Subquery Syntax”  
Section 20.20, “The INFORMATION\_SCHEMA EVENTS Table”

## DROP DATABASE

Section 12.1.21, “DROP DATABASE Syntax”  
Section 13.6.10, “InnoDB Table and Index Structures”  
Section 21.9.3.11, “mysql\_drop\_db()”  
Section 16.1.3.4, “Binary Log Options and Variables”  
Section 19.7, “Binary Logging of Stored Programs”  
Section 21.9.2, “C API Function Overview”  
Description  
Description  
Section 6.4.1, “Dumping Data in SQL Format with mysqldump”

Section 16.2.3.1, “Evaluation of Database-Level Replication and Binary Logging Options”  
Section 7.6.3.1, “How the Query Cache Operates”  
Section 17.1.5.8, “Issues Exclusive to MySQL Cluster”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 6.5, “Point-in-Time (Incremental) Recovery Using the Binary Log”  
Section 16.1.3.3, “Replication Slave Options and Variables”  
Section 5.1.4, “Server System Variables”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 13.6.13.4, “Troubleshooting InnoDB Data Dictionary Operations”  
Section D.7.3, “Windows Platform Limitations”

## DROP DATABASE IF EXISTS

Section 16.4.1.6, “Replication of `DROP ... IF EXISTS` Statements”

## DROP EVENT

Section 12.1.22, “`DROP EVENT` Syntax”  
Section 19.7, “Binary Logging of Stored Programs”  
Section 16.4.1.9, “Replication of Invoked Features”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## DROP FUNCTION

Section 12.1.4, “`ALTER FUNCTION` Syntax”  
Section 12.4.3.2, “`CREATE FUNCTION` Syntax”  
Section 12.1.23, “`DROP FUNCTION` Syntax”  
Section 12.4.3.3, “`DROP FUNCTION` Syntax”  
Section 12.1.26, “`DROP PROCEDURE` and `DROP FUNCTION` Syntax”  
Section 22.3, “Adding New Functions to MySQL”  
Section 19.7, “Binary Logging of Stored Programs”  
Section 22.3.2.5, “Compiling and Installing User-Defined Functions”  
Section 8.2.4, “Function Name Parsing and Resolution”  
Section 16.4.1.9, “Replication of Invoked Features”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 19.2.1, “Stored Routine Syntax”  
Section 2.12.1, “Upgrading MySQL”  
Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”  
Section 22.3.2.6, “User-Defined Function Security Precautions”

## DROP INDEX

Section 12.1.7, “`ALTER TABLE` Syntax”  
Section 12.1.24, “`DROP INDEX` Syntax”  
Section 11.17.6.1, “Creating Spatial Indexes”  
Section 17.1.4.4, “MySQL Cluster Development in MySQL Cluster NDB 6.2”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## DROP LOGFILE GROUP

Section 17.1.5.8, “Issues Exclusive to MySQL Cluster”

## DROP PROCEDURE

Section 12.1.5, “`ALTER PROCEDURE` Syntax”  
Section 12.1.26, “`DROP PROCEDURE` and `DROP FUNCTION` Syntax”  
Section 19.7, “Binary Logging of Stored Programs”  
Section 16.4.1.9, “Replication of Invoked Features”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 19.2.1, “Stored Routine Syntax”

## DROP SCHEMA

Section 12.1.21, “`DROP DATABASE` Syntax”

Section 17.1.5.8, “Issues Exclusive to MySQL Cluster”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 5.1.4, “Server System Variables”

## DROP SERVER

Section 12.1.27, “`DROP SERVER` Syntax”  
Section 12.4.6.3, “`FLUSH` Syntax”  
Section 7.9.5, “How MySQL Uses Memory”

## DROP TABLE

Section 4.5.1.1, “`mysql` Options”  
Section 12.1.7, “`ALTER TABLE` Syntax”  
Section 12.1.19, “`CREATE TRIGGER` Syntax”  
Section 12.1.28, “`DROP TABLE` Syntax”  
Section 13.11.3, “FEDERATED Storage Engine Notes and Tips”  
Section 13.6.4.4, “`FOREIGN KEY` Constraints”  
Section 13.6.13.1, “InnoDB Performance Tuning Tips”  
Section 12.3.5, “`LOCK TABLES` and `UNLOCK TABLES` Syntax”  
Section 13.8.2, “`MERGE` Table Problems”  
Section 12.4.5.36, “`SHOW SLAVE STATUS` Syntax”  
Section 12.4.5.42, “`SHOW WARNINGS` Syntax”  
Section 12.5.2.7, “`START SLAVE` Syntax”  
Section 12.2.10, “`TRUNCATE TABLE` Syntax”  
Section 12.4.3.5, “`UNINSTALL PLUGIN` Syntax”  
Section B.5.8.2, “Additional Known Issues”  
Section 13.6.8.2, “Consistent Nonlocking Reads”  
Description  
Section 22.2.3.2, “Full-Text Parser Plugins”  
Section 7.6.3.1, “How the Query Cache Operates”  
Section 11.14, “Information Functions”  
Section 17.1.5.8, “Issues Exclusive to MySQL Cluster”  
Section 17.1.5.2, “Limits and Differences of MySQL Cluster from Standard MySQL Limits”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section B.5.8.1, “Open Issues in MySQL”  
Section 17.6.9.2, “Point-In-Time Recovery Using MySQL Cluster Replication”  
Section D.4, “Restrictions on Views”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”  
Section 5.1.4, “Server System Variables”  
Section 5.2.4.2, “Setting The Binary Log Format”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 13.9, “The MEMORY Storage Engine”  
Section 13.8, “The MERGE Storage Engine”  
Section 13.6.13.4, “Troubleshooting InnoDB Data Dictionary Operations”  
Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”  
Section D.7.3, “Windows Platform Limitations”

## DROP TABLE IF EXISTS

Section 16.4.1.6, “Replication of `DROP ... IF EXISTS` Statements”

## DROP TABLESPACE

Section 17.1.5.8, “Issues Exclusive to MySQL Cluster”

## DROP TRIGGER

Section 12.1.30, “`DROP TRIGGER` Syntax”  
Description  
Section 16.4.1.9, “Replication of Invoked Features”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 19.3.1, “Trigger Syntax”  
Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”

## DROP TRIGGER IF EXISTS

Section 17.1.4.3, “MySQL Cluster Development in MySQL Cluster NDB 6.3”  
Section 17.1.4.2, “MySQL Cluster Development in MySQL Cluster NDB 7.0”  
Section 17.1.4.1, “MySQL Cluster Development in MySQL Cluster NDB 7.1”

## DROP USER

Section 12.4.1.2, “DROP USER Syntax”  
Section 12.4.6.3, “FLUSH Syntax”  
Section 12.4.1.3, “GRANT Syntax”  
Section 12.4.1.5, “REVOKE Syntax”  
Section 7.9.5, “How MySQL Uses Memory”  
Section 11.14, “Information Functions”  
Section 17.5.9.2, “MySQL Cluster and MySQL Privileges”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 5.5.3, “Removing User Accounts”  
Section 16.4.1.5, “Replication of CURRENT\_USER( )”  
Section 16.4.1.21, “Replication of the mysql System Database”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## DROP VIEW

Section 12.1.31, “DROP VIEW Syntax”  
Section 2.12.2.1, “Downgrading to MySQL 5.0”  
Section D.4, “Restrictions on Views”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 19.5.1, “View Syntax”

## DROP VIEW IF EXISTS

Section 16.4.1.6, “Replication of DROP . . . IF EXISTS Statements”

## EXECUTE

Section 12.2.1, “CALL Syntax”  
Section 12.6.2, “EXECUTE Syntax”  
Section 12.6.1, “PREPARE Syntax”  
Section 21.9.15, “C API Support for Prepared CALL Statements”  
Section 7.6.3.1, “How the Query Cache Operates”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section D.4, “Restrictions on Views”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.6, “Server Status Variables”

## EXPLAIN

Section 12.1.7, “ALTER TABLE Syntax”  
Section 12.1.15, “CREATE PROCEDURE and CREATE FUNCTION Syntax”  
Section 7.3.1.13, “DISTINCT Optimization”  
Section 7.2.2, “EXPLAIN Output Format”  
Section 12.8.2, “EXPLAIN Syntax”  
Chapter 20, *INFORMATION\_SCHEMA Tables*  
Section 7.3.1.6, “IS NULL Optimization”  
Section 7.3.1.11, “ORDER BY Optimization”  
Section 12.2.8, “SELECT Syntax”  
Section 21.9.7.27, “mysql\_stmt\_store\_result()”  
Section 21.9.3.69, “mysql\_store\_result()”  
Section 21.9.3.71, “mysql\_use\_result()”  
Section 21.9.1, “C API Data Structures”  
Section 21.9.2, “C API Function Overview”  
Section 7.3.1.5, “Condition Pushdown Optimization”  
Section 22.5.1, “Debugging a MySQL Server”  
Section 7.8.4, “How MySQL Uses Internal Temporary Tables”  
Section 7.3.1.16, “How to Avoid Table Scans”  
Section 12.2.8.2, “Index Hint Syntax”  
Section 7.3.1.4, “Index Merge Optimization”  
Section 7.3.1.12.1, “Loose Index Scan”

Section 18.3.4, “Obtaining Information About Partitions”  
Section 7.2, “Obtaining Query Execution Plan Information”  
Section B.5.6, “Optimizer-Related Issues”  
Section 7.3.1.14, “Optimizing IN/ANY Subqueries”  
Section 7.3.3, “INFORMATION\_SCHEMA Optimization”  
Section 7.2.1, “Optimizing Queries with EXPLAIN”  
Section 12.2.9.10, “Optimizing Subqueries”  
Section 7.3.4, “Other Optimization Tips”  
Section 4.1, “Overview of MySQL Programs”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section B.5.5.7, “Solving Problems with No Matching Rows”  
Section 7.3.1.1, “Speed of SELECT Statements”  
Section 12.2.9.8, “Subqueries in the FROM Clause”  
Section 7.3.1.4.1, “The Index Merge Intersection Access Algorithm”  
Section 7.3.1.3.2, “The Range Access Method for Multiple-Part Indexes”  
Section 22.5.1.6, “Using Server Logs to Find Causes of Errors in mysqld”  
Section 11.17.6.2, “Using a Spatial Index”

## EXPLAIN EXTENDED

Section 7.2.2, “EXPLAIN Output Format”  
Section 12.8.2, “EXPLAIN Syntax”  
Section 7.3.1.5, “Condition Pushdown Optimization”  
Section 7.3.1.14, “Optimizing IN/ANY Subqueries”

## EXPLAIN PARTITIONS

Section 12.8.2, “EXPLAIN Syntax”  
Section 18.3.4, “Obtaining Information About Partitions”  
Section 7.2.1, “Optimizing Queries with EXPLAIN”

## EXPLAIN SELECT

Section 7.2.2, “EXPLAIN Output Format”  
Section 13.6.8.9, “How to Cope with Deadlocks”  
Section 1.7, “How to Report Bugs or Problems”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 18.3.4, “Obtaining Information About Partitions”  
Section 12.2.9.8, “Subqueries in the FROM Clause”

## FETCH

Section 12.7.5.3, “Cursor FETCH Statement”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”

## FLUSH

Section 12.4.6.3, “FLUSH Syntax”  
Section 12.4.1.3, “GRANT Syntax”  
Section 12.4.6.6, “RESET Syntax”  
Description  
Section 6.3.1, “Establishing a Backup Policy”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 16.4.1.11, “Replication and FLUSH”  
Section B.5.4.1.3, “Resetting the Root Password: Generic Instructions”  
Section B.5.4.1.2, “Resetting the Root Password: Unix Systems”  
Section B.5.4.1.1, “Resetting the Root Password: Windows Systems”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section 2.13.2, “Securing the Initial MySQL Accounts”  
Section 5.1.6, “Server Status Variables”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## FLUSH BACKUP LOGS

Section 12.4.6.3, “FLUSH Syntax”  
Section 21.9.3.55, “mysql\_refresh()”

## FLUSH BINARY LOGS

Section 5.2.6, “Server Log Maintenance”

## FLUSH DES\_KEY\_FILE

Section 11.13, “Encryption and Compression Functions”

## FLUSH HOSTS

Section B.5.2.6, “Host ‘host\_name’ is blocked”

Section 21.9.3.55, “mysql\_refresh()”

Section 7.9.9, “How MySQL Uses DNS”

Section 5.1.4, “Server System Variables”

## FLUSH LOGS

Section 12.4.6.3, “FLUSH Syntax”

Section 21.9.3.55, “mysql\_refresh()”

Section 6.3.3, “Backup Strategy Summary”

Section 6.2, “Database Backup Methods”

Section 6.3.1, “Establishing a Backup Policy”

Section 5.2, “MySQL Server Logs”

Section 16.4.1.11, “Replication and FLUSH”

Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”

Section 5.2.6, “Server Log Maintenance”

Section 5.1.9, “Server Response to Signals”

Section 5.2.2, “The Error Log”

Section 5.2.3, “The General Query Log”

Section 16.2.2.1, “The Slave Relay Log”

Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”

## FLUSH MASTER

Section 12.4.6.3, “FLUSH Syntax”

Section 12.5.1.2, “RESET MASTER Syntax”

Section 12.4.6.6, “RESET Syntax”

Section 16.4.1.11, “Replication and FLUSH”

## FLUSH PRIVILEGES

Section B.5.2.4, “Client does not support authentication protocol”

Section 12.4.6.3, “FLUSH Syntax”

Section 21.9.3.55, “mysql\_refresh()”

Section 21.9.3.56, “mysql\_reload()”

Section 5.5.2, “Adding User Accounts”

Section 5.4.7, “Causes of Access-Denied Errors”

Description

Section 7.9.5, “How MySQL Uses Memory”

Section 17.5.9.3, “MySQL Cluster and MySQL Security Procedures”

Section 5.4.2, “Privilege System Grant Tables”

Section 16.4.1.11, “Replication and FLUSH”

Section 5.3.4, “Security-Related mysqld Options”

Section 5.1.2, “Server Command Options”

Section 5.1.9, “Server Response to Signals”

Section 5.5.4, “Setting Account Resource Limits”

Section 1.2, “Typographical and Syntax Conventions”

Section 5.4.6, “When Privilege Changes Take Effect”

## FLUSH QUERY CACHE

Section 12.4.6.3, “FLUSH Syntax”

Section 7.6.3.4, “Query Cache Status and Maintenance”

## FLUSH SLAVE

Section 12.4.6.3, “FLUSH Syntax”

Section 12.5.2.5, “RESET SLAVE Syntax”

Section 12.4.6.6, “RESET Syntax”

Section 16.4.1.11, “Replication and FLUSH”

## FLUSH TABLE

Section 12.4.6.3, “FLUSH Syntax”

Section 7.3.2.1, “Speed of INSERT Statements”

## FLUSH TABLES

Section 12.4.6.3, “FLUSH Syntax”

Section 12.2.4, “HANDLER Syntax”

Section 12.2.5.2, “INSERT DELAYED Syntax”

Section 13.8.2, “MERGE Table Problems”

Section 21.9.3.55, “mysql\_refresh()”

Section 12.6.4, “Automatic Prepared Statement Repreparation”

Section 6.2, “Database Backup Methods”

Description

Description

Section 17.1.4.6, “Development History of MySQL Cluster in MySQL 5.1”

Section 7.10.2, “General Thread States”

Section 7.8.2, “How MySQL Opens and Closes Tables”

Section 7.9.5, “How MySQL Uses Memory”

Section 5.1.2, “Server Command Options”  
Section 5.1.4, “Server System Variables”  
Section 6.6.5, “Setting Up a `MyISAM` Table Maintenance Schedule”  
Section 7.3.2.2, “Speed of `UPDATE` Statements”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 13.5.3.1, “Static (Fixed-Length) Table Characteristics”  
Section 13.12, “The `ARCHIVE` Storage Engine”  
Section 5.1.10, “The Shutdown Process”  
Section 5.2.5, “The Slow Query Log”  
Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”  
Section 7.9.7.2, “Using Symbolic Links for Tables on Unix”

## PREPARE

Section 12.2.1, “`CALL` Syntax”  
Section 12.6.3, “`DEALLOCATE PREPARE` Syntax”  
Section 12.6.2, “`EXECUTE` Syntax”  
Section 12.6.1, “`PREPARE` Syntax”  
Section 12.6.4, “Automatic Prepared Statement Repreparation”  
Section 21.9.15, “C API Support for Prepared `CALL` Statements”  
Section 7.6.3.1, “How the Query Cache Operates”  
Section 8.2.2, “Identifier Case Sensitivity”  
Section D.1, “Restrictions on Stored Routines, Triggers, and Events”  
Section D.4, “Restrictions on Views”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.6, “Server Status Variables”  
Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”  
Section 8.4, “User-Defined Variables”

## PURGE BINARY LOGS

Section 12.4.1.3, “`GRANT` Syntax”  
Section 12.5.1.1, “`PURGE BINARY LOGS` Syntax”  
Section 12.5.1.2, “`RESET MASTER` Syntax”  
Description  
Section 6.3.1, “Establishing a Backup Policy”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 5.2.6, “Server Log Maintenance”  
Section 5.1.4, “Server System Variables”  
Section 5.2.4, “The Binary Log”

## RELEASE SAVEPOINT

Section 12.3.4, “`SAVEPOINT` and `ROLLBACK TO SAVEPOINT` Syntax”

## RENAME TABLE

Section 12.1.7, “`ALTER TABLE` Syntax”  
Section 12.2.2, “`DELETE` Syntax”  
Section 13.6.4.4, “`FOREIGN KEY` Constraints”

Section 13.8.2, “`MERGE` Table Problems”  
Section 12.1.33, “`RENAME TABLE` Syntax”  
Description  
Section 7.10.2, “General Thread States”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”  
Section 13.6.2.2, “Using Per-Table Tablespaces”  
Section 7.9.7.2, “Using Symbolic Links for Tables on Unix”

## RENAME USER

Section 12.4.1.3, “`GRANT` Syntax”  
Section 12.4.1.4, “`RENAME USER` Syntax”  
Section 11.14, “Information Functions”  
Section 5.2.4.4, “Logging Format for Changes to `mysql` Database Tables”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 16.4.1.5, “Replication of `CURRENT_USER()`”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 5.4.6, “When Privilege Changes Take Effect”

## REPAIR TABLE

Section 4.6.3.1, “`myisamchk` General Options”  
Section 12.1.7, “`ALTER TABLE` Syntax”  
Section 12.4.6.4, “`KILL` Syntax”  
Section 12.2.6, “`LOAD DATA INFILE` Syntax”  
Section 13.8.2, “`MERGE` Table Problems”  
Section 13.5.1, “MyISAM Startup Options”  
Section 6.6, “MyISAM Table Maintenance and Crash Recovery”  
Section 12.4.2.6, “`REPAIR TABLE` Syntax”  
Section B.5.8.2, “Additional Known Issues”  
Section 13.5.4.1, “Corrupted MyISAM Tables”  
Section 6.2, “Database Backup Methods”  
Description  
Description  
Section 7.7.4, “External Locking”  
Section 11.9.6, “Fine-Tuning MySQL Full-Text Search”  
Section 7.10.2, “General Thread States”  
Section B.5.4.3, “How MySQL Handles a Full Disk”  
Section 6.6.3, “How to Repair MyISAM Tables”  
Section 1.7, “How to Report Bugs or Problems”  
Section 18.3.3, “Maintenance of Partitions”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section B.5.8.1, “Open Issues in MySQL”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 13.5.4.2, “Problems from Tables Not Being Closed Properly”  
Section B.5.7.1, “Problems with `ALTER TABLE`”  
Section 2.12.4, “Rebuilding or Repairing Tables or Indexes”  
Section 16.4.1.11, “Replication and `FLUSH`”  
Section 16.4.1.16, “Replication and `REPAIR TABLE`”  
Section 18.5, “Restrictions and Limitations on Partitioning”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.4, “Server System Variables”  
Section 6.6.5, “Setting Up a MyISAM Table Maintenance Schedule”  
Section 7.3.2.4, “Speed of `REPAIR TABLE` Statements”  
Section 12.3.3, “Statements That Cause an Implicit Commit”  
Section 13.12, “The ARCHIVE Storage Engine”  
Section 5.1.10, “The Shutdown Process”  
Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”  
Section 7.9.7.2, “Using Symbolic Links for Tables on Unix”

## REPEAT

Section 12.7.1, “`BEGIN ... END` Compound Statement Syntax”  
Section 12.7.4.2, “`DECLARE` for Handlers”  
Section 12.7.6.5, “`ITERATE` Statement”

Section 12.7.6.4, “`LEAVE` Statement”  
Section 12.7.6.6, “`REPEAT` Statement”  
Section 19.1, “Defining Stored Programs”  
Section 12.7.6, “Flow Control Constructs”

## REPLACE

Section 12.1.17.1, “`CREATE TABLE ... SELECT` Syntax”  
Section 12.1.19, “`CREATE TRIGGER` Syntax”  
Section 12.2.5.2, “`INSERT DELAYED` Syntax”  
Section 12.2.5, “`INSERT` Syntax”  
Section 12.2.6, “`LOAD DATA INFILE` Syntax”  
Section 13.8.2, “`MERGE` Table Problems”  
Section B.5.2.9, “MySQL server has gone away”  
Section 12.2.7, “`REPLACE` Syntax”  
Section 21.9.3.1, “`mysql_affected_rows()`”  
Section B.5.8.2, “Additional Known Issues”  
Section 21.9.4, “C API Prepared Statements”  
Section 13.6.4.3.2, “Configurable InnoDB Auto-Increment Locking”  
Section 10.1.4, “Data Type Default Values”  
Description  
Section 7.1.2, “Designing Applications for Portability”  
Section 11.14, “Information Functions”  
Section 13.6.8.6, “Locks Set by Different SQL Statements in InnoDB”  
Section 5.2.4.4, “Logging Format for Changes to `mysql` Database Tables”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section B.5.8.1, “Open Issues in MySQL”  
Section 17.1.5.11, “Previous MySQL Cluster Issues Resolved in MySQL 5.1, MySQL Cluster NDB 6.x, and MySQL Cluster NDB 7.x”  
Section 12.6, “SQL Syntax for Prepared Statements”  
Section 5.1.2, “Server Command Options”  
Section 12.2.9, “Subquery Syntax”  
Section 13.12, “The ARCHIVE Storage Engine”  
Section 2.12.1.1, “Upgrading from MySQL 5.0 to 5.1”

## REPLACE ... SELECT

Section B.5.8.2, “Additional Known Issues”  
Section 13.6.4.3.2, “Configurable InnoDB Auto-Increment Locking”  
Section B.5.8.1, “Open Issues in MySQL”

## RESET

Section 12.4.6.3, “`FLUSH` Syntax”  
Section 12.4.6.6, “`RESET` Syntax”  
Section 1.8.4, “MySQL Extensions to Standard SQL”  
Section 12.3.3, “Statements That Cause an Implicit Commit”

## RESET MASTER

Section 12.4.6.3, “`FLUSH` Syntax”  
Section 12.5.1.2, “`RESET MASTER` Syntax”  
Section 12.4.5.36, “`SHOW SLAVE STATUS` Syntax”  
Section 21.9.3.55, “`mysql_refresh()`”  
Description  
Section 17.6.3, “Known Issues in MySQL Cluster Replication”  
Section 16.4.4, “Replication FAQ”  
Section 16.3.6, “Switching Masters During Failover”  
Section 5.2.4, “The Binary Log”

## RESET SLAVE

Section 12.5.2.1, “`CHANGE MASTER TO` Syntax”  
Section 12.4.6.3, “`FLUSH` Syntax”  
Section 12.5.1.2, “`RESET MASTER` Syntax”  
Section 12.5.2.5, “`RESET SLAVE` Syntax”  
Section 12.4.5.36, “`SHOW SLAVE STATUS` Syntax”

Section 16.4.5, “Troubleshooting Replication”

## SHOW OPEN TABLES

Section 12.4.5.26, “`SHOW OPEN TABLES` Syntax”

## SHOW PLUGINS

Section 12.4.3.4, “`INSTALL PLUGIN` Syntax”  
Section 12.4.5.27, “`SHOW PLUGINS` Syntax”  
Section 22.2.4.1, “General Plugin Data Structures and Functions”  
Section 12.4.3.1, “Installing and Uninstalling Plugins”  
Chapter 18, *Partitioning*  
Section 22.2.1, “Plugin API Characteristics”  
Section 22.2.2, “Plugin API Components”  
Section 20.17, “The `INFORMATION_SCHEMA PLUGINS` Table”  
Section 17.5.8, “The `ndbinfo` MySQL Cluster Information Database”

Section 13.6.2.1, “Using InnoDB Plugin Instead of the Built-In InnoDB”  
Section 1.5, “What Is New in MySQL 5.1”

## SHOW PRIVILEGES

Section 12.4.5.28, “`SHOW PRIVILEGES` Syntax”

## SHOW PROCEDURE CODE

Section 12.4.5.20, “`SHOW FUNCTION CODE` Syntax”  
Section 12.4.5.29, “`SHOW PROCEDURE CODE` Syntax”

## SHOW PROCEDURE STATUS

Section 12.4.5.21, “`SHOW FUNCTION STATUS` Syntax”  
Section 12.4.5.30, “`SHOW PROCEDURE STATUS` Syntax”  
Section 19.2.3, “Stored Routine Metadata”

## SHOW PROCESSLIST

Section 12.4.1.3, “`GRANT` Syntax”  
Section 13.6.12, “InnoDB Error Handling”  
Section 12.4.6.4, “`KILL` Syntax”  
Section 12.4.5.31, “`SHOW PROCESSLIST` Syntax”  
Section 12.4.5.33, “`SHOW PROFILES` Syntax”  
Section 12.4.5.36, “`SHOW SLAVE STATUS` Syntax”  
Section 12.3.1, “`START TRANSACTION`, `COMMIT`, and `ROLLBACK` Syntax”  
Section B.5.2.7, “Too many connections”  
Section 21.9.3.43, “`mysql_list_processes()`”  
Section 16.1.4.1, “Checking Replication Status”  
Description  
Section 7.10.2, “General Thread States”  
Section 5.3.3, “Making MySQL Secure Against Attackers”  
Section 17.4.1, “MySQL Server Usage for MySQL Cluster”  
Section 5.4.1, “Privileges Provided by MySQL”  
Section 16.4.4, “Replication FAQ”  
Section 16.2.1, “Replication Implementation Details”  
Section 16.3.6, “Switching Masters During Failover”  
Section 16.4.5, “Troubleshooting Replication”

## SHOW PROFILE

Section 12.4.5.32, “`SHOW PROFILE` Syntax”  
Section 12.4.5.33, “`SHOW PROFILES` Syntax”  
Section 7.10, “Examining Thread Information”  
Section 7.10.2, “General Thread States”  
Section 5.1.4, “Server System Variables”  
Section 20.26, “The `INFORMATION_SCHEMA PROFILING` Table”  
Section 2.3.3, “Typical configure Options”

## SHOW PROFILES

Section 12.4.5.32, “`SHOW PROFILE` Syntax”  
Section 12.4.5.33, “`SHOW PROFILES` Syntax”  
Section 5.1.4, “Server System Variables”  
Section 20.26, “The `INFORMATION_SCHEMA PROFILING` Table”  
Section 2.3.3, “Typical configure Options”

## SHOW RELAYLOG EVENTS

Section 12.4.5.3, “`SHOW BINLOG EVENTS` Syntax”

## SHOW SCHEMAS

Section 12.4.5.15, “`SHOW DATABASES` Syntax”

## SHOW SESSION STATUS

Section 20.24, “The `INFORMATION_SCHEMA GLOBAL_STATUS` and `SESSION_STATUS` Tables”

## SHOW SESSION VARIABLES

Section 20.25, “The INFORMATION\_SCHEMA GLOBAL\_VARIABLES and SESSION\_VARIABLES Tables”

## SHOW SLAVE HOSTS

Section 12.4.5.35, “SHOW SLAVE HOSTS Syntax”

Section 16.1.4.1, “Checking Replication Status”

Section 16.1.3.3, “Replication Slave Options and Variables”
